According to Jones (2021), the utilization of deception (including disinformation) for public opinion control and as a tool in aggressive foreign policy is increasingly favored by authoritarian regimes in the MENA region. COVID-19 disinformation has been instrumentalized by regional actors in the Persian Gulf and beyond to attack rivals or bolster the legitimacy of their regimes (Jones 2020). Researchers also draw attention to the presence of disinformation in the media, paying attention to contextual differences from country to country. (Al-Kaisy 2021; Bebawi 2021). M.-C. Chang, C.-C. Chang and T.-H. Lin (2020) provided empirical evidence on how Arab countries, including Qatar, Bahrain, and Yemen, found themselves caught between Saudi Arabia and Iran, bearing the brunt of their neighbors' disinformation attacks. The West also became another target.

IMPACT ON POLICY An example of the direct impact of disinformation operations on policies is the sanctions introduced by the EU in 2022 on Russia. As outlined by the EU (2024): "*The Russian Federation has engaged in a systematic, international campaign of disinformation, information manipulation and distortion of facts in order to enhance its strategy of destabilizing both its neighboring countries and the EU and its member states. To counteract this, the EU has suspended the broadcasting activities and licenses of several Kremlin-backed disinformation outlets.*" European sanctions were also imposed sanctions on media and individuals responsible for **propaganda** and disinformation.

A vibrant discussion in the literature centers on Russian **cyberwarfare**, shifting the focus of interest from political regimes to cybersecurity. Numerous works specifically focus on Russia's information warfare in the EU (Čižik 2017; Hellman & Wagnsson 2017; Bokša 2019; Clarke 2022), offering the potential for further analysis within the context of disinformation, encompassing strategies, narratives, impact, and countermeasures, for instance.

REGIONAL VARIATION Most existing studies have focused on the individual-level effects of disinformation (Sato et al. 2023). The literature is replete with case studies from all over the world. Little attention has been paid to geographical variations of disinformation – either in the use of disinformation by various actors or citizens' susceptibility to it. Scholars placed the main geographical focus of this study field on Western countries, Russia, and China (cf. 'examples' above). The externally-driven dissemination of false information has been evidenced as a contributing factor to Russia's regional influence in Eurasia and extends across continents, reaching Africa, the United States, and Latin America (Lucas & Pomeranzev 2016; Cristóbal 2021; Siegle 2021). Chinese disinformation and propaganda reach into Taiwan, the Indo-Pacific region, African countries and Latin America (Dickey 2019; Bergengruen 2023; Cristóbal 2021).

Works going beyond case studies are less common on Latin America, Africa, MENA and Indo-Pacific, but worth acknowledging (Mare et al. 2019; Garbe et al. 2023; Salgado & Ferreira 2023; Madrid-Morales et al. 2021; Matei 2023; Rodríguez-Virgili et al. 2021;

Znojek 2020; Madrid-Morales & Wasserman 2021; Bebawi 2021; Jones 2021; Abrahams & Leber 2021).

What is crucial from a regional perspective on disinformation is the issue of **authoritarian promotion**. There is empirical evidence that democracies with a neighboring authoritarian regime that adopted a higher degree of Internet capacity are exposed to a higher risk of suffering from foreign disinformation than other countries (Chang et al. 2020). It means that autocracies have adopted information weapons to infiltrate the politics of nearby democracies and are doing it in practice, pursuing 'iWars' (Chang et al. 2020). Some geographical insights can also be derived from Y. Sato, F. Wiebrecht and S.I. Lindberg's (2023) comparative study of the systemic effects of disinformation on political regimes. However, determining regional characteristics was beyond the scope of the study and thus requires further research.

NEW FRONTIERS In addition to the previously mentioned lack of comparative research on disinformation, there are at least several understudied areas worth exploring to broaden the understanding of various aspects of disinformation. Studies on pre-bunking demonstrate an innovative approach that combines insights from psychology and medical studies to address the challenge of countering misinformation and disinformation (Lewandowsky & Van Der Linden 2021; Roozenbeek et al. 2022). Based on the medical inoculation theory, pre-bunking serves as a psychological vaccine against misinformation, aiming to immunize citizens against manipulated narratives. In contrast to the post-factum debunking of fake news, pre-bunking suggests that individuals should initially have controlled exposure to misinformation, allowing them to navigate real-life instances more effectively when encountered online.

Second, research is emerging that focuses on automating the detection of disinformation and fact-checking, leveraging AI as well (Alsuliman et al. 2022; Ozbay & Alatas 2020; Lahby et al. 2022; Chorąś et al. 2021). This latter aspect may also align with studies on **digital authoritarianism**, so it is worthwhile observing whether and how digital dictators will utilize artificial intelligence to influence both internal and external audiences.

Elections & Electoral Malpractice

It's Not Who Votes That Counts, It's Who Counts the Votes
– Refrigerator magnet quote, wrongfully attributed to Stalin

How can you vote for anybody who'd run for office?
– Doug Larson (1926-2017)

Though it may seem counter-intuitive, almost all authoritarian regimes hold elections. This was not always the case. Going back over five decades ago, only 59% of autocracies regularly held elections (Kendall-Taylor & Frantz 2015). However, as of 2023, only a handful of countries do not hold elections, including China, North Korea, Eritrea, the United Arab Emirates, Qatar, Bahrain, Eritrea, Cuba and Brunei (IDEA International).

There are good reasons for this trend. Authoritarian regimes hold elections because they help prolong their rule (Geddes 2005). There are times when elections lead to a turnover in power, such as was the case in Mexico in 2000, when the *Institutional Revolutionary Party* (PRI) regime finally allowed the opposition *(National Action Party)* to win the presidential election. There are also times when authoritarian regimes hold fraudulent elections, which then trigger regime-ending protests, such as was the case in Georgia's rigged 2003 elections that led to the Rose revolution (cf. **color revolutions**), which ousted Eduard Shevardnadze from power (Fairbanks 2004).

DEFINITION An election is a formal 'group decision-making' process by which a population (an electorate) chooses an individual or multiple individuals to hold public office or some other position of authority. It is the standard method by which a democracy selects its representatives. Elections are typically held at regular intervals as prescribed by a state's laws or constitution, and those elected may fill offices in the legislature, executive, judiciary, or local and regional governments. The process involves eligible candidates who are usually predetermined, proposed, or preselected, and voting rights are exercised by the electorate to choose among them. Today, elections are considered the most important form of political participation in democratic systems, providing **legitimacy** to elected officials and the policy decisions they make and serving as a tool for voters to ensure the accountability of their leaders. From the viewpoint of **political regimes**, elections can re-vitalize polities and adapt policies to a changing world, allowing new generations and new groups into politics and giving them agency. This is in stark contrast to long-lived authoritarian regimes, where policies often stagnate, and any real reform is considered taboo. From the perspective of political (especially authoritarian) control, the electoral process embodies an element of precariousness with regard to public order. Elections, at least in theory, open up the possibility of a transfer of power and often coincide with violence and **repression** as **incumbents** see their authority weakened during elections.

SEE ALSO Elections and their malpractice under 'electoral authoritarianism' (**Schedler**) diverge across regimes, and this variation has – among other factors – been captured by categorizing their **parties** and regime types. **Trichotomous classifications,** in particular, study the dynamics, effects and trajectories of these electoral hybrids. Elections are an arena of interaction with **opposition** forces, where **co-optation** and **repression** become communicating vessels to achieve **legitimacy** through electoral victory on an uneven playing field while impeding challengers from mustering too much support while at the same time dissuading them from high-jacking or boycotting the whole process.

ORIGIN Electoral history is long and varied and too often monopolized in popular discourse as a European invention, with its origins attributed to the Athenian practice (sixth century BCE) of 'direct democracy' where some leadership positions were elected by the 'Assembly' (ἐκκλησία – *eccleseia*) of free, male Athenian citizens (a small substrate of the classical city state's total population – cf. **selectorate theory**). Note that most other Athenian offices were filled through the practice of 'sortition' (random selection). (Britannica 2014) Almost all officials in ancient Athens were selected by random lot after 487-486 BCE, even the top positions of the three 'archons' (*árchontes,* singular: *árchōn*, ἄρχων) or main magistrates. Historically, the *Boule* (βουλή, the council) of 500 (preparing the agenda for the Assembly) and the juries for legal cases were selected in the same

way. Sortition avoided competitive elections; short ruling spans ensured regular turnover in office, and the whole process subscribed to (free) citizen equality. There were practices in place to keep officials accountable (similar to a vote of no confidence) and remove (and banish) them if needed. This latter procedure of 'ostracism' (ὀστρακισμός – *ostrakismós*) was to prevent **tyranny** but also to break up political deadlocks by imposing compromise on politicians (by threatening a ten-year-long exile) (Węcowski 2022).

A key work that exposes the Western bias on the origins of democracy is *Black Athena: The Afroasiatic Roots of Classical Civilization* (three volumes 1987-1989) by Martin Bernal. It argues that Greek civilization was significantly influenced by Afroasiatic civilizations, particularly Egypt and Phoenicia. Bernal was one of the first to challenge the widely accepted notion that ancient Greece was the sole source of Western civilization and argues that historical contributions from African and Semitic societies have been unjustly overlooked and marginalized due to deep-seated prejudices and biases. Yves Schemeil (1999; 2000) similarly contends that the concept of democracy was not solely invented by the Greeks as traditionally thought and explores proto-democratic practices in Egyptian and Mesopotamian polities. Note that 'consultation' as a practice (at the local or regional level) was much more prevalent in polities across the globe than the practice of elections and thus not limited to the West (Isakhan & Stockwell 2012).

From the perspective of how elections (as an institution) fared after the demise of Athenian democracy, unfree and unfair elections were predominantly the norm throughout history, although not always at a local level. Just like in **monarchies** and **oligarchies**, the republics disenfranchised non-elites by law, and **patronage** politics were the bread and butter of any political alliance. When these elite democracies started moving toward popular democracy in the eighteenth–nineteenth centuries, cautiously extending the right to vote to all adult males and (much) later to women as well (by the mid-twentieth century), elections gained different functions. However, these often remained unfair due to unequal power relations (e.g., the power of landlords, the clergy and government officials over voters), electoral fraud (e.g., the manipulation of the electoral register), and the use of intimidation or bribery in politics, the increase of the electorate made elections increasingly more difficult to control or manage.

Still, even with such widespread malpractices, elections were important consultative rituals that socialized elites into parliamentary politics. Frank O'Gorman's (1989) work on England posits the limits of patronage in early-modern electoral orders: While he finds that local families had a significant grip on the electoral system, widespread political engagement habits moderated their power. The effectiveness of **patronage** varied across different constituencies, indicating that patronage alone was insufficient for securing electoral victory. O'Gorman notably highlights the importance of electioneering and canvassing activities, pointing out that political allegiance was not automatically granted based on status but needed to be actively pursued. Moreover, the process of electoral canvassing turned into significant communal events, making electoral politics a more inclusive, engaging, and participatory affair over time. Additionally, the active participation of the elite in elections led to their deeper commitment to parliament, thereby endorsing representative forms of government (Posada-Carbó 1996: 3).

LITERATURE & KEY SIGNIFICANCE The historical functions of elections predate **democracy** as a regime type, and it is thus no surprise that contemporary electoral authoritarian regimes implement them for similar purposes. Elections in dictatorships are often seen as tools for incumbents to maintain power, but holding them is not without risks: in some cases, serial multi-party elections can pave the way for democratic **transitions** (Lindberg 2008; Teorell 2010). Although Donno (2013) nuances that **hybrid regimes** tend to do so only when domestic and international actors choose to pressure the regime. In the absence of pressure, elections are no more likely to lead to democracy than elections in closed regimes.

Analyzing dictatorships through the logic of democratic elections can obscure their unique functions and dynamics within authoritarian regimes. While democratic elections are generally seen as mechanisms for expressing the popular will and facilitating peaceful transitions of power, elections in dictatorships serve different purposes; as tools for maintaining control rather than transferring power, they can serve to legitimize the regime both domestically and internationally, co-opt opposition, and manage elite relations. Elections can be a means to distribute patronage and maintain the loyalty of elites by providing them with opportunities to gain office and its associated benefits (Gandhi & Lust-Okar 2009).

Unlike the relatively standardized process in democracies, authoritarian elections vary significantly across regime types. They differ in terms of competitiveness, levels of repression, and the degree to which they allow genuine opposition participation. This diversity means that applying a democratic framework can overlook these nuances and lead to misinterpretations about their role and impact (Gandhi & Lust-Okar 2009).

Also, the dynamics of voter behavior, candidate strategies, and incumbent manipulation in authoritarian elections are distinct from those in democracies. Voters may participate due to coercion or patronage rather than genuine political competition. Candidates might run not to win but to gain visibility or negotiate power within the regime's constraints (Gandhi & Lust-Okar 2009).

In this part, we lay out the main topics of how elections in autocracies are studied. Part A covers their functions for the rulers; Part B discusses how elections structure and affect interactions with **opposition** forces; and Part C looks inside the toolkit of electoral manipulation.

(A) Functionality The role of elections and other

institutions in autocracies was once dismissed as window-dressing, mimicking democracy for external legitimacy. In the last 30 years, however, this 'democratic-biased' gaze has been abandoned in favor of a deeper look to evaluate their real and alternative purposes in authoritarian polities – as mechanisms to help tackle the dual challenges for dictators: authoritarian power-sharing and authoritarian control (cf. M. **Svolik**). Below, we describe these main functions as recorded in the literature.

Legitimacy Rigged elections provide authoritarian leaders with a *façade* of **legitimacy**, both at home and abroad. This perceived legitimacy helps justify their grip on power and reduces domestic opposition while also potentially gaining recognition and support internationally (if there is no widespread evidence of fraud). Blatant rigging of elections, such as widespread fraud and suppression of opposition, can erode legitimacy by undermining the credibility of the electoral process and results. This can lead to public anger, protests, and international condemnation. (Dawson 2022; Rød 2019) Elections can thus be a powerful tool for enhancing regime stability, but they also carry significant risks. The outcome ultimately depends on the regime's ability to manipulate the electoral process effectively. For this reason, Higashijima (2022) finds that dictators aim to mobilize public support through economic means rather than overt manipulation.

International legitimacy In the first two decades after the Cold War, holding elections could enhance a regime's **external legitimacy**, especially for regimes tied to Western democracies economically and considered to be 'in transition' (cf. Box 5.3 on transitology). This can enhance the regime's reputation, attract foreign investment or aid, and reduce international pressure for **democratization**.

Since 2010, authoritarian regimes, especially global powers like Russia and China, have set up their own institutions (affiliated with their own international organizations – IOs) to monitor and validate elections, a prerogative previously exclusively managed by Western IOs like the OSCE or the EU. While in the early 2000s, even closed autocratic states like Uzbekistan would still go through the motion of inviting Western election observers, today, many of the latter are now barred entry in favor of observers from Allied organizations, like the *Eurasian Economic Union* (led by Russia) or from the *Shanghai Cooperation Organization* (a Chinese-Russian led IO) that will not raise any concerns about the validity of rigged elections (Ambrosio 2008). See **authoritarian regionalism** for other benefits of such **authoritarian collaboration**.

Normally, authoritarian regimes hold elections because they enable the incumbent regimes to solidify their support, but other factors play important roles as well, depending on specific local contexts.

Information-gathering Elections can serve as a gauge of public opinion, revealing the geographical distribution of regime support and opposition strongholds (Gandhi & Lust-Okar 2009). They offer insights into the distribution of support within society and among the elite, aiding leaders in making policy adjustments and identifying threats to their rule. They allow regime actors to verify opinion polls and surveys regarding regime popularity. (Ananyev & Poyker 2022: 14) They also help monitor local officials' performance and assess governance strategies' effectiveness. Elections in authoritarian regimes are also important for providing the regime with information about which regions and localities are most effectively delivering patronage to voters and which are not. What areas of the country should the regime target with additional support? (Lust 2009). The PRI in Mexico used elections to identify areas where they had less support. To rectify this, they provided these areas with greater resources to ensure victory (Magaloni 2008).

Elite Cohesion Autocracies also hold elections because they help to maintain elite cohesion (Geddes 2005; Blaydes 2008). Autocrats can use the results from the elections to reward or punish individuals who are competing for state resources less controversially (Blaydes 2010). Elections help to motivate elites to support the regime's objective of winning elections, and this also ensures that it is only the most competent and committed individuals who win seats. Moreover, Magaloni (2006: 46) argues that ballot stuffing was also aimed to discourage elite defections and demonstrate the party's willingness to use all means to stay in power.

Elite Loyalty & Co-optation Authoritarian elections engage elites in the regime's electoral process, fostering their loyalty and mobilizing their resources for regime benefits. Local elite support is crucial for regime stability and longevity. When local elites control substantial political resources like established patronage networks, economic leverage, or traditional authority, autocrats often see a strategic need for **co-optation**. In such scenarios, permitting local elections can serve as a strategic concession to these elites, offering them a degree of autonomy and a platform to build their own power bases within the regime's structure (Reuter et al. 2016).

Once integrated into the regime's power structure, their dependence on **rents** for political survival and economic gains ensures that elites remain loyal to the regime (Geddes 2005; Magaloni 2006). Additionally, by allowing some degree of electoral competition at the local level, regimes can placate subnational elites and prevent potential dissent by providing them with a controlled avenue for political participation (Boix & Svolik 2013).

Furthermore, local elections serve as a tool for monitoring elite performance. Successful vote delivery in these elections is often a criterion for promotions or continued appointments within the regime's hierarchy. Conversely, failure to secure votes can lead to demotion or removal from power (Gandhi & Lust-Okar 2009; Egorov & Sonin 2006). Thus, local elections are instrumental in maintaining elite loyalty by aligning their interests with those of the central regime through a combination of rewards and accountability mechanisms. There is some evidence that if many local districts in a region are currying

favor of the supreme ruler by manipulating turnout and generating pro-regime votes, this creates a competition effect, and the trend spreads to nearby districts. (Moser & White 2017)

(B) Interactions There is a complex and dynamic relationship between regimes and opposition groups in authoritarian contexts. Elections are a key arena where this relationship plays out, and **repression** is a strategic tool that regimes use to shape the dynamics of this interaction. The level of competition allowed in elections (cf. **parties**), the opposition's strategies (cf. regime & repertoires – Box 5.8), and the regime's use of information control all play a role in determining whether elections serve to stabilize or undermine authoritarian rule.

State capacity is also a factor: Seeberg (2021) explores how state capacity supports authoritarian regimes during elections. Control over territory through the state apparatus is crucial for autocrats to achieve large electoral victories. High-capacity rulers use local agents and institutions to subtly manipulate elections by controlling media and restricting domestic election monitors, avoiding overt tactics like election violence. Analyzing multi-party elections from 1946 to 2017, her study finds that state territorial control correlates with large victories and subtle manipulation strategies, such as media bias, while negatively associating with election violence, indicating a preference for less overt methods.

Finally, S. Michalik (2015: 132) sees the introduction of competitive elections when regimes are dealing with a split in the ruling coalition. These institutional reforms aim to dissolve the current coalition and ensure that at least one faction remains in power. A new ruling coalition emerges, comprising some members from the previous government and others from the formerly excluded opposition. Legalizing opposition parties aids in redistributing government resources. Empirical evidence suggests that an authoritarian ruling coalition is more likely to resolve internal conflicts if it has already established a power-sharing mechanism, such as a (collegial) ruling **party**. Consequently, it is less likely to transition to a competitive authoritarian regime.

Aside from the myriad ways of **protest & uprisings**, and state **repression**, electoral processes can directly structure interactions between regimes and opposition in these three areas:

Signaling & intimidation Elections can also enable authoritarian regimes to deter potential rivals by signaling to the opposition how dominant they are (Geddes 2005; Magaloni 2006). Autocracies can have access to much more funds to spend on campaigns to ensure that they win without having to resort to blatant fraud. True, some authoritarian regimes hold elections that are a complete farce, but others allow the opposition to run, though there is little doubt about the outcome. The regime, the opposition and the public know that there will be a large victory for the incumbent. A landslide victory for the incumbent, even with rigged elections, might be demotivating for the opposition and a form of intimidation to the electorate (like **personality cults**). The intimidation theory, however plausible, remains thus far unproven, as there is no evidence that higher victory margins in some precincts reduce protests (Ananyev & Poyker 2022).

Divide-and-rule Elections in authoritarian regimes can also undermine the opposition. It is often difficult for the opposition to coordinate and work together, and they often end up competing against themselves when regimes apply a divide-and-conquer strategy to encourage splits (by co-opting some parties in order to break up (emerging) coalitions). Autocracies can also bar some opposition parties from running and then co-opt those that are allowed to compete, as was the case in Jordan (Lust-Okar 2004; Schedler 2002).

Boycotts Opposition groups in authoritarian regimes must strategically decide how to engage with elections. They can choose to participate in an effort to gain influence and legitimacy, or they can boycott elections that are seen as rigged, risking further repression but potentially highlighting regime illegitimacy (Bernhard et al. 2020). The decision to boycott elections is strategic, influenced by the 'unlevel' playing field established by incumbents. Scholars have found that opposition parties are more likely to withdraw from elections perceived as unfair, marred by violence, or in majoritarian systems where the incumbent wins a disproportionate number of seats (Gandhi & Lust-Okar 2009).

Mageloni (2010) finds that even when opposition parties lack the military capability to succeed in a revolt, their unity and the potential for widespread civil disobedience can pressure autocrats into conducting fair elections and stepping down. This pressure can cause divisions within the state apparatus and lead to defections from the armed forces. Opposition unity can be driven by elites, with parties coming together before elections to support a single presidential candidate, or it can be driven by voters, where elites remain divided, but voters collectively resist electoral fraud.

(C) Manipulation toolkits 'Malpractice,' in a general sense, refers to improper, illegal, or negligent professional activity or treatment, especially by a medical practitioner, lawyer, or public official. In the context of electoral processes, as defined by Sarah Birch, electoral malpractice is *"the manipulation of electoral processes and outcomes to substitute personal or partisan benefit for the public interest."* This definition highlights the deviation from democratic norms where elections are intended to serve the public good. Malpractice relates to other terms such as misconduct, manipulation, corruption, and abuse. 'Misconduct' can refer to any inappropriate behavior that may not necessarily involve intent to deceive or harm. 'Manipulation' involves influencing processes or outcomes but may be legitimate in some contexts. **'Corruption'** generally implies a broader scope of unethical behavior for personal gain. 'Abuse' indicates misuse of power or resources. (Birch 2011) Such malpractice can take place through 'electoral fraud' or 'institutional bias.' Electoral fraud involves illegal activities like forging voter IDs or ballot-box stuff-

ing, which distort citizen preferences and violate democratic equality. Institutional bias, on the other hand, manipulates representation rules, such as gerrymandering, to favor incumbents without overtly breaking laws. While fraud directly alters election outcomes through illegal means, bias subtly skews the electoral field within legal frameworks to maintain power.

For theoretical overviews of autocratic toolkits, see Schedler 2013; Lehoucq 2003; Alvarez et al. 2009; Birch 2011; Consult: Tolstrup (2015) for foreign interference – **black knights**. Below, we describe several dimensions of electoral malpractice to provide an overview of these ever-adapting practices. This list is not exhaustive but does capture the most common spheres of both electoral fraud and institutional bias in modern electoral authoritarian regimes.

Electoral rules Regimes can manipulate electoral rules to their advantage, making it harder for the opposition to win even if they enjoy significant popular support. They often play with the fairness of the rules of how votes translate into seats. In Turkey, to prevent the Kurds from gaining too much power, all parties had to reach a 10% threshold in order to gain seats in the parliament (Alkin 2011). Other authoritarian regimes maintained their dominance by redistricting to ensure that the incumbent regime had a huge advantage, such as when the *Fidesz* party in Hungary won 67% of the seats based on only 45% of the votes in 2010 (Kovács & Vida 2015). These types of manipulation include (i) gerrymandering, (ii) malapportionment, (iii) manipulating the electoral system to favor the ruling party, and (iv) removing term limits for the supreme office.

Gerrymandering (i) involves manipulating electoral district boundaries to favor a particular party or candidate. This can be achieved through techniques like packing, where opposition voters are concentrated into a few districts to reduce their influence, and cracking, which spreads them across multiple districts to dilute their voting power. Other methods include kidnapping, which forces two popular incumbents from the opposing party to compete against each other, and hijacking, which places a rising opposition leader into a district with a strong incumbent from the ruling party. Famously, the term 'gerrymandering' originates from the early nineteenth century in the US. It is named after Elbridge Gerry, a Massachusetts governor and vice president under James Madison, who in 1812 signed a bill that redistricted the state to benefit his *Democratic-Republican Party*. One of the districts was said to resemble the shape of a salamander, leading to the coining of the term 'gerrymander' (Cox & Katz 2002).

Malapportionment (ii) occurs when districts have unequal populations, giving more weight to voters in certain areas. This can be intentional, often over-representing rural areas where regime support is stronger, or result from population shifts over time if boundaries are not updated. (Schedler 2002)

Changing the electoral system (iii) is another tactic used to benefit the ruling party. For example, shifting from proportional representation to a majoritarian system can allow a party to win a majority of seats without a majority of votes. Manipulating district magnitude, or the number of representatives per district, can also skew results in favor of the regime's party. (Higashijima 2022)

Another common tactic of authoritarian regimes (especially **personalist rule**) is to simply get rid of **term limits** (iv) for the executive or extend them considerably. This ensures that the **incumbent** will not be considered a 'lame duck' (Box 3.14) and effectively can serve as a president for life. This is crucial for autocrats to remain in charge of their regimes. Term limits were extended by a national referendum in Rwanda for Paul Kagame in 2015, which enabled him to stay in power until 2034. Term limits were also extended in Russia after the 2020 amendments were made to the Constitution, which ensures Vladimir V. Putin remains in power until 2036, though any successors would be limited to two presidential terms.

Scheduling elections Electoral manipulation may also entail making changes to the electoral calendar to benefit the incumbent. In Senegal, President Abdoulaye Wade repeatedly used his power to alter the dates of the elections to leave the opposition in the dark as to how and when to prepare (Mbow 2008). In Madagascar, Didier Ratsiraka employed imaginative diversionary tactics to keep the opposition fragmented. In the 1982 elections, he postponed the parliamentary elections to 1983, preventing the opposition from uniting behind a single presidential candidate. He did so a second time, in the late 1980s, when he used an official visit by the Pope as a pretext to delay the 1988 legislative elections to 1989 and move the presidential elections forward from December to March 1989. These maneuvers ensured his victory, securing over 80% of the vote in 1982 and 62% in 1989 (Mukonoweshuro 1990: 394).

Voting obstacles Authoritarian regimes can also try to influence the ease of voting. Voters can be suppressed and intimidated through tricky laws or by being physically and emotionally harassed. In Zimbabwe, voters for the opposition have been regularly harassed and, in some instances, killed (Bekoe & Burchard 2017). This has had the effect of depressing voter turnout for the opposition. Even Donald Trump has tried to both undo (2020) and encourage (2024) absentee and mail-in (early) voting, depending on the chosen electoral strategy (Rinaldi 2024).

Election campaigns Authoritarian regimes also have an advantage when it comes to promoting their campaigns. As they usually exercise control over the media, there is usually a large imbalance of media coverage. In Venezuela, Chávez acquired the major television stations, more than 145 local radio stations, 75 newspapers and dozens of pro-Chávez websites (Corrales & Penfold 2007). He also used his weekly chat show *'Alo Presidente'* to connect with voters (Frajman 2014). In Zimbabwe, Robert Mugabe's regime prevented the opposition from having access to the media at all.

Disqualification Using legal or extra-legal means to prevent opposition parties or individual candidates from participating in elections. This might involve

arbitrarily banning parties or creating specific legal provisions to disqualify opponents, such as 'nationality clauses' used to target specific individuals (Schedler 2002). Another 'legal' method is to raise the threshold criteria for registering political parties to absurd heights: demanding improbable ethnic or gender balances, national representation, or an enormous number of (publicly) registered party members.

Targeted repression Bhasin and Gandhi (2013) highlight the strategic use of repression around elections. They argue that regimes often moderate violence against ordinary citizens before elections to enhance legitimacy and encourage participation. However, in free but unfair elections, they may target opposition leaders and activists to undermine their ability to campaign effectively. In more serious cases (unfree elections), authoritarian regimes simply do not allow viable members of the opposition to run in elections, preferring to allow only token parties to run instead. In Iran, presidential elections take place, but the candidates must be vetted by the *Guardians Council* (Raisi 2021). It is only candidates who are supportive of the regime that are allowed to run for office. In Nicaragua, under Daniel Ortega, just before the 2021 elections, the regime arrested and imprisoned seven key members of the opposition, including his main rival, Christiana Chamorro (Thaler & Mosinger 2022). Autocracies can also restrict the opposition by preventing them from organizing rallies. In Russia, doing so could violate extremism laws, and the opposition and their supporters could face fines, losing their jobs or jail time (Sanovich et al. 2018). Voter intimidation and pre-electoral violence have also been commonplace in Uganda (Kagor 2016).

Vote buying There are numerous other strategies that authoritarian regimes have at their disposal to ensure a victory. Vote buying is a common tactic. In the case of Venezuela under Hugo Chávez, cash transfers were given to people experiencing poverty (Corrales & Penfold 2007). In Taiwan before it democratized, the ruling *Kuomintang* regime (KMT) used to regularly give its supporters red envelopes before elections that were filled with cash to remind them of who to vote for (Rigger 2000).

Voter lists Voter registration roll manipulation always echoes images from N. Gogol's work *Dead Souls*. In Argentina, as early as 1886, a significant source of electoral fraud involved adding the names of ineligible males to the voter registry. In a society experiencing a large influx of immigrants from the Old World, political parties were strongly motivated to register any male aged 18 or older – who all had suffrage rights – regardless of whether they had been naturalized as Argentinian citizens (Sambruccetti 1980, cited in Lehoucq 2003: 238).

Stealing the votes In other cases, electoral malpractice is much more obvious. Autocracies can hold elections but can interfere with how votes are counted, known as fraud. Regimes can refuse to count votes in opposition strongholds. Ballot boxes can be stolen or stuffed with the votes of phantom voters. Ballots can be falsified, or an exact percentage of victory can be specified, such as when Bashar al-Assad of Syria won with 95% of the vote (Repucci & Slipowitz 2022). The key to accomplishing all of this is to ensure that the regime loyalists are in control of the Election Commissions, as is the case of Russia under Putin (Trochev & Solomon 2018). In Zimbabwe, the electoral commissions were packed with regime loyalists, which could guarantee that no matter what the outcome, Mugabe's party would win (Makumbe 2002).

Post-election disputes Dictators use a combination of strategies to manage post-election disputes, especially after fraudulent elections. These strategies aim to control the narrative (downplay the scale of the irregularities), suppress dissent, and selectively appease or co-opt potential challengers. As concessions, they can promise future reforms or minor power-sharing arrangements. Most often, disputes are referred to electoral commissions, tribunals or constitutional courts, which are then pressured to rule in the regime's favor. By the time a verdict is (finally) issued, the protests have petered out. The success of these strategies, of course, depends on various factors, including the regime's capacity, the scope of judicial control, the level of public discontent, the mobilization capacity of the opposition, and the presence or absence of external support.

MEASUREMENT Elections are so central to democracies that there is no shortage of organizations, NGOs and think tanks that scrutinize their validity and fairness across the globe. Here, we listed a handful of the most renowned institutes:

The **Varieties of Democracy** (V-Dem) dataset is a comprehensive resource for studying elections and electoral fraud. It provides various indicators based on expert assessments, covering aspects like reiterated elections and election-day irregularities. V-Dem includes measures for election fraud through indicators such as 'irregularities' and 'repression,' offering insights into procedural and coercive efforts to influence election outcomes. Its scope is broad, covering over 200 countries from 1789 to the present (Bernhard et al. 2020).

The *National Elections Across Democracy and Autocracy* (NELDA) dataset focuses on elections in authoritarian regimes. It provides information on various aspects of elections, including post-election protests and types of fraud employed. NELDA is particularly useful for constructing measures of electoral misconduct intensity by examining factors like media bias and pre-election restrictions. Its methodology involves analyzing the political environment before, during, and after elections to assess integrity (Hyde & Marinov 2012).

International *Institute for Democracy and Electoral Assistance* (IDEA) is an intergovernmental organization dedicated to supporting and strengthening democracy worldwide. It has the status of a UN observer. Its 'Electoral Processes' workstream focuses on enhancing the quality of legal and institutional frameworks, building the capacity of electoral institutions, and promoting inclusivity in electoral processes. IDEA also supports civil society and the

media in ensuring accountability and integrity in elections. They compile data on elections, electoral violence and constitutions (among other things) (IDEA 2024).

The *Electoral Integrity Project* (EIP) dataset offers a comprehensive assessment of electoral integrity across various dimensions, including laws and procedures. Based on expert surveys, their *Perceptions of Electoral Integrity* (PEI) dataset offers a detailed analysis of how countries' electoral processes align with international standards of electoral integrity. It generates an overall score for each election, ranging from 0 to 100, and provides comparative rankings of countries based on these scores (Garnett et al. 2024). Their *Electoral Management Survey* (EMS) collects information from electoral authorities worldwide on how elections are conducted in their countries, providing data not easily accessible through laws or websites. One representative from each national electoral management body is asked to complete the survey on behalf of their organization.

Lastly, the *Database of Political Institutions* (DPI), supported by the *World Bank Group,* contains information on election results, including votes and seat shares for government and opposition parties. While not as comprehensive as other datasets for certain analyses, it measures checks and balances, tenure and stability of the government, identification of party affiliation and ideology, and political fragmentation in the legislature, covering about 180 countries for 40 years.

Other entities include the *Global Network of Domestic Election Monitors* (GNDEM), which facilitates nonpartisan citizen election monitoring to enhance electoral integrity and governmental accountability across over 100 countries. The OSCE *Office for Democratic Institutions and Human Rights* (ODIHR) conducts election observation missions to assess compliance with democratic standards, focusing on campaign activities, legal frameworks, and media coverage. The *International Foundation for Electoral Systems* (IFES) provides technical assistance to build resilient electoral bodies capable of conducting credible elections worldwide. The *Kofi Annan Foundation* and *National Democratic Institute* (NDI) aim to advance democracy by promoting electoral integrity and also offer insightful reports.

METHODOLOGICAL ISSUES While some scholars argue that elections in authoritarian regimes can lead to **democratization** by exposing regime weaknesses or fostering opposition unity, others suggest that these elections often reinforce authoritarian rule by creating an illusion of competition without threatening the regime's control. The conditions under which elections might lead to democratization are complex and contingent on factors like international pressure and the strength of opposition coalitions (Gandhi & Lust-Okar 2009). Elections are also sensitive moments for authoritarian regimes. They are likely to control media content, manipulate public opinion (to their ability) and restrict the activities of spoilers. By definition, election fraud is illegal, and even long after elections have passed, scholars struggle with the scarcity of data when assessing how widespread the manipulated vote actually was.

As a study object, viewing authoritarian elections through a democratic lens can lead to a misunderstanding of their function as instruments for regime consolidation rather than democratization. This perspective can obscure the strategic use of elections by dictatorships to manage internal challenges and enhance regime stability (Gandhi & Lust-Okar 2009). The same goes for delineating electoral malpractice solely from a democratic viewpoint.

We know that structural factors like social and economic inequality, ethnic polarization, electoral systems, and media freedom play a role. Also, institutional factors, such as the strength of oversight bodies, the independence of the judiciary, and the presence of international observers (Box 3.3), are important. (Dawson 2022) Still, regime-type differentiation has mostly been limited to dimensions of plurality and competitiveness, which inform most **trichotomous classifications** covering **hybrid regimes** or **electoral authoritarianism**; other dimensions (like tutelary bodies, state capacity, threat perception, political culture, etc.) remain understudied when it comes to election dynamics and outcomes.

As a concept, Birch (2011) explains that 'electoral malpractice' can be understood through four primary approaches: (a) legal, (b) perceptual, (c) best practice, and (d) normative. The *legal approach* (a) defines malpractice as any violation of electoral law or regulations. However, this approach is limited by the variability and potential corruption of laws across different jurisdictions (laws differ significantly across countries). The *perceptual approach* (b) considers malpractice based on societal norms and perceptions, which can vary widely within and between societies (cultures permit, tolerate or condemn different actions). The *best practice approach* (c) aligns with international norms and standards for democratic elections, such as those outlined in the *Universal Declaration of Human Rights* and *The International Covenant on Civil and Political Rights* are considered the 'gold standard' for international law regarding elections. Accordingly, elections must be conducted periodically and adhere to five key criteria: they must be conducted by secret ballot, ensuring voter privacy; under universal and equal suffrage, allowing all eligible citizens to vote equally; in a non-discriminatory manner, ensuring no bias against any group; allowing for direct choice, enabling voters to select their representatives directly; ensuring the free expression of the electorate's will, and allowing voters to express their preferences without coercion or interference. Lastly, the *normative approach* (d) defines malpractice as deviations from ideal democratic models that prioritize policy accountability and public trust. (Birch 2011: 11-14). This latter approach brings the concept closer to M. Glasius (2018) and her concept of authoritarian practices (which also centers on lack of accountability).

Hoarding

A government that robs Peter to pay Paul can always depend on the support of Paul.
– George Bernard Shaw

In the context of **personalist rule** or **sultanism & neo-sultanism**, 'hoarding' refers to the strategic accumulation and control of resources, privileges, and opportunities by the ruling faction, typically led by an unconstrained leader who controls not only the military and state apparatus but also the coalition-building process. This centralization gives the leader significant leverage over how resources are distributed among factions within the regime. The term was coined by Barbara Geddes (2004) in her original game-theoretical model designed to distinguish between the authoritarian regime types.

Hoarding in this context can be understood as a deliberate choice by the leader's faction to limit or exclude rival factions from access to **rents** (political or economic benefits derived from control over resources, see also: **resource curses**) and other perks associated with being part of the ruling elite. The leader's faction has the initiative and can decide whether to share these spoils with rivals or to 'hoard' them, which means concentrating benefits within a smaller circle of loyalists. By doing so, the leader's faction increases its share of resources while minimizing what is available to potential rivals.

The rationale behind hoarding is rooted in both political survival and economic considerations. By keeping the ruling coalition small and exclusive, the leader's faction can maximize its gains without having to distribute too many resources across a broad group. This concentration of benefits not only strengthens loyalty within the inner circle but also helps maintain regime stability by ensuring that enough resources are available to keep key supporters satisfied.

Hoarding has been broadened as a concept to denote **kleptocracy** and the 'sultanization' of the state by the regime or the process of increasing centralized control over state sectors (cf. **rent-seeking**, **neo-patrimonialism** and **systemic corruption**) by the ruling network (cf. **patronalism**). Van den Bosch (2021) lists it as one of the defining behavioral characteristics of **personalist rule**.

However, hoarding comes with risks. If it becomes too extensive, it may alienate rival factions or weaken their support for the regime. Nevertheless, as long as the rival factions perceive that they are better off remaining within the regime – because leaving it would mean losing all access to power and resources – they are likely to continue cooperating despite being (cyclically) excluded from the spoils of office. This dynamic creates a delicate balance where hoarding (and rotating **patronage**) is a common practice, but it must be calibrated carefully to avoid triggering defections or destabilizing the regime.

In essence, hoarding in personalist dictatorships is a strategy of resource control that serves both to consolidate power and manage internal competition among elites in the **ruling coalition**. It reflects how leaders in such regimes manipulate economic incentives to maintain their grip on power while keeping potential rivals in check. It is a 'Faustian bargain', however, as underdevelopment and exclusion are bound to create different (violent) challenges to rulers down the line; see also: **development in authoritarian regimes**.

Box 3.3 Electoral Observers: A Cat-and-Mouse Game?

If voting made any difference they wouldn't let us do it.
– Mark Twain

Election observers can deter blatant forms of electoral manipulation, such as ballot stuffing. For instance, a study in Russia showed that independent observers reduced the ruling party's vote share by 11 percentage points, highlighting their deterrent effect. (Ananyev & Poyker 2022) However, while observers may prevent some forms of manipulation, they can also prompt a shift towards subtler tactics that are harder to detect. This shift is influenced by civil society's organizational capacity, which can affect both fraud levels and protest activities.

Since the end of the Cold War, election observers have boomed (Carothers 1997). This is actually a peculiar thing. Previously, elections were always considered a domestic affair. So, why do countries invite monitors and nevertheless cheat? Kelley (2008) and Hyde (2011) find that the end of the Cold War clearly freed Western countries to push more vigorously for democracy and increased the use of democratic conditionality. The norm then spread through a complex interplay of incentives, normative shifts, and geopolitical changes. Initially, as more honest governments invited monitors, refusing to do so increasingly signaled electoral manipulation, raising the costs of non-compliance. This created a feedback loop intensifying domestic and international pressure. However, focusing solely on incentives overlooks the normative underpinnings and the impact of the post-Cold War power shift, which enabled Western democracies to promote democratic legitimacy unchallenged by an ideological counterpart.

However, this evolution also created unintended side effects. Simpser and Donno (2012) find that, on average, high-quality election monitoring has a measurably negative effect on the rule of law, administrative performance, and media freedom as dictatorships start targeting the courts, administrative bodies and the media instead of playing the cat-and-mouse game with observers.

Despite their contributions, election observers often still have a limited impact on the overall integrity of elections in authoritarian contexts. Target regimes possess a variety of tools for **electoral malpractice**, including control over electoral administration and candidate restrictions. Furthermore, there is always the risk that regimes or external actors might instrumentalize observers to legitimize fraudulent elections. This phenomenon is known as '**black knight** election bolstering,' where foreign autocrats support domestic allies. In this case, Kelley (2009) finds that having multiple agencies engaged in electoral monitoring is a mixed bag. United, they can boost their individual legitimacy as well as the legitimacy of the international norms they stress, divided they end up outright contradicting each other or working at cross-purposes. The emergence of **authoritarian regionalism** and increased **authoritarian collaboration** regarding (rigged) election monitoring has definitely contributed to the latter.

There are several potential drawbacks to relying on international observers. One major issue is partisanship; observers can be influenced by political interests, leading to biased assessments that may legitimize flawed elections. Additionally, international observers often lack deep knowledge of local contexts, languages, and cultures and miss instances of fraud or manipulation, especially subtler actions. Moreover, the focus on election day procedures routinely overlooks irregularities occurring during the preparation phase. Observers' limited resources and time constraints mean they cover only a small percentage of polling areas, potentially missing widespread issues as regimes can shift their illegal activities. Lastly, the presence of international observers may sometimes lead to diplomatic pressures that affect their impartiality, as powerful states or donors may influence their evaluations to avoid destabilizing relationships (e.g., required for peacekeeping) or allied regimes. (Lynge-Mangueira 2012; Aceproject 2006; Kelley 2012)

Traditionally led by international organizations, election observation has seen a surge in domestic initiatives since the 1990s. Domestic groups, often civic organizations or NGO networks, now organize and support these efforts, handling logistics, training observers, and analyzing election data. Crucially, they determine and report whether elections are 'free and fair.' (Nevitte & Canton 1997) Domestic election monitoring remains under-researched (cf. Grömping 2017) but still covers half of all observed elections globally.

Ananyev and Poyker (2022) suggest that regimes are more likely to carry out electoral manipulations where it is easier to achieve the desired vote margin. This 'efficient allocation theory' aligns with the observed practices of electoral fraud in developing countries. For instance, Asunka et al. (2019) examined the 2012 parliamentary elections in Ghana and found that electoral manipulations were more likely to occur in precincts without observers. Similarly, research from Russia by Enikolopov et al. (2013) showed that polling stations with randomly assigned observers recorded fewer votes for the pro-regime party in the 2011 elections. (Ananyev & Poyker 2022: 14) However, it is important to note that **opposition** parties may be more motivated to boycott elections due to concerns that international observers might legitimize them (Beaulieu & Hyde 2009).

Overall, while election observers can deter certain types of fraud, their impact is mixed and complex within the framework of comparative authoritarianism. Elklit and Svensson (1997) question the expected verdict of 'free and fair' in the context of developing nations, arguing that more nuance is needed to benchmark electoral quality.

Indoctrination

Without education, we are in a horrible and deadly danger of taking educated people seriously.
– G.K. Chesterton

Indoctrination refers to a process of inculcating a specific ideology, values, or worldview in a way that suppresses alternative perspectives and discourages critical thinking. Often associated with authoritarian and totalitarian regimes, indoctrination serves to enforce compliance and loyalty through a range of methods, from educational systems to media influence. This process is distinguished from regular education by its manipulative intent, aiming to create uncritical acceptance of doctrines and shaping individuals to serve the interests of the regime.

DEFINITION Indoctrination is a persuasive process by which ideologies, values and practices are deliberately inculcated at the expense of all other competing worldviews or principles. (Brandenberger 2014) Indoctrination involves teaching someone to accept doctrines uncritically regardless of evidence. Indoctrination closes down alternatives through the promotion of a single view that is to be universally accepted (Sears & Hughes 2006). Indoctrination is also enduring. Indoctrination is a process by which a subject irreversibly learns an attachment (Eibl-Eibesfeldt & Salter 1998).

The indoctrination process involves an authority relationship, where the instructional agent – often directed by a regime – tries to shape the views and beliefs of the public. The public must accept the instructor's guidance without criticism. By doing so, this is important to attaining full compliance of the population to authoritarian regimes.

Indoctrination can take place in all types of regimes but has been especially noted under **totalitarianism** and **authoritarianism**. The educational system is the most commonly used route to indoctrinate individuals. Indoctrination may also take place at youth camps, through youth groups and mass organizations and to a lesser extent through the state-run media and entertainment industry (Dinas & Ball 2016).

SEE ALSO Indoctrination is also associated with brainwashing, **propaganda**, political **education**, domination, and manipulation of individuals and groups, often using a coherent political **ideology**. **Totalitarianism** is the regime type most associated with the practice, and its effects are observed to linger, as shown in **authoritarian nostalgia**. This entry relates to **digital authoritarianism** and **disinformation**.

ORIGIN Originally, the term indoctrination had a neutral meaning, having its roots in the Latin word *doctrina* – and was equivalent to educative teaching. The term indoctrination was first noted in French literature, originally meaning to disseminate a doctrine (Hemánus 1974). William Heard Kilpatrick introduced the term 'indoctrination' into the debate on education in the 1920s (Kilpatrick 2010). During the early twentieth century, it became much more pejorative (like the term propaganda) and was associated with a coercive style of teaching in totalitarian regimes such as Nazi Germany and the Soviet Union (Gatchel 2010; Lott Jr. 1999).

LITERATURE Most of the literature on indoctrination has focused on how to define it (and distinguish it from other forms of teaching), what its role is in the educational system and what impact it may have. There is no consensus on the exact definition of indoctrination, and scholars concur that there is some sort of indoctrination that takes place in all educational systems (Cuypers & Haji 2006; Dahlbeck 2021; Zrudlo 2021). Nevertheless, Michael Merry (2005) points out that arguing that all forms of education are tantamount to indoctrination is problematic because it trivializes indoctrination. We focus on indoctrination in authoritarian regimes, and there are several aspects of the definition that have been consistently highlighted.

One of the biggest debates is how to distinguish between indoctrination-serving socialization and other forms of teaching (Copp 2016; Zembylas 2021). In contrast to educative teaching, indoctrination is negatively valued because it promotes adopting beliefs without understanding (Snook 1972). Indoctrination means to learn without understanding rationally what is being taught. Indoctrination may also be used to incite emotions and inculcate hatred toward others (Momanu 2012). The recipient believes the content being indoctrinated is true to such an extent that nothing can shake this belief (White 1972). An indoctrinated person holds their conviction despite the counter-evidence (Hemánus 1974).

The content of indoctrination is also important. The content is not based on evidence or merely misuses evidence. For some scholars, the content also has to be based on some sort of doctrine or dogma and, therefore, has a political, ideological component to it, as Anthony Flew claimed, "No doctrines, no indoctrination" (Flew 2010). However, beyond teaching doctrines, indoctrination takes place when only the positive side of a doctrine is taught and teaching something as if it is scientific when it clearly is not.

Indoctrination also entails the abuse of authority. For James McClellan, indoctrination subverts educational institutions in their activity of teaching and learning (McClellan 1976). Indoctrination is a one-sided way of teaching (Puolimatka 1996). The indoctrinator has extensive control over the learning process (McClellan 1976).

Ivan Snook (2010) also argues that indoctrination is connected to an authoritarian teaching style, where teaching content is drilled into students' minds, and free discussion is forbidden. Teaching involves rewards and punishments (Benson 1975; Green 2010). Students who provide correct answers are rewarded, while students are punished for providing the wrong answer.

The method of teaching is not meant to generate critical thinking – or thinking for oneself (Crittenden 2010; Huttunen 2003). The educator encourages the student to think for oneself, while the indoctrinator watches out for signs of trouble and is ready to intervene to suppress critical thinking (Smart 1973). The indoctrinator is disregarding the individuality and rationality of the person being taught. Harold Metz and Charles Thompson (1950) wrote that indoctrination was about stifling imagination, depriving people of their individuality, and dulling the tools of thought. This contributes to enslaving the individual to the state.

Studies of **totalitarianism** examined the role of indoctrination of children in the educational system and how this was used to strengthen stability in these regimes (Arendt 1979; Ford & Kwon 2008; Spector 2016; Zembylas 2020). Children were indoctrinated with information in order to transform them into loyal subjects of the state, depressing the development of their personalities (Cathala 1986).

At the personal level, there can be educators who have an agenda that they which to imbue in their students, but much of the literature on indoctrination is concerned with the role of the state using the educational system to indoctrinate values, beliefs and political ideologies that are supportive of the regime (Snook 2010). In totalitarian systems, the state is trying to create a 'new man' in order to transform society (Krylova 2000). Some studies of indoctrination in non-democratic regimes have noted that the content may also focus on convincing individuals that there is a need for some suffering to achieve the mission of the regime (Adler 2012; Gerschewski 2012). Memoirist Yeonmi Park (2015: 67) stated, *"We were taught that it was an honour to suffer for our leaders."*

There has been a wide body of literature that has looked at the long-lasting impact of indoctrination that has taken place during the educational system (Alwin & Krosnick 1991; Burke & Stets 2009; Diwan & Vartanova 2020; Inglehart & Welzel 2010; Krosnick & Alwin 1989; Sears 1983; Sears & Valentino 1997). The indoctrination process in North Korea was so extensive that individuals who defected had to undergo a process of unlearning years of education by brainwashing (García 2017).

Indoctrination has the most impact when experienced directly through the educational system (Dinas & Ball 2016). In particular, the importance of the **ideology** makes education an important activity to help diffuse the ideology. Education can have policy-prescribed ideologically correct curricula. Subjects are infused with ideological messages at schools, universities, the media and the arts. Teachers, textbooks and students toward the leaders directed ritual praise and expressions of love. Images of the leaders are everywhere, as are symbols of the state (Eibl-Eibesfeldt & Salter 1998).

CLASSIFICATIONS There are different conceptions of indoctrination, which vary in terms of how negatively the term is interpreted. In the broad sense of the term, indoctrination can simply constitute the production of content that serves the purpose of a political regime. More specifically, indoctrination requires manipulative intent of the instructor, the suppression of alternative views and a style of learning that discourages critical thinking.

Past work has identified different types of indoctrination based on its objectives. The works of Olivier Reboul (1977) highlighted that *sectary indoctrination* replaces pre-conceptions while *conformist indoctrination* strengthens pre-existing conceptions. The former is more akin to brainwashing, relying on

psychological abuse to create a fully pliant population, while the latter plays on confusion to inculcate new values that are almost invisible to the consumer and take a longer time to materialize (Momanu 2012).

METHODOLOGICAL ISSUES & MEASUREMENT There is no consensus about how to measure indoctrination in the absence of a consensus on its definition. Indoctrination can be measured by examining the content of the curriculum, the method of teaching, whether or not there is **academic freedom**, the centralization of the educational system and the scope of educational penetration.

Qualitative studies have looked at case studies, specifically exploring the textbooks and the ideology in the curriculum, updates to the curriculum, or whether certain academic fields are eliminated for students starting as young as primary school. Studies can also look at how teachers are trained, teaching methods, and whether teachers have been fired for disobedience. (Hare 2007; Qi-quan 2006). Studies can also look at learning methods, whether students are taught to memorize information or are allowed to engage in critical thinking, whether students are given obedience training, whether students are given any civic training, or whether de-politicization is taught. (Sigauke 2011) Studies may also look at academic freedom at universities and whether academic staff members are free to think and teach freely, encouraged to publish and elaborate on the ideology of the regime, and produce scholarship that is inspired by the ideology. Data can be drawn from observing lessons, interviewing students and staff, and looking at curricula directly (Qi-quan 2006).

EXAMPLES Indoctrination in North Korea was to make people loyal supporters of the regime, and the ideological training was meant to reinforce a brand-new identity (Hassig & Oh 2009). Ideological indoctrination starts the moment the child enters the classroom. The walks are painted with scenes of children performing gymnastics alongside images of North Korean soldiers stabbing American, Japanese and South Korean soldiers. Propaganda seeped into every subject, including math, science, reading and music. The principles of the regime are drilled into students' minds through rote learning. Books detailed what a terrible and disgusting place South Korea is. No deviation from the norms is permitted. By secondary school, the guiding principles of the regime are completely ingrained in the minds of students, such as myths that all Chinese imported goods on the black market were dyed red using human blood. Public executions are shown as a teachable moment in schools, with children forced to witness victims shot by firing squad in plain view. Violence is part of the educational process (García 2017).

Patronage

Lack of money is lack of friends; if you have money at your disposal, every dog and goat will claim to be related to you.
– Yoruba proverb

As a global phenomenon, patronage is the exchange of goods or services between two unequal parties in a hierarchical relationship. Both patron and client depend on one another, but the more powerful is able to coerce the latter. More than **clientelism**, patronage is conceptually linked to public office and the political and mostly concerns high-level politics in political regimes, but note that both concepts are often used interchangeably (Piattoni 2001: 4).

ORIGIN 'Patron' is derived from Latin (*pater* – father, *patrone* – protector, also from *patria* – homeland, i.e., the institution that protects its members/citizens). In some contexts, the word retains a positive and non-political meaning, such as in the case of the Italian *padrone* (the owner of a coaster (small ship) or property owner of an eatery or hotel). Patronage can also refer to the word 'support' or 'sponsorship' in the contemporary sense. In the past, the rulers and nobility patronized religious missions, artists, warriors, athletes, and sports teams (royal patronage, *patronato real, padroado*). In a less positive meaning, a patron could be a person who employs others' services and labor in exchange for legal or illegal fees. The latter brings us closer to the meaning *patronus*, i.e., the person who controls something or, particularly, somebody.

DEFINITION Patronage is closely connected with **informality** in societal relations. Although the formal institutions could define the patron and client (i.e. patron holds a specific (public) position), informal relations determine real patronage. As Oksana Ismailbekova (2017: 6) writes in her book on patronage and kinship in Kyrgyzstan, patronage denotes *"a social institution whereby two or more actors enter into a relationship characterised by trust, exchange, and mutual benefit that is nevertheless asymmetrical in the sense that the patron benefits more from the relationship than do the clients."* Patronage provides safety for clients in times of uncertainty; a patron selectively distributes employment and exchanges favors with their clients. The latter offer their (vocal and exclusive) loyalty (thus enhancing a patron's reputation), information (about others), various services, and political support. Patronage is contradictory: it combines inequality with the promise of reciprocity and voluntarism with coercion.

Depending on the context and (political) culture, some forms of patronage are tolerated and legal, even if they are covert, like using political discretion to appoint trusted individuals to non-elective positions in the public sector. See, for instance, W.C. Müller (2000) for patronage in West European governments; Kopecký & Spirova (2011) for post-communist Europe; Kopecký (2011) for Sub Saharan cases; and Panizza et al. (2018) for Latin American cases.

Wolf (2001: 179) offers an interesting anthropological perspective: *"When instrumental friendship reaches a maximum point of imbalance, so that one partner is clearly superior to the other in his or her capacity to grant goods and services, we approach the critical point at which friendship gives way to the patron-client tie."* However, the minimal charge of affect (trust) remains the basis for such lop-sided "instrumental

friendship," and beyond the material gain and protection received from patrons, there is the clients' strive to fight against anonymity – to know 'someone' higher up – (especially in urban settings), and pursue such primary personal relationships, to belong in a 'faction,' and, maybe, in turn, become 'somebody' themselves, as brokers or smaller patrons (Wolf 2001: 179-181).

SEE ALSO The term almost overlaps with **clientelism** – as explained below. The exchange of goods or services for political gain is the glue that ties political and other elites together into ruling networks structured by informality and loyalty. It is at the heart of tribal, **clan politics** or **ethnic politics** and a cornerstone for the ideal types like Weber's **patrimonialism** and its derivatives (**neo-patrimonialism**, **sultanism, & neo-sultanism**). When its effects are detrimental to the functioning of states and societies, one enters the realm of **state capture** and **systemic corruption**. It is the focus of theories like **patronalism** and is also covered by larger frameworks like **informality**.

METHODOLOGICAL ISSUES Because the concept is used so interchangeably with clientelism and neo-patrimonialism, depending on the region under observation and personal preferences of the researchers, there are no unanimously accepted definitions.

Origins Like **clientelism**, a society's patronal system is created when informal structures play a significant role compared to the formal (i.e., legal) management of public and private affairs. Often, such lack of legality in society is compensated for by the emergence of networks that help people to achieve their demands (Radnitz 2010: 24). People use these connections to make payments to higher-positioned people in exchange for some (otherwise) inaccessible goods or service. The payments can be made through official bribery using money, gifts or mutually advantageous exchange of goods or services, including, for example, sexual services, typically in the case of men's patronage toward women. Clients in one dyad often act as patrons in other networks. Nested in broader frames of **informality** and **systemic corruption**, once the gains for the patron become political (vote-buying, political support, etc.), one can apply the specific frames of 'patronage' and 'clientelism.'

Scope Unlike clientelism, patronage is somewhat more narrowly defined and mostly associated with the exchange of public goods (not private resources) at the top level of a polity. Also, its clientelistic recipient base is rather a group (and not another individual), meaning that the redistributed gains are subordinated to the (symbolic) political influence the patronal relationship yields (Erdmann & Engel 2007: 107). More than clientelism, patronage has an integrative function, tying elites together. Clientelism is more associated with **hoarding**.

Delineation Patronage is thus rather considered a vertical exchange between a patron and a network of clients. Nevertheless, this is only one interpretation, and exchanges can proceed horizontally using kinship or personal connections – the latter, specifically, is called 'блат' *(blat)* in Russian. Although clientelism can be linked to kinship, often it is not, while patronage (e.g., under **personalist rule)** often blurs with nepotism (see Box 1.1) because of its heavy reliance on kinship ties. So, the closest patron-client connections are those based on family, clan, friendship, classmate group or other informal affinities. Kinship can partially erase the superiority and subordination in patron-client relations and makes arrangements more hassle-free. Even then, kinship ties or *blat* do not necessarily mean the relations are horizontally equal. In effect, most of the demands are satisfied on vertical and asymmetric systems of patronage (Hale 2015: 21).

Patronage differs from **prebendalism**, where clients are given a public office in order to acquire access to state resources (for personal gain) in exchange for loyalty (van de Walle 2007: 51). According to M. Weber, 'prebends' and 'fiefs' (as in feudalism) are standard forms of rents to reward or solicit loyalty from followers under **patrimonialism**.

KEY SIGNIFICANCE The study of patronage is key to understanding elite cohesion, regime consolidation and survival in autocracies. Patronage can link rural areas to urban centers (cf. Hutchcroft 2014), integrate various ethnic groups (**ethnic politics**), and serve to convince opposition parties to ally themselves with the ruling party. In democracies and **hybrid regimes**, patronage, like other forms of **informality**, is often studied for its corrosive effects on democracy, electoral processes, and development.

MEASUREMENT For African politics, Arriola (2009, following van de Walle 2001) gauged the size of ministerial cabinets as proxies to measure the number of elite clients sustained by a ruler. See also the sections on 'measurement' in the entries: **state capture** and **systemic corruption**.

CLASSIFICATIONS D.A. Bearfield (2009) distinguishes four styles of patronage for American political realities, thus foremost, relating to political appointments: (a) *organizational patronage* is used to strengthen or create political organizations; (b) *democratic patronage* seeks to achieve democratic or egalitarian goals using patronage; (c) *tactical patronage* uses the distribution of public offices to bridge political divisions or cleavages as a means of achieving political or policy goals; and (d) *reform patronage* emerges when those committed to reforming the existing patronage system themselves engage in the practice as the means of replacing the corrupt political regime that preceded them.

Kenny (2015) finds that (i) *centralized* and (ii) *decentralized* patronage systems differ mainly in control distribution and reform potential. In centralized systems (i), like nineteenth-century Great Britain, patronage control is concentrated within the central government, making reform easier due to fewer veto points. This centralization allows a reformist coalition to implement changes more effectively.

Conversely, decentralized systems (ii), such as in the United States, distribute patronage control across multiple local levels, creating numerous veto points where local elites can block reforms. This makes decentralized systems more resistant to reform efforts. Decentralization often arises from historical state-building processes that involve concessions of patronage powers to subnational entities during critical junctures like decolonization. This results in a fragmented political structure where national leaders must negotiate with subnational elites for control over state institutions (Kenny 2015: 162-164).

LITERATURE & REGIONAL VARIATION For the study of political regimes, it is impossible to separate the literature on clientelism, patronage and neo-patrimonialism neatly. As a specific subtype of the first, find the key works on the mechanics of patron-client interactions under **clientelism**. As the bread and butter of the last, find several works covering regional variation under **neo-patrimonialism**.

Personality Cult

A cult following is a nice way of saying very few people like you.
– Martin Mull

Je suis le drapeau Haïtien
(I am the Haitian flag)
– François 'Papa Doc' Duvalier, Ruler of Haiti (1907-1971)

Wherever a leader gains authority and exaggerated devotion from the public by manipulating the tools of the mass media and educational system, such systems of veneration are called personality cults or leadership cults.

DEFINITION A personality cult is a deliberately constructed system of mass veneration of a political leader, where the political system is integrated around the leader's persona (Rees 2004). Personality cults emerge when leaders create a heroic image of themselves through the erection of objects that glorify the leaders, such as statues or portraits everywhere (Tucker 1977). Leaders immortalize themselves with ostentatious architecture, cult imagery and objects, and written, visual and performance arts. As citizens are confronted with images of the leader everywhere in everyday life, they may become mesmerized by the leaders' power and mystique and come to believe that a leader is superhuman and possesses exceptional *"personal, intellectual, oratorical, diplomatic, or other abilities"* (Brooker 2013: 133). These leaders are romanticized and believed to be saviors for the masses. Personality cults use physical displays to portray the leader as a deity.

Personality cults entail a powerful psychological and emotional identification between the leader and their followers (Kinne 2005). Followers of a person-

ality cult are willing to defend the leader unconditionally and provide blind obedience and unqualified emotional support (Post 1986). Their allegiance to this leader goes above party or policies (Edwards 2002; Madsen & Snow 1991). In personalized charismatic relationships, followers identify directly with the leader based on the leader's attributes rather than identifying primarily with the values and ideas that the leader represents (Sankowsky 1995). Nevertheless, personality cults tend to create an **ideology** around themselves and their charisma.

In personality cults, the leader also becomes the sacred carrier of important narratives about the country, endowing them with substantial cultural meaning (Moghaddam 2012). These narratives help sustain important values that can be sustained over time. The narratives that are attached to these sacred carriers are often unchanged.

Because charismatic styles of authority are inherently unstable, they require routinization. The most likely way in which **charismatic rule** becomes routinized is through **patrimonial** forms of governance (Weber 1978). Personality cults are institutionalized through inserting practices of the cult into the daily lives of the followers. Institutionalization would include commemorative events and rituals of devotion to the leader, which are embedded into the institutions of society and eventually become engraved into the minds of the public.

SEE ALSO Personality cults are synonymous with cults of personality and are also associated with **charismatic rule** and **legitimacy**. Some consider them a **coup-proofing** technique and a form of mass intimidation (**repression**).

KEY SIGNIFICANCE Personality cults are a very important part of most totalitarian systems and some authoritarian systems. These cults constitute an important element of the process of legitimation of totalitarian power (Żyromski 2019), but they are almost as old as human history and can be found in all inhabited parts of the world. To dismiss the practice of leader veneration as a mere 'personality cult' is essentially orientalist, and therefore, it is important to study its functions in **political regimes**.

ORIGIN The notion of personality cults has factored into academic research on authoritarianism for decades. Early studies find that personality cults are synonymous with what sociologist Max Weber termed 'charismatic authority' (Weber 1978). A charismatic leader, according to Weber, owes their position not to legal or traditional authority but to the *"virtue of which he is set apart from other men and treated as endowed with supernatural, superhuman, or at least specifically exceptional powers or qualities"* (Weber 1978). Supporters perceive these leaders as *"superhuman, blindly believe them, follow them unconditionally, and give them unqualified emotional support"* (Post 1986).

While authors such as Weber have conceptualized charismatic forms of authority, the term 'personality cult' was popularized after Nikita Khrushchev's so-called 'Secret speech' on 25 February 1956 at the twentieth Congress of the Communist Party of the Soviet Union (formally titled: *On the Cult of Personality and Its Consequences*), in order to highlight adulation of Stalin and his abuse of power. This was the start of Khrushchev's de-Stalinization campaign (Box 3.4). The term has had a largely negative connotation and has been associated with leader-centric totalitarian dictatorships (Tucker 1968).

Though the term personality cult was popularized in the twentieth century, there are many examples of personality cults from ancient history. In ancient Egypt, Persia, Greece and Rome, living and dead emperors were also deified, and many Roman emperors also developed sophisticated personality cults, like the first emperor, Octavianus Principate 'Augustus' (63 BCE – 14 CE, the 'Restorer' of the Republic) or Caligula (12-41 CE) and Nero (37-68 CE) as living gods (Rees 2004; Zanker 1999). For example, Benito Mussolini modeled his cult after Augustus. A more modern example of a cultivated personality cult emerged in mid-nineteenth century France under Napoleon III, 'Emperor of the French' (Plamper 2012).

Relatively more recent personality cults originated from totalitarian regimes, such as in the former USSR under Joseph Stalin (1922-1953), Germany under Adolph Hitler (1933-1945) and in China under Mao Zedong (1949-1976). A cult of personality also emerged in North Korea under Kim Il-Sung, which has continued to this day as part of the Kim dynasty. **Totalitarianism** in the twentieth century generated personality cults, which embodied Weber's characterization of charismatic authority. Careful campaigns were set up to mold the public perception that the leader possessed exceptional powers or qualities and was not solely in charge due to their formal political position (legal-rational) or hereditary title (cf. **traditional rule**).

Personality cults can also exist under **authoritarianism** like Saddam Hussein in Iraq ('the New Nebuchadnezzar'), Gnassingbé Eyadéma of Togo ('Guide of the People') and Saparmurat Niyazov of Turkmenistan ('*Türkmenbaşy*' – 'Father of the Turkmen'). Xi Jinping is currently creating a personality cult in China, reminiscent of Mao Zedong ('Chairman Mao'). Dikötter (2019) has many descriptions of famous personality cults.

LITERATURE The literature has focused on what constitutes a personality cult, when they develop, how effective they are for maintaining control over the masses and how they become routinized. Postoutenko and Stephanov (2021) provide an excellent diachronic overview of ruler veneration from ancient times to today.

Daniel Leese (2016) finds that personality cults are also deeply imbued with **nationalism**, so the fate of the nation coincides with the fate of the leader. Others similarly see them primarily as a connective force, bridging past and present, the familiar and the elevated, with the aim of establishing a deep-seated bond between the leader and their followers. By linking the ruler to revered historical figures, heroic deeds, and the promise of a golden age, these cults position the leader as a modern embodiment of tradition. They reimagine traditional symbols and sacred rituals for contemporary purposes, portraying the leader as a protective father figure devoted to

the 'nation family.' Xavier Márquez (in Postoutenko & Stephanov 2021) describes this as both a performance of the charismatic relationship between ruler and ruled and the deliberate production of symbolic artifacts – from monumental statues to public praise – that project the leader's superhuman qualities and normalize this portrayal. Such imagery resonates especially in totalitarian systems, where active public participation is essential.

For Jan Plamper (2012), a personality cult was not possible without a mass audience, the mass media on an enormous scale and the confines of a dictatorship. Thus, for Plamper, a personality cult could not fully develop in a democratic regime. Exercising total control over the media and other forms of information dissemination is critical (Tucker 1968). Total control over mass communication allows a regime to engage in a nationwide process of brainwashing to achieve total ideological integration of its people. Modern communications can help project the image of the charismatic leader to a far greater number of people by repeatedly disseminating images and information portraying the leader as a messianic figure (Tucker 1968).

Edward Shils (1965) claimed that the public has a strong need for a charismatic leader due to the challenges of everyday life and the universal need for order. The power of charisma is that it links the individual's sense of hope and security to the leader. For these reasons, charismatic leaders obtain unusually high levels of intense support. The support the charismatic leader receives is stable and easy to mobilize, as subordinates have a fairly durable emotional identification with the leader (Edwards 2002; Bass 1999).

A number of factors facilitate a leader's creation of a personality cult. According to Weber, charismatic leaders are more likely to emerge during times of physical, psychological, economic and political distress and profound upheaval (1978). A wide range of stressors can foster conditions that are conducive to the emergence of a personality cult (Tucker 1968). The leader takes advantage of this by presenting himself as the savior to lead the people out of this distress, making the masses feel completely dependent on him. This leads to an intense and unquestioning loyalty on behalf of the public (Tucker 1977). Hitler emerged at a time when Germany faced rising unemployment, inflation and poverty. He exploited the stress and anxiety of German citizens and resentment following the harsh terms of the Versailles Treaty following World War I. Leaders who are able to exploit these moments and convince followers that they are uniquely qualified to lead them out of their predicament have the opportunity to develop personality cults (Tucker 1968).

Many scholars have noted that personality cults emerge when there is a perception of a crisis that the current political institutions seem unable to cope with (Pinto et al. 2007). Possibly more important than a crisis may be the opportunities, such as when there is a relative weakness in the regime's institutions (Gill 1984; Pinto et al. 2007; 2014). The Soviet Union was ripe for the emergence of personality cults as through much of Russian history, it was ruled by a system where the tsar enjoyed unlimited powers (Plamper 2012). In China and the Soviet Union, the personality cults of Mao and Stalin, respectively emerged at a time of relative weakness of their communist parties (Gill 1984). Furthermore, the urgency to ensure their political survival and the lack of rules on political ascent enables personality cults to develop (Leese 2016). For this reason, personality cults are, unsurprisingly, most pervasive in **personalist regimes**.

Finally, the media can play an important role in fostering personality cults. Writing in the 1960s – long before the advent of social media and other information communications technologies – Tucker (1968) asserted that *"modern communications media make possible the projection of a charismatic leader (…) to a far greater number of people than ever before"* (Tucker 1968: 733). Modern media facilitates the repeated dissemination of images and information portraying the leader as a god-like figure incapable of wrongdoings (Tucker 1968: 389). The erection of objects that glorify the leader, such as statues and omnipresent portraits, also cultivates support for the leader. In Turkmenistan, for example, Saparmurat Niyazov's picture appeared in the upper right-hand corner of every TV screen, his name was given to thousands of places throughout the country, and monuments such as a golden statue of him that rotated to face the sun were pervasive throughout the country.

For some, personality cults could develop in democracies as well, as a crisis evokes an emotional response to leaders that enables them to exert strong influence over followers (Madsen & Snow 1991). Whoever is able to take the lead and create 'order' will naturally generate a response of awe and reverence (Geertz 1977). Studies have shown that during stressful times, more charismatic candidates in democracies are more likely to be elected (Halverson et al. 2004). Perceptions of charisma are heightened when contextual circumstances cause followers to look to political leaders for a solution.

There is no consensus as to whether the strategy is to gain *legitimacy* or just compliance. Leader worship takes place in mass spectacles and rituals, but this does not indicate that everyone truly believes in the personality cult. All that matters is that charismatic leaders are perceived by their followers as charismatic (Weber 1978). Those who fail to adhere to the personality cult in dictatorships face serious consequences. Misspelling Mao's quotations or inadvertently defacing Mao's image would lead to serious consequences (Leese 2011). Letting on that you were aware of fabrications surrounding Stalin's personality cult would lead to a death sentence (Tucker 1990).

For Lisa Wedeen (2015), in her study of Hafez al-Assad in Syria ('the twentieth-century's Saladin') the main objective was compliance through enforced rituals of participation. Though these rituals were obviously a farce to those who were orchestrating them and to those taking part, the cult of Assad aimed to habitualize citizens to behave as if they believed in all of the hype of the rhetoric and imagery. Victor Chung-Hon Shih (2008) sees personality cults playing a similar role. Attempts to foster a personality cult may not legitimately transfix the

public, but it may foment competition from both elites and supporters to see who can be the most sycophantic (Box 6.5). In the case of China, Chung-Hon Shih observed nauseating displays of flattery as supporters aimed to outdo one another. Haifeng Huang (2015) concurs that personality cults do not actually mesmerize citizens, but serve another purpose to signal the strength of the regime, which in turn causes citizens to communicate their loyalty. This intimidates the masses and prevents any legitimate challenge to the incumbent.

In this way, personality cults serve as a tool for intimidation and coup-proofing. Through constant repetition of the leader's central role, they suppress any potential for rivals by stripping other elites of visibility and discouraging resistance among the public. In Mobutu Sese Seko's Zaire (Box 1.7), for example, news outlets would withhold the names of ministers, identifying them only by position, ensuring the leader's supremacy remained unchallenged. (Svolik 2012: 80-81) This also extends to elites, who legitimize their positions through allegiance to the leader, effectively hiding behind their image and insulating themselves from opposition.

Many scholars of dictatorships argue that personality cults emerge due to the need for the political survival of rulers and to maintain themselves in power indefinitely (Friedrich & Brzezinski 1956). Nevertheless, political and psychological approaches counter that leaders, such as Stalin, needed a personality cult to satisfy the needs of their psyche, not just to maintain themselves in power. Saddam Hussein, Stalin, and Hitler, in particular, were diagnosed as ego-maniacs, malignant narcissists and sadists who needed to have unrestricted control over human beings (Glad 2002; Post 1993). While these studies have been criticized for making psychological diagnoses from afar, personality cults are such grandiose displays of extravagant adulation that future research may need to explore in more depth the psychological components of personality cults.

MEASUREMENT There is no precise way to measure a personality cult, but there are elements in each case that can be identified. This includes the extent to which a leader's image exists everywhere. Does the media propagandize the leader's messianic qualities regularly? Are there songs, books, poems, statues, buildings that commemorate the leader? Is the leader romanticized and commemorated in the educational system? Is there an outpouring of grief after the leader dies?

Studies can also engage in content analysis of the leader's speeches. Does the leader himself refer to his messianic qualities? Does the leader refer to himself as synonymous with the state and/or regime? V-Dem data record if (personalist) political parties portray their leader as having exceptional leadership qualities (Frantz et al. 2021).

EXAMPLES One of the most extensive personality cults was created by Kim Il-Sung in North Korea. Kim Il-Sung (the 'Eternal President') claimed he could use a gun to shoot down an enemy warplane, while his son, Kim Jong-Il (the 'Dear Leader'), supposedly knew how to control the weather and create rainbows during a snowstorm (Hassig & Oh 2009: 33-34). Kim Jong-Un is known as the 'Respected Supreme Leader' or 'Great Successor.'

In the Soviet Union, Stalin's image was omnipresent, as the state-controlled mass media projected his image everywhere (Lu & Soboleva 2014). Cities, schools, factories, roads and many different kinds of prizes were named after him. Stalin's birthday was celebrated as the most important day of the year. Newspapers often featured stories of workers sending in letters expressing their undying gratitude to Stalin (Heller & Plamper 2004). Nevertheless, as much of the public was illiterate at the time (roughly one-third of males and two-thirds of females), the personality cult was mostly visual through sculptures and paintings, but also through film, poetry and music (Plamper 2012). Portraits of Stalin, in particular, dominated the landscape – and Stalin approved every picture before it was published. All non-fiction writing had to stress Stalin's genius, omniscience and omnipotence. From history to politics, geography to chemistry, physics to genetics, all disciplines had to incorporate his guiding ideas (Crabtree et al. 2020).

In China, Mao Zedong also fostered a personality cult around his mystique. He supposedly knew how to cure diseases, and the masses were encouraged to gather in front of his portrait. Mao also published his *Little Red Book* in 1964, filled with over 400 of his quotations (cf. Box 1.18 on 'holy books' and Box 3.5 on 'infernal books'). The *Little Red Book* served as a bible for the masses during the Cultural Revolution (Luqiu 2016).

A more modern personality cult outside of the communist context could be observed in Venezuela under Hugo Chávez. Chávez rose to power after a massive crisis of **corruption** and public frustration with **rent-seeking** by the traditional elites. In this tense environment, Chávez convinced the public that he alone had the power to deliver and help put Venezuela on the right path. Surveys of Chávez's capacity and abilities revealed a disconnection between public perception and reality (Weyland 2003). Chávez had an approval rating of almost 92% (Gil Yepes 2004). Statues of Chávez are all over Venezuela. His image is on T-shirts, murals, banners and billboards, while portraits of his image hang from the walls of every important public building.

IMPACT ON POLICY Personality cults are formidable to contend with. More scholarly attention is needed to investigate the role of charismatic leadership in explaining electoral performance in democracies as well as gray zone regimes (Caprara et al. 2008). Polling data indicates that perceptions of leadership and character are growing increasingly important to voters. Candidates who are perceived to be strong leaders, caring, compassionate, moral, determined, reliable and trustworthy have a strong influence on voting (Bartels 2002). Studies have shown how something as simple as a candidate's appearance can affect a candidate's chances (Todorov et al. 2005).

Personalization

The higher the monkey climbs, the more he shows his tail.
– African proverb

Absolute power does not corrupt absolutely, absolute power attracts the corruptible.
– Frank Herbert

As a process, personalization refers to the series of actions necessary to achieve personalist power within a political **party** or a **political regime**. This process – the tug-of-war for power between a leader and his inner circle – can manifest itself in all regime types, even democracies, but the tension and stakes derived from this struggle for dominance rise exponentially when regimes do not possess institutions to

mitigate or arbitrate such conflicts.

As mentioned in the entry on **personalist rule**, the academic study of the exact dynamics of this *process* within political regimes is relatively new and has concentrated on three main areas (I-III):

First, the personalization *within* political parties (I) in democratic and electoral contexts, often linked with **populism**; and second, the personalization in (fully) authoritarian regimes (II), which can occur through *executive takeovers*, either gradually or via self-coups. Both scenarios represent forms of **autocratization** but at different starting points (and levels) in the process.

The first two approaches study 'executive aggrandizement:' either as a risk in democratic settings where such personalist regimes are associated with democratic backsliding once they gain power or as a specific process in already authoritarian or hybrid settings, where a collegial ruling coalition becomes dominated by the *primus inter pares*. In settings without higher authority to solve conflicts and where violence is thus the ultimate arbiter, such processes are vicious power plays, usually with bad outcomes for the losers.

Third, the final process of 'personalization' actually refers to 'sultanization' (III) (cf. **neo-sultanism**) and denotes a form of **state capture**, the takeover of a polity or state by a (personalist) regime. In particular, this refers to the process of **neo-patrimonialism**: How a regime network dominates the most important economic sectors through **systemic corruption** and hollows out other state institutions, modeling the latter to its needs as organs for societal control or for doling out **patronage**. This third process is *not* covered in detail in this entry but different angles in the mentioned related entries tackle the phenomenon.

(I) Personalization of political parties Kostadinova and Levitt (2014b: 492) find that the presence of a dominant leader and a weakly structured organization (by design) are the two defining features of a personalist party. *"Within such a group, we argue, interactions between the leader and other politicians are driven mainly by loyalty to that leader rather than, for example, organizational rules, ideological affinities, or programmatic commitments."*

This topic and its related literature are covered by Alberto Lioy (2023), who provides a comprehensive examination of the definitions and classifications of *personal* (pertaining to a leader), *personalist* (being and acting as such), and *personalized* (having become so) political parties. Lioy critiques the narrowness of existing definitions and highlights the limitations of defining personalist parties merely 'as electoral entities with minimal organization,' as this fails to capture their complexity and diversity.

Lioy (2023: 827-829) identifies five key analytical distinctions used in the literature to differentiate personal parties: (a) *personalist* vs. *personalized*, (b) large vs. small, (c) ideological vs. non-ideological, (d) centralized vs. decentralized, and (e) institutional vs. mediatic (when a politician behaves as a party's owner, but the party itself is not necessarily insti-

Box 3.4 De-Stalinization: Ideological Exodus after Apostasy

Comrades!... quite a lot has been said about the cult of the individual and about its harmful consequences.
– First line of Nikita Krushchev's 'Secret Speech' in 1956.

De-Stalinization refers to the various policies and measures undertaken in the years after the death of Joseph V. Stalin (1878-1953, real name: იოსებ ბესარიონის ძე ჯუღაშვილი – Ioseb Besarionis dze Jughashvili, in Georgian), the longstanding leader of the USSR. The process was an attempt to restore the 'betrayed values' of the original project and revert and abolish the legacy of Stalin's policies. (Tismaneanu 2013: 67)

After Stalin's death on 5 March 1953, by the end of the same year, amnesty was given to the prisoners of the GULAG (*Glavnoe Upravlenie ispravitel'no-trudovykh LAGerei* – Main Administration of Corrective Labor Camps) systems, and the entire GULAG prison system would be truly abolished by the early 1960s. The crucial element in de-Stalinization, however, was Khrushchev's 'Secret Speech' at the twentieth Party Congress of the Communist Party in 1956, where he addressed in a closed session the representatives of the Party and where he openly spoke about Stalin's crimes. Khrushchev denounced Stalin's violent politics, his **personality cult**, as well as the mass **purges** committed on his orders. Khrushchev also criticized Stalin for his purges of old Bolsheviks, who were important members of the party prior to the October Revolution. In these processes, many squares and towns that had been named after Stalin had their names soon reverted to their original ones. Hundreds of Stalin's monuments were destroyed. Stalin's body was removed from Lenin's mausoleum on the Red Square in Moscow. In addition to these domestic changes, foreign policy was adapted as well, and a more peaceful coexistence with the Western capitalist world was promoted (for a while).

Thus, de-Stalinization represented a clear break from the past; however, the internal Party structure, particularly during the Brezhnev era, remained intact, and many of the de-Stalinization processes were halted during this time. It was only with the Perestroika and Glasnost reforms (cf. Box 3.10), implemented by Mikhail Gorbachev, that de-Stalinization resumed – though with a very different outcome: the eventual fall of **communism**.

The Stalinist era, de-Stalinization and the denunciation of Stalin led to significant shifts within the broader communist bloc. In China, there was a specific adaptation to this new process. Mao Zedong feared that de-Sta-

linization could threaten his rule and thus refused to implement any similar policies. In 1956, Mao launched the *Hundred Flowers Campaign*, encouraging intellectuals, workers, peasants, and students to critique Party politics. However, following Khrushchev's 'Secret Speech' and Soviet intervention in Eastern Europe, the campaign was abruptly ended in the summer of 1957 and replaced by an 'anti-Rightist' campaign, followed by the *Great Leap Forward* (大跃进 – *Dà yuèjìn*, an economic campaign aimed at rapidly transforming China from an agrarian society into an industrialized socialist nation), as a means to consolidate Mao's leadership.

Crucially, after Mao's death, the CCP never undertook a similar process of de-Maoization. Instead, there was a discursively mild but practically radical negation of his economic policies through the introduction of market reforms, while his political decisions and campaigns were never denounced (Kramer 2013; Tismaneanu 2013). As Naimark et al. (2017: 2) note, *"Soviet hegemony did not overcome the test of de-Stalinization. The breakdown of the Sino-Soviet alliance was of key importance in putting an end to international communism as a unitary actor in world politics."*

In North Korea, the de-Stalinization processes in the Soviet Union led to even greater isolation and the further closing off of the country. This also created the context for the development and stabilization of the Juche (주체 – 'self-reliance') ideology (cf. Box 4.9). Additionally, the Sino-Soviet split (Box 3.9), which was partially ideologically driven and followed de-Stalinization in the USSR, played a crucial role in securing strong domestic ideological **legitimacy** for North Korea within the Cold War context of the Communist bloc (Armstrong 2013; Gray 2023).

In Hungary, encouraged by the de-Stalinization in the USSR and the Secret Speech, they attempted a **revolution**. Similar attempts were made in Poland, but the Soviet Union brutally suppressed both. *"Soviet leaders feared that political unrest and instability in an East European country, if left unchecked, would prove 'contagious' in the Soviet Union. Concerns about this prospect played a salient role in the Soviet Politburo's deliberations during the crises in 1953, 1956, 1968, and 1980-1981"* (Kramer 2013: 150).

On the other hand, de-Stalinization and the Secret Speech were crucial in thawing relations between the USSR and Yugoslavia after Tito's 1948 rejection of Stalin and the *Informbiro* split. This split refers to the political and ideological rift between the USSR and Yugoslavia after Stalin attempted to exert greater control over the latter's foreign and domestic policies through the *Communist Information Bureau* (Cominform), an organization created to coordinate communist parties across Europe. This was opposed by Tito.

The de-Stalinization in 1956 led to a temporary thaw, despite initial steps toward reconciliation taken as early as 1955 with the *Belgrade Declaration*, signed by Tito and Khrushchev. However, this rapprochement was only a prelude to a new distancing between the USSR and Yugoslavia, leading to Yugoslavia's isolation from the Eastern Bloc and its pursuit of what would later become known as the strategy of the *Non-Aligned Movement* (Banac 2017).

The impact of de-Stalinization was evident in the significant shift within the international communist movement, as the revelations of Stalin's crimes led to widespread fractures. The strong ideological pressure and monopoly that had maintained party control were severely undermined by these revelations, particularly in the West. De-Stalinization resulted in numerous splits and factions among Western leftist intellectuals, with many distancing themselves from communism and Marxism during this period. Additionally, it contributed to divergent paths within the global communist camp (Anderson 1976).

Box 3.5 Infernal Books: The Top Ten – The Editors' Pick

As with monotheism, philosophy or classical music, the great peaks have already been formed and everything that now follows will exist in their shadow. (…) Today's dictators offer us only lesser, derivative works.
– Daniel Kalder, *The Infernal Library,* 2018

A window into the minds of madmen, tyrants, despots, revolutionaries, and fanatics – our fascination for the literary ambitions of dictators never seems to fade if one can stand their style. For most of these tyrannical authors, it is more prudent to relish their creative offspring in small doses (*amuse-bouche*-size) instead of chowing down their dreary bookshelves one by one.

When it comes to style, talent and originality, any critical reader reappraises the importance and need for a solid editorial process when confronted with their scribbles. Most works would not go beyond a polite desk rejection and the majority that do are bound to be retracted later for not disclosing ghostwriters.

A good title is key: For instance, *Mein Kampf* (*My Struggle*, 1925) by Adolf Hitler is probably the most infamous of works. He wrote it while jailed for treason after his failed Munich *Putsch* (before succeeding the second time). It is his autobiographical manifesto outlining his racist (foremost antisemitic) and fascist political ideology. His original title would have been *Viereinhalb Jahre (des Kampfes) gegen Lüge, Dummheit und Feigheit (Four and a Half Years (of Struggle) against Lies, Stupidity and Cowardice)* if his like-minded editor, Max Amann had not suggested something shorter. (Bullock 1991: 121) One can only wonder if his posthumous book sales and popularity among contemporary fascists would have been affected if Amann had not dissuaded him. Still, with his ascent to power in the 1930s, the book became a best-seller, generating generous royalties. A second part was already published in 1926, but his sequel on foreign policy (1928) never emerged, as the early draft went out of date too soon. (Bullock 1991: 133) Despite the long ban on this publication in Germany, the expiration of the copyright term now makes it widely available.

While many proto-rulers dabble in poetry (especially when young), few excel. A notable exception would be the Japanese Emperor Meiji (1852-1912), who recently had a collection of his *tanka* poems translated into English: *Bridge on the Shikishima Way* (Wright 2022). Of course, even constructive editorial feedback is dangerous when the author can have you shot with one command, so sycophancy is the optimal survival mode since editors are replaceable.

Regarding ghostwriting, eventually, every final product is guaranteed to be heralded by public applause in the national literary community. However, under normal circumstances few artists experience the anguish of coerced ghostwriters handing in their manuscripts for inspection and approval to the supreme leader. While Stalin was notorious for his personal micro-management of line editing (Kalder 2018), North Korean leader Kim Il-Sung must have had a whole publishing house at his disposal since he is credited with authoring hundreds if not thousands of works.

Works by rulers (themselves), when (actually) written before their ascent to power, provide an interesting testament to their ideological worldviews that drove their revolutionary action. When published during the pinnacle of their power, these serve to justify their rule and boost their **personality cults**, but also to consolidate or formulate a coherent vision for their political projects and sometimes **succession**. Regimes with a political **ideology** can actually be constrained policy-wise if the guiding doctrine is a comprehensive canon unbudging to reinterpretation or manipulation – cf. Box 1.18 on 'holy books.'

Below are ten colorful and infamous (non-ideological) works by autocrats that each stand out in one way or another. They are presented in chronological order because topic, genre and quality vary too much to list them otherwise. Note that this overview is far from complete, and there is much more joyful scraping from the literary barrel for this genre if one feels inclined to do so. Not included are legal treatises (e.g., Napoleonic code), poetry bundles, or works fully (and indisputably) ghost-written by others.

I – Rewriting history: From the stylus of Julius Caesar, the Roman archetype of a dictator-for-life *(dictator perpetuo)* until his assassination on the Ides of March (15 March 44 BCE), the *Commentarii de Bello Gallico* (*Commentaries on the Gallic Wars*, 58-49 BCE) uphold a glorified image of his victories and military carnage during his conquest of Gaul (in Western Europe), brought in simple Latin prose, ideal for classrooms, where it is often still a curriculum classic. Caesar knew he had enemies in the senate who wanted him removed for becoming so powerful. His commentaries served to solicit support and boost his image among other political forces in Rome, especially the masses.

II – Lost in translation: Columbus' original journal, first reconstructed as *Libro de la Primera Navegación y Descubrimiento d'estas Yndias*, is a logbook of his first journey to the Americas, but no example survived to common knowledge. His narrative has been recreated from fragments of (badly transcribed) copies and chapter abstracts by, e.g., Bartolomé de las Casas (1484-1566), Columbus' contemporary, and there were fewer than ten translations by 1900. (Morison 1939) The work remains of primary importance for historians, archaeologists of the 'New World' and biographers of these conquistadors, some very inaccurate but still very influential in national and European historiographies and collective memory. It is no surprise that Columbus remains such a controversial topic (as does 'Columbus Day') since his colonial regime was (rightfully) accused of abuse of power even in his own time and of systemic violence, **racism**, slavery, and even genocide (Box 1.19) today.

III – Much to say: When it comes to famous speeches, Ghazi Mustafa Kemal (Atatürk) was a real trailblazer. Now simply known as *Nutuk* (*The Speech*, 1927), his most famous one was a 36-hour literary barrage (read by the leader himself over a six-day session) guiding his followers through his version of recent historic events, the dissolution of the Ottoman Empire and the struggle

for Turkish independence, thereby paving the path for future Kemalist interpretation of the new nation's historiography.

IV – Give yourself a movie-deal: In fascist Spain, Francisco Franco published his 1942 novel *Raza* (*Race*) under the pseudonym Jaime de Andrade. Unsurprisingly, the novel shores up the image of the current regime on its victory path during the Spanish Civil War. It swiftly got a movie deal and won awards (also unsurprisingly). It is a typical piece of totalitarian kitsch, erasing "every display of individualism" (M. Kundera, cited in Yarza 2004), but at the same time, it is also a unique work because it was meant to be adapted for film from the start, and it is unusual that a ruler justifies his victory in an autobiographical fiction where he is represented through the eyes of fictional authors (Utrera Macías 2009).

V – The influencer: The *Little Red Book* (real title: *Quotations from Chairman Mao Zedong* – 毛主席语录 – *Máo Zhǔxí Yǔlù*, 1964-1976) was a must-have, literally – one could get in trouble for not having one in your possession. Illustrated with iconic pictures by Hou Bo, the 'court' photographer, the booklet started out in 1964 to aid the indoctrination of the *People's Liberation Army* (PLA) with a mere 200 selected citations of the supreme leader on 23 topics. By 1976 it had bloated to 427 citations and 33 chapters. Its many translations and attractive concise format inspired many a dictator, but not exclusively. For instance, in 1969, two Danish schoolteachers published *Den Lille Røde Bog For Skoleelever (The Little Red Book For School Pupils),* challenging prevailing norms on the topics of sex, drugs, smoking and alcohol. It raised quite the scandal and was as often translated as banned. Today's People's Republic of China has an App for everything. Designed by *Alibaba Group,* the App 'Study and Strengthen the Nation' (学习强国 – *Xuéxí qiángguó*) has boasted record downloads. The name of the App is a pun: *Xuéxí* can mean 'Study' or 'Learn from Xi (Jinping)' and offers options for personal organization, official news and updates, together with history and ideological courses, while at the same time tracking your data and activities (Kuo & Lyons 2019; Zhong 2019).

VI – Genre crossover: The well-known *Green Book* (الكتاب الأخضر – *al-Kitāb al-Aḥḍar*) by Muammar al-Qaddafi of Libya comprises a series of political treatises in simple prose, finally amounting to a book with three slim parts: One (1975) on the ideal governing system: a third way between divisive democracy and the dominance of single-party rule, so-called 'direct democracy;' The second (1977) on the best economic system (the abolishment of wages to eradicate slavery) and Qaddafi's take on **Socialism**; and a third book (1980) propagating a 'third universal theory' – a third path between Socialism and Capitalism for nation states – an ideological smoothie of Nasserism, (Syrian Ba'athist) Arab Socialism, Africanism, with a splash of Quranic scripture, later applied to the identity of the individual. His later works, however, comprise short stories and satire – appraised by objective reviewers as 'surreal gibberish' and 'sarcastic rants' – bundled as *Escape to Hell* (1993) and *Illegal Publications* (1995); in English, these are published together as *Escape to Hell and Other Stories* (1999) (Chapin Metz 1987; Kalder 2010).

VII – A manual for life: Rukhnama (*Book of the Soul*, officially published in 2001) by Saparmurat Niyazov (1940-2006) of Turkmenistan can aptly be described as *"a hodgepodge of revisionist history, pedantic moralizing, petty philosophizing, and unsubstantiated claims. Its style was a blend of sermonizing and a call to exploration."* (Hiro 2009: 215). As a philosophical, historical and political Chimera, this fusion epic tale combines a decolonized revision of Turkmen history with spiritual prescription. The book became a sacred text of the young nation and also a key pillar of Niyazov's **personality cult**. In the years before Niyazov's death, it had attained the status of universal obligatory reading, and correct citations were required to pass a driving test or obtain government employment successfully.

VIII – Fifty Shades of Kitsch: Zabiba and the King (زبيبة والملك – *Zabībah wal-Malik,* 2000) by Saddam Hussein is a *Thousand and One Nights*-styled romantic tale about an enamored pagan king, Arab (actually Saddam) instructed in the art of leadership has intimate conversations about love, God, family, loyalty, etc. with a wise, young, unhappily-married, Muslim woman, Zabiba (representing Iraq, and symbolically wedded to the USA). A grandma tells the story, but it is absolutely not for children's ears, including scenes of rape and bestiality. Also, the king talks a lot about his death. (Saddam did have a traumatic childhood.) A year later, it was adapted into a television series and a musical. (Note: the cover art of the Arab version constituted a copyright infringement of an oil painting made by Canadian artist Jonathon Earl Bowser.) Three more works in the same genre followed: *The Fortified Castle* (2001), *Men and the City* (2002), and *Begone Demons* (2003). (Sciolino 2001; Bengio 2002)

IX – The starving artist: Dictators do not only publish at their pinnacle of power. Italian general and revolutionary Guiseppe Garibaldi (1807-1882), a mercenary who temporarily found himself in charge of Sicily after his invasion of May 1860, a phase in the unification of Italy, ended up writing books to support himself and his family after he was removed from his command. His novels *Clelia, Il Volontario (The Volunteer),* and *I Mille (1 Thousand)* were not well received. For his fourth one, *Manlio*, he could not even find a publisher (White Mario 2010).

X – Painful regrets: Benito Mussolini, on the other hand, actually published a full novel *before* entering politics. His deeply anti-clerical, *L'amante del Cardinale: Claudia Particella, romanzo storico* (*Claudia Particella, The Cardinal's Mistress,* 1910) was a romantic novel he co-authored with Santi Corvaja. After his political views had shifted to the far-right and he had struck a pact with the Vatican, Mussolini tried to get the book out of circulation to salvage his reputation (Delzell 1971: 3).

tutionally personalized). These distinctions help to understand the varying characteristics and dynamics of personal parties across different contexts. For instance, the distinction between *personalist* and *personalized* parties is crucial for understanding whether a party serves primarily as a leader's electoral vehicle or if a leader takes over an existing party structure.

Narrow definitions also obscure the reality that while some personal parties may initially appear weakly organized or short-lived, they can evolve into more institutionalized entities over time. Lioy (2023) also challenges the notion that personal parties must be non-ideological by citing examples like the *Dutch Socialist Party* and the *Swiss People's Party*, which maintain strong ideological stances despite their personalized nature.

The impact of such personalized parties on political systems is not to be underestimated and strongly contributes to democratic erosion. Frantz (et al. 2021) note that leaders who establish their own parties are associated with greater polarization than leaders from established parties. The latter tend to reduce polarization after being in office for around four years, while personalist parties in power for a longer period continue to increase it.

Personalist parties are a significant driver of democratic decline, as they often reduce or eliminate internal resistance to leaders' power expansion efforts. Unlike members of established political parties, who usually gain experience with democratic processes through local government or internal party roles, politicians in personalist parties are often outsiders with limited exposure to democratic institutions. This lack of experience in democratic norms, such as negotiation, compromise, and coalition-building, means they are generally less committed to upholding these values. Personalist leaders themselves are focused on centralizing authority rather than preserving democratic checks and balances. Over time, this undermines democratic resilience, increasing the likelihood of an enduring shift away from democratic governance (Frantz et al. 2021; 2024).

If they come to power, such personalist parties are notably more prone to preside over governments that see marked decreases in democratic practices as they try to rule their countries like they manage their parties, and they frequently oversee the collapse of the democratic regimes they control. By consolidating control within their parties, personalist leaders weaken democratic norms and facilitate incremental moves toward authoritarianism (Frantz et al. 2021; Rhodes-Purdy & Madrid 2020).

The study of personalized parties has received new interest due to the overall rise of **populism** in the West and several regional great powers, accompanied by an increased rise of **personalist rule** worldwide. With the rise of electoral dictatorship as a result of the 'Third Wave' (Box 6.3) combined with the rise of digital and social media, the importance of **disinformation** and **propaganda** has never been so salient. Technology makes it easier for leaders to personalize politics and appeal to followers directly. They can use technology to amplify traditional media narratives that cause societal divides, endorse the ruling party, and support cultural conservatism. Criticism can be deflected with counterclaims or be buried in the noise. When trying to win elections, leaders in personalist parties share many characteristics with social media influencers. Once elected, they fall back on other forms of **digital authoritarianism**, and they continue the personalization of the regime (II).

More research is needed to understand the intricate interaction between technological advancements and the global rise of personalist parties in democratic systems. What we do know is that personalist rule has various points of origin and can emerge from democratic polities. Personalist parties are the first step in such a long process of personalization, hence the current interest in this topic. Future research should concentrate on institutional elements that encourage the emergence of outsider candidates and the formation of weak parties. It is also important to understand the conditional impacts of institutional factors versus cultural legacies and political attitudes. (Kostadinova & Levitt 2014a: 488) Their variation needs to be explored, and

in-depth case studies are one of the ways forward: Levitt & Kostadinova 2014; Resmini & Abbott 2024).

Veenendaal (2020) finds that for the smallest of states, informality and personalization generally do not translate into political volatility or government collapses and that, even if such concentration of power sometimes results in dominant or even repressive leadership, formal democratic institutions survive, and many of these small states have extremely stable political regimes.

(II) Personalization of political regimes As the previous part covered the effects of intra-party personalism on democratic and electoral systems, this part covers another piece of the puzzle by taking a wider perspective. It groups the available literature into several questions, but only regarding the process of personalization. For the literature on **personalist rule**, its behavior and significance, consult the dedicated entry in the section '**concepts & archetypes**.'

What is it? The personalization of power is a phenomenon that can emerge across all types of regimes. It is not limited to party-based regimes and can take place in military regimes and (technically) even monarchies. The personalization process is a growing power imbalance between a ruler and the inner circle. Rulers want to reduce their dependence on those groups that helped them seize power and are thus in a position to replace them. These elites, logically, abhor the idea of being sidelined and work toward increasing their influence. (Escribà-Folch & Timoneda 2024: 79) This fear of being sidelined can drive the most ambitious in inner circles to actively work toward becoming the *primus inter pares* themselves.

For rulers, several practices can increase their power and enhance their survival chances. Ironically, the less they rely on institutions to mitigate and resolve elite conflicts, the more unattractive **exit options & leader fates** become. (In contrast, by trusting in regime institutions, rulers accept they are bound by institutional constraints, distributing power among the inner circle in a collegial fashion). Van den Bosch (2021) identifies four behavioral practices that define personalist rule and enable personalization: **coup-proofing**, **gatekeeping**, **repression** and **hoarding**. (**Purges** as tactics are considered both a form of repression and coup-proofing).

When using concepts from **selectorate theory**, personalization can be theorized as the process where **incumbents** weaken the cohesion and organizational capacity of their **winning coalition** (inner circle) by rotating, exiling, purging and replacing members to (i) increase the personal loyalty of its members; (ii) tie them to the ruler in a patron-client relation and cut them off from their independent bases of support; and to (iii) impede this group to act collectively to disobey, veto policy or remove the incumbent (either formally, e.g., politburo-vote or illegally through a **coup**).

The framework developed by Baturo & Elkink (2021) outlines four key pillars of regime personalization. They look within and beyond the intra-regime dynamics (as explained in the entry of **personalist rule**) and identify four features: (a) personalization through the ruler's patronage network, (b) de-institutionalization, (c) media dominance and (d) the perception of permanence. These components interact to consolidate personalist rule. Their book examines these pillars in detail, using Vladimir Putin's regime since 1999 as a case study to explore this personalization process.

Their first pillar, *patronage personalization* (a), refers to the ruler's establishment of a dominant patron-client network within institutions (cf. 'sultanization' under **neo-sultanism**). Since directly measuring a ruler's power is challenging, this pillar looks for observable effects that indicate power, such as the appointment of loyalists to crucial roles and positions within the polity. The second pillar, *de-institutionalization* (b), involves weakening or circumventing formal institutions to strengthen the ruler's authority. Tactics may include capturing institutions through **patronage** or modifying constitutional frameworks to ensure the ruler's supremacy. The third pillar, *media personalization* (c), focuses on the ruler's growing control over the media to craft their image and foster a **personality cult**. (Note: Brunkert & von Soest (2023) study the effects of personalist legitimation strategies). This can involve employing tactics like **propaganda**, **censorship**, and **disinformation** to maintain a favorable public perception. Finally, *permanency in office* (d) pertains to efforts aimed at prolonging the ruler's tenure, often by manipulating or removing **term limits** to secure their position indefinitely (Baturo & Elkink 2021).

Why does it occur Scholars initially thought that the causes of regime personalization were structural; currently most agree it is a process driven by a combination of structure and agency (and serendipity). Early on, Tullock (1987) suggested that non-democratic regimes would quickly devolve into personal rule due to weak institutions. However, many (military) non-democracies are governed by multi-member **juntas**. Using a dynamic game of coalition formation, Acemoglu et al. (2009) model that in such environments, juntas remain stable because members cannot credibly commit to not eliminating each other. In a three-person junta, members avoid eliminating one another to prevent becoming the next target. Larger juntas may reduce power to maintain stability, making them more inclusive than democratic coalitions.

Milan **Svolik** (2009; 2012) contends that in dictatorships, this is a structural process: in the absence of an independent authority to enforce mutual agreements among the ruling elite, 'violence is the ever-present, ultimate arbiter.' A dictator may start as 'first among equals' but gradually amasses enough authority to establish one-man rule. This process is often gradual, and due to imperfect information and concealed motivations, other factions within the ruling coalition fail to counter the dictator's power moves in time. Eventually, they may find themselves too weakened or divided to halt the progression. For dictators, gaining more power also means becoming a larger target for a **coup**, compelling them to secure additional tools of control and eliminate rivals.

So, Svolik (2009; 2012) theorized that most autocracies possess a tendency to turn (more) personalist over time. However, then, his next observation has been even more significant: *"there is no return from established to contested autocracy. Once a dictator is established, he may, of course, still lose power, but such instances should be rare and occur primarily by a process that is politically divorced from the interaction between the dictator and his ruling coalition. Hence, rather than by the hands of their inner circle, established dictators should more often lose power by popular uprisings (…) or by foreign interventions"* (Svolik 2019: 63). So, the dynamic is thus self-sustaining and effectively irreversible, as no personalist dictator would willingly re-empower those within the inner circle after taking risks to neutralize them as potential threats. (Van den Bosch 2021:12)

When does it occur? The size of the **winning coalition** matters: Small inner circles, like in military regimes, allow a dictator to consolidate power more easily, as the group dynamics can easily tilt in a ruler's favor after replacing some key members with loyal followers. Also, a small coalition can be closely controlled, minimizing internal threats, but it is harder to co-opt rivals (cf. **co-optation**). Conversely, a larger, more diverse winning coalition can restrict personalist tendencies. In such cases, particularly when the coalition is structured by a (pre-)established institution like a functional political party (predating the ruler) or a type of traditional tutelary body (e.g., religious council), the dictator may need more time (sometimes decades) to achieve personalization (if ever). Smaller winning coalitions do not mean that co-optation is no longer possible. Svolik (2009) discovered that when the winning coalition is small but the **selectorate** is large (**patronage**), elite loyalty to the dictator will be higher.

Moreover, regarding the timing of **personalization**, Ishiyama et al. (2024) find that personalizing rulers tread lightly at first but purge more freely once established. Jun Koga Sudduth (2017) models that dictators are more likely to eliminate rivals (purge) when elite capabilities to remove them are temporarily weakened. There seems to be a concerted dance between coup attempts and purges – a lethal tango that seems to drive personalization in bursts. Optimal moments thus seem to be either right after a failed coup (Easton & Siverson 2018: Bokobza et al. 2022; Timoneda et al. 2023) or just after their own power grab (Sudduth 2017).

To quote Timoneda et al. (2023: 880) at large: *"Failed coups alter the information environment and create both incentives and opportunities for the dictator to escape the elites' control. First, by signalling the existence of inside threats, failed coups incentivize rulers to take action to prevent further challenges and avoid costly post-exit punishments. Second, surviving a coup attempt undermines, at least temporarily, the credibility and deterrent effect of elite threats. By revealing information about the loyalty of members and factions in the ruling coalition, failed coups allow dictators to identify and eliminate rivals while also limiting the remaining elites' motives to challenge their position."*

Sudduth (2017) finds that successful coups installing new dictators temporarily reduce elites' capacity to launch a new coup and oust the new ruler, offering such dictators a strategic window to personalize power just after they came to power.

How does it occur? Escribà-Folch and Timoneda (2024) are the first to map the pathways of personalization across dictatorships. The absolute majority of rulers (over 80%) make a personalizing move, and most do so in the first two years of their tenure. Leonid Brezhnev in the USSR and Sangoulé Lamizana (cf. Box 3.6) in Burkina Faso are rare exceptions. Regarding the sequence, the first move is to control appointments to the highest office in order to install loyalists and only then conduct a purge. They find that new dictators tend to focus on the military apparatus. Rulers with the longest tenures did so, too, before dealing with civilian constraints (to a large extent). In any case, in the first two decades of personalist rulers, military and civilian personalization (on average) go hand-in-hand.

Is it reversible? As Svolik (2009) found, de-personalization during a ruler's lifetime is an anomaly. The only (rare) examples can be attributed to external 'shocks' or strategic retreats, or so-called 'autocratic troubleshooting' (Van den Bosch 2024: 279-281). However, de-personalization is much more common after **succession**, especially after sudden power vacuums (e.g., **assassination** of the incumbent), and anticipated, orderly (first) hereditary succession where appointed heirs are *"either handed the keys to the party or the armory, but usually not both"* (Van den Bosch 2024: 282-288). De-personalization after (orderly) succession is explained by Leber et al. 2023, who find that the 'old guard' – retired leaders, party elders, and other elites of the outgoing generation – retain oversight capacity over their incoming successor.

How to measure? Escribà-Folch and Timoneda (2024: 78) concede that the task of benchmarking personalism still possesses conceptual and measurement challenges. Initially, scholars used proxies to capture the phenomenon, either relying on the **Polity Index** dataset criteria for formal institutional constraints on the executive (thus missing all informal constraints) or using the duration of tenure (which is endogenous with regime consolidation regardless of the level of personalism).

Svolik's (2012) classification developed indicators to measure the presence of institutional constraints by the military or parties on rulers. His **continuous measures** are broader than just personalism.

One of the first comprehensive attempts to measure latent levels of personalism was by Gandhi et al. (2014), who used the typology of **Geddes, Wright & Frantz** (GWF) and combined it with other variables available to measure intensity.

In 2018, the GWF dataset introduced its own '*latent measure of personalism*' (LMP) with refined criteria derived from the original classification. For its details, see 'measurement' under **personalist rule**.

Gandhi and Sumner (2020) created a *power consolidation index* based on factors like the number of

political offices held by a dictator and their autonomy from party and military constraints. Their measure is probability-based because it directly observes the behavior of dictators toward elites, particularly in terms of personnel decisions and institutional control, to gauge the latent level of personalism.

Frantz, Kendall-Taylor, Nietsche and Wright (2021) compiled new data covering 106 democracies from 1991 to 2020 to create a new 'index of personalism' in democracies, also using indicators from the **Varieties of Democracy** (V-Dem) dataset, such as the personalization of the party and government legitimation strategies. It examines whether the party primarily serves the leader's political career and if the leader is portrayed as having exceptional leadership qualities. Their latent index of personalism ranges from about -2 to +2 (with an average around zero). Higher values suggest greater personalism and lower values suggest less personalism. The index can be used to compare levels of personalism across leaders and within their tenures over time.

Box 3.6 Sangoulé Lamizana – Burkina Faso's Good Dictator?

We must dare to invent the future
– Thomas Sankara

In the former French West African colony of Upper Volta (*Haute-Volta*) – before Thomas Sankara's regime renamed the country Burkina Faso ('The land of 'Tall' (upstanding) People') in 1984 – Aboukabar Sangoulé Lamizana (1916-2005, reign: 1966-1980) initially seemed as any military dictator. However, his rule was marked by a complex interplay of military governance, attempts at democratization, and economic challenges. Lamizana came to power through a military **coup** in 1966, which (peacefully) pressured the first (corrupt) president, Maurice Yaméogo, to relinquish power to the **junta**, amid widespread social unrest and economic difficulties. Initially, Lamizana's rule was declared as a provisional measure to stabilize the country, but it eventually extended over 14 years, during which he played a pivotal role in navigating Upper Volta through periods of drought, famine, and dire economic hardship.

One of the defining features of Lamizana's controversial rule was his approach to governance, which oscillated between military rule and efforts towards **democratization**. In the early years of his presidency, Lamizana dissolved the National Assembly and suspended the constitution, ruling by decree. However, in a first attempt to move towards democratization, Lamizana consulted with political and traditional leaders to draft a new constitution, which was approved in a referendum in 1970, leading to the establishment of the Second Republic. Lamizana's initial attempts to transition the nation to multi-party civilian rule faltered due to persistent corruption and a legislative political deadlock, leading him once again to resort to military rule (i.e., *autogolpe* – self-coup) in 1974, thereby ending the Second Republic.

During the second attempt to restore a multi-party system, Lamizana agreed to complete civilian rule. He retired from his military position to contest presidential elections. Most puzzling was that he actually allowed free and fair elections in 1978 – considered amongst the most democratic elections ever held in West Africa – which he won, thus becoming the first, and (probably) only personalist dictator to willingly democratize without external pressure. Together with L. Brezhnev (USSR) he is one of the few dictators that seemingly did not attempt to increase **personalization** during his tenure. (Escribà-Folch & Timoneda 2024) Since his short democratic rule ended rapidly in November 1980 when Colonel Saye Zerbo overthrew him in a bloodless military coup, this rare case often disappears in Large-N statistical research.

It is hard to untangle the real motivations behind Lamizana's decision to embark on democratization. Was he personally convinced this would be the right path for 'his' country? Was he tired of ruling alone? Or was the reason his regime's ongoing dependency on foreign aid to battle the effects of drought and famine on Burkina Faso's economy?

Lamizana's rule is overall remembered positive. He navigated the country through troublesome economical times (the Sahelian droughts of the early 1970s), saw efforts to address the ethnic and regional disparities within Upper Volta by balancing the plethora of ethnic and regional groups to uphold stability. Nonetheless, state capacity and socio-economic development remained low, nor did the former colony truly emancipate from France under his reign. His regime did face criticism for its suppression of political opposition and limited civil liberties. There were instances of human rights abuses, including the use of **censorship** and occasional crackdowns on dissent, but overall, his rule was less harsh than under later dictators: Only a select few dissidents faced imprisonment. Those who posed a challenge from within the trade unions were bribed with lucrative positions to secure their silence. Failing that, they were relocated to remote areas. Troublesome student activists were whisked away with government scholarships to study abroad. (Englebert 2018: 26)

After Zerbo's coup, Lamizana retreated from public and political life and kept a low profile under the instability that followed. Unlike most dictators, he had not amassed visible personal wealth during his tenure. He was shortly put on trial during the 1984 revolution, but acquitted. He died on 26 May 2005, aged 85.

Propaganda

Those who are capable of tyranny are capable of perjury to sustain it.
– Lysander Spooner

The most effective way to destroy people is to deny and obliterate their own understanding of their history.
– George Orwell

Propaganda is information, which could be factual, misleading and/or biased, that is disseminated in order to promote a particular aim or agenda and influence public opinion.

DEFINITION Propaganda is a deliberate attempt to transmit social and political values to affect how people think and feel, shape their perceptions, manipulate their cognitions and achieve a favorable response (Jowett & O'Donnell 2018; Kenez 1985, 4; Marsden 2013).

SEE ALSO Propaganda also refers to brainwashing, **disinformation**, persuasion, manipulation, advertising, political marketing, **indoctrination**, **personality cult**, and **soft power**. It is traditionally associated with **totalitarianism** and **fascism** but currently also with **digital authoritarianism**.

KEY SIGNIFICANCE In addition to being commonly used to mobilize the public to action during times of war and conflict, propaganda is a critical tool in the toolbox for regimes to maintain authoritarian rule. While most dictatorships also censor and repress their populations, propaganda is used to drum up support for a regime and to justify it. Propaganda may also have a lasting legacy for citizens who consume propaganda. These citizens may hold onto the emotions conjured up by propaganda, creating **authoritarian nostalgia** for the previous form of rule or, at best, indifference toward democracy (O'Shaughnessy 2004).

ORIGIN The use of propaganda for political aims goes back centuries and centuries, though the term propaganda was not used until the seventeenth century (Jowett & O'Donnell 2018). Some early interpretations of propaganda were more benign – that it simply was the presentation of facts to influence people's opinions (Schumpeter 1942). Nevertheless, with the rise of Adolph Hitler and Joseph Stalin, propaganda earned a negative connotation for spreading false information to exercise social and political control (Marsden 2013). Technological developments in the field of mass communications led to a growth in propaganda. In particular, fascist and totalitarian regimes were known for their sophisticated propaganda techniques and desire to arouse popular enthusiasm for the regime and create mass compliance (Edmond 2013).

LITERATURE There is a large body of literature that has looked at the role of propaganda in sustaining authoritarian rule (Guriev & Treisman 2019; 2020). For authoritarian regimes, propaganda may be even more significant than the use of force and repression to gain control. Joseph Stalin claimed that *"the production of souls is more important than the production of tanks"* (Davies & Harris 2005: 14).

Empirical studies have also demonstrated that propaganda in authoritarian regimes can affect the political attitudes and behavior of a target audience in ways that are beneficial to the regime (Adena et al. 2015; Bleck & Michelitch 2017; Cantoni et al. 2017; Chen & Shi 2001; DellaVigna et al. 2014; Enikolopov et al. 2018; Esarey et al. 2017; Jowett & O'Donnell 2018; Kern & Hainmueller 2009; Stockmann & Gallagher 2011). Theoretical studies have also looked at the various mechanisms by which propaganda can help sustain authoritarian rule (Chen & Xu 2017; Gehlbach & Sonin 2014; Guriev & Treisman 2015; Little 2017).

Early works argued that the role of propaganda in authoritarian regimes was more to stabilize the regime, compared to totalitarian regimes that aimed to transform society (Cassinelli 1960). However, propaganda can have a more serious impact on all non-democratic regimes. Propaganda, even in moderate or partial doses, is often potent enough to sway subjects and convince them to adopt beliefs and commit actions that they would not otherwise consent to without the influence of mass persuasion (Auerbach & Castronovo 2013). Laboratory experiments have also found that subjects tend to believe what others say – even if the sender has clear incentives to distort the truth (Cai & Wang 2006; Patty & Weber 2007).

Various case studies have looked at the role of propaganda more in-depth. A study of Nazi Germany showed that there was more support for the Nazis in Germany after the exposure to propaganda on the radio (Adena et al. 2015). Another study found that exposure to Serbian media in Croatia increased ethnic animosity and behavior, with growing nationalist sentiment for Croatians and voting for more extremist nationalistic parties in Croatia (DellaVigna et al. 2014). A study looking at the *World Values Survey* shows that media exposure in China increased satisfaction with national leadership among Chinese citizens (Kennedy 2009). This same study also shows that Chinese citizens who have only completed compulsory education are also more likely to respond to political news positively and display high levels of political support. Another survey of Chinese citizens using a 2004 natural survey found that media exposure increases trust in the administration in China (Yang & Tang 2010).

Case studies have also demonstrated that citizens are well aware of government propaganda and are able to simply ignore government efforts to persuade in countries like China (Chen & Shi 2001), the former Soviet countries (Havel 1985), Syria (Wedeen 1999); and the United Arab Emirates (Bush et al. 2016), propaganda is not solely used to socialize citizens.

More recent literature argues that propaganda in the twenty-first century is used to disincentivize joining a protest (Crabtree et al. 2015; Dimitrov 2014; King et al. 2017; Shadmehr & Bernhardt 2011). More specifically, propaganda is not meant to brainwash people but to communicate how strong the government is (Huang 2015). Propaganda may deter political action against the regime if it appears as though many citizens believe it – since they can be easily mobilized to support the regime in the event of protests against it. Manipulated citizens may mobilize, further deterring possible actions from those who disbelieve, doubt or are against the regime (Little 2017). A related view is that propaganda makes citizens less informed and less able to take on risky anti-government action (Gehlbach & Sonin 2014; Shadmehr & Bernhardt 2015).

CLASSIFICATIONS Propaganda can be classified as soft (i) and hard (ii). Soft propaganda (i) is more subtle and sophisticated while still aiming to influence public opinion. Soft propaganda produces positive content to support a government agenda without necessarily resorting to overtly name enemies of the state. Soft propaganda may try to distract the public to cheer for the regime. Non-democratic regimes today understand that to be effective, propaganda must harness a rich range of sentiments beyond negative emotions such as hatred, fear and envy to include more positive feelings such as pleasure, joy, belonging and pride.

In contrast to soft propaganda, hard propaganda (ii) is more heavy-handed and obvious and may rely on stereotypes, lying, repetition, and appealing to authority (Huang 2018). Some hard propaganda is simply blunt and only focuses on blatantly praising the regime. For authoritarian regimes like China, the political system is legitimized through myths that bestow constant praise on its leadership without focusing as much on potential enemies (Chen & Xu 2017). However, there is also an aggressive type of hard propaganda that glorifies the regime while also constructing enemies in order to justify the repression of subversives. The leaders are elevated to a cult-like status while opponents are defamed (Schneider 2014). Hard or aggressive propaganda is also called 'exhaustion propaganda,' because there is a barrage of false claims which cannot be verified for those living under the confines of authoritarian rule (Horz 2017).

MEASUREMENT Propaganda is not simple to measure because there is no consensus about exactly how to define it. While some see it as a value-neutral term, others see it as premeditated and deliberately manipulative. Many of the studies of propaganda have looked at the content of state-produced television, film, radio, newspaper articles, books and, more recently, social media to determine the content and quantity of propaganda being disseminated. To identify propaganda, studies look to find pro-regime messages (as well as messages that critique an enemy) produced by the state and are not able to distinguish between information that is deliberately meant to deceive and information that simply aims to garner more support for the regime.

METHODOLOGICAL ISSUES Most studies that examine propaganda are interested in what its impact may be. To do so, studies of propaganda have used experimental surveys, hypothetical designs and selective history designs (Huang 2018; Little 2018; Pan et al. 2020). A study might take different groups and expose them to hours of videos or newspaper articles. Studies may also identify individuals who have been exposed to a particular course to see what impact this had on those who took the course (such as 'Principles of Marxism' and 'Modern Chinese History') compared to the control group that had not (Pan et al. 2020). However, measuring how an individual is impacted by propaganda presents different methodological challenges as confounding factors may affect how individuals respond, and it is difficult to replicate the real work in a survey environment.

EXAMPLES One of the most notable propaganda states is China. The propaganda system in China continues to be an important tool for maintaining stability and control though some of the content and modes of dissemination have changed.

In the past, the propaganda system was used to justify the Communist revolution of 1949 (Dittmer 2020). Under Mao Zedong (1949-1976), a steady onslaught of propaganda was disseminated through the state-run media, books, newspapers, television, radio, and films. Films were used both to entertain and promote the regime's agenda. In these movies, a hero would fight against a cruel bourgeois landlord or show the victory of the Communist Party. The propaganda film *Taking Tiger Mountain by Strategy* had over seven billion viewers (Ma 2016).

Today television has become another key tool (Wang & Klein 2021). In 1978, there was only one television per thousand people in China; by 1997, there was an estimated one set for every four people and roughly one billion people had access to television. By 2007, coverage was virtually 100%, and even nomad communities had access to television as a result of a government project to donate televisions and extend satellite coverage to all corners of China (Brady 2009).

In the years since the Tiananmen Square protests of 1989, the goals of the regime focused more on instilling nationalism, patriotism and collectivism to guide public opinion in ways that are conducive to regime and social stability (Huang 2015; Brady 2009). The sophisticated patriotic education campaign has led to high levels of satisfaction and trust in the regime (Zhao 1998).

The Chinese propaganda apparatus has been revitalized in other ways as well in recent years (Shambaugh 2017). China controls the Internet, and mass media uses **censorship** and political mass communications to spin narratives about the regime, its successes and the dangers of Western influence and democratic forms of governance (Holbig 2013). The Chinese government uses social media to pay government employees to generate about 448 million comments every year (King et al. 2017).

IMPACT ON POLICY The use of propaganda by authoritarian regimes was commonly used to prop up their rule. While this may have dissipated with the end of the Cold War, today, the use of propaganda has been reinvigorated by non-democratic regimes. Authoritarian regimes have been highly effective in using information warfare to cast doubt on Western models of democracy and to promote their accomplishments. In particular, authoritarian regimes have been able to harness social media in ways that sow divisions in other regimes while also bolstering their support at home. This has led to policy support for regulating social media more vigorously, offering more intensive support in media literacy for citizens while also pushing for press freedom to counter false narratives.

NEW FRONTIERS An interesting review of contemporary propaganda techniques, 'spin dictators', and current practices can be found with Guriev & Treisman (2022). The *Sage Handbook of Propaganda* (Baines et al. 2020) provides a splendid contemporary overview. Goldstein et al. (2023: 2024) find that AI-generated propaganda is convincing. Large language models (LLMs) can create highly persuasive text, and a person fluent in English could improve the persuasiveness of AI-generated propaganda with minimal effort.

Purges

Смерть решает все проблемы. Нет человека, и нет проблем
(Death is the solution to all problems. No man – no problem)
– Artistically attributed to J.V. Stalin by Anataliy Rybakov

Saboteurs disguise themselves by over-fulfilling the plan.
– J.V. Stalin

Within comparative authoritarianism, purges have resurged as a research topic and are currently being mapped, compared and theorized. There is still quite some disagreement on their definition and which variations to include, e.g., can purges be non-violent? In general, purges are considered a politically motivated, strategic removal of a set of individuals or a large group that was previously considered part of the elite, affiliated with them, or at least tolerated in state structures.

Their exact motivations are also debated. Earlier theories meandered between **hoarding**, **coup-proofing** and the personal preferences of the leadership (**racism**). For instance, Yu Xiao and Ji Zeng (2023) revisit Stalin's reputation for antisemitism regarding his mass purges of Jews, finding that political reasons prevailed: *"The political purge of Jews was predominately caused by his fear of the growing national sentiments of Soviet Jewry following the establishment of the State of Israel (to which he gave decisive support), and driven by his paranoiac desire for internal subservience and political conformity in the context of the early Cold War."* (Xiao & Zeng 2023).

DEFINITION A purge is when national leaders attempt to remove members (as a group) from the elite, armed forces, or other state institutions or sectors that they consider politically undesirable. Those seen as treacherous or disloyal to the leaders or the state are especially targeted. This definition does not include administrative personnel reforms designed to improve an agency's performance, disciplinary actions unrelated to perceived disloyalty, or changes in the politically appointed leadership following a democratic election (Gentry 2023).

SEE ALSO A purge can have many forms, but at its core, it is a form of (elite or mass) **repression** against groups associated with the regime. Purges follow the logic of **coup-proofing** and are one of their tactics, for instance, when they target undesired (ethnic) groups in the armed forces (cf. **ethnic politics**). Purges have other functions as well, like providing new opportunities for **patronage** or increasing performance.

ORIGIN The word 'purge' has its roots in the Latin word *purgare,* meaning to cleanse or purify. In the context of Soviet history, however, the term took on a specific and nuanced meaning that differs from its broader Western usage. In Soviet terminology, a 'purge' (Russian: чистка – *chistka*, literally meaning 'cleaning' or 'sweeping') referred to periodic membership screenings within the Communist Party. (Initially, it was called перерегистрация – *pererегistratsiya* or 're-registration' in 1919, and each subsequent 'purge' was called проверка – *proverka* 'verification' after 1921 or *chistka*). These operations were designed to remove undesirable elements from the party ranks, such as nonparticipants, careerists, drunks, corrupt officials, and ideological enemies. The goal was to maintain the party's integrity and discipline by ensuring that only loyal and active members remained. (Getty 1985: 38-40)

Importantly, in Soviet usage, the term 'purge' did not refer to political trials, police terror, or mass arrests of non-party citizens. For example, the intense period of political – and mass arrests during 1937-1938, known as the *Ezhovshchina* (after NKVD chief Nikolai Yezhov), was never referred to as a 'purge' in Soviet discourse. The distinction is significant because Western scholars often apply the term 'purge' broadly to describe various forms of repression during Stalin's rule, including show trials and terror campaigns. However, within the USSR, purges were strictly internal party affairs focused on membership regulation rather than public political repression (Getty 1985: 38).

The origins of this practice date back to early Bolshevik ideas about maintaining a disciplined revolutionary vanguard. Lenin's vision for the Communist Party emphasized a small, professional cadre of revolutionaries who would be rigorously selected and monitored. This idea was formalized after the

Bolsheviks came to power in 1917 when they faced the challenge of managing a rapidly growing party membership (a large influx of unknown members during the Civil War). Several 'purges' were conducted throughout the 1920s and 1930s to ensure that only ideologically committed individuals remained in the party. These purges were seen as necessary to protect the party from infiltration by bourgeois or counter-revolutionary elements (Getty 1985: 39-41).

CLASSIFICATIONS Purges are often classified on some dimensions but not others. Scholars often focus either on elite or mass purges from a comparative perspective, but seldom both. Table 3.1 is an attempt to map purges according to their scope and intensity, distinguish their main targets and formulate some potential motivations for each combination. These are drawn from the literature on coup-proofing and purges and fragmented case studies. More research is needed to study purges from a full comparative perspective and untangle the causal factors behind them with nuance based on solid data.

(I) Intensity & Scope Most classifications look at the level of violence and the breadth of purges, but when accounting for different target groups, their scope automatically overlaps with the dichotomy of elite vs. mass purges (see below). So, more salient is the difference between 'soft' and 'hard' or 'mild' (i) and 'violent' (ii) purges.

Mild purges (i) are those with clearly defined targets (their performance is taken into account), usually adhering to means of removal like demotion to low-level positions (but still part of the regime), marginalization within institutions (e.g., sometimes masked as promotion to honorary positions, but effectively removed from real decision-making), termination or non-renewal of employment, sometimes combined short detainments and questioning, and with the ultimate goal of replacing or rotating individuals or groups within existing organizations (Montagnes & Wolton 2019).

Technically, those purged might be disgruntled and aggrieved but still free (and alive). While some may remain loyal and keep serving (often trying harder), others, in theory, become likely candidates for defection or mobilizing against the regime (if they have the required skill sets, like soldiers). Disgruntled intelligence officers who were purged or feared being purged might leak sensitive information or defect, creating counterintelligence challenges and potential costs. However, this seems to be relatively rare (Gentry 2023).

Violent purges (ii) are reserved for undesired elites, and they target disgraced groups regardless of their performance (indiscriminately). The logic behind them is foremost associated with regime survival and **coup-proofing** of the inner circle and coup-prone agencies. Such purges coincide with restructuring or abolishing whole organizations or agencies. The removal or replacement of the target group members often coincides with arrest (sometimes including brutal questioning with torture), and the ultimate fate of those 'on the list' ranges from imprisonment and exile to execution.

Beyond the immediate political consequences, violent purges have profound and lasting psychological effects on both the individuals targeted and the broader society. They foster an 'atmosphere of terror' through imprisonment and execution, which serves to intimidate potential challengers and solidify the dictator's control. Combined with mass terror (and even random **repression** – Box 3.13), this atmosphere of fear and uncertainty can permeate all levels of society, discouraging dissent and fostering tyrannical obedience to the regime.

(II) Target As mentioned, scholars either focus on elite targets (A) or the victims of mass purges. (B) Angiolillo and Matthews (2024) study their combination in coordinated campaigns (C). Within these categories, scholars have started to differentiate between groups and sectors within the state architecture. As for now, this image is still fragmented, and more research is needed.

Elite purges (A) Target selection is both strategically and personally motivated in regimes where rulers can issue policy unrestrained. Still, even in personalist dictatorships, leaders often target less powerful and less unified elite groups to avoid backlash rather than influential institutions like the military. For potential targets, factors like educational background and foreign experience also affect purge risk, as shown in Taekbin Kim's study of North Korea. Similarly, networks from prestigious schools can influence the dictator's choice of purge targets. Interestingly, repeated demotions during one's career may actually decrease purge likelihood, as they reduce an elite's power without outright removal (Kim 2021: 90-91).

This category of elite purges can target various specific groups within the inner circle: (a) first-generation elites, (b) civilian elites, (c) military elites, and (d) ideological rivals.

Dictators are more likely to purge *first-generation elites* (a), their peers, fellow coup-plotters, brothers-in-arms, original revolutionaries, and fellow visionaries. Dictators are right to fear them. These individuals hold greater power by negotiating their roles in the new regime from a strong position and maintaining valuable connections with other elites. They usually have their loyal followers. For example, Fidel Castro purged a significant portion of his first cabinet. Of the original 21 ministers appointed immediately after the Cuban Revolution, only six remained in office two years later (Easton & Siverson 2018). Because of their real and symbolic roles in the regime's origin story, dictators also tend to imprison these purged elites – rather than executing, exiling, or merely dismissing them – to prevent backlash from other elites or to stop the purged individuals from continuing to cause unrest (Goldring & Matthews 2023).

Regarding *civilian elites* (b), Bokobza et al. (2022) find that after coups, dictators are more likely to purge higher-ranking ministers and those who occupy strategic positions like ministers of defense while holding on to more loyal and veteran minis-

Table 3.1 – Mapping Purges, Their Targets & Rulers' Main Motivations

Type of purge		**Mild**	**Violent**
Elite purges	***Faction:***	***Discriminate purges***	***Discriminate purges***
	Inner circle rival factions (military & civilian)	Coup-proofing (musical chairs)	Personalization (remove rivals or constraints) Mobilization (increase obedience) Coup-proofing (preemptive or retributive)
	First-generation elites	Coup-proofing (musical chairs)	Personalization (remove rivals or constraints)
	Ideological factions	Ideological softening (easing out hardliners and radicals)	Ideological radicalization (weeding out moderates)
Mass purges	***Sector:***	***Discriminate purges***	***Indiscriminate purges***
	Party	Mobilization (promote loyalty and competence) Coup-proofing (musical chairs) Patronage (make new positions available)	Mobilization (zeal & dedication) Coup-proofing (lower mutual trust by fueling rivalry)
	Bureaucracy	Mobilization (promote loyalty and competence) Restructure regime institutions Patronage (make new positions available) Ideological radicalization (promoting zealots)	Mobilization (boost obedience but not competence) Ideological radicalization (promoting zealots)
	Army	Coup-proofing (ethnic stacking) Ideological radicalization (promoting zealots)	Coup-proofing (preemptive or retributive) Ideological radicalization (promoting zealots)
Coordinated purges (Elites & mass)	Party	Remove rivals (elites – discriminatory) and their networks (mass – indiscriminatory). Such combined purges are likely to provoke coup attempts, especially if they are done bottom-up (meaning first networks, then the elites).	

Source: Author's own work, based on: Goldring & Matthews 2024; Angiolillo & Matthews 2024; Idrizi 2022; Kim 2021; Montagnes & Wolton 2019.

ters. This means that dictators make rational calculations even in post-coup retributive contexts.

Military elites (c) as targets vary a lot. Historically, using biographical data on subordinates of the founding emperors across seven ancient Chinese dynasties, Wong and Chan (2021) reveal that military experience significantly predicts political purges. Emperors were less inclined to execute officers who had extensive battle experience yet more likely to execute commanders with established military credentials predating the empire's founding. Political purges also intensified in an emperor's later years, suggesting a concern for protecting designated successors. Blood relatives of emperors frequently faced milder purges, such as title deprivation (Wong & Chan 2021).

In contrast to autocrats who cast aside a disliked predecessor through a 'leader reshuffling coup' (a palace **coup**) within the same regime, those rulers who come to power in a (regime-changing) coup face different dilemmas. They tend to take a long, hard look at their fellow ruling elites and often conclude that some of their peers who helped them to power might not be best-suited for prominent positions in the new regime or they may pose too significant a threat for the new leader to tolerate their inclusion in the regime's top ruling body. Goldring and Matthews (2024) verify who gets purged in such a situation and find that military usurpers are more inclined to target civilians rather than coercive elites as the proverbial low-hanging fruit since the costs of purging civilians are lower. However, these same rulers do target coercive elites if these individuals played key roles in the coup. They view them as potential rivals, cynically recognizing that their participation in the coup signals both possible disloyalty and a readiness to initiate regime change. (This compiles the evidence that first-generation elites (a) are at greater risk).

Ideological rivals (d) do not get much specific attention in the literature. They summarily fall under strategic rivals and risk the ruler's authority due to their (different) claims to ideological legitimacy. A ruler, especially when constrained by **ideology** when deciding on a specific, controversial course of action, may fear ideological condemnation. Such criticism may come from ideological moderates and ideological hardliners. When the goal is to radicalize the regime, purify the ideology and implement the ideological vision, the moderates have to be dealt with

harshly. If the goal is to build bridges and alliances with non-ideological or different political actors, resolve conflicts or negotiate ceasefires, hardliner criticism can undermine these processes, and thus, the latter must be sidelined, preferably quietly.

A different reason to target ideological elites is that they can tap into alternative alliances (as part of 'transnational ideological networks,' cf. **regime promotion**), and they thus possess preferential access to these relations with foreign actors and foreign powers. Cleaning up such networks through purges can insulate dictators from foreign intermingling and diversion and cut off foreign support of domestic rivals. (**gatekeeping**).

This is usually part of larger regime **personalization**: In North Korea, Kim Il-Sung's purges of rival factions were crucial for his consolidation of power, occurring from the late 1940s to the late 1960s. Initially, Kim eliminated the *South Korean Workers' Party* faction by accusing its leader, Pak Hon-Yeong, of treason in 1952. In 1956, the 'August Faction Incident' saw Soviet and *Yan'an* factions (those that had returned from China) attempt to oust Kim, but he preemptively crushed them, purging many Soviet Koreans and *Yan'an* members by 1958. Ideological campaigns like the *Chongsan-ri* Spirit in the early 1960s further centralized his authority by subordinating party structures to his leadership. The final major purge occurred in 1967 when Kim turned against his own loyal *Gapsan* (anti-Japanese) faction, accusing them of individual heroism. This completed his consolidation of power, eliminating all internal opposition and transforming North Korea into a **personalist rule** centered around his leadership, with no remaining pluralism or political competition.

Mass purges (B) Large-scale purges in authoritarian regimes serve as a tool for top-down accountability, allowing autocrats to motivate and screen their subordinates, such as party members or state bureaucrats. The primary function of these purges is to ensure that agents remain loyal and perform their duties effectively despite the autocrat having limited information about their true loyalty or competence. By purging individuals deemed disloyal or underperforming, the autocrat can replace them with new subordinates, ideally improving the overall performance and loyalty within the regime (Montagnes & Wolton 2019).

Note that mild and violent purges have different effects. The former is discriminatory, meaning that under-performance is a selection criterion for removal. Such purges will increase loyalty and overall competence in the purged institution. The latter type is indiscriminate, meaning talented and untalented are arbitrarily chosen and removed. As a result, such purges will boost obedience but not the overall performance or the efficiency of the purged institution (Montagnes & Wolton 2019).

In the USSR and the People's Republic of China (PRC), the frequent occurrence of mass purges was not incidental but rather a deliberate system of governance. Leaders in both countries sought to regulate the periodicity of these purges to maintain control and ensure the functioning of their regimes. The purges had two primary objectives. First, they provided the necessary momentum to carry out the grand designs of these totalitarian regimes, helping to sustain a high level of activity and engagement within the party and state apparatus. Second, they were intended to 'cleanse the system in anticipation' of future challenges or inefficiencies. By removing a proportion of party members, these purges allowed for the influx of new members to refresh party ranks and ensured that new members were ideologically aligned or more competent than those purged (Brzezinski 1956; Teiwes 1993; Montagnes & Wolton 2019: 1047).

Coordinated purges (C) *Coordinated purges* are defined as the sequential elimination of both elites and mass supporters within a short period, targeting entire factions or networks within a regime. These purges aim to consolidate power by removing potential rivals at all levels, thereby neutralizing opposition both from within the ruling elite and among their broader support base. By purging elites, dictators eliminate direct threats to their authority, while mass purges dismantle the patronage networks that sustain these elites (Angiolillo & Matthews 2024).

However, coordinated purges can provoke coups because they create widespread insecurity among regime insiders. When elites and their supporters are purged in rapid succession, those who remain may perceive the purge as an existential threat. The sudden and comprehensive nature of coordinated purges signals that no one is safe, prompting surviving elites to preemptively organize a coup in self-defense before they, too, are targeted. This dynamic is particularly strong in bottom-up coordinated purges, where mass purges precede elite purges, leaving powerful elites with time to react and strike back against the autocrat before they are removed themselves (Angiolillo & Matthews 2024).

(III) Motivation Every purge is a calculated risk. Overreach can risk a coup, mutiny or an insurrection. Rulers that have not obtained a high level of *personalization* usually go about them carefully, waiting for the right time to remove rivals and selecting targets (and numbers) that are unlikely to cause much opprobrium:

"Stalin tolerated Trotsky for years before he could grind his reputation down and find enough support in the Politburo to oust him. At the same time, Stalin did not deal fatal blows to all adversaries right away when he had the chance: Before the October Revolution, Stalin intervened in an early fallout between Lenin with Grigory Zinoviev and Lev Kamenev. Lenin wanted to kick them out of the party, Stalin convinced him otherwise. Demoted, the latter two became unthreatening allies for Stalin to counter Trotsky's influence. Later the dynamic would change and he would pick them off one by one in a long series of intra-party intrigues." (Khlevniuk 2015, cited in Van den Bosch 2021: 22)

Once dictatorships consolidate and rulers face a lower risk of coups, purges can then be used to enhance the efficiency and *performance* of dictatorial rule. In these cases, purges are employed to demonstrate the leader's political superiority and ensure

elite obedience, making governance easier by deterring both active resistance (such as coups) and passive forms of disobedience or non-cooperation (Kim 2021).

Another key motivation is **coup-proofing,** and here, purges are but one tactic in that larger toolbox, albeit with different purposes. If there is an imminent risk of a coup d'état, violent measures of expulsion are required, but when a ruler intends to act preventively, mild purges (demotions) can create the effect of 'musical chairs' or 'game-of-chairs' where elites are shuffled around to disorientate them and cut their ties with their subordinates. When purging the army or other security apparatuses, the goal can be ethnic stacking to fill the ranks with loyalists. 'Cleaning' house by removing suspected groups or under-performing (complacent, opportunistic) members from organizations provides regimes with available options for **patronage** to loyal staff (Montagnes & Wolton 2019).

Purges can also be *retributive*, especially after a regional rebellion or a coup attempt. Easton and Siverson (2018) find that between 1950 and 2010, slightly over 60% of all coup conspirators were either executed or imprisoned; the remaining 40% suffered lighter punishment or escaped retribution altogether. Moreover, in autocracies, the more severe the post-coup purge, the longer the tenure of autocrats.

(IV) Timing Jun Koga Sudduth (2017) models that dictators are more likely to eliminate rivals when elite capabilities to remove them are temporarily weakened. She posits that dictators are more inclined to purge fellow elites when the risk of a coup is low rather than high. Additionally, she argues that successful coups installing new dictators temporarily reduce elite capacity to oust them, offering dictators a strategic window to personalize power.

Ishiyama et al. (2024) find that not all personalist regimes purge equally, and many favor the co-optation of rivals instead. More research is needed to assess *when* rulers feel confident to purge, what are their main *motivations* at different stages of their tenure, what *type of purge* they prefer, and how *regime type* interrelates with all these variables.

KEY SIGNIFICANCE Purges have different effects on political regimes and their societies. In addition to the insights listed above, Sudduth (2021: 876-879) finds that purging members of the security apparatus actually reduces a regime's ability and willingness to repress civilians. Cyclical purges and middle- and low-rank officer rotations prevent the latter from developing leadership skills and building strong ties with their troops, which are essential for coordinated repressive actions. Additionally, purges can increase resentment among officers, leading to a reluctance to follow orders or even prompting defection from the regime.

Another effect is that military purges disrupt intelligence-gathering structures and a military's organizational capacity. To counteract this, military leaders outsource the task of control and repression to Allied militias that have the local intelligence skills necessary to manage the civilian population. This challenges the protectionist attitude of militaries toward maintaining their monopoly on violence (Eck 2015).

In common usage today, purges are conflated with broader acts of state repression, but in Soviet practice, purges were specific administrative processes aimed at maintaining party discipline and ideological purity.

LITERATURE The characteristics of military purges also vary significantly depending on the type of authoritarian regime. **Personalist regimes** exhibit the highest rates of military purging as leaders seek to consolidate power by eliminating potential rivals within the military. (Approximately 50% of leaders who purged their militaries more than seven times are coded as personalist regimes in the **Geddes, Wright & Frantz** dataset.) Leaders such as Saddam Hussein and Idi Amin frequently conducted large-scale military purges involving imprisonment or execution of high-ranking officers.

Regarding early works, Zbigniew Brzezinski (1956; 1958) was among the first to explore the function of purges and the motivations behind them under totalitarianism. Rigby (1968) and Conquest (1968) analyzed the dynamics of the Communist Party in the USSR and the role of purges. Höhne (1972) did the same for Hitler's *Schutzstaffel* (SS – ᛋᛋ), his protection squadron. Getty (1985) revisited the topic of Soviet purges; Teiwes (1993) did so for China.

The primary motivation in personalist regimes is personal survival (**coup-proofing**). (Sudduth 2021; Escribà-Folch et al. 2020) Although, Ishiyama et al. (2024) nuance this, finding that not all personalist regimes purge, and many favor the co-optation of rivals instead. They posit several explanations, rulers that are still in an early process of **personalization** might not overplay their hand by risking purges. Established, consolidated personalist rule is much more likely to do so. Maybe the **psychological profile** of the ruler is a deciding factor.

Military regimes tend to engage in more frequent but less intense purging compared to personalist regimes. Purges in these regimes are often non-violent and involve dismissals or forced retirements rather than executions. The motivation behind these actions is typically related to maintaining cohesion within the military hierarchy (filtering out ideological dissidents) rather than eliminating personal rivals and their allies. (Sudduth 2021; Escribà-Folch et al. 2020; Ishiyama et al. 2024) They may perceive purges as a necessary tool to maintain discipline and order among the rank-and-file.

Single-party regimes tend to have lower rates of military purging compared to personalist regimes because they rely on institutional mechanisms for managing elite competition. Within the ruling party, however, leaders often lack reliable information about who is truly loyal, so they use purges to test loyalty by forcing subordinates to denounce others or participate in repressive actions. This creates a culture of complicity where officials are incentivized to remain loyal out of fear of being next. Purges can also serve to 'cleanse' the party by removing opportunists or those who have grown complacent. This

allows for the promotion of new, more loyal members who owe their positions to the leader. Purges in these regimes are less likely to be violent and often involve demotions or transfers within state structures rather than outright eliminations. The motivation for these purges is typically ideological conformity or maintaining party unity. (Sudduth 2021; Escribà-Folch et al. 2020; Montagnes & Wolton 2019)

Monarchies engage in fewer military purges compared to other regime types due to their reliance on traditional legitimacy rather than coercion for maintaining power. (They employ other coup-proofing tactics.) When monarchies do conduct purges, they tend to be non-violent and involve reshuffling positions within the royal family or security apparatus rather than executions or imprisonments. The primary motivation for these purges is ensuring loyalty among elites rather than preventing coups or eliminating rivals, although elites able to block a preferred **succession** often end up as purge targets. (Sudduth 2021; Escribà-Folch et al. 2020)

Democracies – While not really associated with purges, there are instances where democracies purge. The first scenario is after a **transition** from autocracy when a new democratic order is cleaning house within the state bureaucracy. Here, purges involve the removal of individuals from positions of power, often more aggressively than lustration (cf. Box 3.7), and are used to eliminate the remnants of the previous regime. While they can help in dismantling undemocratic structures, purges can also be controversial if they are perceived as politically motivated or if they undermine stability. When conducted with transparency and fairness, purges can aid in the establishment of democratic norms by ensuring that those who have committed abuses are not in a position to repeat them (Nalepa 2022).

A second scenario is explained by Gentry (2023), where democratic leaders may purge intelligence agencies when they perceive that the agencies have failed in their duties, such as in the aftermath of major intelligence failures (e.g., failure to prevent attacks or provide accurate intelligence). Additionally, democratic leaders may act if they believe intelligence services are acting independently or disloyally, especially when agencies resist government policies or exhibit excessive autonomy. The 'political' motivation of such purges is thus sometimes open to interpretation (when applying the criteria from our 'definition' above), as objective performance criteria also play a role in such decisions.

MEASUREMENT Recently, scholars have invested much time and effort to gather data on purges, either for country-years or, in some cases, about the individual elites that were purged.

The *Military Purges in Dictatorships* (MPD) dataset by Jun Koga Sudduth (2021) provides systematic data on military purges in authoritarian regimes, covering 566 political leaders across 116 countries from 1965 to 2005. A military purge is defined as the removal of individuals from the military or security apparatus by a political leader. The dataset includes detailed information on the dates and characteristics of these purges, such as whether they were peaceful or involved arrests, imprisonment, or killings, as well as the positions and number of officers purged and the reasons behind the actions. MPD is available in both event data and leader-year panel data formats, allowing for analysis of individual purges and broader trends. Unlike other datasets that focus on country-year observations, MPD carefully codes cases where multiple leaders ruled within the same year, providing more precise data. This resource aims to support research on the causes and consequences of military purges in autocracies. (Sudduth 2021) Note, as the author herself admits, due to the unequal availability of data, some regimes are underreported, which could bias the data in favor of well-known dictatorships.

Bokobza et al. 2022 compiled an impressive new global data set, which covers over 23,000 cabinet members in 115 autocracies from 1967 to 2016. This dataset lists the most detailed individual-level evidence available.

An older work by Roessler (2011) updated the *Ethnic Power Relations* (EPR) dataset (Cederman et al. 2009; Vogt et al. 2015) with instances when a particular ethnic group is excluded from the central government and how this affects coup probability.

Goldring and Matthews (2024) compiled an original individual-level dataset sampling both civilian and military autocratic elites, their background and their fates, holding offices within sixteen ruling institutions between 1922 and 2020.

METHODOLOGICAL ISSUES As current research is doing now, it is important to study purges not just at the regime level over time but at the individual level to understand better who is at risk and why in order to understand the strategic calculations of rulers when removing rivals, preempting coups or just 'cleaning house' to improve performance (Goldring & Matthews 2024: 1916-1917).

Gathering data on purges is an ongoing process with much promise. Earlier works relied too much on personal accounts of purge victims (memoirs or autobiographies), often written many years later and often deemed unreliable by historians. Getty (1985: 4) explains: *"It is not clear what the Great Purges memoirs can reveal about why the terror happened, or even about exactly what happened. In general, they provide more heat than light: They can tell us how their authors felt but not how Stalin felt."*

Historical studies (e.g., Wong & Chan 2021) with Large-N data can be useful in exposing broader diachronic patterns of purge behavior to strengthen middle-range theories. In-depth case studies like Kim (2021) on North Korea or Idrizi (2022) on Enver Hoxha's last purge are excellent for nuancing popular beliefs and raising new questions.

REGIONAL VARIATION Military purges vary significantly in their intensity, nature, occurrence, and motivation across different world regions. Sudduth (2021) provides insights per world region over the period 1965 to 2005, but solely for how dictators deal with their militaries. (There are currently no systemic data for political purges of civilian elites, intelligence services, etc., comparing world regions).

Latin America Latin America has experienced fewer military purges compared to other regions (0.18 per country-year). While military intervention in politics was common during the Cold War era, the frequency of purges has declined since. Historically, Latin America used violent purges to weed out political opponents within the armed forces who might challenge their authority or align with leftist movements (Sudduth 2021).

Sub Saharan Africa This stands out as the region with the highest number of military purges, typical for **personalist rule**. The probability of a purge occurring in any given year is approximately 0.26 per country-year in this region. Purges here often involve both violent and non-violent methods. These purges are frequently motivated by **ethnic politics** or factionalism within the military, with leaders targeting officers from rival ethnic groups (ethnic stacking, see **coup-proofing**) to prevent coups or ensure loyalty (Sudduth 2021).

MENA The frequency of purges for this region is comparable to Sub Saharan Africa, with an average probability of 0.25 per country-year. The region's history of military coups and civil-military tensions contributes to this high frequency. Purges in this region are often violent, involving arrests or executions, as leaders seek personalist power by eliminating potential rivals within the military. **Monarchies** and **personalist regimes** in this region are particularly prone to using purges as a tool for regime survival (Sudduth 2021).

Indo-Pacific The Indo-Pacific also experienced a high number of purges, with a similar probability of 0.25 per country-year. In countries like China, purges have historically been large-scale and violent, targeting top military officials through imprisonment or execution. The motivation behind these purges is often ideological, particularly in communist regimes where leaders seek to eliminate those deemed politically unreliable or ideologically deviant (Sudduth 2021).

Eurasia In contrast, Eastern and Western Europe have seen fewer purges since the fall of Communism. The probability of a purge occurring is lower (0.24 per country-year), and the nature of purges has shifted from violent actions under communist regimes (e.g., Stalin's Great Purge) to more restrained methods in post-communist states. During communist rule, military purges were driven by ideological conformity and the elimination of perceived counter-revolutionaries (Sudduth 2021).

Regime Promotion

The empires of the future are the empires of the mind.
– Winston S. Churchill

Ideology is the most powerful tool created to protect a power structure.
– Srilatha Batliwala

This entry provides a universal model to explain why, when and how political actors promote regimes. In doing so, it scrapes together fragmented pieces of literature to present a universal framework to explain the phenomenon, which is currently still dichotomized between democracy studies (A) and comparative authoritarianism (B), each with its own canons.

DEFINITION Regime promotion refers to the efforts by an actor, typically a state but sometimes non-state entities, to influence the political regime of another actor in a manner that aligns with its own preferences. This influence can take several forms, including (a) promoting regime change, (b) preserving an existing regime, or (c) shaping specific characteristics of a regime.

In promoting regime change (a), the actor seeks to replace the existing regime with a different one, such as transitioning from an authoritarian to a democratic system or vice versa or replacing one authoritarian regime with a different type of dictatorship (e.g., overthrowing a monarchy to establish a Leninist single party regime or ousting a civilian oligarchy with a military coup).

When preserving an existing regime (b), the actor supports and stabilizes the current political system, especially if it faces internal or external challenges. In this case, the actor behaves like a 'guardian.' Depending on the respective viewpoints of two (foreign) actors in the context of geopolitical or ideological competition for enabling or halting regime change in a target state, each promoting actor considers the other a '**black knight**' or disrupter from its own vantage point. For this reason, Van den Bosch (2020: 81) distinguishes between regime promoters and regime guardians.

Shaping regime characteristics (c) involves modifying aspects like institutions, practices or policies to align with the promoter's preferences without fundamentally changing the regime type. From the study of regime promotion, this latter approach only applies if the promoter and target regime are already compatible in many options, but specific regime differences stand in the way of full congruence. An example may clarify. After the Sino-Soviet split (Box 3.9), Moscow and Beijing competed for influence in African Socialist regimes, which already were anti-colonial, single-party regimes. This rivalry manifested in various ways, including China's efforts to counter Soviet influence by hosting leaders of African liberation movements in Beijing and offering support that was perceived as less intrusive than Soviet aid. Meanwhile, the Soviets criticized China's approach as overly radical and accused Beijing of interfering in internal affairs (Scalapino 1964).

The methods employed in regime promotion are diverse and can be either peaceful or coercive. Peaceful methods include diplomatic pressure, economic incentives, technical assistance, and support for civil society organizations. Coercive methods may involve military intervention, sanctions, or backing armed groups within the target state.

The motivations behind regime promotion are varied. Security interests often drive actors to promote regimes that align with their foreign policy goals or counter perceived threats, such as rival ideologies or hostile states. Ideological beliefs can also motivate actors committed to specific values like democracy or human rights to promote regimes that embody these principles. Economic interests might lead an actor to support regimes that create favorable conditions for trade, investment, or resource access.

SEE ALSO When surveying the literature, this field of study is split between two camps, each of them with established traditions and canons: (A) democracy scholars and policy-experts studying **democracy promotion** and (its more politically-correct, less ideologically-tainted or ambitious) **democracy support & assistance**; and (B) or those comparativists analyzing **authoritarian promotion** and **authoritarian collaboration**.

The first group (A) is foremost motivated by improving our knowledge about how to foster **democratization** in target countries. How to pressure authoritarian governments, appease and convince **hybrid regimes**, boost general respect for **human rights** and cultivate a political culture with 'meaningful' **elections** and political, economic and civic freedoms that might consolidate one day as a (liberal) democracy. The focus is limited to interactions along a democracy-non-democracy dyad, where the recipient or target states are usually electoral authoritarian regimes but do not meet the standards of liberal democracy. The promoting actors then aim to impose, improve or standardize norms so the former regime types would transform and become more similar to the promoters.

The second group (B) is often motivated by concern. Along the paradigm of the liberal democratic West locked in a decades-long struggle to promote its values, sometimes the tide turns, as shown in our framing of this process through 'waves' of democracy and authoritarianism (Box 6.3). Whenever democracy is on the retreat, scholars muster in a search for domestic and external culprits and try to untangle the dynamics and mechanics of how autocracies (with low legitimacy) are still able to sabotage democratization processes and convince foreign elites to 'join the dark side.'

Western post-Cold War enthusiasm regarding democratic superiority was inflated with the **color revolutions** and then brutally extinguished in the

Box 3.7 Lustration: Purification with a Naughty List

You cannot make an omelette without breaking eggs
– Robert Louis Stevenson (1897)

Lustration typically occurs during periods of political transition (**democratization**) and its aftermath (**democratic consolidation**), particularly in post-authoritarian or post-totalitarian societies. As with de-Nazification in Germany, it is a process typically associated with (Central) European post-communist regimes (Poland, Czech Republic, Slovakia, Hungary, and even Ukraine – after V. Yanukovich's ouster), but also Argentina (after military rule), Tunisia (after the **Arab Spring**) and Iraq (the de-Ba'athification after Saddam Hussein's fall in 2003 – cf. Box 4.5) are recent examples of similar processes. (Letki 2002; David 2006) Tellingly, Croatia and Serbia did not comprehensively implement such processes after the Yugoslav civil wars, and this has significantly hindered democratization and EU integration.

Lustratio was an ancient ritual in which a newborn was purified from evil spirits through a ceremonial procession and sacrificial offering. It also applied to cleansing locations, such as crime scenes, or protecting cities and fields from evil. After purification, the child was named, its future predicted, and recorded in the census. In Christianity, baptism replaced *lustratio* as a cleansing ritual, though the term later referred to an inventory of people and property. After 1989, Czechoslovak Interior Minister Richard Sacher used 'lustration' to describe the political cleansing of the elite, specifically targeting secret agents through the use of lists derived from the secret police (*Státní bezpečnost* – StB) card files. This process maintained two core elements of the original ritual: purification and lists. (Paczkowski 2023)

Lustration laws often involve the mass disqualification of individuals associated with the prior regime from holding public office. The laws are intended to prevent the restoration of the old regime and to mark a break from the past. Alongside the process of purging individuals who were associated with the previous regime, especially those who held positions of power, were involved in human rights abuses or collaborated with the secret police forces (as informers or enforcers), the aim of lustration is to ensure that individuals who were complicit in the old regime's injustices are unable to obtain or hold positions of influence in the new political order.

The decision to implement **purges** or lustration laws can significantly affect (and break) **elite pacts** during **transitions**. Lustration can disrupt these pacts by (suddenly) displacing former regime members from their positions of power and influence, cutting them off from **rents**, and dissolving their immunity (provided by their political mandate), which might lead to resistance or destabilization if those individuals feel betrayed, threatened or marginalized. The decision to implement lustration and its scope can vary widely depending on the specific historical, political, and social context of the transition.

In some cases, lustration is seen as necessary for justice and reconciliation, while in others, it may be viewed as a form of political retribution that could hinder the process of democratization and reconciliation. The policy is controversial and has yielded mixed results. While it aims to build social trust between the new regime and society and provide **legitimacy** through accountability, it has sometimes led to unintended negative consequences, such as decreased trust in social institutions like trade unions and the church. In Poland, for example, lustration has been criticized for being politically misused by right-wing parties as a political weapon of retribution and a demagogic electoral discourse; and has failed to improve **trust** in political elites and state institutions. (Letki 2002; Williams 2005; Szczerbiak 2002)

To quote Monika Nalepa (2022: 256) at length: *"In democracies recovering from authoritarian rule or civil war, politicians trying at all costs to prevent their skeletons from coming out of the closet fail at being effective representatives and betray the interests of their voters. In an effort to bury the truth about skeletons in the closet they succumb to blackmail. The advice to 'let bygones be bygones,' 'forgive and forget,' or 'let sleeping dogs lie' especially when applied to crimes committed secretly under the authoritarian regime may be deadly for a new polity. At the same time, new democracies' temptation to punish 'known' members and collaborators of the former regime is a form of 'ritual sacrifice.' Although it signals to some voters a clean break with the former regime, it has little beyond symbolic significance and may be equally crippling as the decisions to let sleeping dogs lie."*

Purges, depending on the skills and loyalties of those who are being purged, may or may not contribute to **democratic consolidation**. In **transitions** from authoritarian rule to democracy, a careful balance between purges and transparency is crucial. Purges should be used sparingly to avoid destabilizing the new government and losing valuable expertise. Transparency, however, should be widely applied, taking the form of either lustration or truth commissions, depending on the context. Truth commissions are effective in the short term, as they apply to everyone, not just those seeking office, and help reveal hidden collaborators, prevent blackmail, and undermine authoritarian networks.

Overall, lustrations and truth commissions (Box 5.7), their social costs notwithstanding, make new democracies healthier. The choice between them depends on the duration and control methods of the former regime. Short-lived, violently repressive regimes may have fewer collaborators to lustrate, whereas long-standing regimes with extensive surveillance networks may require more comprehensive transparency measures. Paradoxically, these processes can seem unfair, as high-ranking officials from repressive regimes might retain their positions due to their expertise, while ordinary citizens or dissidents who made minor compromises may face severe consequences. This paradox underscores the complexity of transitional justice and the need for nuanced approaches that balance accountability with societal reconciliation. (Nalepa 2022: 253-260)

aftermath of the **Arab Spring**. Since democracy is no longer ideologically challenged in the global post-Cold War order – save for some region-specific and regionally-bound forms of **political Islam** and the odd ideological firebrand (like Hugo Chávez – Box 3.8) – such a democratic rollback after 2010 was unsettling. Beside a new interest in **populism** and extreme parties in the West (the proverbial mutiny on board), scholarly attention shifted to international actors involved to map these disturbing trends. Resulting research coalesced around the topics of **authoritarian promotion**, **authoritarian regionalism** and **authoritarian learning**.

Admittedly, there is a third group (C) or those scholars who have been working on democratic diffusion since the late 1980s. On the tailcoats of the 'Third Wave of democracy,' they have gone beyond actor-agency to dissect the more passive (systemic) mechanisms of how a regime type spreads from country to country, checking a whole laundry list of potential factors (like economic development, regional influences, international organizations, the role of media and technology, etc.) that facilitate the spread of (democratic) norms and ideals. Around 2010, this group flipped their focus to analyze the 'reverse diffusion' (**authoritarian diffusion**) of authoritarian practices and influences.

METHODOLOGICAL ISSUES The balkanization of political science subfields has hindered progress to come comprehensive understanding of regime promotion at an analytical level that raises above **democracy promotion** and **authoritarian promotion**.

Scope Almost all democracy studies (A) and comparative authoritarianism (B) follow the same dyad but in different directions: For A, 'democracy' is the normative promoter, and for B, 'non-democracy' has the agency to disrupt, damage and erode democratic progress. Authoritarian promoters are often seen as **black knights** subverting ongoing democratization processes. They usually do not target consolidated democracies (although the recent **disinformation** and interference in the UK and US elections are exceptions) but target states that the West has been 'supporting and assisting' in their democratic development. So, A is primarily occupied with fostering democratization, while B has the end goal of aiding the cause to 'protect democracy' and counter autocratization (Leininger 2022).

This black-and-white, 'good vs. evil' narrative between democracy and non-democracy is, of course, relevant from a Western perspective, where policy makers living and educated under democratic rule sincerely hope to extend such political order to populations beyond the democratic bloc. Still, such frames obscure an important observation: authoritarian regimes sometimes differ more from one another than they do from liberal democracy. For instance, in a world before democracy, monarchies and republics were embraced in a similar stand-off, promoting their form of rule abroad, often violently. Lumping all target states (or authoritarian agents) together as non-democracies severely limits our understanding of when and why regimes succeed in influencing and changing regimes abroad.

Arguably, the scholars working on democratic and authoritarian diffusion (C) similarly routinely gloss over the heterogeneity of dictatorships, but their focus beyond actors and active policies did shift attention to the circulation of practices, norms, and procedures, as well as the salience of institutional and bureaucratic legacies.

Disciplinary fragmentation The study of regime promotion is intricately positioned at the intersection of various subfields within political science, primarily comparative politics, International Relations (IR), and Foreign Policy Analysis (FPA). Each subfield offers unique perspectives and methodologies that contribute to understanding the complex dynamics of regime promotion. Both A and B approaches do not fully embrace an IR perspective. They analyze regime promotion in terms of democratization or autocratization and the role of domestic actors and institutions in facilitating or resisting change. Comparative politics provides insights into how different political systems respond to external pressures for regime change and how internal factors can either support or hinder such efforts.

IR examines regime promotion from a broader geopolitical perspective, considering how states interact within the international system. This subfield explores the motivations behind foreign-imposed regime changes, such as strategic interests or ideological conflicts, and how these actions impact global stability and international norms. IR theories

often address the implications of regime promotion for international peace and conflict, analyzing how power dynamics and alliances influence state behavior in promoting or resisting regime changes. However, few IR approaches go beyond the binary democracy vs. non-democracy regime labels. (The political history of IR does, of course, and here, there is much untapped potential for studying regime promotion in a systemic matter).

For instance, Owen IV (2010: 8) finds that realism (as an IR theory) fails to justify why states should impose regimes on others, as it typically ignores domestic properties like regime type, focusing solely on military power. This omission means realism cannot predict or explain the costs states incur when using force for regime change, making such actions anomalous within its framework. Realism suggests that forcible regime promotion should *only* occur when states are secure enough to indulge domestic interests in exporting regimes (the data contradict this).

FPA bridges the gap between domestic and international politics by focusing on the decision-making processes of states regarding regime promotion. FPA examines how different regime types influence foreign policy choices and how these choices are implemented through diplomatic, economic, or military means. It also considers how domestic political considerations shape foreign policy strategies aimed at promoting specific regimes abroad. While this is crucial to understanding their motivations and preferred methods, this does not provide systemic evidence of how successful such attempts have been in specific contexts or in the long run.

To recap, too few bridges have been built to cross from FPA (the motivations, means and perspectives of promoters) to comparative politics (the impact of and reactions to foreign pressures by governments and subnational actors in target states) or combine these with applied IR frames to understand systemic patterns, with the goal to formulate middle-range theories to explain and predict them.

Selection bias Regime changes, especially sudden power transfers, are fairly evident in most cases. If states apply violent methods to achieve such foreign policy goals, these also do not go unnoticed. For these reasons, our systemic research is still too biased on the visible and successful patterns of regime change, overlooking subtle, non-violent attempts, failed attempts, but also aborted attempts of regime promotion while including cases caused by serendipity that were embraced and supported by foreign powers *after* a regime change (with domestic causes) took place. As we go back in time, the nuances of failed and non-violent regime promotion events are often lost, skewing those data as well.

Great power bias There are also biases for big states. It is assumed that **power** is required to influence political behavior in the international system. For logical reasons, great and regional powers are scrutinized better, so data-collection is also in their favor. This obscures some dynamics of regime promotion, shown below.

ORIGIN There is no consensus on how old the phenomenon is, but the literature is riddled with isolated (seemingly non-related) observations like this one: The Romans strategically employed kingship among barbarian tribes to establish stable and manageable conditions along their borders. For instance, the Cheruscans had a king who benefited from Roman military support, while the Romans actively imposed kingship on the Bructerans. Tacitus noted that the power of these kings was heavily reliant on Roman authority, receiving either military or financial assistance from Rome, both of which were equally influential. This Roman influence serves as a caution against overly idealizing ancient Germanic tribes and ideological Germanism. (Ehlers 2004: 6-7)

So, in Ehlers' (2004) pursuit of the origins of kingship and the historical development of governance systems in the first century CE, he noted that the Roman empire engaged in regime promotion to secure their frontiers, where 'barbarian' political regimes had multiple coexisting kings rather than a singular monarchy, which posed challenges for making sustainable alliances or rendering vassals.

EXAMPLES That the Soviet Union gained and lost much in the Global South as a result of coups is beyond dispute. David (1986: 3-4) found that in terms of gains, the USSR recognized that virtually the only way pro-Soviet governments come to power in the Global South is through violence and that the **coup d'état** is the most frequent form of violent regime change among the developing states. Fourteen coups in 13 countries resulted in a pivot toward the USSR, placing a regime in power that (immediately or over time) proved more supportive of Soviet interests. The Soviets have also lost influence in the same way, following successful counter-coups or abortive coups. Historically, the USSR initially believed decolonization would naturally lead to pro-Soviet regimes. However, setbacks in the 1960s, where pro-Soviet leaders were overthrown by coups, prompted a reassessment. Consequently, the Soviets developed tactics such as military assistance to instill a pro-Soviet ethos in Third World militaries and supported vanguard parties to centralize power and mobilize support for pro-Soviet regimes. Several motivations drove the USSR's shift toward using coups during the Cold War. Pro-Soviet governments could realize their strategic interests such as establishing military bases, controlling raw materials, and countering Western and Chinese influence. The ideological motivation was also significant. The emergence of regimes proclaiming loyalty to Marxism-Leninism validated Soviet ideology and demonstrated the perceived decline of the West. This ideological alignment was crucial for the Soviets to perpetuate their own rule and maintain legitimacy despite domestic challenges (David 1986).

LITERATURE John M. Owen IV's model (2010) for analyzing forcible regime promotion, as detailed in his work *The Clash of Ideas in World Politics*, examines the historical and ideological contexts in which states attempt to impose their political regimes on others through force. This model is rooted in the

understanding that such actions are not anomalies but rather recurrent features of international politics, driven by ideological conflicts and transnational networks.

Why? States engage in forcible regime promotion primarily to secure their interests, both domestically and internationally. Owen argues that governments may perceive the spread or maintenance of a particular regime type abroad as crucial to their own security and ideological alignment. This is particularly true when there is high ideological polarization across nations, meaning that elites and societies are sharply divided along ideological lines, such as liberal democracy vs. Communism or secularism vs. Islamism. In such polarized environments, states may feel compelled to act to prevent the spread of **ideologies** they oppose or to support those they favor.

How? The process often involves direct military intervention or support for coups and revolutions that align with the promoting state's ideology. Owen identifies two main incentives for such actions: external security, where a state seeks to influence the international balance of power by ensuring friendly regimes abroad, and internal security, where a state aims to prevent ideological threats from gaining traction domestically by suppressing them abroad. These interventions can be triggered by events like regime crises within target states or large-scale wars involving major powers, which can polarize regional politics and create opportunities for forcible regime promotion.

When? Historically, such promotions tend to occur during periods of intense ideological conflict and are often clustered in waves: *"forcible regime promotion tends to happen more when international security is scarce, as in hot or cold war, rather than when it is plentiful. (...) typical are promotions and counter-promotions by states seeking to increase their security and extend their power"* (Owen 2010: 8). Owen identifies three major waves over the past five centuries: the religious conflicts of early modern Europe, the struggles between **republicanism** and **monarchy** in the eighteenth and nineteenth centuries, and the ideological battles of the twentieth century involving **Communism**, **Fascism**, and liberal democracy. A series of interventions characterize these waves as states react to ideological shifts and alignments across borders.

Overall, Owen's model highlights that forcible regime promotion is deeply intertwined with transnational ideological contests. States act not just out of strategic interests but also due to pressures from *transnational ideological networks* (TINs) that advocate for specific political ideologies. These networks can intensify polarization and create conditions where states see regime promotion as necessary for their survival and ideological coherence.

TINs play a pivotal role in facilitating regime change by spreading ideologies and mobilizing support across borders. These networks are composed of various actors, including NGOs, social movements (**civil society**), and even parts of governments, which collaborate to promote their preferred regime type. This collaboration involves sharing resources, strategies, and information to influence public opinion and political outcomes in different countries.

Moreover, transnational networks create demonstration effects; successful regime changes in one country can inspire similar movements elsewhere. Networks amplify these effects by highlighting successes and offering blueprints for action. They often engage in contentious politics by organizing protests, lobbying international bodies, or even supporting insurgencies to destabilize regimes they oppose. Overall, TINs act as catalysts for regime change by exploiting ideological divides and leveraging global connections to support domestic actors seeking political transformation (Owen 2010).

Owen's 'clash of ideas' is, of course, inherently linked with incompatible worldviews and **legitimacy**. His diachronic study of three historical waves of ideological confrontation (between 1520 and 1650, 1770 and 1850, and 1917 until today) about the nature of 'just rule' goes so much deeper than the democracy-non-democracy divide which dominates contemporary scholarship about democracy 'promotion' and 'protection.'

Note that Owen's frame is limited to forcible regime promotion between sovereign states. He does not cover institutional transformation as a result of imperialism or colonization. Data on non-coercive regime promotion is harder to find and qualify. However, scholars of democratic and **authoritarian diffusion** (group C) did develop some models to qualify these more covert and incremental changes.

S. Levitsky and L. Way's (2010) model for democracy promotion, **linkage & leverage theory**, rendered 'neutral' by J. Tolstrup (2014) to account for authoritarian promotion, who updated the theory with the concept of **gatekeeping**, is often applied to measure regime promotion within wider diffusion and interaction patterns between regimes. Van den Bosch (2015) provides a list of examples of how this middle-range theory can be applied to study regime promotion.

CLASSIFICATIONS The diverging focus on democracy studies (A) and comparative authoritarianism (B) persists, and each has a large canon with models dedicated to **democracy promotion** or **authoritarian promotion**, respectively. Below, I list several frameworks (or elements of them) that are more universal or at least transferable to analyze 'regime promotion.' Note that the overall literature remains fragmented.

Actors (I) Kurt Weyland (2017) distinguishes between two ideal-types of interest-driven and ideology-driven cooperation and diffusion (to account for non-democracies in their collaboration in international relations).

Interest-driven autocracies prioritize self-regarding goals, focusing on economic and political interests to maintain regime stability and protect against external threats, particularly from democratic forces. These regimes, such as Russia and China, mainly react defensively, aiming to secure their

influence within geographically close regions to reinforce their political control and resist democratic encroachment. Their cooperation is primarily regional and focused on regime preservation.

In contrast, *ideology-driven autocracies* pursue other-regarding goals and proactive expansion. These regimes, exemplified by Mussolini's Italy (**Fascism**) and Chávez's Venezuela ('*Bolivarismo*' – Box 3.8), actively promote their ideological models, seeking to inspire emulation beyond their borders. Motivated by missionary zeal, they aim to spread their ideologies globally, often attempting regime change and ideological conversion in foreign states. This form of cooperation and diffusion is expansive, targeting distant allies who share similar ideological goals. Therefore, ideology-driven autocracies have a broader geographic scope, extending beyond regional influence to spread their values and reshape foreign regimes in alignment with their ideological vision.

Instruments (II) Fabio Fossati (2017; 2022) compiled a simple but universal framework for analyzing the promotion of regimes abroad. It encompasses four modes: (a) control, (b) conditionality, (c) rewards, and (d) emulation.

Control (a) involves direct interventions, such as military actions, to change or maintain regimes. An example is the US intervention in Iraq in 2003, which aimed to establish a democratic government through military means. Political *conditionality* (b) uses negative incentives, like **sanctions** or exclusion from international bodies, to pressure regimes into adopting certain behaviors. This approach is often applied against authoritarian regimes that violate human rights. Alternatively, it can be economical blackmail by autocrats to pressure target states. *Rewards* (c) involve offering positive incentives to encourage regime change or support existing regimes, including economic aid, diplomatic support, or assistance to civil society groups. *Emulation* (d) refers to an indirect process where countries adopt similar governance models due to cultural or ideological influence without direct intervention. This often occurs through regional or global waves of democratization or authoritarianism (Fossati 2020).

Fossati's (2020) model provides a clear framework that encompasses both direct and indirect methods and considers both positive and negative incentives. Its flexibility allows for a mix of strategies, acknowledging that states may use a combination of these four instruments depending on the context and their objectives. A tally of methods used by states can be turned into a matrix to evaluate (authoritarian) regime promoters (hard vs. soft; flexible vs. rigid). A rigid interaction is characterized by support exclusively for authoritarian regimes. In contrast, a flexible relationship allows for a 'plan B,' which includes promoting **hybrid regimes** as well. Hard power relations are rooted in direct military interventions, whereas soft power relies on diplomatic, economic, indirect military inducements, and blackmail (Fossati 2022: 20).

However, there are also limitations to consider. The model oversimplifies complex international interactions by categorizing them into (just) four distinct processes. Regime promoters are pigeonholed regarding their empirical behavior, not their motivations. Additionally, the model might not fully account for cultural and ideological differences that can significantly affect the success or failure of regime promotion efforts. Fossati's early works (1999; 2004) are available in Italian.

Linkages (III) Marianne Kneuer and Thomas Demmelhuber (2016) then discern between *intentional* and *unintentional* modes of external autocratic influence. The former is subdivided between *coercive* and *voluntary*. (The latter can logically only be voluntary.) Note that the more similar the promoter and the target regimes are, the more likely that innovation will travel without the need for coercion. (Bunce & Wolchik 2006: 287).

Based on Dolowitz's (2000) model of policy transfer, Kneuer and Demmelhuber (2016: 787-789) identified four arenas to analyze the ways in which autocratic governance characteristics may be imposed, diffused, and transferred among states. These include the institutional (i), policy (ii), ideational (iii), and administrative (iv) arenas, each targeting different aspects of governance. They integrated this frame with their middle-range theory of 'authoritarian gravity centers,' shown in Box 6.2.

The *institutional arena* (i) involves modifications to political and constitutional structures (e.g., **term limits**) to reinforce autocratic control. These changes may include abolishing democratic institutions like independent **judiciaries**, altering electoral systems (**elections**) to sidestep parliamentary oversight, expanding executive powers, and limiting civil liberties. The purpose is to weaken opposition and secure regime longevity.

In the *policy arena* (ii), regimes may adopt policies that align with autocratic ideals and challenge democratic norms. Economic policies, especially in resource-rich regimes, play a significant role in achieving **legitimacy** and can include nationalizing resources and managing distribution selectively. Security policies are also prioritized, exporting models for **repression** or **patronage** models that ensure regime stability. Additionally, media control is critical, with autocratic regimes curbing alternative voices and controlling digital media to stifle opposition.

The *ideational arena* (iii) focuses on promoting ideologies, values, and attitudes that legitimize the regime. These elements are instrumental in rallying domestic support and forging regional solidarity by building transnational networks. Such networks enable the dissemination of ideas (**propaganda** and **indoctrination**) that foster a shared regional identity, which is essential for the legitimacy of autocratic regimes.

Lastly, *administrative techniques* (iv) operate at an informal level, enabling subtle control methods such as surveillance, electoral fraud, media license revocations, and property seizures. These measures often avoid international scrutiny but effectively maintain regime control. Collectively, these arenas illustrate the varied, layered approach autocratic

regimes use to sustain power and influence their geopolitical surroundings.

Patterns (IV) By borrowing concepts from economic cluster theory, Van den Bosch (2020) introduces 'Regime Cluster Theory' (RCT), a framework aimed at analyzing the dynamics of regime promotion and diffusion within regional clusters. RCT emphasizes how political regimes interact based on three primary cluster types: (a) ideological, (b) hegemonic, and (c) biotopical. Each cluster type influences regime promotion differently, shaped by unique drivers and patterns of interaction.

Ideological clusters (a) are grounded in shared values and norms, where regime promotion occurs through ideological influence, such as the historical spread of Marxism-Leninism or liberal democracy. *Hegemonic clusters* (b), on the other hand, are dominated by powerful states or coalitions that promote regimes primarily through military and economic power, as seen with countries like Russia and China. *Biotopical clusters* (c) differ from both by lacking a unifying ideology or a dominant power; instead, they are shaped by regional structures, such as historical legacies and geopolitical factors, which are prominent in regions like Sub Saharan Africa and Central Asia.

The implications of this theory go beyond the conventional democracy-autocracy framework, suggesting that regime stability in regions may be affected by the emergence of alternative ideologies but also hegemony, which can stem waves of opportunistic regime promotion in biotopical clusters. For example, the rise of Nigeria as a regional power around 2000 ended the wave of foreign-backed rebel takeovers in Western Africa.

The paper further explores how each cluster type employs different mechanisms of regime promotion, including coercion, voluntary cooperation, bounded learning, and contagion, highlighting the varied diffusion dynamics across clusters. RCT shifts the analytical focus from individual regimes to the interactions within clusters, providing insight into how regimes cooperate, compete, and adopt survival strategies within these regional contexts.

Patterns of forcible regime promotion (not limited by proximity) can thus be explained as a clash between two ideological clusters or the reactionary behavior of a hegemonic cluster trying to stem the inroads of a nearby ideological cluster – like Russia countering Western values and closer linkages (EU or NATO membership) in what it considers its own 'near abroad.'

To summarize, this entry proposes to bridge the existing islands of scholarship by puzzling together some parts of a broader, universal framework for the study of regime promotion and its patterns over time. As shown in 'methodological issues,' there is still a long way to go to integrate the most useful frameworks and establish the back-and-forth between regime collaboration, promotion and learning and distinguish these from more incremental and elusive diffusion processes.

Rent-Seeking

But the cruelest of our revenue laws, I will venture to affirm, are mild and gentle, in comparison to some of those which the clamour of our merchants and manufacturers has extorted from the legislature, for the support of their own absurd and oppressive monopolies. Like the laws of Draco, these laws may be said to be all written in blood.
– Adam Smith, Scottish economist and philosopher

Making is not the same as taking. It is not inequality itself that is unfair but rather the process that generates it.
– Angus Deaton, American microeconomist

Rent-seeking refers to the process of individuals or firms attempting to obtain economic profit by manipulating the social or political environment rather than by creating new wealth or goods. The term is widely used in economics as well as in political science, where it is often associated with the behavior of interest groups, politicians, and bureaucrats who seek to capture economic rents by influencing public policy.

DEFINITION In her seminal article on rent-seeking, Krueger (1974: 291) did not provide an explicit definition of this phenomenon. She just conceptualized it as a competition for **rent**, which can take a number of forms, both legal and illegal. This conceptualization is the core of most definitions of rent-seeking, and there are no major differences in this regard between definitions provided by individual scholars. They mostly differ in how complex they are, i.e., if their authors just attempt to capture the general logic of rent-seeking or if they also specify the actors, activities, or consequences. An example of a complex definition is the one provided by Hartle (1983: 539): *"Rent seeking can be defined comprehensively as investments of real resources undertaken by individuals or groups (coalitions) of individuals with similar interests in the expectation of obtaining an increase (avoiding a decrease) in their income wealth as a result of securing (blocking) changes in legal rights; or maximizing the benefit (minimizing the cost) of earlier policy changes that created non-exclusive rights."* An example of a simple definition is provided by Khan (2000: 70), who defines rent-seeking as *"the expenditure of resources and effort in creating, maintaining or transferring rents."*

SEE ALSO Related concepts such as **systemic corruption** and **clientelism** refer to an informal institution or practice typically present in rent-seeking societies; on the other hand, **state capture** describes the systemic penetration, privatization, or appropriation of the state by economic or political actors. If countries collect windfalls of **rents** from natural resources (i.e., **resource curse**) or other steady sources of income, they can become **rentier states**.

KEY SIGNIFICANCE Rent-seeking refers to a process of creating, maintaining, and transferring rents. Furthermore, because this can be realized by a number of means, both legal (lobbying, contributions to political parties, etc.) and illegal (bribes, illegal political contributions, expenditure on private mafias, vote buying, etc.), the research on rent-seeking is inevitably closely connected with research on **corruption**, **informality**, etc. (Khan 2000) Most of the literature on rent-seeking comes from the field of economics. For example, an influential account of relations between rent-seeking and corruption was provided by Lambsdorff (2002) and Aidt (2016); a major contribution on rent extraction and political extortion was written by McChesney (1997); and Svensson (2000) claimed that foreign aid is typically associated with higher corruption and rent-seeking in developing countries.

In political science, the concept of rent-seeking has been used mainly in the context of the redistribution of wealth. While Kitschelt (2000: 863) claimed that *"countries with a small public sector yield fewer opportunities for rent-seeking groups and clientelism than do large public sector countries,"* Olson (1982: 37-42) stressed that it is democratic countries that are plagued by redistribution and coined the term 'distributional coalitions' in order to describe parochial self-serving vested interests of groups seeking for rents. However, as Wintrobe (2000; 2003) convincingly shows, rent-seeking is even more typical in dictatorships. While in democracies, rent-seeking involves individuals or groups seeking to use political influence or regulatory power to gain economic rent or special privileges that are not available to others, in dictatorships, rents frequently stand at the very core of the regime (Tullock 1986). They may serve as a concession to other important actors or segments of society when dictators distribute some of their spoils to them in order to avoid rebellion. As Gandhi (2010) convincingly demonstrates, the share of rents distributed among the **opposition** can play a major role in the survival or ousting of a dictator. A similar argument on a dynamic game between oligarchs and a dictator who contains rent-seeking was provided by Guriev & Sonin (2009).

Resource-dependent dictatorships may even take the form of **rentier states**, i.e., countries that derive a significant portion of their revenue from the rent generated by their natural resources, such as oil, gas, or minerals (cf. **resource curse**). In a rentier state, the government typically controls the natural resources and uses the revenue to fund the state's activities, including public services and infrastructure, as well as to maintain political power and control over the population. The concept was developed by Mahdavy (1970) and later elaborated by Beblawi & Luciani (1987) and Skocpol (1982). Recent contributions to

Box 3.8 Chávismo: Rebranding Bolivarismo

Huid del país donde uno solo ejerza todos los poderes: es un país de esclavos.
(Flee the country where a lone man holds all power: It is a nation of slaves.)
– Simón Bolívar
El águila no caza moscas.
(The eagle does not hunt flies.)
– Hugo Chávez

Chávismo is a political movement that emerged in Venezuela with the rise of Hugo Chávez, a figure whose charismatic leadership and populist rhetoric redefined the country's political landscape. At its core, Chávismo combines elements of **populism**, **socialism**, and Bolivarian **nationalism**. However, the movement is more than just a collection of ideological tenets – it is deeply rooted in the personal appeal and political strategies of Chávez himself. The extent to which Chávismo is defined by Chávez's **charisma**, its populist nature, and its revolutionary aspirations has been a central focus of political science scholarship.

From the outset, Chávismo was characterized by Hugo Chávez's extraordinary charisma. Similar to Jerry Rawlings in Ghana, his rise to prominence began not with electoral politics but with a failed military **coup**. Chávez's televised address following his 1992 coup attempt – where he took responsibility for the failure but urged his followers to stand down – captured the imagination of many Venezuelans who were disillusioned with the country's political elite. This moment marked the beginning of Chávez's transformation from an obscure military officer into a national figure capable of mobilizing mass support. His subsequent electoral victory in 1998 was largely due to his ability to position himself as an outsider challenging Venezuela's corrupt political establishment. (Hawkins 2003)

Chávez's charisma was central to his ability to build a direct relationship with 'the people,' bypassing traditional party structures and institutions. In this sense, Chávismo fits squarely within the framework of **populism**. Populist leaders often rely on their personal appeal to create an unmediated connection with their supporters, presenting themselves as the embodiment of the popular will. Chávez did exactly this by framing his movement as a struggle between 'the people' and a corrupt elite, which he blamed for Venezuela's economic woes. He frequently used Manichaean (good vs. evil) rhetoric to polarize society into two camps: those who supported his Bolivarian Revolution and those who were aligned with imperialist forces seeking to undermine it. (Hawkins 2003; Hellinger 2003)

While not all charismatic leaders are populists, most successful populists rely on charisma to sustain their movements. Chávez's ability to inspire loyalty among Venezuela's poor and marginalized populations was unmatched by any other political figure in recent Venezuelan history. However, Chávez himself did reject the label of 'populist,' likely because of its negative connotations in Latin American politics. Instead, he preferred to describe his movement as revolutionary or Bolivarian.

'Bolivarismo' or Bolivarianism refers to the nationalist ideology inspired by Simón Bolívar, the nineteenth-century Venezuelan leader who played a key role in Latin America's wars of independence against the Spanish colonizers. Bolívar's vision for Latin America included not only independence but also regional unity and social justice. On the whole continent, Bolívar has long been revered as an international hero, and various political movements have invoked his legacy over the years.

Chávez co-opted Bolivarianism as part of his broader nationalist project, renaming Venezuela 'The Bolivarian Republic' and frequently invoking Bolívar's name in his speeches. However, Chávez's interpretation was distinct from earlier iterations of the **ideology**. While traditional Bolivarianism had a militaristic bent and sought to make Venezuela a great power in Latin America, Chávez fused it with socialist principles drawn from guerrilla movements of the 1960s. This synthesis allowed him to present his government as both nationalist and anti-imperialist while also emphasizing social justice and wealth redistribution (Straka 2017).

The incorporation of Bolivarianism into Chávismo served several purposes. First, it provided historical **legitimacy** to Chávez's movement by linking it to one of Venezuela's most revered figures. Second, it allowed him to frame his policies – such as nationalizing key industries and redistributing wealth – as part of a broader struggle for national sovereignty against foreign (especially US) interference. Finally, Bolivarianism helped Chávez differentiate Chávismo from other left-wing movements in Latin America by grounding it in Venezuelan history rather than Marxist theory alone.

One of the key debates surrounding Chávismo is whether it should be classified as a revolutionary movement or merely as an example of populism. While both populism and revolution share certain characteristics – such as emerging during periods of crisis and mobilizing large numbers of people – they are distinct phenomena:

Populism is generally understood as a rhetorical strategy that occurs outside established institutions. Populist leaders claim to represent 'the people' against corrupt elites but do not necessarily seek to overthrow existing political systems entirely; instead, they often aim to reform or renew those systems from within. **Revolution**, on the other hand, involves more fundamental changes to a country's political and social order. Revolutionary movements seek not just reform but a complete break from the past.

Chávez often described his movement as revolutionary rather than populist. He saw himself as leading Venezuela toward socialism through what he called the 'Bolivarian Revolution.' This revolution aimed not only at redistributing wealth but also at transforming Venezuela's political system from a liberal representative democracy into what he called 'participatory democracy.' Under this model, power would be devolved to local communes where ordinary citizens could have

direct input into decision-making processes.

Many scholars argue that Chávismo did indeed have revolutionary characteristics – particularly its emphasis on mass mobilization and its efforts to create new forms of governance outside traditional liberal democratic institutions. For example, Chávez introduced mechanisms such as referendums and communal councils that allowed citizens greater participation in politics than under previous regimes.

However, other scholars are more skeptical about whether Chávismo truly constitutes a revolution rather than simply an extreme form of populism. They point out that while Chávez introduced significant changes – such as nationalizing industries like oil – he did not dismantle Venezuela's capitalist system entirely, nor did he abolish private property rights altogether (at least not initially). Moreover, while Chávez spoke frequently about socialism after 2005 (when he formally declared himself a socialist), there was little evidence before then that he intended Venezuela's economy or society to undergo radical transformation.

As its main ideologue, Chávez pushed for **authoritarian collaboration** and even **authoritarian regionalism** by creating the *Bolivarian Alliance for the Peoples of Our America* (ALBA), founded in 2004. ALBA is a regional bloc that promotes social, political, and economic cooperation among its member states, with a focus on socialist principles and anti-imperialism. It was created as an alternative to US-backed free trade agreements, emphasizing solidarity and mutual aid among Latin American and Caribbean nations. ALBA's initiatives include cooperation in areas such as healthcare, education, and energy, with Venezuela providing subsidized oil to member countries through programs like *Petro-Caribe*. In particular, they were a lifeline for Cuba.

The decline of Chávismo can be traced to several key factors following his illness (cancer) and finally death in 2013 at the age of 58 (Parraga 2013). Chávez's successor, Nicolás Maduro, struggled to maintain the same level of popular support due to his lack of charisma and the worsening economic crisis. (Arenas 2016: Smilde 2015) Under Maduro's rule, Venezuela experienced hyperinflation, widespread poverty, and a sharp decline in oil revenues, which had been the backbone of the Chávista economic model. These economic difficulties severely undermined the government's ability to fund social programs that were central to maintaining popular support. At the international level, it has diminished Venezuela's **soft power** and ability to push for **regime promotion** abroad.

Additionally, Maduro held on to power through electoral fraud and appalling human rights abuses, further eroding domestic and **external legitimacy**. Protests against his rule met with violent **repression**, contributing to growing discontent among Venezuelans and deepening the country's political polarization. Still, Maduro has proved to be an adaptable autocrat, surviving coup and assassination attempts. (Smilde 2015; Freeman 2023)

Despite these challenges, Chávismo has not completely disappeared. Maduro continues to cling to power with support from international allies like Russia and China. In the 2024 presidential election, evidence of fraud surfaced again as opposition candidate Edmundo González Urrutia claimed victory but was denied by the government-controlled *National Electoral Council* (CNE), which declared Maduro the winner. This has led to ongoing protests and further international condemnation. Today, Chávismo survives more as an ideology for grasping political power than as a vibrant political worldview with widespread grassroots support. (Freeman 2023)

Box 3.9 Sino-Soviet Split

When brothers fight to the death, a stranger inherits their father's estate.
– African proverb

The split between the USSR and China that started in the 1950s was one of the main events in the Cold War period, marking the biggest split within the communist world after Yugoslav leader Tito's 'No' to Stalin in 1948.

The split was initiated by the death of Soviet leader Joseph Stalin and the de-Stalinization processes in the USSR by Nikita Khrushchev (cf. Box 3.4). Due to different interpretations of the true essence of Marxism-Leninism, the USSR's renunciation of Stalinism and Khrushchev's propagation of peaceful coexistence with the capitalist West (which meant the end of the idea of world revolution), Chairman Mao Zedong and the Chinese Communist Party (CCP) denounced the USSR as a revisionist country (Lüthi 2008; Li 2012).

There was also a clear struggle to gain political and economic influence in the developing world which was played out in the various liberation struggles against neo-colonial and colonial rulers. Both countries jockeyed to maintain or gain power over the global communist movement (cf. **regime promotion**).

Crucially, one should also not disregard the ambivalent and delayed support of Stalin for Mao and the contradictory 'advice' of the Soviet regime during the Chinese Civil War once the (unlikely but pragmatic) cooperation between the Communists and the *Kuomintang* (國民黨 – *Guómíndǎng*) ended with the conclusion of WWII (Lüthi 2008; Li 2012; Li & Xia 2018).

The 'perpetual revolution' advocated by Mao led to the denunciation of more moderate elements within the CCP, while he also went on and *"explicitly associated the Soviets with his domestic ideological enemies and viewed them as essentially the same threat"* (Ringger 2023: 108). Especially since the early 1960s, Mao began a struggle against domestic enemies, while *"the struggle against domestic ideological revisionism merged with his battle against its counterpart in the policy of the socialist camp toward imperialism"* (Lüthi 2008: 2).

The Sino-Soviet split was primarily driven by Mao Zedong's ideological struggle against internal opposition (**personalization**) and his efforts to assert China's leadership within the socialist camp, as well as the broader geopolitical rivalry between China and the Soviet Union over influence in the developing world (Lüthi 2008; Ringger 2023). Mao's radical ideological positions, such as his rejection of Khrushchev's de-Stalinization policies and his accusations of Soviet 'revisionism,' were central to the conflict. These positions were not only aimed at distinguishing China from the USSR but also served Mao's domestic agenda, where he equated Soviet policies with his internal ideological opponents, consolidating his control through **purges** and radical campaigns like the 'Great Leap Forward' (Ringger 2023; Lüthi 2008).

The split was unusual because it involved two revolutionary states in open conflict, challenging the expectation that such states would unite against 'reactionary' powers (Kissinger 1999; Halliday 1999). It demonstrated that ideological differences when combined with competing national interests and internal struggles, could fracture even ostensibly united socialist movements (Ringger 2023: 107).

In addition, many foreign policy issues widened the Sino-Soviet split: the Chinese border struggles with India and China's bombing of the *Kinmen* archipelago (金門 sometimes *Jinmen* or *Quemoy* – cf. the Second Taiwan Strait Crisis) are just a few examples. The most serious conflict occurred in 1969 on the Ussuri River (Zhenbao/Damansky Island).

The Sino-Soviet Border Conflict of 1969 on the Ussuri River was a series of violent clashes between the USSR and the PRC, rooted in territorial disputes and ideological rivalry. The conflict began on 2 March 1969, when Chinese troops ambushed Soviet border guards near Zhenbao/Damansky Island, leading to heavy casualties. A second major clash occurred on 15 March with the Soviets responding with overwhelming force. Both sides escalated militarily, raising fears of full-scale war, including potential nuclear strikes. The crisis was de-escalated after a ceasefire was negotiated in September 1969 by Soviet Premier Alexei Kosygin and Chinese Premier Zhou Enlai.

After Mao's death, the relations between the USSR and the PRC became more pragmatic, but the Sino-Soviet split remains one of the most important elements of the Cold War period and can truly be considered a 'cold war' within the communist world (Lüthi 2008).

One significant outcome of the Sino-Soviet split was the unexpected rapprochement between China and the US, the leading capitalist power since WWII. Following the split, the US, under President Richard Nixon, sought closer ties with China to isolate the Soviet Union further. This shift culminated in China's admission to the United Nations in 1971, where it replaced the Republic of China (Taiwan) as a permanent member of the Security Council. The rapprochement also laid the groundwork for future economic cooperation between the US and China, which, combined with Deng Xiaoping's market reforms, fueled China's economic and political rise. This rise has since evolved into today's geopolitical and economic rivalry between the two nations. Thus, the Sino-Soviet split had far-reaching, unintended consequences that continue to shape global politics and power dynamics in the twenty-first century.

the rentier state include, e.g., Weyland (2009) and Bjorvatn & Naghavi (2011) or the special issue of the *British Journal of Middle Eastern Studies* on rentierism edited by Yamada & Hertog (2020). An influential contribution to the tendency or resource-dependent rentier states toward authoritarian governments was provided by Wantchekon (2002).

However, distributing rents is not limited to 'capitalist autocracies.' As showed by Hillman & Schnytzer (1986), even in the Soviet economy, where the government had a monopoly on economic activity and the opportunity to buy goods in the official market was limited, officials had a strong incentive to engage in rent-seeking behavior in order to gain access to the resources controlled by the state. Illegal economic activities, such as bribery, black market trade, and embezzlement, were common ways for officials to extract resources from the economy for their own benefit. A similar argument was made by e.g. Belova & Gregory (2002) and Anderson & Boettke (1997). On the other hand, Nell (2011: 597) argued that it was only Perestroika that *"infused the [Soviet] system with rent-seeking and triggered the collapse of the planned economy."*

While rent-seeking is typically seen as negative, several authors, such as Bhagwati & Srinivasan (1980) and Samuels (1992: 111), challenge the widespread assumption that rent-seeking always leads to a social loss; instead, they suggest that rent-seeking theory's exclusive focus on negative or unproductive activities might overlook the potential positive contributions that certain behaviors which can be seen as rent-seeking (e.g., patents or other legal protections to gain exclusive rights to inventions) can make to the economy. Critics argue that a more nuanced approach is needed to differentiate between harmful and beneficial forms of rent-seeking and to consider the broader economic context in which these activities occur. In some cases, they argue, rent-seeking activities might help allocate resources more efficiently.

ORIGIN The theory of rent dates back to the early nineteenth century and was developed by economists Thomas Malthus and David Ricardo, who understood rent as an excess payment above the cost of production that owners of a resource in limited supply earn. In the words of Henry George, another nineteenth-century economist, rent is a form of unearned increment or income (Lackman 1976). The concept of rent-seeking originated in economics in the 1960s and 1970s and is closely connected with the development of public choice theory, regulation theory, game theory, and neoclassical economy. The systematic research on rent-seeking dates back to the seminal article by Tullock (1967), one of the major proponents of the Virginia School of political economy. In his article, Tullock elaborated on the previous work of Harberger (1954) and his concept of the deadweight loss and the Harberger triangle; however, the authorship of the term rent-seeking is attributed to Krueger (1974), who was unaware of Tullock's article (Tollison 2004).

According to Harberger, the deadweight loss occurs when the market is not operating efficiently and resources are wasted. The Harberger triangle is associated with government intervention in a perfect market and represents the loss of welfare that occurs due to distortions such as price floors, caps, taxes, tariffs, or quotas. In his article, Tullock demonstrated that various government interventions, monopoly costs, or mere theft create a Harberger triangle representing the loss of economic welfare that occurs when resources are diverted away from productive uses. However, Tullock also pointed out that the loss from rent-seeking is much larger than the deadweight loss because resources are not only diverted away from productive uses, but they also create further costs that others must pay in the economy.

A number of authors have contributed to the development of the theory of rent-seeking, such as Buchanan (1980), Tollison (1982; 2012), Hillman (Hillman & Riley 1989; Hillman & Schnytzer 1986), Appelbaum & Katz (1986; 1987), McChesney (1997), and many others.

LITERATURE Congleton et al. (2008) edited an authoritative two-volume compendium providing an excellent overview of theoretical debates as well as applied research on rent-seeking. Another large companion edited by Congleton & Hillman (2015) contains chapters on economic modeling of rent-seeking as well as a number of applications of theoretical models in different social and cultural contexts.

CLASSIFICATIONS There is no generally accepted typology of rent-seeking; however, a number of scholars have developed several economic models of rent-seeking, such as monopoly rent-seeking (Jadlow 1985), competitive rent-seeking (Krueger 1974), or efficient rent-seeking (Tullock 1980). A major contribution to the typologization of rent-seeking was provided by McChesney (1997), who claimed that politicians involved in rent-seeking may either extract rents they created or they can politically extort rents created by private enterprises (see also: Beck et al. 1992). In political science, modeling or typologizing rent-seeking is relatively rare. One of a few examples in this regard is Bussell (2013), who suggests focusing on the distribution of rents among different types of actors (high-, mid-, and low-level politicians and bureaucrats).

MEASUREMENT Like other phenomena based on informal practices, which are hardly observable or unobservable, rent-seeking is also difficult to measure. From the economic point of view, it is the social cost of rent-seeking, which can be measured. A general overview of measuring social costs of rent-seeking is provided by Hillman (2013: 311-317) or del Rosal (2011).

METHODOLOGICAL ISSUES Most studies on rent-seeking are based on quantitative methodologies and modeling. Fewer studies follow the qualitative methodologies and aim at a narrative description of rent-seeking activities.

EXAMPLES Using a rent-seeking approach, Meissner (2011) analyzed the political system in Azerbaijan. Instead of measuring social costs, he demonstrates how the ruling elite embezzles public funds from the oil industry and other economic sectors.

IMPACT ON POLICY Rent-seeking has a significant impact on policy outcomes, potentially leading to inefficient and inequitable policies that benefit specific groups at the expense of the broader public. For example, when businesses lobby for tax breaks, subsidies, or other preferential treatment, they may divert resources from productive activities to lobbying activities. Rent-seeking by a particular industry can result in policies that protect that industry from competition, ultimately leading to higher prices and reduced innovation, inefficient allocation of resources and can ultimately harm economic growth and undermine support for democratic political regimes. In dictatorships, due to less transparency and accountability, rent-seeking activities can go unchecked, leading to even greater distortions in policy outcomes; it can lead to policies that benefit those in power or their cronies at the expense of the broader public. On the other hand, rent-seeking can also be used by those in power in order to compensate certain groups that are not part of the ruling elite. Case studies on the impact of rent-seeking on individual policies are provided, e.g., by Tan (2008) or Kwon (2015).

NEW FRONTIERS While a large portion of the rent-seeking literature focuses on the role of institutions (both formal and informal) in rent-seeking activities, significantly less is known about how culture affects rent-seeking. A pioneering study in this regard is Choi & Storr (2019: 104), who explore *"how culture affects the nature and level of rent seeking that a society pursues, and whether institutional shifts can strengthen or break down a culture of rent seeking."*

Box 3.10 Perestroika & Glasnost

Le mieux est l'ennemi du bien
Das Bessere ist des Guten Feind
Lepsze jest wrogiem dobrego
– French, German and Polish version of *'Leave well (enough) alone'*

After the death of Leonid I. Brezhnev in 1982, the elite of the Communist Party of the Soviet Union (CPSU) was faced with large contradictions and economic stagnation (the so-called 'Эпóха застóя' – *Epókha zastóya* or 'epoch of standstill'). Ideological splits within the Party leadership began to emerge. The Politburo (Box 8.4), after Brezhnev, was still dominated by older men, exemplified by the elections of Yuri Andropov and Konstantin Chernenko to head the USSR (cf. Gerontocracy in Box 1.12). In spite of changes in leadership, the Soviet economy was not able to recover from the economic malaise of the 1970s.

Mikhail S. Gorbachev was elected as secretary-general of the CPSU in 1985 (its *de facto* leader) and later (also) as the head of the USRR in 1988 (chairman of the *Presidium of the Supreme Soviet* – a formal position, with the presidium acting as the collective head of state under both the 1936 and 1977 Soviet constitutions). He focused his political program on liberalization and democratization reforms. Gorbachev launched four related reforms: *Uskorenie* (ускорение) – acceleration of reforms; the *Perestroika* (перестройка) – political and economic reforms, aimed at liberalization and commercialization of the economy; *Glasnost* (гласность – 'openness' or 'transparency') and *Demokratizatsiya* (демократизация), the intra-party democratization of the communist party electoral system with multiple candidates but without abolishing the monopoly of the party rule.

Perestroika was based on several important economic and political reforms. In 1987, the *Law on State Enterprises* was adopted, and it allowed enterprises to determine the output levels based on demand and the production of other enterprises. According to a decree from 1986, collective farms were now free to set the prices for their above-quota products higher than official prices. The *Law on Cooperatives*, implemented in 1988, for the first time, after the abolishment of the *New Economic Policy* (launched by Lenin from 1921 to 1928 as a temporary measure after the wars) that private ownership was allowed again for businesses in services, manufacturing and trade sectors (Dasai 1989: 32-43).

Glasnost, the second crucial new direction launched by Gorbachev in the mid-1980s, encompassed a set of policy changes aimed at liberalizing the political system, and more media freedom was granted. Its primary aim was to increase transparency in government and society, reduce **censorship**, and encourage public discussion of political, social, and economic issues. Gorbachev wanted more involvement of citizens in political affairs and also political liberalization fostering a freer flow of information.

The success and legacy of these reforms are still debated today. Gorbachev's reforms seriously undermined the existing *nomenklatura* (Box 1.11) recruiting system – Gorbachev wanted to change the bureaucratic obstacles and general ways of operating the clogged state machinery while also attempting to replace the ruling party elite (Hill & Löwenhardt 1991). Dimitrov claimed that Gorbachev's reforms, specifically Glasnost and Perestroika, have actually *"revealed to the general public that communism was moribund both as an economic system and as a political system"* (Dimitrov 2013: 25-26). Accordingly, this has led to an ideological delegitimization of the entire communist political-economic institutional arrangement.

Holmes (2013) claimed that the lasting influence of Perestroika was manifested in the economic boom in

the early 2000s and the rise of the domestic bourgeoisie in Russia, citing Barrington Moore, that if democracy was intended in Russia, then market reforms had to be implemented. Moreover, she also claims that Gorbachev's moves to introduce Perestroika were not the crucial ones that contributed to the disintegration of the USSR.

Contrary to these positions, Archie Brown (2022) argued that there had been a clear intention in Gorbachev's reforms. He claimed that the *"dismantling of the Soviet system was not an unintended consequence of Gorbachev's perestroika, as is too often assumed. It had become, rather, a conscious goal for Gorbachev, as his conception of what needed to be changed became more far-reaching"* (Brown 2022: 133). Although these claims have been rather rare among scholars, a shared view has been expressed by Di Palma that the reforms, which were initially aimed to save communism, actually *"triggered or perhaps accelerated a vast array of mechanisms that led to the end of a certain form of communism"* (Di Palma 2019: 2).

Mikhail Gorbachev's reforms were polarizing, celebrated abroad but criticized in Russia. Domestically, Glasnost exposed **systemic corruption** and historical abuses, shattering trust in Soviet institutions, while Perestroika caused economic chaos, shortages, and plummeting living standards. Many Russians blamed Gorbachev for the USSR's collapse and the hardships of the 1990s, viewing him as a leader who weakened Soviet power without securing stability. Among elites, his reforms faced resistance from conservatives, fearing loss of power and criticism from reformists for being too cautious.

Internationally, 'Gorby' was praised as a visionary who ended the Cold War peacefully, reduced nuclear tensions, and allowed Eastern Europe to democratize. Western leaders admired his embrace of democratic values and economic liberalization. However, in former Soviet republics, opinions were mixed; some saw him as a liberator, others as responsible for post-Soviet chaos. His legacy reflects success as a global statesman but failure as a domestic reformer.

A specific feature of the legacy of the political and economic reforms in the USSR has been their influence on the trajectory of the CCP and its political-economic system. In understanding today's developments, a comparison between China and the Soviet Union appears. Namely, China introduced market reforms (a form of Perestroika) even before the Soviet Union but has kept the monopoly power of the CCP intact and never introduced any sort of reform resembling Glasnost. China, after 1989 and the Tiananmen Square massacre, tightened its political control, as it did again after 2012 (Halper 2010; McGregor 2012, Kołodko 2021). Rupprecht has argued that the ideas of Gorbachev and Deng Xiaoping were similar in following the trends of 'market socialism.' However, the structural conditions were very different – in the USSR, they led to economic collapse, while in China, they led to an economic boom (Rupprecht 2023).

Repression

The guerrilla is the fish.
The people are the sea.
If you cannot catch the fish,
you have to drain the sea.
– Guatemalan President General J.E. Rios Montt

You killed my ma, you killed my pa, I'll still vote for you!
– Unofficial electoral slogan for Liberian warlord and president Charles Taylor, 1997

Repression is difficult the theorize and compare across regime types. While there is a wide consensus that democracies are less repressive – their respect for political, economic and civil liberties is one defining aspect – dictatorships exhibit much variation across regime types, as well as through time. The comparative endeavor becomes even more complicated as scholars apply different definitions of repression, and its manifestation is also greatly contextual (cf. Box 5.8 – regimes & repertoires).

DEFINITION As mentioned, the relation between regime type and repression is not linear, nor is the concept of repression unambiguous. N. Rost (2011) captures the complex overlap between 'democraticness' and 'non-repressiveness' aptly: *"While repression is usually reduced as the level of democracy increases, democracy and non-repressiveness are conceptually and empirically distinct phenomena. Civil liberties and political rights may be suppressed without widespread violations of the most basic human rights. (…) the level of repression varies greatly in the most authoritarian regimes. The level of personal integrity rights violations ranges from absent and almost absent to widespread in the least democratic countries. Democracy – political rights and civil liberties – is often more a matter of political institutions, whereas repression is more a matter of government strategy and the behavior of its armed forces."* (Rost: 2011: 421-422).

If repression is reduced to its narrow definition, its scope is limited to personal integrity violations: extrajudicial killings, torture or similar physical abuse, disappearances, and political imprisonment (Wood & Gibney 2010: 369). This narrow definition is often synonymous with 'state terror.' Others like C. Tilly have defined repression more broadly as "*actions that increase the costs of protest*" (Tilly 1978), therefore including restrictions on civil liberties, or even surveillance/spying, and anti-riot policing.

Jennifer Earl (2003; 2011: 262) was one of the first to notice that most definitions either explicitly or implicitly focus on state action. She is one of the few scholars who argue that repression should not be limited to state action but should include private actors as well. Earl (2011: 263) then proposes to rephrase Tilly's definition of repression as: *"state or private action meant to prevent, control, or constrain non-institutional, collective action (e.g, protest), including its initiation."* Earl's broad, consensual approach allows for many nuances in the study of repression: elements such as 'fear among protesters from invigilation' or 'intimidation by counter-manifestations.' Davenport (2007b) distinguishes between 'restrictions' that curtail coordination among protesters and 'violence' (physical integrity rights violations) that reduce the willingness of protesters (through fear and intimidation).

SEE ALSO Within the frame of repression, its targets are usually the opposition and the population as a whole. Technically, repression that targets regime actors would fall under **coup-proofing** and **purges**. Alternatively, any action that divides the opposition by offering some fractions among them access to state rents in exchange for regime loyalty or breaking ranks with their peers is called **co-optation**, and technically, this falls under non-coercive repression (see below). A specific subtype of psychological repression would be **propaganda** and the **personality cult**. While these overlap, the onslaught of propaganda and the relentless demand of loyalty rituals, either to a ruling ideology or to the leader personally, create a situation where everybody either believes or pretends, making it very hard to trust fellow citizens for fear of denouncement. (Guriev & Treisman 2022)

CLASSIFICATIONS Typologies of repression have been as varied as their definitions: from a mere continuum of 'repressiveness' that orders various actions of political violence along their intensiveness, according to their basic goals (deterrence, incapacitation, and surveillance), etc. (Oliver 2008).

Bove et al. distinguish between 'vertical' repression (i.e., against citizens) and 'horizontal' repression (i.e. against elites). Their model identifies the underlying forces explaining the optimal mix between citizens' coercion, purges of elites, and public goods. *"On the one hand, the elites ought to be compensated by the dictator, thus making it costly to maintain a large body of inner supporters. On the other hand, elites are useful to the ruler since they increase the grip of the ruler on the population and therefore enhance his coercive ability. The dictator is thus facing a trade-off between purging the elites and thereby reducing their co-optation costs by having a smaller group of supporters on the one hand, and enhancing his coercive capacity on the population by reducing people's collective action capacity, on the other hand."* (Bove et al. 2017).

M.M. Ferree (2005: 141) rephrases types of repression in gendered terms. Ferree refers to 'hard' (male-gendered) government repression and 'soft' repression, encompassing different non-violent levels of civil society repression like micro-level silencing, meso-level stigma, and macro-level ridicule. However, putting all government repression in one basket of 'hard' repression does not help comparative research (Tanneberg 2020: 22).

Table 3.2 – J. Earl's Typology of Repression

Repressive Actor	**Coercion**		**Channeling**	
	Observable	**Unobserved**	**Observable**	**Unobserved**
Regime actors	Extrajudicial killings, arrests, imprisonment, torture, show trials, public executions, etc.	Surveillance, disappearances, blackmail, 'accidents,' harassment, etc.	Civil and political rights restrictions, censorship laws, propaganda, personality cults, etc.	Co-optation (bribing, patronage), special NGO regulations or taxation, anti-corruption laws, etc.
Paramilitary organization, militia or youth movement	Roadblocks, mass violence, ethnic cleansing, social banditry, strike-breaking, intimidation, etc.	Voter intimidation, harassment, etc.	Indoctrination	Club benefits, permission to plunder, etc.
Privileged (ethnic) group(s)	Counter-demonstrations, intercommunal violence, lynching, etc.	Discrimination of other groups, informants, denunciations, etc.	–	–

Sources: Earl 2003; 2011; Van den Bosch 2021.

J. Earl's (2003) typology classifies repression according to the nature of the repressive actor, whether the action is 'coercive' or 'channeling' and whether the repression is 'observable' or 'covert.' Coercive means are linked with violations of physical integrity, while channeling techniques are more structural methods to prevent contestation or to force it into a framework of interactions that can be more easily monitored or controlled. Observable methods are meant to be seen in order to dissuade others from organizing protests; unobserved methods are the opposite, meaning repressive actors will make an effort to keep them under cover.

Table 3.2 gives an overview of the most common agents and their respective repressive toolkits. The list of methods is far from exhaustive but serves to illustrate the complexity of this research object.

EXAMPLES Table 3.2 shows that regime actors have the most repression tools at their disposal due to their higher level of organization, instrumentalization of state organs and bureaucracy, control over military and police structures, as well as through their access to state funds. At the observable, coercive end, there is a long list of physical integrity violations of individuals and groups that are deemed a threat or a nuisance to the powerholders. With unobserved coercion, different state actors engage in surveillance (Box 3.11) and careful elimination, leaving doubts about the fate of the deceased or disappeared. Under this frame, we also find low-level harassment (named *Zersetsung* (corrosion) by the East German *Stasi*) that was aimed to grind down or distract dissidents from making them cease their political activities (Guriev & Treisman 2022). Such harassment included actions such as threatening letters and phone calls, disconnecting phones, heating, water or other appliances, breaking property (targeted vandalism), rearranging or stealing possessions when targets leave the house, killing pets, spreading awful rumors in the community, frequent searches, and bogus short-term arrests and fines (e.g., for speeding, being drunk, or fraud).

As powerholders, regime actors also have the most options when making laws to circumvent political, economic and civil rights. More subtly, they can wield repressive bureaucratic frames (forced registration, additional taxation, audits, withholding permits), like forcing NGOs to register as 'foreign agents' if they accept foreign funding is an excellent way to disrupt their organization. Their access to state funds allows them to co-opt (selected) opposition groups in order to impede the formation of large, dangerous coalitions.

Semi-regime actors include **paramilitary organizations**, militias but also **youth movements** or other groupings of followers (e.g., **mercenaries**). Those with a military component can be used for **coup-proofing** to balance the regular armed forces, but all such organizations can serve to bind and indirectly enlist groups of (young) men and women (sometimes even children – cf. Box 8.5 on child soldiers) to serve and protect the regime. Wherever these groups have a strong presence, they can be instrumentalized to provide the manpower to counter manifestations and boost up surveillance, or the regime can just bluntly empower them to terrorize and intimidate the population, especially during elections. Sometimes, their indirect (unobserved) link to the power holders allows the regime to escape blame for any excesses and atrocities committed by such groups. In some cases, these groups are 'paid' with plunder rights in the territories they occupy – like in Liberia under Charles Taylor in the 1990s, who offered such incentives to motivate his child soldiers to take frontline assignments (Gerdes 2013: 68).

The last category of privileged (ethnic) groups has a looser affiliation with the ruling power, sharing affinity and descent, but most of its members are not tied directly to the ruling elites. As the home base of the regime's power, they benefit through investments and prestige, redirected from the power center to their region. Such groups (and their diasporas) can more easily be mobilized as the ruling elite networks have some roots among these communities. They can be fierce defenders of the regime when it is threatened since regime change holds no advantages for them.

KEY SIGNIFICANCE & LITERATURE The topic of repression is fully entwined with a regime's ability to uphold authoritarian control over its population. However, leadership motivations, checks on policy-making, feasibility, and expected consequences are but a few variables that make detailed comparisons over time and space near impossible. When adding the other dimensions, such as the groups that contest regimes and third parties (both domestic and international), the picture becomes very complex indeed.

Motivation Starkly contested in the literature is the question of why governments repress. Davenport (2007a/b), Vreeland (2008) and Conway (2015) explain that repression is likely when regime power is challenged – so repression may be considered a pre-emptive or reactionary practice. The second approach denotes a switch of strategies (a shift from channeling to coercive techniques, cf. Earl's typology in Table 3.2), meaning that autocracies resort to coercion when co-optation does no longer suffice (Wintrobe 2000; Desai et al. 2007).

Both approaches put forward 'regime survival' as the main explanation for repression in autocracies, the effect when regimes perceive their authority is threatened. Of course, repression has other causes: during the **personalization** phases, repression usually increases and targets regime insiders (cf. **coup-proofing**). Phases of **succession** or **elections** also influence repression patterns. Boudreau (2005) finds that depending on their capabilities, states have to find a trade-off when to repress challengers and when to use their power to extend state hegemony.

Restraint Threat perception changes over time as regime capabilities themselves change. Regimes in their takeover phase may thus act very differently from those that are consolidating and those that are established.

V. Boudreau (2005) investigates the link between the degree of violence, its relationship to central state objectives, and the size of the social challenge. He identified match-up problems between the amount of state repression *vis-à-vis* the level of threat emanating from the challenger. He proposes to distinguish between two elements of power: 'breadth' – "how broadly diffused are forces across time and space?" and 'depth' – "how extensively, or deeply does the force control society." This dichotomy of power should be applied to the regime and challenger alike. Both elements of power are treated as broad categories (Boudreau 2005: 37, 39, 41), and the threat of challengers is most pressing when there is a mismatch between the power of the two actors. Thus, weak and insular states are expected to react to threats to their rule disproportionally. Keremoğlu et al. (2022) confirm such disproportional responses but find that regimes overreact when their regime legitimacy is challenged. Yuen and Cheng (2017) study the reverse image of authoritarian tolerance (attrition) in the case of Hong Kong.

Wallace (2013) finds evidence for an urban bias as well when it comes to threat perception. Christensen (2018) confirms this but nuances that while it is true that regimes are less concerned with rural protest, they are similarly less concerned with the backlash of lethal repression, resulting in more casualties. Here is evidence that younger populations are more subjected to repression (Nordås & Davenport 2013; Shadmehr & Haschke 2016). Platteau et al. (2018) discover a bias in favor of wealthy populations. This partly accounts for the higher levels of state repression under **personalist rule** compared to collegial authoritarian regimes. The former even reacted to international **sanctions** by increasing repression (Escribà-Folch 2012). Frantz et al. (2020b) provide statistical data that higher levels of **personalization** match an increase in repression and, thus, a decrease in respect for **human rights**.

Control over one's followers also matters: For instance, Jerry Rawling's (first) takeover in Ghana in June 1979 was quite violent, executing eight senior army, air force and naval officers (including three former heads of state), but most arrests were transmuted into prison sentences once his **junta** established some control over its followers (the regular rank-and-file of the Ghanaian Army) in the months that followed. His second takeover in 1981 was initially also marred by arbitrary killings, but these stopped after mid-1983 for the same reasons.

Regime type matters as well: From an analysis of 137 countries from 1976 to 1996, C. Davenport (2007b: 500) finds that **single-party regimes** *"are consistently the least repressive form of autocracy: that is, they are less likely to restrict civil liberties and violate personal integrity. In comparison, military governments are less repressive than other forms of autocracy when civil liberties restrictions are considered, but they are more repressive than other forms of autocracy when violent activities such as torture and mass killing are considered."* This has been explained that in **military regimes,** the powerholders from the armed forces undergo lethal training, impose self-isolation with indoctrination, and have direct access to weaponry, and single parties are more able to extend patronage and co-opt other groups, respectively.

Frantz and Kendall-Taylor (2014) nuance these findings and, like Gerschewski (2013), treat repression and **co-optation** as communicating vessels (cf. three pillars of stability). They provide statistical evidence that electoral regimes, which rely more on co-optation through the use of political parties and a legislature, supplement such control measures with targeted coerced repression. With better informa-

tion, autocrats thus target the specific individuals who pose the greatest threat to their rule and reduce their use of more indiscriminate repression through societal restrictions on speech and assembly rights, which have the potential to fuel popular discontent. Tanneberg (2020) builds upon these findings and develops his own model.

Threat perception is also higher for developing countries with an electoral component. (Regan & Henderson 2002) This overlaps with the findings for **anocracies** that similarly seem to be more politically repressive due to the combination of their lower state capabilities and open political landscape. In contrast, in 'closed' regimes, the population ends up rendered cowed and quiescent due to successful intimidation by the state apparatus.

Democracies, in contrast, are not only institutionally restrained to use repression, but democratic norms also favor dialogue when faced with opposition. Democracies are also less likely to perceive domestic dissent as a threat (Davenport 1999; Carey 2006) and have a lower willingness and opportunity to engage in repressive behavior when faced with contention (Poe et al. 1999: 293).

Among regime types, Jessica Weeks' 'audience costs' (see Box 7.1) is a theoretical frame that can account for measuring the level of restraint present (or not) in autocratic decision-making. In addition, there are costs from the international arena as well such as sanctions or political isolation (cf. Box 3.12 on the 'Mogadishu Line'). International **sanctions** and resulting budget constraints also influence a dictatorship's decision to resort to repression (Wood 2008; Escribà-Folch 2012) as funds for co-optation dissipate.

Contexts To paraphrase C. Tilly (2005: 222): *"It makes little sense to treat repression as something that authorities do by themselves and mobilization as something that dissidents do by themselves."* Moreover, that is why it is key to study the interrelation of these two elements. The perceptions of protesters matter as well. For instance, perceptions of ruler vulnerability can affect the relationship between state repression and collective action. Protesters might bear greater risks if they perceive that the regime could be overthrown or when the state is perceived as militarily weak. (Goodwin 2001: 26; Ortiz 2013: 291)

The timing of repression also matters beyond regime life cycles, and cyclical elections play an important role in this: in the months before **elections,** opposition candidates and potential challengers are targeted with gusto, but at the same time, incumbents refrain from oppressing ordinary voters, which support rulers aim to solicit (Bhasin & Gandhi 2013). Also, right after autocratic leadership **transitions,** some new powerholders increase repression to establish their reputation (Licht & Allen 2018).

Few regimes operate in isolation, and when, for instance, civil conflict breaks out in a neighboring country, this geographic proximity of unrest will solicit preventive repression at home to stop emerging rebellion in its tracks (Danneman & Hencken Ritter 2014). Even natural disasters can trigger preventive repression for the same reasons (Wood & Wright 2016). Grasse et al. (2021) posit proof for 'opportunistic repression' during the COVID-19 pandemic.

Effectiveness Does repression actually work? The debate rages on. Hultquist (2013) found that collective repression is more cost-effective and easier to impose than selective repression. For the former, states simply need to finance security forces to monitor if citizens are adhering to the policies designed to increase the cost of dissent (such as limits on speech and mobility); for the latter, targeted violent repression requires sophisticated **intelligence services** (Conway 2015: 28). Therefore, wealthy states will be able to repress more selectively than poor states. (Hultquist 2013) Since most states cannot distinguish between actual insurgents, their supporters, and neutral civilians, and they must respond somehow, they rely on what they may consider to be the next best thing: collectively targeting the rebel recruitment pool. (Hultquist 2013: 7)

In any case, Escribà-Folch (2013) offers systemic evidence that repression does work. In his research, he limits repression to political terror and civil rights restrictions – so (only) as observable coercion and channeling by state actors according to Earl's classification in Table 3.2. Overt channeling of mobilization through civil rights restrictions proves to be more effective as it prevents both regular (non-violent) **ousters** and irregular and violent **exits**. Observable coercion (political terror), when applied selectively, can only reduce the likelihood of non-violent exits and coups. When violent repression is used to counter violent contestation, it leads to the escalation of protests and elite defections. It is not effective against uprisings once they have started (Escribà-Folch 2013: 556-557).

Zhukov (2023) takes the violent threshold approach to new heights and finds comparative evidence from Chechnya and other subnational conflicts that extreme, mass violence is effective in deterring rebellions but that, luckily, not all states have the stomach nor resources to apply state terror on such scale – cf. Box 3.12 on the 'Mogadishu Line.'

Nonetheless, even random violence can be effective in some cases. F. Herreros explains why dictatorships resort to such practices. He found that random political violence against citizens is less costly – instead of gathering evidence, it can be obtained by torture or falsified – and can be effective in deterring groups from mobilizing. Such arbitrary terror must be designed in such a way that it does not look random. As soon as the oppressed realize there is no advantage in *not* mobilizing (since deference will not protect them), this tactic ceases to be effective (Herreros 2006; Rozenas & Zhukov 2019).

Consequences Violence begets violence, and harsh state repression and violent contestation are locked in a positive feedback loop with a strong tendency to escalate in the short run, but not indefinitely. The most obvious barrier is the limited pool of potential protesters and the rising costs of coordination and communication once the group of protesters becomes too large (Carey 2006: 4). Every form of repression (whatever the motivation) comes at a

price, both in the form of 'audience costs' or the reaction of the population as a whole in response to state repression. Repression can have a backlash and fuel more protests (e.g., Martin 2007; Schulte & Steinert 2023), and more political violence increases coup probability (e.g., Bove & Rivera 2015) – while coups themselves increase state repression in their aftermath (Lachapelle 2020).

To summarize, repression has a long scholarly history that is difficult to navigate, but some recent works provide excellent overviews of the literature and its evolution. Dag Tanneberg (2020) explores how regimes have optimized the combination of vertical and horizontal repression (or against the population and fellow elites) in line with M. **Svolik**'s continuous measure of regimes and his distinction between 'authoritarian control' and 'authoritarian power-sharing.' Regimes aim to strike an optimal balance between restrictions and violence in order to prevent campaigns (sustained, mass collective action with maximalist demands for change) from emerging. Once anti-regime campaigns are set up, however, restrictions become inefficient to maintain authoritarian control. The resulting political instability from violence has repercussions for authoritarian power-sharing as elites question their loyalty when they witness the incumbent's dwindling capacity to reward supporters. In their work, *Spin Dictators* Guriev and Treisman (2022) focus on contemporary cases and track how the nature of repression has been refined over time since WWII, following the trend set by Singapore's Lee Kuan Yew (1923-2015). As shown in **digital authoritarianism,** the study on new and social media and their application for repression and **disinformation** are ongoing (e.g., Frantz et al. 2020a; Feldstein 2021; Earl et al. 2022).

MEASUREMENT Measuring political violence is a complex task that often requires multiple data sources and methodologies. Here are some well-known datasets commonly used for this purpose:

Uppsala Conflict Data Program (UCDP). This dataset has provided information on armed conflicts and political violence worldwide since the 1970s. It covers both state-based and non-state conflicts and includes data on conflict duration, intensity, and involved actors. UCDP also covers state repression, providing insights into governmental responses to dissent and political opposition. See: Hultquist 2015; Krause 2023; Svensson et al. 2022.

The *Armed Conflict Location and Event Data Project* (ACLED) collects data on political violence, including riots, protests, and armed conflicts, from various sources (Raleigh et al. 2010). It covers a wide range of countries and provides information on events, actors, and locations. For studies referring to repression and using ACLED data, see: Barceló et al. 2022; Lewis & Ives 2023.

The *Political Terror Scale* (PTS) measures state-sponsored political violence and repression. It assesses the extent to which governments engage in human rights abuses, including torture, extrajudicial killings, and political imprisonment. See: Wood & Gibney 2010; Wood et al. 2016.

The *Correlates of War Project* (COW) includes various datasets related to interstate and intrastate conflicts, providing information on the duration, intensity, and outcomes of conflicts, as well as data on the countries involved. See: Besley & Persson 2009.

The *Political Instability Task Force Dataset* (PITF). This is a US government-sponsored database on domestic political conflicts leading to **state failure**. This dataset includes information on various forms of political instability, including coups, civil wars, and insurgencies. See: Zhukov 2023; Anderton 2014.

The *Minorities at Risk Project* (MAR) focuses on tracking conflicts and political violence related to ethnic and religious minorities. It includes information on minority groups, their grievances, and various indicators related to violence. See: Gurr 2000; Caprioli & Trumbore 2003; Hug 2013.

The *Social Conflict in Africa Database* (SCAD) investigates the causes and outcomes of political conflict and protest events in Africa, offering data on demonstrations, riots, strikes, and other forms of political violence. Consult: Cullen & Salehyan 2017; Christensen 2018.

The *Nonviolent and Violent Campaigns and Outcomes* Data Project (NAVCO). This dataset tracks nonviolent and violent political campaigns and their outcomes, providing information on actors, tactics, and geographic locations. It is used to analyze the effectiveness of different forms of political activism in achieving goals and understanding the consequences of political campaigns. See: Chenoweth et al. 2018; Tanneberg 2020.

It must be noted that some (older) data used to measure political violence, like the *US State Department Country Reports*, used to have a tendency (during the Cold War) to bias against leftist countries (Poe et al. 2001).

METHODOLOGICAL ISSUES Most research on the protest-repression nexus can be divided into two groups: One group uses repression as an independent variable, and the other employs repression as the dependent variable (Carey 2006). However, both variables influence and reshape each other as interdependent factors. Both are structurally constrained by each side's capabilities and resources, but in the socio-political world, perception plays an important role, too, and this is subject to change as regimes evolve (cf. Box 3.14 on lame ducks).

At the same time, local traditions of contestation and their dyads (cf. Tilly's repertoires – Box 5.8) render repression incredibly contextual with significant catalyzers emanating from the international system. The exact information on inner circle decision-making processes remains opaque and may come to light only after the regimes have broken down (Barros 2011). The same is true for protest movements. For this reason, shifting the focus away from the actors to the events (which are observable) allows their study through frames related to 'political opportunity structures' (POS) and 'transformative events' (cf. Hess & Martin 2006; Tilly 2010; Shultziner 2018). Bagozzi et al. (2021) track down the diversity of repertoires among types of regimes, also finding that, globally, repertoires of state repression are growing less diverse over time.

Delineation Defining repression and protest in clear, parsimonious terms is key to applying such concepts universally across research design. Currently, too many different approaches make it hard to merge and integrate findings and re-test their validity. Many works apply 'umbrella concepts' that combine multiple dimensions and hence carry too many attributes to relate unequivocally with any outcomes of interest (Tanneberg 2020: 18).

Quantitive bias There is definitely a bias toward coercive human rights violations because these are easier to measure and quantify than, say, voter intimidation. For this reason, statistical analysis is often a preferred method to test new hypotheses or find new general trends, but seldom is there a follow-up with qualitative works to evaluate such findings. The same goes for protests, with much more research going into violent contestation, while nonviolent forms (civil resistance) are barely integrated into the mainstream literature. (There are exceptions: Hess & Martin, 2006; Martin 2007; Kurtz & Smithey 2018; Chenoweth et al. 2017).

Causality bias For this reason, the inverted-U hypothesis – or the non-linear relationship between the level of democracy and repression, is still contested. While some studies find that both highly democratic and closed autocratic regimes tend to face less violent contestation and thus resort less to (coercive) repression, the weaker, more open regimes in the middle tend to face most (violent) protests and respond to them violently. On one side, in democracies, people still engage in protests regularly, and riots and other violent contentious actions are part of the repertoire used to confront legitimate authorities (Meyer & Tarrow 1998; Ortiz 2013: 291; Nam 2006). On the other side, autocratic states and closed regimes also have varied effects on the incidence of contentious actions. In the literature on **revolutions**, for example, scholars suggest that a regime's military infrastructure and the protester's threat perception matter (Ortiz 2013: 291).

Categorization Seldom do scholars use **categorical measures** to account for the differences in regime type, and too often, they rely on continuous measures, which sometimes incorporate 'the absence of political violence' as one of the indicators of their scales of 'democraticness.' Those who do apply categorical distinctions find robust evidence for such a differentiated approach, for example, Davenport (2007) and Escribà-Folch (2012; 2013), but most Large-N research relies on **continuous measures**.

Actor bias Not all theories of threat perception should be taken at face value: Government agencies within regimes also try to perpetuate their existence. When special security forces are put into place to protect the national executive and to control dissident groups, they usually try to maintain their status and are, therefore difficult to dissolve (cf. Davenport 1995). For example, once Mobutu Sese Seko of Zaire (DRC) had installed his *Garde Civile* in 1984, the members of this civil guard (militarized police) did not want to lose their position and continued to repress dissidents to preserve their interests (Carey 2006: 3). Mehrl and Choulis (2023) confirm that secret police are more (physically) violent when they establish their reputation and when they are in competition with other security services – thus tying these behaviors to the **coup-proofing** literature. Semi- or non-regime actors and their role in overall repressive strategies are also under-explored in favor of state actors. Eck (2015) investigates why regimes outsource repression to non-state militias (to mitigate the disruption caused by purges of the military).

IMPACT ON POLICY The prohibition of torture in international law is especially crucial for authoritarian regimes, where human rights violations, including torture, are prevalent tools of suppression. The *United Nations Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment*, in force since June 1987 (Danelius & Burges 1988; Wendleland 2020) and its *Optional Protocol*, effective since June 2006 (Nowak et al. 2019) along with the *Rome Statute* of the International Criminal Court, operational since July 2002, (Arsanjani 1999; Cassese et al. 2002) are fundamental in addressing abuses committed by autocracies. Despite the legal framework, challenges persist due to the secretive nature of torture in these regimes. The Geneva Conventions provide essential safeguards in armed conflicts and the protection of war victims (Pictet 2012). The *UN Special Rapporteur on Torture* plays a key role in documenting, investigating, and addressing cases of torture globally (Méndez & Nicolescu 2020). However, the struggle against torture in authoritarian contexts remains ongoing, as these regimes frequently resist international scrutiny and accountability mechanisms.

The literature on international law is very rich, so it is worth pointing out research that concerns specifically dictators. J.R. Vreeland (2008) explores why dictatorships that engage in torture are more inclined to ratify the *UN Convention Against Torture* compared to those that do not, positing that this phenomenon is linked to the rationale behind torture and the power dynamics inherent in various political systems. C.R. Conrad and E.H. Ritter (2013) discuss the effectiveness of courts when they are free from manipulation and when domestic actors are willing and able to punish noncompliance, even in states that do not implement treaty terms into domestic law. International human rights treaties can increase the probability of leaders experiencing litigation, which changes citizens' expectations of leaders' behavior regarding repression. Domestic actors adjust their conflict behavior based on these expectations. J.R. Hollyer and B.P. Rosendorff (2011) modeled authoritarian governments' decision to sign the *UN Convention Against Torture* and showed that signatory regimes survive longer in office than non-signatories and enjoy less domestic opposition.

Autocracies frequently disregard international laws prohibiting torture, whether they are signatories to such agreements or not. Highly repressive regimes that engage in repression and torture may encounter international isolation manifested in several ways, including diplomatic actions such as

the revocation of ambassadors, the imposition of economic **sanctions** aimed at ruining the regime's financial resources, or a lack of support within international organizations. Other countries or international organizations stigmatize torture as a form of repression for various reasons. This approach is commonly referred to as naming and shaming. Naming involves a public act of identifying evidence of human rights violations, usually by a government or other entity, while shaming pertains to the strategic intention behind naming, which is the hope that by publicly identifying these violations, the target (an authoritarian regime or rebel group for example) will be persuaded to stop engaging in these widely condemned actions (Franklin 2015).

C.S. Hendrix and W.H. Wind argue that the impact of naming and shaming on respect for human rights varies depending on the regime type. In authoritarian countries, naming and shaming are associated with improved human rights outcomes, while in democracies and hybrid regimes, the practice either has no effect or worsens human rights outcomes. Analyzing the UN shaming of specific human rights violations, J.H. DeMeritt and C.R. Conrad (2019) posit that such a strategy may not lead to a reduction in government repression. Instead, the authors propose the concept of 'repression substitution,' wherein governments alter their human rights violations, either by shifting focus to other areas or targeting different groups, as a means of evading international scrutiny. However, the case of Latin American countries between 1981 and 1995 shows that human rights criticism can lead to a reduction in repression of subsequent challenges if there are strong economic ties to other countries (Franklin 2008).

On the level of policy, states also oppose repression in the form of **sanctions**. They may impose economic sanctions, travel bans, or arms embargoes against regimes known for engaging in torture and human rights abuses. These sanctions serve to pressure authoritarian governments to change their behavior and respect human rights standards.

Economic sanctions might have unintended consequences on political repression, reducing the level of political freedoms in sanctioned countries, enhancing the regime's coercive capacity, and creating incentives for political repression by the regime's leadership (Peksen & Drury 2009). According to M. Wood (2008), the imposition of economic sanctions contributes to increased state-sponsored repression, as incumbents increase repression to prevent the defection of core supporters and stifle dissent in the face of declining economic conditions or growing opposition support. Multilateral UN sanctions contribute to greater increases in repression compared to unilateral sanctions from states like the US. UN-backed weapons embargoes do not appear to be systematically related to changes in repression. The success of sanctions depends on various factors, such as the target country's level of economic interdependence, regime type, and domestic political dynamics (Perksen 2019).

REGIONAL VARIATION The repression literature is too large to summarize or recap, but below are some specific strands or trends per world region that have caught the eye of the authors.

MENA Specific attention has been given to repression patterns in the wake of the **Arab Spring** (Davenport & Moore 2012; Brownlee et al. 2015; Josua & Edel 2021), especially in the contexts of **authoritarian collaboration** (cf. Colombo 2016) and **authoritarian learning**. There are several studies devoted to promising cases (for lasting reform) that soon after 2011 reverted to full autocracy (El-Haddad 2020), like Morocco (Lawrence 2013) and Egypt (Sika 2019; 2023), as well as their legitimation strategies (Edel & Josua 2018). Tunisia and the Jasmine Revolution, the center of the uprisings, remains an interesting case (Louden 2015; Allusson 2018; Kuznetsov 2022). The topic of autocratic resilience, especially for monarchies, is also addressed: Bank et al. 2014; Berti & Guzansky 2015; Bischof & Fink 2015; Lawson & Legrenzi 2017; Korotayev & Khokhlova 2022).

Latin America The South American military regimes and their legacy likewise enjoy a long scholarly tradition. First of all, a careful reading reveals that older works also highlight these states' **authoritarian collaboration** (Pion-Berlin 1983; King 1998) before this topic became mainstream after 2010. Case studies bring up surprising insights: Esberg (2018) finds that the Pinochet regime in Chile (1973-1990) persecuted victims in high-support areas after experiencing a drop in popular support, meaning they used repression to legitimate their fabricated communist threat and muster support.

Sub Saharan Africa Hendrix and Salehyan (2017) nuance the threat perception of African military regimes and their sensitivity toward ethnic factionalism (see also: Beiser-McGrath 2019). Rudbeck et al. (2016) find that the use of paramilitary groups, death squads, vigilantes, gangs, and other irregular, non-state actors to suppress popular opposition is meant to reduce the transaction costs (ranging from international economic **sanctions** to strikes and boycotts).

NEW FRONTIERS Nudged by the similarity in repressive actions during the **Arab Spring,** Roman-Gabriel Olar (2019) is one of the first to combine the aspect of **authoritarian learning** and **authoritarian collaboration** to the comparative study of (coercive) state repression in the context of *Operation Condor*, in particular regarding the intense collaboration in dissident disappearances between the military regimes of Latin America (cf. Box 3.13 on terror). Olar (2019) aims to capture the transnational dimensions of state repression and authoritarian interdependence and finds that authoritarian regimes emulate and learn from regimes with whom they share similar institutions, but (surprisingly) regimes with similar dissent experience do not emulate and learn from each other. *Operation Condor* also included transnational **assassination** (McSherry 2010), a field that is also gaining more traction (see below).

Shen-Bayh (2018) finds evidence that when regimes persecute regime insiders, they tend to adhere more to judicial methods (using courts) than extrajudicial means. By manipulating **judiciaries** for this purpose,

the logic behind this is to signal (to other elites) that their repression is legitimate. A judicial strategy legitimizes punishment, deters future rivals, and generates shared beliefs regarding incumbent strength and challenger weakness – see also **patronalism**.

E. Schleutker (2021) explores the coercive-channeling relations between autocracies and religious groups, clustering cases that (a) restrict such groups' organization but at the same time support and endorse religion (**co-optation**) in order to gain legitimacy; (b) those that just restrict without co-optation, and a residual category (c) that neither restricts nor supports. Henne and Klocek (2019) show how past religious conflict is a salient context for repression patterns.

A fascinating new avenue is transnational repression. Dukalskis et al. (2023) constructed the *Authoritarian Actions Abroad Database*, tracking transnational repression between 1991 and 2019, in order to statistically probe the drivers of autocracies that repress populations beyond their state borders. Tsourapas (2021) expands a similar theoretical framework by including legitimation and co-optation (cf. Gerschewski 2013). Michaelsen and Ruijgrok (2023) take a stab at controlling for regime type (and dyads with host countries) regarding this type of transnational repression. Moss et al. (2022) expose how regimes 'go after the family' to punish dissidents abroad. Al-Jizawi et al. (2020) explore digital transnational repression.

Term Limits & Extensions

The longer the visit, the less welcome the guest.
– English proverb

Know when to hold 'em, know when to fold 'em, know when to walk away, and know when to run.
– Kenny Rogers, *The Gambler* (1978)

Term limits are a major restraint on executive control in dictatorships. In party-based regimes, they can help enforce collegial rule within the inner circle, formally supporting rotation systems, but for personalist dictators, they are a real hurdle as active limits 'constitutionally' forbid a ruler from remaining in office for life. When dictators come closer to the end of their term limits, fellow elites can come to see them as 'lame ducks' (cf. Box 3.14) because they no longer believe that the ruler's position can be guaranteed in the near future, and thus they will lose their control over **patronage** or **repression** apparatuses.

DEFINITION Term limit extension constitutes removing limits or extending the terms of leadership. Term limits are in place for various positions of power, but here we look at how term limits and their removal or extension are used to prolong the rule of the executive. Most dictatorships use presidential systems. Grauvogel and Heyl (2021) find that term limits should also be understood within authoritarian regimes where they might not necessarily undermine authoritarian rule but could be adapted to it.

Term limits have been most often used in **single-party regimes**. Most single-party dictatorships have term limits in place and are better institutionalized when this is the case. China under Mao Zedong (reign: 1949-1976) did not have term limits, and his rule was personalist, leading to poor decision-making. When Deng Xiaoping (reign: 1978-1989) took over, he implemented term limits for all government positions and ensured that the president could only serve two five-year terms, along with an upper age limit of 70 years for party leadership posts (Dittmer 2003). This was eliminated under Xi Jinping (reign: 2012–present), and there are concerns that Xi is fostering a similar **personality cult** to Mao.

Mexico avoided having an all-powerful dictator after it institutionalized the turnover of the power of the president in 1928. As stipulated by the constitution, both the president and senators can only serve on a non-renewable six-year term of office, while deputies are elected for a single three-year term (Guliyev 2009). The six-year presidential term, better known as the *sexenio*, enabled the *Institutional Revolutionary Party* (PRI) to rule for over seventy years. Regular rules for **succession** meant that rivals within the PRI could wait their turn, disincentivizing the need for a **coup** or **assassination** (Flores-Macías 2013). Regular elections were held that gave the opposition an incentive to keep playing by the rules of the game, even though the odds were heavily tilted in favor of the PRI.

Personalist regimes rarely have a constitution that they are willing to adhere to and rarely have rules of **succession** in place. As a result, the regime seldom outlasts the death or exit of the leader. In rare cases where the regime survives, this is due to hereditary succession of some kind being used, such as in the infamous case of North Korea with the Kim dynasty or with Gabon and its power transfers from Omar Bongo to his son Ben in 2009.

Most **military regimes** did not have rules about term limits, partially because they do not tend to be in power for very long and also because true power lies in the hands of the **junta**. Some military regimes do have institutionalized formulas for turnover in power, which helped explain the longevity of the military regime in Brazil which ruled from 1964 to 1985. The first military ruler, Humberto de Alencar Castelo Branco (reign: 1964-1967), set a pattern of stepping down and ensuring succession through officer consensus (Skidmore 1990). In most cases, the military either steps down from power (even announcing that their rule will be temporary), possibly leading to **elections**, or the military leader in charge manages to personalize power, resulting in **personalist rule** such as was the case of Pinochet in Chile and Sani Abacha of Nigeria (1993-1998).

SEE ALSO Term limits feature in the wider study of **authoritarian constitutionalism** and constitutional design (Ginsburg 2012). They hamper **personalization** and can render dictators 'lame ducks' (Box 3.14) when they are unable to get rid of them and are forced to appoint a real successor or a 'puppet' because they cannot stand in the upcoming **elections**.

EXAMPLES Examples abound of leaders getting rid of term limits. In Belarus, a referendum in 2004 removed term limits on President Alexander Lukashenko. In Rwanda, Paul Kagame ostensibly rules by decree, and a 2015 referendum was passed to keep him in power until 2034.

In contrast, both in the Philippines (Querubin 2012) and Kazakhstan, the legislature once voted to lift term limits, and in both cases, term limits were reinstated again; in the former, after Marcos' ouster; in the latter after the first president Nursultan Nazarbayev left office (Radio Free Europe 2022). The executive position in both countries is now bound by a single term (six and seven years, respectively), which is to prevent the concentration of power and ensure regular leadership transitions.

In Venezuela, Hugo Chávez won approval in the February 2009 referendum for a constitutional amendment that enabled him to run for the presidency when his term ended in 2012 (Corrales 2016). Uzbekistan held two referenda in 1995 and 2002 that extended President Islam Karimov's term.

Some leaders have been powerful enough to

Box 3.11 Informants, Snitches & Whistleblowers

Snitches end up in ditches
– American saying

Pavel Trofimovich Morozov (Павел Трофимович Морозов), known as 'Pavlik,' was a Soviet youth, born in 1918 in Gerasimovka, Russia. He became a symbol of communist loyalty after allegedly denouncing his father to Soviet authorities at age 13. His father, Trofim, was accused of forging documents and aiding Kulaks, the wealthier peasants resisting collectivization. As a result, Trofim was arrested and later disappeared in a labor camp. Pavlik's denunciation led to his murder by family members in 1932. The Soviet regime glorified Pavlik as a martyr and hero, using his story to promote loyalty to the state over family ties. Monuments were erected, and his tale was taught to generations of Soviet children as an example of ideal communist behavior. His story became a powerful propaganda tool, encouraging children to inform on their families if they opposed Soviet policies. However, after the USSR's dissolution, evidence suggested that much of Pavlik's story was fabricated. Still, he remains a controversial figure, representing the complex interplay between **propaganda**, **indoctrination**, and truth in authoritarian regimes. (Druzhnikov 2017)

Fitzpatrick and Gellately (1996) define 'denunciations' as *"spontaneous [often written and privately delivered] communications from individual citizens to the state (or to another authority such as the church) containing accusations of wrongdoing by other citizens or officials and implicitly or explicitly calling for punishment."* The related (but not synonymous) concept of 'informers' implies a regular (often paid) relationship with state authorities. Informers can be motivated by various incentives, including financial rewards or reduced penalties for their misconduct. Often, they are offered protection by authorities. 'Snitch' is a derogatory term for the latter, labeled from the perspective of those informed on (aggrieved by the betrayal or disloyalty) and foremost used in criminal contexts, not political ones.

In contrast, a 'whistleblower' is usually an insider, such as an employee or contractor, who exposes illegal or unethical activities within an organization with the aim of protecting the public interest or upholding ethical standards. Whistleblowers often act out of a sense of duty or moral obligation rather than personal gain. Mostly seen in a positive light, they are sometimes even protected by laws (in democracies) that shield them from retaliation by their employers and sometimes receive rewards if their information leads to significant legal action.

Informants are pivotal in maintaining control and suppressing dissent, and studying such networks provides significant insights into authoritarian governance. Such networks are carefully set up to tackle the famous 'dictator's dilemma' – the uncertainty about the level of popular support a ruler has.

The primary role of informers is to support surveillance and control: They monitor citizens and report on dissenting activities, fostering a climate of fear that discourages collective action against the regime. Informants are also crucial for information gathering, providing intelligence on potential threats such as political dissidents and opposition groups, which allows regimes to take preemptive actions to neutralize these threats. Comparing China and Soviet-era Bulgaria (with Cuba, East Germany, and the USSR), Dimitrov (2023) shows in remarkable detail how leftist **single-party regimes** obsessively collected information on dissenters, not just to target them but to preempt protest by targeting economic largesse to affected regions. Additionally, when working with **intelligence services,** informants can influence and manipulate opposition groups by infiltration, spreading misinformation or provoking internal conflicts, thereby weakening the opposition's organizational capabilities.

The use of informants has several consequences. It lowers the costs of information gathering for **repression,** and it leads to the erosion of trust within society, as citizens are encouraged to spy on one another, creating an environment of suspicion and paranoia that undermines social cohesion and the effective functioning of civil society. Fitzpatrick (2010) portrays this reality under Stalin: Bergerson (2004) in Nazi Germany; Bosworth (2005) in Mussolini's Italy; and Simpson (2020; 2021) for Salazar's regime in Portugal and the infiltration networks of the *Polícia Internacional e de Defesa do Estado* (PIDE). Lüdtke's (2016) edited volume also contains precious case studies.

Bergemann (2017) compares the early years of the Spanish Inquisition (1486-1502) and Romanov Russia (1613-1649) to distinguish two models of interaction: top-down coercion and bottom-up volunteers. These orientations of potential denouncers have significant implications. In the coercion model, individuals often attribute citizen participation to state incentives, directing anger toward authorities. Denouncers may resent coercive tactics. In contrast, the volunteer model lacks authority-based incentives, leading individuals to see denouncing as a personal choice, potentially harming others or showing regime support. Denouncers might appreciate authorities for resolving private disputes. Here, blame or dissatisfaction with social control is shifted from authorities to the local community.

The reliance on informants routinely results in human rights violations, including arbitrary detention, torture, and extrajudicial killings. As a motivation, ideology does not play such a large role: The most common argument for why people denounce repressive regimes is self-interest (Bergemann 2017). Informants may provide false information due to coercion or personal vendettas, leading to unjust persecution. The higher the animosity and divisions between societal groups, the more effective the denunciations.

Furthermore, the deployment of informants can undermine the regime's **legitimacy** both domestically and internationally. It underscores the regime's dependence on coercion rather than popular support, which can fuel further dissent and attract international condemnation. Post-transition, infiltrated and divided societies

need to rebuild trust. Lustration laws (Box 3.7) and truth commissions (Box 5.7) can be instrumental to this purpose.

Studying informants in authoritarian regimes enhances our understanding of how these systems maintain power and control. Researchers employ various methods, such as covert research, ethnographic studies, and survey methods, to explore the dynamics of informant networks and their impact on society. These studies reveal the mechanisms of control used by authoritarian governments and contribute to the broader field of comparative authoritarianism by highlighting the complexities of regime stability and citizen behavior (and agency) under repressive conditions.

Box 3.12 The Mogadishu Line: Fatal Loss of Domestic & International Legitimacy

Never open a door that you cannot lock again.
– Persian proverb

This concept has traveled from peacekeeping to dictatorship studies: it originally emerged from the international intervention in the Somali Civil War during the early 1990s. It refers to the critical juncture where a foreign involvement transitions from peacekeeping or diplomatic efforts to active combat operations, often with the aim of regime change. This term gained prominence following the Battle of Mogadishu on 3-4 October 1993, when humanitarian missions by international forces evolved into complex military engagements due to escalating violence and internal clan conflicts. The United Nations initially deployed troops under UNOSOM *(United Nations Operation in Somalia)* to facilitate humanitarian aid, but as the situation deteriorated, a larger US-led force (*Unified Task Force* – UNITAF) was introduced. Despite these efforts, progress was impeded by ongoing local power struggles between rebel groups. Consequently, the Mogadishu Line has become a metaphor in International Relations (IR), symbolizing the reluctance of foreign powers to escalate their involvement due to fears of becoming embroiled in protracted conflicts without clear political outcomes.

In IR theory, the Mogadishu Line represents a cautionary tale influencing foreign policy decisions. For example, its aftermath contributed to hesitancy in US interventions during crises like the Rwandan genocide and conflicts in the Balkans in the 1990s. Scholars such as S. Larcom et al. (2014) have extended this concept metaphorically to denote a tipping point beyond which a **revolution** mobilizes against a dictator. This adaptation highlights a threshold moment when regimes can no longer suppress armed challengers, leading to critical security and capacity gaps.

In the study of dictatorships, the Mogadishu Line encompasses a tipping point resulting from extreme repression by dictators, leading to an absolute loss of domestic and international **legitimacy**. Once crossed, dictators face full rebellion domestically and cannot be rehabilitated by the international community. Three scenarios emerge: dictators might turn the tide with sufficient foreign (**black knight**) support; they may negotiate a **transition** or just flee into exile before reaching this point; or they continue fighting until one side is defeated (Van den Bosch 2021: 233, 247).

M. Siad Barre's regime in Somalia collapsed after he crossed his own Mogadishu Line. In the fallout of his failed Ogaden campaign (his foreign **invasion** of Ethiopia from July 1977 to March 1978), Barre resorted to extreme repression and purges in order to stay in control. Resistance was met with punishment expeditions

to clan homeland and 'clan cleansing' – pure state terror with indiscriminate violence against civilians of resisting clans. Somalia spiraled into endless violence and became a failed state. Eventually, Barre fled into exile into Nairobi, marking a complete loss of both domestic power and international legitimacy, as protests in Kenya forced him to move onward to Nigeria, where he died in 1995.

Charles Taylor's rule in Liberia ended when he faced mounting domestic rebellion and international pressure due to his long involvement in regional conflicts and human rights abuses. His criminal record traces back to his rebel invasion of Liberia in 1989, supported by M. Qaddafi (Libya) and B. Compaoré (Burkina Faso). Notorious for their wanton violence, looting and child soldiers, he ended up terrorizing the country to such a degree that he was allowed to run in the presidential elections in exchange for ending hostilities. Still in control of wide swathes of territory and wielding widespread intimidation, the war-fatigued Liberian population elected him president in 1997. Soon, old and new rebel movements took up arms against him. In 2003, a battered Taylor resigned and went into exile under pressure from both rebels and international actors. Taylor was later extradited and convicted for war crimes, illustrating his crossing of the Mogadishu Line. He currently sits out his sentence in *HM Prison Frankland* in County Durham, UK.

Bashar al-Assad's regime in Syria presents a nuanced case. Despite extreme repression during the Syrian Civil War – including the indiscriminate use of chemical weapons in towns like Ghouta (21 August 2013) or Khan Shaykun (4 April 2017) – Assad did succeed in retaining power with significant support from allies like Russia and Iran and by ongoing state terror. While he evidently crossed the Mogadishu Line, diplomatic efforts by regional powers in the years before his domestic ouster (December 2024) seem to suggest a slow rehabilitation internationally, highlighting complexities in determining absolute loss of legitimacy. The United Arab Emirates (UAE) was one of the first countries to embrace Assad back into the diplomatic fold, reopening its embassy in Damascus in 2018. (Hokayem 2023; Costello 2024; Holleis 2024)

These examples illustrate how crossing the Mogadishu Line can lead to varied outcomes for dictatorships influenced by internal dynamics and international interventions. While some regimes collapse entirely, others manage to navigate these critical junctures with external support or strategic concessions.

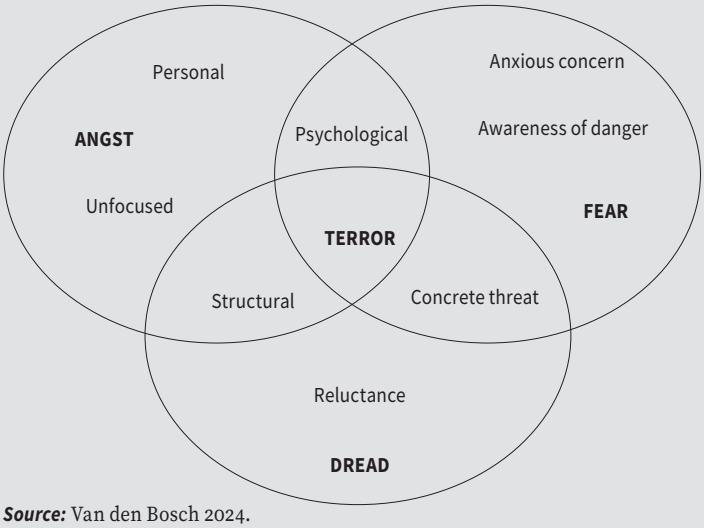
Box 3.13 Terror – Transformative Violence



Violence is like a weed – it does not die even in the greatest drought.
– Simon Wiesenthal, Holocaust survivor and Nazi hunter.

The few thousand deaths and injuries caused by 'terrorism from below' every year pales into relative insignificance besides the hundreds of thousands of people killed, kidnapped, 'disappeared', injured, tortured, raped, abused, intimidated, and threatened by state agents and their proxies in dozens of countries across the globe.
– R. Jackson et al. (2010: 1)

To understand political terror, one needs to start by disassembling the term 'terror' in its conceptual parts, as shown in Figure 3.2. To capture terror in all its aspects, one must foremost clarify its meaning beyond its etymological roots. (In Latin, *terrere* means 'to frighten' or 'to tremble.') In contemporary Anglo-Saxon contexts, *terror* is often equated with fear, dread, and angst, though each of these terms carries distinct nuances. *Fear* and *dread* are typically responses to specific, concrete threats. *Angst*, by contrast, is more diffuse, representing a generalized sense of impending doom without a clear source. Dread and angst are also more structural; they stem from familiarity with the cause of the emotion, whereas fear can be sudden and linked to unfamiliar threats. Dread often implies reluctance, fear involves awareness of danger, and angst is tied to a personal psychological state. Terror, as understood today, can be seen as a structural form of psychological fear that arises from the anticipation of a concrete evil. (Van den Bosch 2024)

This understanding of terror provides a foundation for defining political terror. Political terror involves using fear as a tool to achieve political objectives by manipulating the behavior of target groups. This is shown in the entries of **repression** and **purges**. It is a transformative force under **totalitarianism** and **Fascism**. As Paul Wilkinson (1974) noted, political terror typically involves extreme violence against individuals, creating destruc-

Figure 3.3 – A Conceptual Map of Terror

Source: Van den Bosch 2024.

tive harm. However, with the advent of cyber-terrorism (see also **cyber-warfare**) – though it has not yet claimed major loss of life – its psychological impact is expected to rival that of traditional terrorism (Gross et al. 2016). The fear generated by such acts is powerful enough to influence political outcomes.

In this context, political terror can be defined as *"the use of structural fear in anticipation of unexpected acts of premeditated, indiscriminate violence generated from specific threats or previous violent acts as a strategy to alter the behavior of other groups and achieve political aims."* (Van den Bosch 2024)

This definition emphasizes several key points: (i) The audience's fear does not necessarily imply that the violence itself is indiscriminate. The perception that anyone could be a target amplifies the effectiveness of terror. (ii) By avoiding specific references to agents or targets in this definition, it allows for the attribution of terror tactics to a wide range of actors – foreign armies, **political regimes**, guerrillas and **rebel groups**, community vigilantes, or even organized crime networks. (iii) The term 'strategy' underscores that terror is employed as part of a broader plan to achieve long-term political goals. It may be one of many tactics used by various actors. (iv) Finally, this definition is deliberately amoral; it separates the legal or moral judgments of the act from its political function.

While political terror has to be witnessed, it can technically be 'overt' and 'covert' at the same time. For example, during the 'Dirty War' in Argentina (1974-1983) or under Pinochet's rule in Chile, victims were systematically abducted, detained in secret locations, tortured and killed, with their bodies disposed of in ways that made them impossible to trace (such as being thrown from planes into the ocean during 'death flights'). Hence the term desaparecidos, 'the disappeared' for those persecuted. By making individuals disappear without any official acknowledgment or legal process, these brutal military regimes created an atmosphere of uncertainty and fear. Families did not know what had happened to their loved ones, and society at large was left in constant anxiety about who might be next. Still, it was not uncommon for individuals to be taken by government agents in broad daylight. This made such disappearances both overt and covert forms of terror, intending as much to intimidate an audience as to remove political opponents (Jackson et al. 2010: 22)

Political terror has many uses: It serves as often to intimidate, deter or destabilize as to mobilize, coerce and radicalize target groups. It can be instrumentalized to provoke actors. It can be a promise of retribution to mobilize followers. It is one of the most brutal ways to transform society and political systems. Its effects linger for generations.

declare that term limits have been eliminated. The leader can refuse to schedule elections or unilaterally eliminate them. In the Central African Republic, Jean-Bédel Bokassa (1966-1979) nullified an earlier constitution and then declared himself president-for-life and later emperor (Titley 1997; Decalo 1985).

Most leaders, however, have used the legislative branch or popular referendum to give the impression that they are committed to democracy. Routinely, regimes try to eliminate term limits through standard legal channels, such as using the legislature or judiciary to get rid of them (McKie 2017). The constitution was amended in Equatorial Guinea in 1995. The parliament passed an amendment to eliminate term limits in Cameroon in 2008. An additional five-year term was granted to Sam Nujoma in Namibia in 1999. The National Assembly voted to eliminate term limits in Nicaragua in 2014. Turkmenistan also abolished term limits in 1999, making now deceased leader Saparmurat Niyazov, known as *'Türkmenbaşy'* – 'Father of the Turkmen,' a president for life (Schatz & Maltseva 2012). The Philippines' legislature under Ferdinand Marcos also promulgated a new constitution that allowed him to have an additional term (Choi 2001; Querubin 2012).

This does not always work, however. Denis Sassou-Nguesso of the Republic of Congo had a constitutional referendum passed that removed term limits in 2015, which led to the largest anti-government protests since 1992. When Blaise Compaoré of Burkina Faso tried to change the country's constitution in October of 2014 via referendum, this provoked huge popular protests and led to his ousting.

KEY SIGNIFICANCE Extending term limits or eliminating term limits is a common way that would-be autocrats cement their power and ensure that they are able to lead indefinitely. This maneuver usually represents the death knell of democracy. Term limits in countries with little experience with democracy are one important way of maintaining the guardrails of democratic governance. Many countries have seen their leaders tamper and revoke term limits in order to consolidate power.

Eizenga and Villalón (2020) herald the (mentioned above) example of Blaise Compaoré in Burkina Faso, who was forced to adopt term limits as a result of the democratization wave in Africa in the 1990s. When his terms were running out, Compaoré increasingly frantically tried to undo these constraints. The debate about presidential term limits emerged as the key catalyst for the mobilization of popular disenchantment during the 2014 elections, and the regime proved unable to withstand the pressures. Compaoré was forced to flee in the face of mass protests once his regular military forces mutinied and his presidential guard sided with the protesters. See also S. Moestrop (in Baturo & Elgie 2019).

Grauvogel and Heyl (2021) suggest that the success or failure of third-term bids is influenced by factors such as ruling party cohesion, electoral competition, and societal responses. Strong institutions of accountability can reduce the likelihood of successful term-limit violations.

Violations of executive term limits can provoke constitutional crises when leaders attempt to extend their tenure by amending or ignoring the constitution, disrupting normal political processes and increasing tensions. For example, Niger President Tandja's bid for extended rule led to a **coup**, while the Constitutional Court blocked Colombia's Uribe from a third term. These violations destabilize political systems by undermining the rule of law, potentially leading to systemic instability and eroding democratic governance (Ginsburg et al. in Ginsburg 2012).

ORIGIN Term limits existed long before they were stipulated in constitutions. Similarly, getting rid of term limits and the absence of term limits or their extensions are not a new phenomenon.

The term *continuismo*, which originates from Spanish and is widely recognized beyond the language, refers to the practice of removing, extending, or circumventing presidential term limits. This practice is nearly as old as the concept of presidentialism itself (Fitzgibbon 1940, cited in Baturo & Elgie 2019: 75).

Another older concept that resonates with the practice of overcoming term limits is 'Caesarism' (in its later understanding), which is manifested in regimes where leaders use direct appeals to the public, portraying themselves as irreplaceable and beyond the typical checks of political systems. The term obviously originates from Julius Caesar's rise in ancient Rome, where he gained power by positioning himself as a leader who could directly serve and protect the common people, backed by military force, bypassing the Senate and other checks on his authority. In contemporary political analysis, Caesarism contains elements of charismatic rule, **populism**, **personalization**, and **electoral malpractice**. (For an overview of Caesarism in its original and modern meanings, see: Richter 2005).

By 1950 less than half of constitutions provided for term limits (Ginsburg et al. 2010). Around 87 out of 92 countries with presidential systems have adopted term limits since the 1990s (Maltz 2007), but these numbers fluctuate all the time as political systems change and dictators tweak legal frameworks to suit their needs.

CLASSIFICATIONS Heyl and Llanos (2022), comparing African and Latin American countries, develop a classification with five categories of term limits for presidential and semi-presidential systems as follows:

(i) Single Term Without Re-election This category allows only one presidential term with no possibility of re-election. Mexico is a classic example, where the *sexenio* system prevents personalism while enabling a dominant party's rule.

(ii) Single Term with Re-election After a Break Here, a president can serve one term but may be re-elected after a break from office. Countries like Chile and Panama follow this model.

(iii) Two Terms Without Further Re-election This category permits two consecutive terms but prohibits

re-election after these terms are completed. Ghana and Ecuador are examples of countries with such limits.

(vi) Consecutive Terms with Possible Return This allows for a set number of consecutive terms, with the possibility of returning to power after a specified period. Argentina and Mozambique exemplify this category, where conditions for non-consecutive terms may be explicitly stated or left ambiguous.

(v) No Restrictions on Re-election Except for an electoral veto, and assuming the elections are conducted freely and fairly, presidents can stay in power indefinitely. This situation is exemplified by countries such as The Gambia and Venezuela. (Heyl & Llanos 2022) Josip Broz Tito in Yugoslavia is another known example.

Technically, one could add a sixth category: declaring a ruler *'president for life'* without the need for re-election. This put presidents in the same category as absolute monarchs, which is what they actually became: President of France Louis-Napoléon Bonaparte (1848-1852), afterward known as Emperor Napoleon III (1852-1870), became a monarch through a series of political maneuvers and a **coup**. Initially elected as the president of the French Second Republic in 1848, he capitalized on his popular support and the political instability of the time. In 1851, facing constitutional limitations that prevented him from seeking re-election, he staged a coup, dissolving the *National Assembly* and establishing himself as the ruler of France. The following year, in 1852, he held a plebiscite that resulted in public approval for the establishment of the Second French Empire, thus proclaiming himself Emperor Napoleon III. This move effectively transitioned France from a republic to an empire under his authoritarian rule (Euler 2024).

On the other side, Baturo (in Baturo & Elgie 2019) maps various methods by which rulers overcome term limits into a typology that includes (a) avoidance, (b) extension, and (c) removal of term limits. The practice of *continuismo* encompasses all these strategies: (a) *Avoidance* involves tactics such as discarding time already served through constitutional changes or using proxy leaders to maintain *de facto* control. Presidents might also suspend or postpone elections under the pretext of emergencies to extend their terms without altering the constitution. (b) *Extension* refers to modifying the length or number of terms through constitutional amendments. This can include introducing re-election clauses in previously single-term presidencies or adding *ad hoc* terms for specific circumstances. (c) *Removal* involves eliminating term limits, signaling an intent to remain in power indefinitely. This can include abolishing elections and establishing a presidency for life, although modern dictators often prefer to retain the appearance of democratic processes by holding elections without term limits.

MEASUREMENT & METHODOLOGICAL ISSUES Term limits are measured by looking at the constitution of different countries and the number of eligible years held by each president, along with the length of the term.

The *Comparative Constitutions Project* (CCP) database collects data on over 600 features of constitutions, including term limits (Elkins et al. 2009).

REGIONAL VARIATION As it has some of the oldest presidential systems, Latin America has received considerable attention. The latest wave of abolishing term limits in Africa (observed around 2010) brought this continent under renewed attention as well (Tull & Simons 2017). Latin America was more of an exception and put some emphasis on term limits. After the region experienced many years of one-man rule, term limits were imposed in a few cases, such as Argentina in 1853 and Mexico in 1917 (Maltz 2007). There were not that many cases in Latin America where a leader was in power for long periods, with the exception of Cuba under Fidel Castro (reign: 1959-2008), Paraguay under Alfredo Stroessner (reign: 1954-1989) and Chile under Augusto Pinochet (reign: 1973-1990). By 1945, 95% of Latin American countries had implemented executive term limits, with most stipulating that a president can serve only one single term. By 2010, this had dropped to 85% (Ginsburg et al. 2010).

Earlier works by Corrales and Penfold (2014) compare how reelection rulers boost incumbents to the detriment of accountability. Corrales (2016) looks at what actors can effectively check the **personalization** process of presidents. Leiv Marsteintredet (in Baturo & Elgie 2019) provides a historical overview from ca. 1820 to 1985, showing that stable, republican, and democratic rule was only possible under a ban on immediate presidential re-election. Negretto (2022) extends the scope of analysis to institutional legacies.

Landau (2018) investigates the legal transplants (**authoritarian learning**) among Latin American cases and, in addition, sheds light upon 'the limits of tools limiting constitutional change,' or how political systems try (and fail) to block constitutional amendments that threaten liberal democratic **constitutionalism**. More experimental, I.A. Araya (2023) links **psychological profiles** (personality traits) of presidents to their overreaching behaviors.

Indo-Pacific In the Indo-Pacific, terms limits have rarely been adhered to – as most presidential systems found ways of eliminating them. In South Korea, first, Syngman Rhee (ruled: 1948-1960) and then Park Chung Hee (ruled: 1962-1979) got rid of term limits, as did Ferdinand Marcos in the Philippines (ruled: 1965-1986).

Interestingly, the re-installation of term limits under the 1987 Constitution is considered to be directly responsible for the emergence of political **dynasties** in the Philippines (a president fields more family members in power) to retain influence (Mendoza et al. 2020, Querubín 2012; Labonne et al. 2019).

Regarding China, many scholars have studied term limits at the national level (see Dittmer 2007, Ma 2016; Wang & Vangeli in Baturo & Elgie 2019). Chinese term limits have been studied at the sub-national level, too: Zhan & Gao 2008; Liu et al. 2017

(on governors). For South Korea, see Fiona Yap (in Baturo & Elgie 2019); for Indonesia, see: Hendra et al. 2020; Mietzner & Honna 2023.

Sub Saharan Africa On the continent, leaders also did not adhere to term limits, and from 1960 to 1990, more than two-thirds of African leaders left power violently, usually through a coup or assassination (Posner & Young 2007). Very few African leaders agreed to step down voluntarily. By 2000, peaceful exits through electoral defeat became the norm. Still, institutional legacies matter and structure regimes (Hartmann 2022). Tull and Simons (2017) posit that, overall, term limits matter more as a legitimization of power than as a constraint for rulers. Heyl and Llanos (2023) provide several country case studies.

MENA For this region, there are only individual case studies: Bonci (in Baturo & Elgie 2019) covers Tunisia. Many countries are monarchies, have *(de facto)* abolished restrictions on term limits or have parliamentary systems (e.g., Israel).

Eurasia Here, term limits were implemented (two consecutive terms) for most of the countries in the post-Soviet sphere, such as Russia, Eastern Europe, Central Asia and the Caucasus, as these were considered to be best practices at independence (Baturo 2014). Of course, this was only a matter of time for some regimes: Belarus, Kazakhstan, Kyrgyzstan, Russia, Tajikistan, Turkmenistan, and Uzbekistan. For instance, Azerbaijan removed limits in 2009 and then extended them from five to seven years in 2016 (Synovitz 2008; Fuller 2016).

Russia has received considerable scholarly attention focusing on term limits (See Chaisty in Baturo & Elgie 2019; Chaisty & Whitefield 2019; for the Russian subnational level, see: Paustyan 2023). This is not surprising given that Vladimir V. Putin initially adhered to term limits by switching places with Dmitry A. Medvedev due to constitutional constraints (a maximum of two consecutive terms) in Russia at the time. After serving two terms from 2000 to 2008, Putin thus stepped down and became prime minister under President Medvedev. This castling move allowed him to maintain significant political influence while respecting the constitutional term limits. Later, Putin abolished these term limits through constitutional amendments. In 2020, in the midst of the global pandemic, a nationwide vote – labeled as the 'most manipulative' in the country's history – approved changes to the Russian Constitution, allowing Putin to remain in power until 2036 potentially (Trudolyubov 2020). This amendment effectively 'reset' his presidential term count, enabling him to run for additional terms beyond the previous limit.

LITERATURE There has been some scholarly attention on extending term limits and its relationship with **autocratization**, stability and **succession**. Some of the best recent comparative works are: Baturo & Elgie 2019 and Heyl & Llanos 2023.

Whether a regime is democratic or autocratic, term limits are important for ensuring the stability of the regime. Leadership transitions are very dangerous times for dictatorships when they are unconstitutional, such as with coups (Frantz & Ezrow 2011; Svolik 2009). When power is transferred unconstitutionally, this creates an environment of uncertainty. This can lead to elite purges, chaos, coup attempts and possibly the end of the regime in violent ways. For example, from 1946 until 2009, 178 transfers of power were unconstitutional during this period; 101 led to the end of the regime, while of the 162 transfers of power that were constitutional, only 59 led to the end of the regime. Countries that do not have term limits are more likely to see coups, as has been the case in Benin, Ghana and Nigeria. When term limits are not adhered to this can also lead to coups, such as was the case with Honduras under President Manuel Zelaya (2006-2009) (Cassel 2009).

In contrast, term limits helped the *Tanganyika African National Union* (TANU) party, which merged to become the *Chama cha Mapinduzi* (CCM) in 1977, to ease the transfer of power from founding president Julius Nyerere to Ali Hassan Mwinyi in 1985. Changes were made to the constitution in 1977 to ensure that term limits were in place. Term limits are thus an important safeguard to preventing regimes from dissolving into **personalist rule**, which can lead to unbridled corruption and erratic economic and foreign policies. McKie (2019), however, found that such formalistic collegial single-party regimes like Tanzania's CCM or Mexico's PRI are increasingly difficult to sustain in multi-party electoral settings as factional intra-party splits emerge (cf. Magaloni 2008). They are truly outliers.

Term limits also ensure that there is fresh leadership so that countries are not being ruled by leaders who are well past retirement age (cf. Box 1.12 on Gerontocracy). Term limits may have a liberalizing effect, as they helped the opposition in Kenya get a foothold in the door in 2002. Finally, term limits can lead to less repression (Baturo 2014).

For collegial regimes, term limits play a crucial role in authoritarian power-sharing by ensuring leadership transitions. They involve a fixed term and a pre-appointed successor, which commits rulers to share power with elites and allows monitoring of any breaches. Successful adoption often requires balanced power among elites, initiating a dynamic bargain over political power across generations. Using a dataset from the Chinese Communist Party (1982-2012), Ma Xiao (2016) shows equal promotion chances for leaders and (rival) heir-apparent, highlighting equal influence over **patronage** when succession is institutionalized.

Scholars have noted that term limits are often initially agreed to in order to gain more legitimacy. Donor pressure may be partly responsible for the implementation of term limits (Posner & Young 2007). Authoritarian regimes that decide that they want to hold multi-party elections may also decide that term limits could prevent the accumulation and abuse of power by one leader. Term limits also ensure that elite conflict is diffused, minimizing power struggles that are very destabilizing.

The legislature and/or political party can work as an enforcement institution and possibly as a deterrent for unconstitutional seizures of power. Accord-

ing to one study, authoritarian regimes that do not have parties or a legislature were only able to have constitutional leadership transitions 19% of the time. In contrast, regimes with at least one political party and a legislature experience a leadership transition that is constitutional 58% of the time (Frantz & Ezrow 2011).

Adopting a long-term historical perspective on term-limit decisions reveals stable patterns in African countries shaped by the institutional legacies of pre-1990 authoritarian regimes. **Single-party regimes** often create conditions conducive to enforcing term limits, either by collapsing or surviving as dominant parties, which leads to formalized term limits. In contrast, **personalist regimes**, characterized by a lack of institutional constraints and reliance on informal elite accommodations, are more likely to circumvent these limits. A historical approach by Hartmann (2022) demonstrates that term limit trajectories are not random but are influenced by past political structures and practices. Understanding these patterns helps explain why some countries consistently enforce term limits while others do not, highlighting the enduring impact of historical institutional frameworks on contemporary political decisions.

Box 3.14 Lame Ducks

If it looks like a duck, swims like a duck, and quacks like a duck, then it probably is a duck
– American proverb

Even a lame-duck president can be affected by a clear midterm message if he wants to see his vice president elected and preserve his historical legacy.
– Noah Feldman

The 'lame duck' effect in democratic systems usually considers the weakness of a political actor at the end of his/her mandate, either as an **incumbent** not running in the upcoming elections, or as a politician in the time period between the election result and the moment they transfer their mandate to a successor or victorious challenger. The lame-duck effect can be seen in US politics during presidential and congressional elections. In this period, the maneuvering space for a politician's important decisions is minimized. The lame duck avoids problematic, controversial or radical proclamations or actions (Schelker 2018; Sievert & Hinojosa 2022) and is unable to muster support for policies as former allies or coalition partners flock around the newcomer to establish working relations.

The 'lame duck' may pertain to the regime as a whole (A) or to the ruler in question (B). Its effect on authoritarian regimes (A) is the weakening of the regime regarding its capabilities of authoritarian power-sharing or control. It might come as the result of (a) the (overly) long ruling span of the ruler and regime structures (social class/party/military) in the country, (b) an economic crisis or long-term stagnation, (c) a short-term 'shock' (e.g. war, crisis, famine, disaster), and/or (d) the loss of the monopoly of violence, e.g. the decline of the supremacy of power structures (army, intelligence and secret services).

All effects mentioned usually contribute to the 'lame duck' effect in certain combinations and can lead to different results. Albrecht (2014: 673-674) considers the rising probability of a **coup d'état** following a long-lived presidential term or, on the contrary, the weakness of a newly established leader after the overthrown of the previous regime.

While in democracies lame ducks are elected official whose power is reduced because replacements have been elected (Cambridge Dictionary), the label applies to authoritarian rulers (B) even without a designated successor in play. It relates foremost to changing elite perceptions of the dictator. If regime elites expect a patronal president's imminent departure from power – due to **term limits**, old age, bad health (cf. **age & health**), a sudden drop in popularity, or simple because of their decision not to run – this can undermine the ruler's capacity to shape elite expectations as to how other elites in the system will behave even before the president actually leaves office. *"Elites anticipating the change begin thinking about a future without the old president, a future when the old president may not be capable of deciding who is punished and who is rewarded. The value of presidential promises and the gravity of her threats start to dissipate. The president can become a 'lame-duck'"* (Hale 2015: 84).

Incumbent rulers themselves are often intuitively aware of their 'lame duck' status (although they never admit this publicly) and often take measures to avoid or at least mitigate the situation, usually by internally tightening the regime cohesion or sometimes by involving the country in the fight against external threats (real or virtual) (cf. **conflict & authoritarian regimes**).

The appointment of a successor (**succession**) fosters acute uncertainty for other elites: Will the current power-sharing agreements be upheld under the new ruler? In absence of any guarantees, elites calculate the potential risks and gains: Is the cost of defection and expected punishment from the successor worth the risk to challenge and defeat the successor?

For regimes as a whole, appointing a successor can be as dangerous as the vulnerability that comes from the sudden death or incapacity of the ruler. For this reason, powerholders often tend to prolong their power by extending their mandates or getting rid of term limits altogether. Or, if possible, groom a (pool of) successor(s) that could be the guarantor of stability for the outgoing leadership (Hale 2005). Van den Bosch (2024) offers a systematic overview of succession scenarios for personalist 'lame ducks.'

In Eastern Europe in the late 1980s, in the **color revolutions** in the post-Soviet Area (Georgia in 2003, Ukraine in 2004, Kyrgyzstan in 2005, 2010 and 2020), and in the

Arab Spring, unpopular 'lame ducks' were ousted through popular revolutions, demonstrations or uprisings (Hale 2013: 343).

The Soviet regime could be considered a 'lame duck' by all accounts by the end of its existence. The ideological content of the Soviet system based on communist ideas was exhausted and the economy started to slump downward, breaking the unwritten agreement with its social elites: i.e. the state secures relative social welfare, and people do not question the regime's character. Unavoidable political, economic, and social changes planned to be launched by Andropov and fully extended by Mikhail Gorbachev with his perestroika-reforms (Box 3.10) opened the road to even deeper changes in politics and society than initially expected (Olson 1990).

Soviet Perestroika also initiated similar dismantling processes in the Soviet bloc members, where similar 'social contracts' were often established. (The most typical was 'goulash communism' *(gulyáskommunizmus)* in Hungary, allowing regulated free market reforms on a limited scale for small private enterprises.)

The politics of 'openness' (*glasnost'*), economic hardships (for which the system was unprepared) and also the ambitions of other leaders, groups or ethnic groups within the federal Soviet Union led to the weakening situation in the country, rendering Gorbachev a 'lame duck' – see also Box 3.10 on Perestroika & Glasnost.

This triggered the (unsuccessful) 1991 **coup** against the last Soviet leader, which in turn pushed the whole empire even deeper into 'lame duck' status by autumn 1991, ending with the dissolution of the USSR by its own core members states.

Putin's regime in Russia attempts to avoid the lame-duck effect (Trudoyubov 2018). This fear lay behind (as one of its reasons) the gradual internal tightening of the regime and the initiation of several conflicts (Chechnya, Georgia and Ukraine) to foster elite cohesion, a 'rally-around-the-flag' effect, and tighten control over society.

Absolutism

C'est légal parce que je le veux.
(It is legal because I wish it)
– Louis XIV, *Le Roi Soleil*, King of France (1638-1715)

As a God among men.
– Aristotle, *Politics*, 1284a, 3-1

Absolutism, as a set of theories, is conceptualized as a political system in which a single ruler, typically a monarch, holds all power and authority over the government and its people. This ruler's decisions are not subject to any legal or legislative constraints, and they often claim their right to rule by divine authority. Historical reality, of course, differed from any ideal types of divine kingship, and attempts at their empirical validation have turned absolutism is a highly contested concept. The scholarly debate whether absolutism is real or imaginary (see Thireau 1997; Henshall 2014) smolders on; however, contemporary scholars have found a middle way between *"the distortions created by both the hyperbole of its propagandists and the caricatures of its critics"* (Miller 1990: 1) by treating absolutism as a transgenerational philosophico-political set of discourses favoring and justifying supreme power. However, as an(y) ideal type, its end result *"was always in the making, but never made"* (Parker 1983: xvi; in Cuttica & Burgess 2015: 4). For this reason, Bjørnstad (2021) calls it a dream.

DEFINITION Absolutism can thus be many things: (A) an ideal **political regime** type in political philosophy from classical times to the twentieth century, (B) a political doctrine (**ideology**) justifying centralized one-person rule (usually monarchy), (C) a time period in (European) history – the so-called 'Age of Absolutism' (ca. 1610 to ca. 1789), and – unrelated – (D) a cognitive style or pattern of thinking (in psychology) characterized by a rigid, black-and-white, zero-sum perception of reality, dismissing nuances and complexities. Such thought patterns of over-generalization, dichotomous thinking, catastrophizing and perfectionism are associated with various mental health issues (Al-Mosaiwi & Johnstone 2018).

As an archetype (A) and worldview (B), absolutism is a form of governance characterized by the concentration of sovereign power in the hands of a single individual, who exercises ultimate authority over the state and its institutions. This ruler, often a monarch, is not bound by constitutional limitations or checks-and-balances, and their decrees are considered the highest law. The theoretical foundation of absolutism often includes the notion of the divine right of kings, which posits that the monarch's authority is granted directly by God and therefore cannot be questioned by earthly methods.

In terms of periodization (C), it is a transitional period marking *"the past's moment of becoming modern"* and is characterized by a *"long series of processual nouns, including modernization, secularization, rationalization, instrumentalization, bureaucratization, centralization – if not as a more abrupt transition, as in revolutions in communication, in the management of information, in the control of human life processes, in the waging of war, and so on"* (Bjørnstad 2021: 3-4). Overall, it is used to describe the 'sovereign' monarchical political systems that were increasingly centralized militarily and administratively after the peace of Westphalia (1648), and the breaking of the monopoly of the supranational Catholic Church (still recovering from the Reformation) (Braure 1963: 53-56).

EXAMPLES It covers the realms of rulers like Philip II of Spain, Austria under the Habsburgs, several 'Greats' like Frederick II of Prussia, Peter I and Katerina II in Tsarist Russia, and, of course, Louis XIV of France, who famously declared, *"L'état, c'est moi"* (*I am the state*), epitomizing the essence of absolutist rule.

SEE ALSO Absolutism is an ideal type that many historical **monarchies** have been said to approximate. The absolutist bias (see below under 'methodological issues') of earlier generations of scholars resulted in the concept being applied to **personalist rule** and **totalitarianism** as well. Although, earlier doctrines and theoretical works, clearly differentiate between **tyranny** (unconstrained by any law, custom, tradition or actor) and absolutism (unconstrained by the law of men, but expected to uphold natural law or God's natural order.) **Despotism** varies in its interpretation and can fall under either category.

KEY SIGNIFICANCE Absolutism (as a time period – C) was a crucial phase in the development of modern nation-states (in Europe), centralizing power and reducing the influence of feudal lords and other competing (religious) authorities. There is some dispute whether the legitimizing doctrine (B) facilitated or merely justified the creation of more unified and efficient administrative systems that emerged in the seventeenth century, the precursors of modern bureaucracies and standing armies. Absolutism, as a political concept (A), did lay the groundwork for the later development of constitutional monarchies and democratic states by highlighting the need for checks on executive power.

ORIGIN Having origins in ancient Greek philosophy, Roman legal traditions, and Christian theology, an extensive canon of works exists that subscribe to a ruler's absolute and quasi-divine authority (Braure 1963). Note that not all early modern thinkers derived their arguments from religious contexts; there were diverse intellectual roots: patriarchalism, prudentialism, the insistence on order within the state, etc. The 'Age of Reason,' anti-monarchical discourses, and the establishment of new international norms after the Treaty of Westphalia (1648) (especially

regarding sovereignty and religious tolerance) all influenced the evolution and reinvention of absolutism as a political concept and ideology in the centuries that followed.

The term 'absolutism' is derived from the Latin word *absolutus* meaning 'free from limitations' or 'complete.' It was first used by François-René de Chateaubriand in 1797 and gained prominence in the nineteenth century in both French and English to describe the centralized and unconstrained power exercised by monarchs in early modern Europe, particularly from the sixteenth to the eighteenth centuries (Bjørnstad 2021: 5). Politically, absolutism generally served as an opponent to subsequent developments such as the Enlightenment, **revolution**, modernity, or later forms of constitutional monarchy, and despite its heterogeneous origins, its proponents shared a concern with elevating royal authority to the highest degree, even if many theorists implicitly preferred 'monarchical sovereignty' to absolutism. The concept was also retrospectively applied to Byzantium's **autocracy**.

LITERATURE Absolutist rhetoric and policies were influenced by Renaissance, Baroque, Catholic, and Protestant ideologies. They were also entwined with new philosophical and scientific trends, actively contributing to the formation of a loosely defined 'modern world.' However, patterns of change were complex and multifaceted. Only the most relevant thinkers are presented below. Some solid overviews of the concept and its main theorists can be found in J.H. Burn's chapter in Miller (1990); Henshall (2014); Cuttica (2013; 2015).

Anastos (1965) explores the roots of Byzantine absolutism in ancient Greek philosophical ideas, particularly those of **Plato & Aristotle**, who advocated the rule of a wise and virtuous leader having absolute power: a philosopher-king. The idea was perpetuated and popularized by Alexander the Great through his adoption of Persian royal customs (e.g. προσκύνησις – *proskýnēsis*: the act of prostrating oneself to revere those of higher status, an act that was reserved only for deities in Greco-Macedonian customs), as well as through Alexander's belief in his own divinity, combined with his far-reaching centralization of power through military and administrative reforms (Walbank 2024).

These same concepts were later adapted by Christian theologians, notably Eusebius of Caesarea (ca. 260/265 – 339 CE), who transformed the Byzantine emperor from a god into God's vicegerent on earth, divinely appointed and inspired (Anastos 1965: 94-109). (See also Box 1.17 on Caesaropapism.)

Jacques-Bénigne Bossuet (1627-1704), French bishop and theologian, similarly a prominent theorist of divine right absolutism and a court preacher at Versailles, argued that governments were ordained by God, and subjects were obliged to obey them. In his work *Politics Drawn from the Very Words of Holy Scripture*, he quoted St. Paul: *"Let every soul be subject to the higher powers. For there is no power but of God and the powers that be are ordained by God. Whosoever therefore resisteth the power resisteth the ordinance of God."* Bossuet believed hereditary monarchy was the most appropriate form of government, paralleling divine order and chosen by God for ancient Israel. Beyond biblical justification, he argued that people naturally desired paternal government, that absolutism prevented state division, and that hereditary rule was the most natural and self-sustaining kind (Birn 1977: 138).

As a political doctrine, absolutism was further developed during the early modern period, particularly in the seventeenth century. Thinkers like Jean **Bodin** (ca. 1530-1596) and Thomas Hobbes (1588-1679) articulated the necessity of absolute sovereignty to maintain order and prevent civil war. Bodin's *Six Books of the Commonwealth* (1576), the work of a French jurist and political philosopher, argued that sovereign power must be indivisible and absolute to ensure stability. Note: Turchetti (2007) is especially vocal about pigeonholing Bodin as a sovereignty scholar, dismissing his support for absolutism.

Hobbes, in *Leviathan* (1651), posited that a strong, centralized authority was essential to avoid the chaos of the state of nature (Birn 1977: 138-141). According *"to Hobbes the single most important instant in human history [was when] people applied their powers of reason to their need for self-preservation. Among themselves they agreed to surrender their liberty and 'confer all their power and strength upon one man, or upon one assembly of men.' This act of self-preservation created a 'mortal god,' the great Leviathan, the omnipotent state. Its sovereignty was absolute and its power unlimited. It defined justice, morality, and religion; it made no reciprocal concessions to subjects. Its purpose was wholly to maintain order and avert dissension. Mass rebellion against it was social suicide, for such activity incited a return to the state of Nature"* (Birn 1977: 139).

Natural law theorists were not a unified group. One faction believed that a strong government was the best means to express natural law and protect natural rights. Samuel von Pufendorf (1632-1694), a renowned Saxon professor and jurist, was a prominent advocate of this view. He served influential rulers like Frederick William, the 'Great Elector' *(der Große Kurfürst)* of Brandenburg and king Charles XI of Sweden.

Pufendorf, like Hobbes, argued that people formed political societies to constrain themselves. However, Pufendorf saw the government's role as protective rather than repressive. Consequently, subjects entered into a second (social) contract with their government, pledging loyalty to their ruler, who in turn promised to respect their natural rights. M. Seidler argues that Pufendorf was in essence a sovereignty theorist, and more flexible than his reputation suggests when it came to exploring alternative constitutional forms in which sovereignty can be exercised (Cuttica & Burgess 2015: 159).

Still, Pufendorf's absolutist perspective resonated with the princes of the Holy Roman Empire, who saw themselves as safeguarding their subjects from social chaos and the emperor's ambitions. In the mid-eighteenth century, the 'enlightened despots' (see **despotism**) of central Europe used Pufendorf's ideas to justify their absolutist rule (Birn 1977: 139-140).

By the early twentieth century the concept was adapted to fit non-monarchical forms or rule (e.g. Sturzo 1936; Smith 1939). The focus here was on administrative of bureaucratic absolutism aimed at describing cases that, by the 1940s, would come to be labeled **totalitarianism**. This focus on bureaucratic absolutism has also been re-applied to the German polities before the French revolution (Ertman 2010).

METHODOLOGICAL ISSUES Besides the ongoing debate about whether absolutism ever existed or is a myth, propaganda or a dream (see 'definition' above), this essentially contested concept has been stretched to extend to totalitarian regimes and other modern autocracies, adding to the confusion.

Delineation Absolutism is seldom clearly defined. James Daly (1978: 250) remarked that the label was often retroactively applied to cases where seventeenth-century monarchs had more power than twentieth-century scholars thought they ought to have had. John Miller (1990: 1) finds that the term is routinely used interchangeably with **despotism** (Cuttica & Burgess 2015: 3-4), which clearly goes against the understanding of the original thinkers.

Bossuet, for instance, clearly distinguished between absolute and arbitrary government (**tyranny**), emphasizing that princes must respect fundamental state laws and subjects' property. While civil disobedience was intolerable, subjects could make respectful remonstrances against unjust rulers, with prayers for the tyrant's conversion being the ultimate recourse for a suffering populace (Birn 1977: 138).

While the exact boundary between despotism and absolutism remains uncharted, the true antithesis was actually **republicanism**, whose historical and theoretical ascendancy rests on an implied contrast with (monarchical) absolutism (Seidler in Cuttica & Burgess 2015: 159).

Absolutist bias Debate in the historical analysis of early modern government revolves around the misconception that the crown's authority was absolute and unchallenged. Recent scholarship has shown that the crown's power was significantly limited during the whole period considered the 'Age of Absolutism.'

The power of monarchs in the late medieval period was far from absolute, as evidenced by the diverse and fragmented nature of political and legal institutions across Western Europe. The practice of feudalism (see Box 1.14), where land and authority were granted in exchange for service, led to a dispersal of jurisdiction and political power. Many public functions were managed privately: landowners convened courts to dispense justice to their peasants; guilds and town corporations exercised similar functions within their jurisdictions; and church courts regulated significant aspects of daily life. This multiplicity of jurisdictions was accompanied by a variety of laws, particularly in northern Europe, where law was based on custom. Like the princes and cities of the Holy Roman Empire, whose allegiance to the emperor was often nominal, magnates developed distinct administrations and institutions within their states, raising the challenge of dispersed authority. To manage this, they created representative assemblies to facilitate governance and secure consent for taxation. The monarchs of the sixteenth and seventeenth centuries ruled over lands that were neither compact nor homogeneous, with fiscal, jurisdictional, and ecclesiastical boundaries often not aligned and frontiers uncertain, especially in mountainous regions. This complexity further diluted their power, making it clear that their rule was anything but absolute (Miller 1990: 3-4).

This perspective has enhanced our understanding of early modern governance, revealing that the crown often had to negotiate and compromise with its subjects. Despite this, some historians still imply an absolutist agenda, though evidence suggests that neither the crown nor its ministers aimed to create a centralized, bureaucratic state. Instead, the growth in government size and authority was a byproduct of practical governance and foreign wars, not a deliberate plan for absolutism (James 2006: 94-95).

OTHER LANGUAGES In German, the classic, comparative work of Duchhardt (1989) shows the various conditions under which absolutism thrived, was contested, or failed in Europe. In Russian, L.V. Landina explores Russian and Soviet scholarship on Western European absolutism and Russian autocracy over the past 150 years, highlighting research methodologies and how the meanings of concepts have changed and evolved (Ландина 2020).

Anarchism

We are convinced that liberty without socialism is privilege, injustice; and that socialism without liberty is slavery and brutality.
– Mikhail A. Bakunin (1814-1876)

La tierra es tuya: trabajala!
(The land is yours: work it!)
– Catalan anarchist slogan (1936)

Anarchism, as both a Utopian political **ideology** and a **political regime**, presents a unique perspective on governance and societal organization. Anarchism arose as an explanation of the gulf between the rich and the poor in any community, and of the reason why the poor have been obliged to fight for their share of a common inheritance, but the doctrine also answers the radical question – 'What went wrong?' – when every **revolution** breaks its promises and reinstalls central state control over the masses who made it possible. For anarchists the state itself is the enemy, because every (new) state protects the privileges of the powerful (Ward 2004).

ORIGIN The term is, of course, derived from 'anarchy,' from the Greek *anarkhía* (ἀναρχία meaning 'without rule' or 'without authority'), a pejorative catch-all label for leftist, anti-establishment dissidents challenging the ruling order. As a neutral term, 'anarchy' remains a core concept in political science, especially International Relations (IR).

Social movements questioning the **legitimacy** of the ruling order have emerged in all places and at all times, even before the advent of the European Enlightenment. When such ideas were formulated into a comprehensive worldview, they are sometimes labeled 'early anarchism.' For instance, the main works on Daoism (Taoism) from around the Warring States period in China (ca. 475 BCE – 221 CE), attributed to Lao Zi (老子) the (mythical) sage and ascribed author of *The Way / The Path* (道德经 – *Daodejing* in Pinying, *Tao Te Ching* in the Wade-Giles transliteration), and to Zhuang Zi (莊子 – Chuang Tzu in the Wade-Giles transliteration) resonate with anarchist ideals. Rapp (2012) expands on this debate (but includes inaccuracies regarding Daoism). While Daoism criticizes (coercive) state authority and argues in favor of a natural order and individual freedom, its foremost focus was spiritual and philosophical, and cannot be considered political activism or as promoting an explicit anti-state agenda, due to these thinkers' acceptance of Chinese monarchy as a legitimate system of **rulership** (Pines 2012).

In the times of **Plato & Aristotle**, the father of Stoicism, Zeno of Citium (ca. 335 BCE – ca. 263 CE) has also been credited for anarchist ideas (see Marshall 1993), especially his *Republic* (Πολιτεία), which contains a speculative or hypothetical account of what would happen if every individual were a sage living according to their personal ethic. In such a future, there would no longer be any need for temples or laws. It would be something akin to an anarchist Utopia populated by individuals guided by their own mental dispositions, who all would agree to the extent that they all accord with Nature (Sellars 2007: 19).

European anarchism traces its roots back to the political philosophy of the Enlightenment. In their respective works, Thomas Hobbes (1588-1679), John Locke (1632-1704), and Jean-Jacques Rousseau (1712-1778) presented contrasting views on the 'state of nature' and the transition to political society. In *Leviathan* (1651), Hobbes saw the state of nature as a violent, anarchic 'war of all against all,' necessitating the establishment of a powerful sovereign through a social contract to ensure peace and security. This model has been extrapolated to the international level. In the realist tradition of IR, 'anarchy' refers to the lack of a central authority above sovereign states. This absence of a supranational power means there is no natural order in the international system, since there are no enforceable rules of conduct, especially for powerful states. This leads to a harsh, competitive environment where states' primary goals are survival and security. (Others strands of IR, of course, challenge this vision.)

In contrast (even when never using the term 'anar-

chy'), other Enlightenment thinkers spoke of the 'state of nature' – referring to a hypothetical condition before the establishment of formal societies and governments – in more Utopian terms. For Locke, this was a state of perfect freedom and equality governed by natural law, which led to the formation of government to protect natural rights and ensure impartial justice. Rousseau offered an even more positive view, seeing the state of nature as peaceful and morally neutral, with the development of civilization and private property introducing inequality and conflict, ultimately leading to the formation of political societies. Locke and Rousseau significantly influenced anarchist thinkers through their political philosophies of natural rights, the state of nature, and the social contract.

As an independent political movement, anarchism came into being after the split with **socialism** at the First International (Hague Congress in 1872), where there was a falling-out over deep-seated ideological and strategic differences, particularly regarding the role of the state and the nature of revolutionary organization (see below under 'examples'). This modern version of anarchist thought spread to the Americas through migration (e.g. labor unions in Argentina, Brazil and Uruguay) in the mid-nineteenth century, and to East Asia through Western-educated elites and cultural exchanges in the early twentieth century (Park 2018; Rapp 2012). Since anarchism is constantly reinvented and adapted, it can today be considered a global ideology.

DEFINITION Anarchism, the **ideology** advocating for anarchy as a positive, natural state of human society, opposes all forms of coercive authority and hierarchical structures, including the state and capitalism. McLaughlin (2016) argues that, in essence, anarchists reject all traditional claims to **rulership** and state **legitimacy** – both rejecting **traditional rule** (religion, tradition, dynasticism) and legal-rational rule through **bureaucracy**. Anarchists seek to establish a society based on voluntary cooperation, mutual aid, and self-governance, often through decentralized and federated communities. To this end, they embrace the ethos of 'direct action' – action without intermediaries, whereby an individual or a group uses their own power and resources to change reality in a desired direction (Gordon 2007).

SEE ALSO Because of its militant nature, anarchism is associated with **revolution** and sometimes **terrorism** or **assassination** (e.g. that of US President McKinley in 1901), although the **ideology** has a complex relationship with the **legitimacy** of political violence. As a political regime type it is considered to be unstable, but a few successful examples exist – see below, 'examples.'

LITERATURE Historically, anarchism emerged during the Enlightenment and gained prominence in the nineteenth and early twentieth centuries. Influential anarchist thinkers like William Godwin (1756-1836), Pierre-Joseph Proudhon (1809-1865), Mikhail A. Bakunin (1814-1876), Piotr A. Kropotkin (1842-1921) and Emma Goldman (1869-1940) – among many others – critiqued existing political and economic systems, advocating for a society free from oppression and exploitation. Anarchism encompasses various schools of thought, including collectivist, individualist, and anarcho-communist traditions, each proposing different methods and visions for achieving an anarchist society. The works of Locke and Rousseau were very influential for justifying the resistance to illegitimate rule and for striving to create a 'natural' egalitarian society, respectively.

Locke, in his *Two Treatises of Government* (1689), emphasized natural rights to life, liberty, and property, which exist independently of any government. He argued that legitimate political authority arises from the consent of the governed and that governments exist to protect these natural rights. When a government fails to do so, it loses its **legitimacy** and can be resisted or replaced (even through **protests & uprisings** or 'regicide' – **assassination**). This skepticism about centralized authority and advocacy for individual freedoms laid the groundwork for classical liberalism, influencing anarchist thought.

Rousseau, in his *Discourse on Inequality* (1755) and *The Social Contract* (1762), argued that humans are inherently good but corrupted by civilization and private property. He believed that private property led to social inequality and oppressive political institutions. Rousseau's vision of a simpler, more egalitarian society resonated with anarchist principles, particularly his critique of the state's role in perpetuating inequality and his emphasis on freedom. His ideas influenced early anarchists like William Godwin (1756-1836), who extended Rousseau's critique to advocate for a stateless society based on voluntary cooperation and mutual aid.

METHODOLOGICAL ISSUES As an **ideology**, anarchism contains several logical contradictions that seem impossible to reconcile; for one, the wish to uphold individual autonomy while simultaneously imposing social discipline (Ritter 1980: 25). Anarchists reject the notion that freedom could only exist within the state, arguing that both the state and private property are obstacles to true freedom. At the same time, they must limit freedom to the superior claim of solidarity, which is and will always remain the greatest source of social goods. The doctrine lacks a principle to adjudicate between individuality and community, and cannot rely on (hierarchical) institutions to settle situations where these norms collide (Ritter 1980: 29).

Anarchism is considered a Utopian ideology because it envisions a radically different society based on principles of non-hierarchy, mutual aid, and voluntary cooperation. (Despite its Utopian label, such philosophical speculation can be useful in clarifying values.) While these ideals offer a powerful critique of existing systems of power and domination, they are often viewed as impractical or overly idealistic given the complexities of human society and historical precedents. Is not the emergence of some kind of (minimal) state inevitable? Consequently, is a state of political 'anarchy' not inherently unstable as a political regime type? Anarchism also suffers from the challenge of specificity

– often equally opposing all states out of principle, even as political power can be organized in various ways. Nevertheless, anarchism continues to inspire movements and individuals seeking to create more just and equitable forms of social organization (Fiala 2021).

CLASSIFICATIONS Like **socialism** (see Box 4.9) anarchists have employed both revolutionary (A) and evolutionary strategies to realize their goals. Revolutionary anarchists often support direct action and insurrection to dismantle existing power structures, while evolutionary (B) anarchists focus on building alternative institutions and practices within the current system to gradually transition to an anarchist society. Neither group believes in emancipation through the ballot (Guerin 170).

Some are individualist (I), focused on individual autonomy, personal freedom, and skeptical of collective structures (cf. the works of Max Stirner). Collectivists (II) can be subdivided into (i) anarcho-communism, (ii) mutualism, (iii) anarcho-syndicalism. The first (i) advocates for communal ownership of property and resources, aiming for a stateless, classless society; mutualism (ii) promotes a society where individuals and cooperatives exchange goods and services based on mutual benefit; and the last (iii) focuses on labor unions and direct action to achieve workers' control over production.

Of the revolutionary type (A), anarcho-communists are stereotyped as associated with **terrorism**, especially those adhering to insurrectionary anarchism, and operating with the legacy of some militant branches of Russian anarchists that employed the 'propaganda of the deed' against monarchic rule and were, most notoriously, responsible for the **assassination** of Tsar Aleksander II in 1881 in Russia.

EXAMPLES Anarchism, as a **political regime**, has had several notable, albeit short-lived, real-life instantiations in history. These illustrate attempts at the practical application of anarchist principles in various contexts, often during periods of social upheaval or revolution. Fellow leftist organizations often stuck the knife in the back of anarchist experiments. Anarchism and **communism** have a complex interplay. The two movements often initially align to overthrow a common enemy but then fall out over issues of control and strategy. Both oppose capitalism and strive for a classless, stateless society with collective ownership. However, anarchists reject the state entirely, favoring immediate abolition and decentralized organization, while Marxists see a transitional state as necessary. Anarchists prefer direct action, whereas Marxists focus on seizing state power through a **coup** or **revolution**. Nevertheless, some anarchist political regimes did emerge in history:

The Paris Commune (1871) – Although not purely anarchist, rather a precursor, the Paris Commune was a radical socialist government that briefly ruled Paris in the wake of the Franco-Prussian War (1870) and implemented policies such as the abolition of the standing army, the separation of church and state, and workers' control of businesses. Anarchists like Kropotkin saw the Commune as a practical example of anarchist principles in action, despite its short-lived existence (Ward 2004).

The *Makhnovshchina* (Махновщина – 1918-1921) – In Ukraine, in the wake of WWI and the Russian Civil War, the anarchist Nestor I. Makhno (1888-1934), a convicted bandit and bank robber with peasant roots, radicalized in prison, returned to his hometown of Huliaipole in 1917 after a general amnesty, where he started an insurrection and the movement named after him. This movement established a stateless society in parts of southeastern Ukraine (Zaporizhzhia), characterized by self-managed communities and voluntary militias. Makhno grew larger than life due to his successful guerrilla campaigns, and his myth lives on stubbornly (Yanovitz 2007; Darch 1985). The Makhnovists preached a form of anarcho-communism, emphasizing collective ownership of land and resources, although at the regime level his movement may be compared to other historical **warlords** or **rebel regimes** marked by excessive **repression** and **personalist rule**. Constant military threats from Ukrainian nationals, the White Army and the Red Army, including the betrayal of several alliances with the latter, led to his eventual downfall and exile in Paris (Mitchell 2009; Shubin 2011).

The *Shinmin Autonomous Region* (신민부 – *Sinminbu,* 1929-1931) was an anarchist self-governing zone established by Korean exiles in Manchuria after the Japanese occupation of Korea. It hosted two million Korean refugees, and operated on principles of mutual aid, decentralized governance, and collective economic organization, employing **nationalism** as societal glue. Despite facing significant challenges from Japanese imperial forces and Korean communists, which, by 1931, led to its downfall, the region remains a significant milestone in anarchist history and the Korean independence movement. This movement, the *Korean People's Association in Manchuria* (재만한족총연합회), was the first to demonstrate the practical application of anarchist principles in a real-world context, emphasizing grassroots decision-making, collective farming, and cooperative societal structures (Crump 2023; Ki-Rak 1986).

Revolutionary Catalonia (1936-1939) – In the tradition of Proudhon, Ramón de la Sagra founded the first anarchist journal in Spain in 1845. Francisco Pi y Margall promoted mutualist ideas and attempted decentralization in 1873. Later, however, Bakunin's influence grew through Giuseppe Fanelli's establishment of International branches in 1868. By 1870, the movement had 40,000 members, growing to 60,000 by 1873. Despite frequent suppression, anarchism thrived among Catalan factory workers and Andalusian peasants, mostly underground. During the Spanish Civil War (1936-1939), anarchists succeeded in establishing a large-scale society in Catalonia along anarcho-syndicalist lines, with powerful labor unions in the cities and collectivized agriculture in the countryside. The anarchists implemented principles of direct democracy and self-management, creating a society based on mutual aid and voluntary cooperation. Despite initial successes, the anarchist territories were eventually defeated by a combina-

tion of Franco's Nationalist forces and the divisions within the Republican side (Smith 2007; Ealham 2010).

Zapatista Autonomous Municipalities (1994-2023) – Inspired by Emiliano Zapata, a key figure in the Mexican Revolution (1910-1920), who championed land reform and indigenous rights, the Zapatista movement, led by the *Ejército Zapatista de Liberación Nacional* (EZLN), emerged in Chiapas, Mexico, in 1994 as an armed response to centuries of indigenous marginalization and NAFTA's neoliberal policies. The Zapatistas established autonomous municipalities governed by direct democracy and self-management, rejecting the Mexican state's authority. Despite the dissolution of these autonomous municipalities in 2023, due to escalating violence, the Zapatistas' emphasis on anti-capitalism, decentralized governance, and indigenous autonomy remains influential. Their model of community-based governance and resistance against neoliberalism continues to inspire global social movements advocating equity and self-determination (Collier & Quaratiello 2005; Gilbreth & Otero 2001).

These historical examples of anarchist regimes demonstrate the diverse contexts in which anarchist principles have been applied. While many of these experiments were short-lived and faced significant external and internal challenges, they provide valuable insights into the practical implementation of anarchist ideas and the potential for creating societies based on voluntary cooperation, mutual aid, and self-management.

IMPACT ON POLICY Contemporary anarchism has evolved significantly from its historical roots, broadening its focus to oppose all forms of domination, including patriarchy, **racism**, and environmental destruction. Unlike the more formal federations and unions of the past, modern anarchism favors decentralized, network-based organization and emphasizes direct action and prefigurative politics – creating alternative social structures in the present. Influenced by subcultures such as punk and environmentalism, contemporary anarchism integrates diverse cultural practices and missions (such as food distribution, harm reduction, and decarceration) and utilizes digital communication technologies for coordination. The movement is characterized by intersectionality and theoretical pluralism, incorporating post-structuralist critiques and rejecting any notion of a post-revolutionary resting point. This evolution reflects a shift from the class struggle-centric anarchism of previous centuries to a more inclusive and adaptive form of activism (Gordon 2007; Honeywell 2021).

Communism

The philosophers have only interpreted the world, in various ways; the point, however, is to change it.
– Karl Marx

Socialism and communism are related ideologies that advocate for collective ownership and the reduction of social inequalities, but they differ significantly in their principles and modes of implementation. While communism is sometimes presented as the end goal of socialism, it can also be considered a more radical form of socialism that aims to establish a classless, stateless society where all property is communally owned. To this end, communism relies on a revolutionary, single-party regime to transform the state and assume full state control over the economy.

The entry for **socialism** contains more details on both topics, and shows connections to related entries in the encyclopedia, like **totalitarianism**, **ideocracies** and **single-party regimes**. Box 4.9 provides a regional comparison of socialist and communist movements.

Constitutionalism

'We the People.'
– Preamble to the United States Constitution

Constitutionalism, due to its foundational principles and flexibility in application, is both an **ideology** and an aspect of other worldviews. As an ideology, constitutionalism is rooted in the belief that government powers should be legally limited, and that the legitimacy of government depends on its adherence to these limits. This concept, heavily influenced by thinkers like John Locke and the American founders, posits that a constitution sets the framework for government authority and its constraints, ensuring that power is not absolute but subject to legal boundaries, a pillar of Max Weber's legal-rational **rulership**.

The ideological aspect of constitutionalism in liberal thought is evident in its core tenets. It emphasizes the rule of law, separation of powers, and the protection of civil liberties. These principles are designed to prevent the concentration of power and protect individual rights against government overreach. The idea is that by establishing clear, enforceable limits on government actions, constitutionalism promotes a stable, predictable, and just political order. This ideological framework is reflected in the structure of many democratic states, where constitutions serve as the supreme law, guiding the creation and implementation of other laws and policies.

Such 'negative constitutionalism' focuses on limiting state power to protect individual liberties. It views the state as a potential threat and relies on judicial review to enforce these limits. Positive constitutionalism, conversely, empowers the state to promote public welfare, emphasizing positive rights that require state action, such as education and healthcare. It sees the state as a necessary actor for achieving social justice and substantive goals. The main criticism of negative constitutionalism is that it can hinder governance (since it also limits the legislative and judiciary as well), and runs counter to egalitarianism because it entrenches one political position by constitutional fiat, forcing reformers to win their case in democratic forums (Barber 2018: 5). Positive constitutionalism risks judicial overreach and implementation complexity.

However, constitutionalism is not just an isolated ideology; it is also an integral part of various other worldviews and political theories. For instance, in liberal democracies, constitutionalism aligns with the broader liberal ideology that values individual freedoms, equality, and democratic governance. In the US it supports the liberal emphasis on protecting individual rights through mechanisms like *Bills of Rights* and judicial review, which ensure that government actions do not infringe upon fundamental freedoms. Moreover, constitutionalism interacts with other political theories such as **republicanism**, which focuses on civic virtue and the common good. In this context, constitutionalism helps balance individual rights with collective responsibilities, ensuring that government actions serve the public interest while respecting personal freedoms. This interaction is evident in the design of many republican constitutions, which incorporate checks-and-balances to prevent **tyranny** and promote the common welfare.

The flexibility of constitutionalism allows it to adapt to different political and cultural contexts, making it a versatile component of various worldviews. Religious constitutions are the pillars of modern manifestations of **theocracy** and many other **ideocracies** have enshrined the dogmas of their worldviews in this form of supreme law. Constitutions can thus ensure the 'legalization' of any type of political rule at a certain moment of history – an order that did not always exist, and which might disappear over time (Grimm 2016: 3).

As shown in **religions of the world & statecraft**, pre-modern political orders universally adhered to the concept of a 'constitution' as a set of legal constraints, ordained by deities, against **tyranny** or **despotism**, informed by religious ethics intended to impede the corruption of leaders and uphold social

harmony in hierarchically structured, non-egalitarian polities. These constitutions should *"not be confused with the normative text that seeks to regulate rule and is enacted by a political decision"* (Grimm 2016: 4). The latter is the outcome of European revolutions, where new political actors – who, like Prometheus, stole fire from the Gods – appropriated the right to make laws without any religious limitations, without being beholden to higher, divine laws.

Furthermore, constitutionalism's role in shaping judicial interpretation highlights its dynamic nature. The debate between 'originalism' and 'living constitutionalism' illustrates how constitutional principles can be interpreted in ways that either emphasize historical intentions or adapt to contemporary values and circumstances. Originalists argue for a fixed interpretation based on the original meaning of constitutional texts, while living constitutionalists advocate for a more flexible approach that considers evolving social and moral standards. This ongoing debate underscores the importance of constitutionalism in guiding legal and political discourse, and the practice is of course subject to political manipulation, as shown in **authoritarian constitutionalism**.

Corporatism

The definition of fascism is the marriage of corporation and state.
– Benito Mussolini

Corporatism is the political doctrine or **ideology** that political systems are built on analogy with the human body or *corpus* (in Latin), and that is why this line of thought is considered part of a broader framework of political thinking known as organicism. Under the influence of Isaac Newton's works and Newtonianism, the earlier idea of 'mechanicism' – a natural philosophy likening the universe to a giant mechanism – gradually became outdated in political theories; some authors and political movements oriented themselves towards the more experience-based notions of corporatism, organicism (nature has an organic foundation), blood-ties and the common descent of people (nations) (Wolfe 1974). Corporatism was revived around 1850 to reappraise the role and position of traditional institutions and the 'divine' right of the state, threatened by the class egalitarianism of the French Revolution and the laissez-faire economics of Adam Smith's classical Liberalism (Britannica 2014). Earlier, it had served as an ideology in European Antiquity (later influenced by Christianity and its focus on the relation between the carnal (body) and the divine) and formed part of a well-established canon of pre-modern concepts.

DEFINITION Corporatism as a *political doctrine* is grounded in the belief that politics is based on the organic relations among cells and organs within the political body. Society is thus divided into 'corporations' subordinate to the state. According to the logic of state survival, the vital interests of the political body are more important than the equality of individual interests. Therefore, the formulation and representation of vital interests in politics must be organized and presented to the 'head' decision-making bodies, such as government and parliament, following privileged ways and special arrangements. The followers of corporatism therefore strive either to establish direct negotiations between these vital interest groups or to represent these interest groups through special bodies, which supplant or parallel institutions based on liberal doctrine and democratically arranged political systems.

Corporatism is often presented as a 'Third Way' between Liberalism and Marxism, making it an attractive concept to analyze non-Western polities. The concept is indifferent to democratic values, and offered attractive transformative features, after the shedding of its Catholic shibboleths, both to secular liberal democracies and authoritarian regimes with a penchant for technocratic rule.

R.B. Collier and D. Collier (1977: 493) distill three recurring defining features of corporatism: *"(a) The structuring of representation, involving the official recognition of groups, which are organized into well-defined functional categories and enjoy a monopoly of representation within their respective categories; (b) the subsidy of groups, which can occur through direct state subvention and, especially in the case of labor unions, through mechanisms that provide for compulsory membership and that facilitate dues collection; and (c) state control over leadership, demand making, finances, and internal governance"* (Collier 1995: 138).

Corporatism as a *political system* thus differs from 'pluralism' and is defined as a system of interest representation by hierarchically organized and non-competitive groups, recognized and regulated (if not created) by the state (C.A. Hale in: Bethell 1986: 435).

In a wider sense, the term 'corporatism' or 'corpo-

rate interest' is today used in the context of economic Liberalism, denoting a specific relationship between organized interests and government in which associations of interest groups coordinate some of their activities with government policies (usually regarding taxation, permits, oversight, trade privileges and labor legislation).

SEE ALSO Corporatism has parallels with **clientelism**; however, the former is a mode of authority relations among groups, whereas clientelism is a mode of authority relations among individuals. It found common ground with **Fascism** because of its nationalist outlook and indifference to democratic values. Yet too often corporatism was used as a veil to control trade unions and businesses, with the goal of creating state-led economies and establishing **personalist rule**. D. Collier (1995: 142-146) provides a detailed overview of the concept's relation to pluralism, interest mediation, concertation and policy formulation. Its development under authoritarian rule means it is often studied as an aspect of **bureaucratic authoritarianism** or **technocratic rule**.

KEY SIGNIFICANCE The ideas of corporatism offer security, a place and role for everyone in caring for the nation, family, local community. They aim to promote harmony and social peace. Class brotherhood was incorporated into negotiations between trade unions and representatives of capital, thus directly countering Marxist notions of class conflict. R.B. Collier and D. Collier find that societal groups accept state control 'in exchange for' the advantages derived from structure and subsidy (Collier 1995: 138). The goal was to counter the capitalist individualism of *homo economicus*, and replace it – in the words of Ugo Spirito – with *homo corporativus* (Pinto 2017: 5).

Under Italian **Fascism** (1922-1943), it was adopted and heralded as a leading doctrine, on a par with **Communism** and Liberalism. However, Mussolini's totalitarian aspirations clashed with its basic premises. The ideology was promoted as a 'Third Way' between Capitalism and Communism, but, in reality, it was applied pragmatically and selectively to destroy labor movements and suppress political dissent (Soucy 2022). After World War II, corporatism was equated with fascism. Nonetheless, there were attempts to free to concept from this association. In the early 1970s, Philippe Schmitter (1971; 1974) reinterpreted and adapted the concept to modern political systems, dominated by Liberalism and **democracy**, rebranding the concept 'neo-corporatism' or 'liberal corporatism.'

Once tainted by fascism, the concept lost much currency as an ideology to structure politics in Europe, but can still be encountered as a tool for systemic policy analysis or as a broad framework to study policy-making, decision-making processes, and institutions that focus on the relations between society's main dominant interest groups – labor and capital – and the government. It is still used to analyze the changing pattern of these institutionalized arrangements. In addition, there is a growing interest in the impact of neoliberalism and different economic and political crises resulting from different corporatist and neo-corporatist arrangements. In the context of multiple modernities coexisting, with countries having different institutionalized and informal relations between labor and capital, and given global patterns of rising inequality, this study is still dominant in the fields of the sociology of work and policy analysis.

Corporatism has been mostly connected to pre-modern regimes and authoritarian political systems. In fact, as a doctrine, although it is not liberal and not democratic (it reduces pluralism), it is also not purely authoritarian (because it is inclusive). It is built on the promotion of the vital interests in the organic perception of the community and the state – meaning that it aspires to represent the dominant interests of society. In strong capitalistic societies, it thus promotes the logic of the concentration of capital; in other cases, like fascism, it can take an authoritarian form.

ORIGINS Corporatism (*corporativismo* in Italian and Spanish, sometimes also called 'corporativism' in English) essentially originates in a spontaneous way of thinking about the natural world. In all cultures humans identify parallels between their bodies and the world they live in. Such group politics, in the words of H. Wiarda (1973: 222-223), refer to a system in which political culture and institutions reflect a historical hierarchical, authoritarian, and organic view of man, society, and polity.

In European Antiquity this can be found in the thinking of **Plato & Aristotle** about natural social hierarchies and their specific roles. The Romans added forms of representation to each of their classes. Feudal Europe was organized through the system of three estates (the clergy, the aristocracy, and commoners), each fulfilling a vital function in society, with a monarch as its head at the top.

In the High Middle Ages, corporatist organizations flourished: guilds, military orders, universities, chartered cities and towns, etc., until the advent of absolute monarchies subjugated their political influence (Wiarda 1997: 30-33). The French Revolution with its Enlightenment ideas and abolition of class privilege suddenly transformed the adherents of corporatism into political reactionaries. Some of the latter even turned against economic Liberalism and advocated for the restoration of feudal systems.

Corporatism as a doctrine predates Fascism and follows a non-linear path, as it left its mark on Western European liberal democracies as well. Ferdinand Tönnies (1855-1936), the German sociologist, influenced the theocratization of corporatism with his idea of a dualism of 'community' and 'society' (*Gemeinschaft* vs. *Gesellschaft*). Community is based on 'real and organic life,' society on the 'imaginary or mechanical.' Society is 'public life;' in community, *"with one's family, one lives from birth on bound to it in weal and woe"* (Tönnies 1887: 37). He believed that there was unity, a hierarchy of authority, paternalism, healthy relations, community in the Middle Ages, in contrast to modern society where people are strangers to each another and there is atomization and exploitation. In community, natural will

and laws prevail (see **organicism**); in modern society there is but the rational will. The concept of corporatism is very close to Tönnies' concept of communitarianism.

In the nineteenth century, corporatist doctrine was officially recognized by the Roman Catholic Church and later elaborated in papal encyclicals like the Leo XIII's *Rerum Novarum* (1891) and Pius XII's *Quadragesimo Anno* (1931). This approach resulted in the Catholic Church blessing trade unions and organized labor, with the aim of keeping atheist influences among workers at bay. This explicit endorsement certainly moved the corporatist debate from seminar rooms to presidential palaces (Pinto 2023: 27). Under the intellectual tutelage of S.G. Hobson and G.D.H. Cole this thinking sprouted a movement in England called Guild Socialism in 1900-1930, which aspired to establish workers' control of industry through a system of national guilds, inspired by their medieval counterparts (Britannica 2012).

In the 1920s corporatism was officially adopted by Italian Fascism as part of a totalitarian ideology based on ideas of a corporate state, an organically-based political system that promoted organic communities such as the family, and the nation itself as a big family, where there is no room for class conflict or other types of dissent. This type of corporatism later inspired Francisco Franco's Spain, António de Oliveira Salazar's Portugal, and authoritarian regimes in Argentina, Brazil and Chile, in Latin America, and even Yugoslavia and the Baltics. After World War II, many democratic European countries, especially Austria, Norway and Sweden, developed corporatist ideas to mediate and reduce class conflict between business and trade unions (Britannica 2014; Soucy 2022; Panitch 1977).

LITERATURE First emerging as an ideological and institutional mechanism in the first half of the twentieth century, corporatism was later adapted by democracies. The 1970s and 1980s witnessed the rise of corporatism as a political theory, primarily intended to capture Latin American realities. Schmitter and Grote (1997) later found this turn ironic. Just as academics started using the concept to analyze trends in advanced capitalist societies, the practice had already peaked and was in decline during the 1980s. After its demise was announced in the 1980s, the concept emerged once more in the 1990s, like a 'corporatist Sisyphus,' only to be questioned again by the turn of the century (Oxhorn 1998). Witnessing the reappraisal of the concept in recent years, the authors might have been spot on about this oscillating interest.

At the beginning of the 1970s, pluralism as the hegemonic global concept was in crisis, and the ideology of corporatism had grown more powerful in its neo- or liberal forms. "Pluralism between Liberalism and Socialism," a work by Rainer Eisfeld (1972), provided an excellent illustration of the state of ideas by the end of 1960s. At the same time, Schmitter began a new discussion by arguing in his well-known article "Still the Century of Corporatism?" that pluralism was insufficient as a model for understanding political processes. Alongside these ideas there emerged a school of corporatist thinkers – G. Lehmbruch, R.E. Pahl, J.T. Winkler and others – who developed a compelling criticism of pluralism, promoting ideas of neo-, liberal, or societal corporatism instead. Corporatism was put forward as a *"new form of political-economic organization"* that involved, *"like socialism, a high level of state activity, but (...) in which the state plays a qualitatively different role"* (Pahl & Winkler 1976: 5). Corporatism was also offered as *"an economic system in which the state directs and controls predominantly privately owned business according to four principles: unity, order, nationalism, and success"* (Pahl & Winkler 1976: 7). Winkler argued that corporatism *"is the most likely development for the UK over the next 5 or 10 years"* (Winkler 1976: 100). Politically, the US was under pressure in the aftermath of the Vietnam War and the weakening of its President during the Watergate scandal. Von Beyme observed: *"the majority of researchers agree that corporatist conflict mediation patterns are not an episode in post-war history"* (von Beyme, 1983: 194).

After neoconservatism and neoliberalism became the dominant ideologies in Western political systems in the 1980s, corporatism lost its currency. In the Trilateral Commission's 1979 report, all forms of direct negotiation, particularly in the field of labor and social market policies, were proclaimed inappropriate for economic development. Trade unions and all kinds of other professional organizations lost much of their power. All other collective forms of organization also lost influence. The process of individualization destroyed the bases of corporatism.

The most powerful forms of corporatism were developed in Austria. *'Socialpartnerschaft'* as a rule led all kinds of policies, including financial policy and state-owned banking (Pelinka 1984). Scandinavian states also developed a huge network of corporatist institutions. Slovenia is a peculiar case. It has a senate, a second parliamentary chamber, elected on the principle of the corporate representation of vital interests, as well as an institutionalized social partnership, in the form of a Social Council, where representatives of trade unions, employees' organizations and the government discuss issues pertaining to financial, social, and labor policies (Lukšič 2003).

Schmitter was the first to link Latin American cases to similar practices in northern Europe in the 1970s, thus revealing the universalist nature of (neo-) corporatism. In contrast, H.J. Wiarda (2009) took another direction when he adopted a more cultural approach (not solely focused on institutions) with the purpose of countering Western-centered frames of development and Easton's systems theory (**modernization theory**) with regard to Latin America. So, corporatism became for Latin American Studies what **neo-patrimonialism** became for African Studies. The Third Wave of democratization in Latin America (1970s to 1990s) contributed to the decline of the study of corporatism as scholarly attention switched to transitions, privatization, austerity measures and liberalization.

The 1990s saw a short resurgence after T.M. Shaw and J.E. Nyang'oro (1989) tried to apply it to African Studies, but its conclusions regarding the applicabil-

ity of the concept were tentative (see below). More recently, the concept recurs in the comparative study of fascism (Pasetti 2017; Pinto 2014, 2015, 2017) and the cultural impact of corporatist authoritarian legacies (Bensusán 2016; Pinto 2023; Pinto & Finchelstein 2018) – see also 'regional variation,' below, for legacies of individual cases.

There are many treatises on the concept and evolution of corporatism. The main works of Schmitter, von Beyme, Pahl and Winkler treat it as a system of interest representation. Wiarda, Collier & Collier, and Pinto consider it as an institutionalized political culture. Other interesting overviews and critiques include P.J. Williamson (1985); A. Cawson (1986); A. Cox (1988); L. Baccaro (2002); O. Molina & M. Rhodes (2002). Note: A very comprehensive bibliography of works on corporatism, before 1984, can be found in Cawson & Ballard (1984).

CLASSIFICATIONS A. Pinto makes a distinction between 'social corporatism' as a system of interest representation – with the accent on structuring and subsidy, and less on state control – and 'political corporatism,' based on an 'organic-statist' system of political representation (Pinto 2017: 5). There is a rough overlap between this division and the diverging approaches launched by Schmitter and Wiarda.

D. Collier differentiates several subtypes in terms of the locus of power along four (a-d) dimensions: (a) power located in either the state or society results in state-imposed or bottom-up corporatism; (b) privatizing vs. statizing, depending on whether groups penetrate and privatize a sector or the state, or *vice versa*; (c) inclusionary vs. exclusionary, depending on whether or not the ruling elites are dependent on societal support to rule; (d) using inducements or restraints, referring to the tactics used by the state to either solicit cooperation or apply direct control (Collier 1995: 145; Collier & Collier 1979).

METHODOLOGICAL ISSUES D. Collier (1995: 139-141) highlights that most scholars shared an empirical understanding. Despite the fact that Schmitter renewed interest in the phenomenon, his exemplary case (Brazil), with its elaborate corporative system, was rather an outlier. Scholars did not assume the existence of similar levels of corporatism in other cases. That being said, theory and reality did not often match: and even Brazil did not install an overarching labor confederation at the national level. Corporatist organizations combining labor and business were not only very rare (e.g. Peru after the 1968 coup); they also proved to be unsuccessful. A. Pinto (2023: 31) notes that while fascist Italy was the dominant model, it had one of the slowest implementations, resulting in more inter-institutional tensions than other authoritarian transformations.

Other criticisms observe that corporatist state control was uneven and biased toward managing labor while always leaving business less constrained (Collier 1995: 140); and that the focus is always on national institutions, ignoring the local level (Linn Hammergren, cited in Wiarda 2009: 95).

MEASUREMENT No system has been developed to measure corporatism as a political doctrine. So far, the only way is to describe its elements, such as institutions and values. A. Stepan (1978: 46) finds that corporatism contains an inherent risk of imbalance. *"On the one hand, power may shift toward the state to such a degree that corporatism is simply transformed into a system of state domination of groups. On the other hand, power may shift toward the groups to such a degree that central coordination, an essential attribute of corporatism, is lost or is fundamentally weakened"* (Collier 1995: 139). Of course, there is no established 'correct' balance.

Pahl and Winkler (1976: 12) classify political systems according to criteria of ownership (private or public) and control (private or public). By also considering non/egalitarianism, they obtained eight types of arrangements, two of which are corporate: Scandinavian redistributive corporatism and fascist Italy's conservative type.

To measure corporatism as an interest mediation system, specific indicators have been developed, allowing scholars to gauge the level of corporatism within a specific political system. Using the criteria of organizational centralization and the representative monopoly of interest organizations, Schmitter (1981: 294) ranked the political systems of countries from Austria, where corporatism is strongest, to the US, where it is weakest.

REGIONAL VARIATION Most treatises on corporatism deal with few case studies, but larger regional comparisons are also common. Interwar Europe and post-World War II Latin America are the main world regions under scrutiny, tied together by colonial legacies and fascist emulation. Wiarda (1973: 209-213) finds that the durability of this pattern in Latin America can be explained by the fact that its Iberic-Latin nations were largely bypassed by the great revolutions associated with the making of the modern world, rendering these polities in the 1970s a 'living museum,' where older institutions and traditions persisted alongside newer forms.

As concerns Europe, most works on Mussolini's Fascism cover his state corporatism (Golden 1986; Gagliardi 2016; L. Cerasi in: Pinto 2017) and Salazar's *Estado Novo* – the most durable example, lasting from 1933 to 1974 – in Portugal (McAdams 1952; Schmitter 1975; Ingerson 1984; Stoer & Dale 1987; Garrido 2018, 2020; Freire & Ferreira 2019; De Lucena 2021; Wiarda 2021). Rarer exceptions are Chirot (1980) on socialist Romania, and Whitman (1991) on the spread of corporatist ideas in the USA.

In former Yugoslavia, corporatism was most firmly established in Slovenia and Croatia, which were influenced by Catholicism and the Habsburg monarchy. Even under Tito's communism, socialist self-management contained the idea of functional representation in the form of a delegate system, and transferring the interests of self-governing communities, labor organizations and local communities to the state level. Even today, the Republic of Slovenia has a second house of parliament, which is based on functional representation and not on liberal democratic principle. Representatives to the Senate are

elected by interest groups and not by voters in a general election. Social partnership (institutionalized co-operation between labor, business and government) and the chamber system, having mandatory membership, is also in force in Slovenia (Lukšič 1994; Zver 1990; Zakošek 1987).

Latin America is the other much-studied world region (Malloy 1976; Philip 1980; Bensusán 2016; Wiarda 2019), with many works focusing on Mexico (Wiarda & Guajardo 1988), Brazil (French 1991; Albernaz 2016; Teixeira 2018; Vannucchi 2022), Chile (Drake 1978; M. Sznajder in Pinto & Finchelstein 2018), and Argentina (Buchanan 1985; F. Finchelstein in Pinto & Finchelstein 2018; Etchemendy 2019).

Corporatist legacies are also a popular research subject (Morck & Yeung 2010) with attention paid to individual cases: Portugal (Stoleroff 1992; Rovo 2002), Spain (Pérez-Díaz 1986; Martinez-Alier & Roca 1987; Royo 2006; Begega & Balbona 2014; Prat & Molina 2014), Italy (Baccaro 2002; Salvati 2006), Mexico (Grayson 2007; Patroni 2001), Brazil (Doctor 2003; 2007), and Argentina (Patroni 2001)

There are also many regional comparisons on the common legacy of Iberic-Latin corporatism (Wiarda 1974; Pinto 2015; Teixeira 2016; Pinto & Finchelstein 2018), on the decline of neo-corporatism in Europe (Balbona & Begega 2015), their links with fascism (Pinto 2014; 2017; Pasetti 2017) and Catholicism (J. Pollard in: Pinto 2017; de Abreu & Costaguta 2021).

Comprehensive application to cases in Africa (Shaw & Nyang'oro 1989) remains a critical but tentative endeavor, yielding mixed results, skepticism and warnings against conceptual stretching. In particular, the perceived 'weakness' of African states, with ethnicity trumping class, and their bias to informal and agrarian economies in those times, made most regimes unlikely cases for the study of corporatism (Negash 1991). South Africa is a better fit (Maree 1993) due to its industrialization.

NEW FRONTIERS Interesting other approaches are the corporatist influence and transformation of bureaucracies under corporatist policies, leading to the creation of accounting syndicates in Brazil (Agrizzi & Sian 2015; Rodrigues & Craig 2022) and the emergence of **bureaucratic authoritarianism** in Portugal (Madureira 2007). Other original avenues involve the concept's relation to Federalism (Encarnación 1999) and ethnodevelopment (Chartok 2013), and the perpetuation of gender inequality (Elomäki et al. 2021).

Despite these new avenues, corporatism as a doctrine and organizational form continues to lose weight because it is being undermined by individualism and 'mechanicism.' Modern authoritarian regimes no longer build an ideological base that is founded on organicism.

Fascism

Democracy is a kingless regime infested by many kings who are sometimes more exclusive, tyrannical and destructive than one, even if he be a tyrant.
– Benito Mussolini

Fascism was a reactionary **ideology** used by conservative forces to counter the growing threat of anarchy and communism. Fascism celebrates military might, extreme devotion to country and the superiority of the nation.

Fascism today is a quasi-analytical political concept that is being increasingly used to characterize far-right authoritarian populist movements, or to disqualify political opponents. Though these movements may take inspiration from past fascist movements, no political movement today has managed to replicate the latter.

There is a broad consensus about the existence of the two fundamental fascist regimes – Italian Fascism and German **Nazism**. However, there is some disagreement about the classification of other regimes of that period, such as Francisco Franco's regime in Spain and António de Oliveira Salazar in Portugal, as well as about the nature and characteristics of the regimes in European colonies. In addition, there is much theoretical disagreement about what the key features of fascism are, as well as what constitutes fascism.

DEFINITION When attempting to explain the phenomenon of fascism, a distinction must be made between the self-identification of the Italian political movement, led by Benito Mussolini, and the wider, and also contested, concept of fascism that has often been used to describe different far-right, conservative, and traditionalist ideologies, political regimes and movements in different parts of the world in different historical periods. This is why Griffin proposes 'Fascism' to label the Italian fascist political regime from 1919 until 1943, and 'fascism,' with a small 'f,' for other similar political regimes outside Italy (Griffin 1991). Traverso further suggests that one must differentiate between historical emanations of fascism and its contemporary variations, noting that *"the concept of fascism seems both inappropriate and indispensable for grasping this new reality"* (Traverso 2019: 4). Therefore, he argues that we should use the concept of 'post-fascism' to define fascist-like movements. However, this still does not provide an answer to the question: what is fascism?

Robinson claims that although *"enormous amounts of research time and mental energy have been put into the study of it (…) fascism has stubbornly remained the great conundrum for students of the twentieth century"* (Robinson 1981: 1). Here we summarize the three most common ways of defining fascism: fascism as a specific ideology (i), fascism as a political movement (ii), and fascism as a political regime (iii).

Political ideology (i) Passmore (2002: 31) defines fascism as a specific *"set of ideologies and practices that*

seeks to place the nation, defined in exclusive biological, cultural, and/or historical terms, above all other sources of loyalty, *and to create a mobilized national community."* Moreover, fascism was an antipode of liberalism – giving priority to the nation over the individual – and actively opposed to socialism and feminism. Fascism is also considered a movement of the 'radical' right because its ideologues state that the defeat of socialism and feminism and the creation of the mobilized nation are necessary to enable the coming to power of a new elite, one acting in the name of the people, headed by a charismatic leader, and embodied in a mass, militarized party (Passmore 2002: 31).

Political movement (ii) Griffin (1991: xi) argues that fascism can be best defined as a revolutionary form of nationalism, one undertaking to be a political, social and ethical revolution, aiming to weld the 'people' into a dynamic national community led by new elites infused with new heroic values. *"The core myth which inspires this project is that only a populist, trans-class movement of purifying, cathartic national rebirth (palingenesis) can stem the tide of decadence"* (Griffin 1991: xi). Griffin emphasizes that this aspect is the 'fascist minimum' or the baseline present in all forms of fascism.

Dave Renton claims that the best way to capture fascism is as a particular form of mass movement, possessing a core set of ideas, in which ideology and mass movement interact. Thus, fascism should not be understood primarily as an ideology, but as a specific form of reactionary mass movement (Renton 1999: 3).

Political regime (iii) Although there are different definitions of fascism, many scholars identify common features: the strong party, the strong leader, the purification of society, the revival of the nation, the removal of 'impure,' 'unhealthy,' 'racially inferior' elements through industrial systems like death camps. Fascist regimes emphasized militarism and glorified war, and have focused on capital accumulation and a military economy. Though fascists usually came to power using quasi-democratic mechanisms, fascist regimes are un-democratic. Fascism closes down and destroys political opposition, while using slave labor (and anti-worker policies – see **corporatism**) to drive economic growth (Griffin 1991; Sternhell 1994; Passmore 2002).

SEE ALSO The concept of fascism is closely associated with other concepts like right-wing extremism, clerical fascism, *caudillismo* (see also Box 1.10 and **coups**), **totalitarianism**, **Nazism**, **ultra-nationalism**. It often also includes elements of **populism**, nativism, xenophobia, **racism**. To better explain the contemporary political phenomena of extremism, ultra-nationalist and racist movements, scholars mostly use the concepts of post-fascism and neo-fascism.

KEY SIGNIFICANCE The concept of fascism was crucial to explaining and understanding the specific political processes and forms of political rule that emerged after the World War I. It was developed to explain the rise of Mussolini in Italy and Hitler in Germany, while also focusing on the relationship with other important political phenomena: liberalism, socialism, democracy, communism, etc. Its significance today is often blurred due to conceptual stretching and due to difficulties delineating it. However, this does not mean that the concept has lost its relevance, but rather that effort is needed to establish clearer benchmark indicators of fascism.

ORIGIN The term 'fascism' is actually of Latin origin: *fasces* meaning 'a bundle,' commonly used to symbolize a bundle of birch or elm rods, with the blade an axe emerging from the bundle. In ancient Rome, the *fasces lictoriae* (bundles of 'lictors,' attendant-bodyguards to magistrates) were the symbol of authority (*imperium*).

In modern usage, the term comes from the word *fascio* (faction) – a word used in the late nineteenth century to designate a political group, guild or syndicate. Prior to and during WWI, there were several different *fascis* in Italy – different political groupings with very different political orientations – from left to right. In 1919, Benito Mussolini founded the *Fasci Italiani di Combattimento* (Italian Fasces of Combat), a succeeding the more leftist *Fascio d'Azione Rivoluzionaria* (Fasces of Revolutionary Action). In 1921, the *Fasci Italiani di Combattimento* was renamed and reorganized as the *Partito Nazionale Fascista* (National Fascist Party) (Cassels 1969; Lyttleton 1979; Seton Watson 1967).

While the origin of the term 'fascism' can be quite clearly traced, there is considerable debate about the historical genesis of the phenomenon of fascism, its origins, and the conditions under which it can emerge. Although fascism as a socio-political phenomenon is tightly linked to the interwar period, its origins and genesis have a longer history. This longer history can be traced to the late nineteenth and early twentieth-century far-right political movements in France (the *Boulanger* movement, the *Sorel* movement, *Action Française* – see Sternhell 1996), Anglo-American theories and immigration, health and social policies of social Darwinism and eugenics (racial hygiene), and broader modern Western imperial racist discourses and policies. It was on these sources that Italian, German and other fascist regimes drew when they were established in the interwar period to address the actual and perceived multidimensional crises (political, economic, identity) of the capitalist nation-state order(s) at both the local and global level.

LITERATURE In wider usage, as a concept, fascism was already introduced in the 1920s, with some important differences. Some authors, like Pelham Horton Box, Herbert Wallace Schneider and Carmen Haider, attempted to define fascism more precisely, while other early scholars viewed fascism as a distinctly Italian experience. Renzo de Felice (1977) provides a detailed overview of the debates and the evolution of the interpretations of fascism in and outside of Italy.

Throughout the twentieth century, and into the twenty-first, many different theoreticians have engaged with the problem of fascism. Marxist approaches to fascism focus on the connection

Box 4.1 Bonapartism: An Impossible Balance Between Representation & Control

I can no longer obey; I have tasted command, and I cannot give it up.
– Napoleon Bonaparte

A. Bullock and F. Deakin (1973) refer to Bonapartism as 'the intellectual's nightmare:' *"The simplest definition of Bonapartism is that it is the perpetuation of the ideas of Napoleon I, the cult of his genius and the appeal to his methods for the solution of France's problems."* It was a distinct mode of governance, both post-revolutionary and post-democratic, a hybrid of military **tyranny** and egalitarian reforms (Richter 2005).

Bonapartism (*Bonapartisme* in French) emerged in response to the chaos unleashed in France by the incessant struggle between forces associated with the **revolution** of 1789 and counter-revolutionary forces associated with the *ancien régime*. Inspired by the ideals and style of governance of Napoleon Bonaparte (1769-1821), it became a complex political ideology that was adopted and adapted by his descendants and their followers. This lack of consistency in its implementation, combined with an unrelenting anti-democratic branding by its opponents in France and abroad, makes Bonapartism very difficult to delineate and define.

It is commonly associated with the glorification of force and the practical exercise of power, its adherents advocating for the return of **charismatic rule** and **personalist rule** with the aim of restoring order and glory – a mission shared by **fascism** (Dülffer 1979). The concept was created after the first fall of Napoleon in 1814. Like all 'isms,' it evolved significantly, gaining some doctrinal clarity after the 1840s that enabled it to coax a distinct political movement into being. By then, it matched neither the worldview of Napoleon himself nor his **personality cult** (Alexander 2022).

Sudhir Hazareesingh (2004: 130) notes that, for a while, Bonapartism and **republicanism** walked hand-in-hand in France. Their fallout was the 1851 **coup** by (President) Charles-Louis Napoléon Bonaparte (Napoleon's nephew, who later ruled as Napoleon III, r. 1852-1870) who closed down the National Assembly, reinstated monarchic rule and ended the second republic. He imposed his own anti-democratic stamp (and its rejection of the rule of law) on the Bonapartist movement, which lasted long after his military defeat in 1870.

For Marx and Lenin, Bonapartism is a form of government that grows out of the counter-revolutionary nature of the bourgeoisie, aided by the military, under conditions of democratic changes and democratic revolution, resulting in a **tyranny** standing over all social groups. In the words of Karl Marx: *"the struggle seems to have reached the compromise that all classes fall on their knees, equally mute and equally impotent, before the rifle butt"* (Marx 1977, cited in Hazareesingh 2004: 129). To these leftist thinkers, Bonapartism nominally and superficially embraces some democratic values in order to instrumentalize the radicalism of the people, but masks a narrow circle of bourgeois powerholders behind the scenes (Lenin 1977: 255-260). For Gramsci's understanding of Bonapartism, consult: Antonini (2020).

The paradox of the concept lies in its double dynamic of centralizing power at the top of the regime and a diametrically opposed democratization of society by breaking down class divisions through egalitarian measures, such as male universal suffrage and enabling local democracy. For Bonapartism, democracy played an important plebiscitary role, and even its centralized authoritarian leadership was expected to enjoy widespread popular support.

This leads to a schizophrenic situation where: *"Local and central administrative institutions were also given explicitly political functions of control, surveillance, and repression. These powers were exercised against individuals and groups who engaged in activities deemed hostile to the interests of the Empire. The elimination of political dissent was part of a broader conception of public life in the provinces that particularly stressed the value of non-partisanship. Representative institutions were presented as administrative rather than political bodies, whose deliberations were not allowed to enter the public domain"* (Hazareesingh 2004: 134).

Thus, partly representative state institutions were supposed to adhere to a form of **technocracy**, fostering a specific form of patriotic citizenship under a centralized command. Of course, no Bonapartist regime ever succeeded in overcoming the inherent tension arising from the heterogeneity of popular representation and the iron fist upholding consensus and order. Still, the formative contribution made by Bonapartist experiments with male universal suffrage to the French model of democracy, and to democratic theory in general, should not be dismissed (Hazareesingh 2004: 151-152).

Modern applications can be found in Abu-El-Haj (2016) and Boita (2020) for Lula's Brazil, and in Hewlett (2007) for Sarkozy's France. For a comparison with 'Caesarism,' see: Richter (2005); McDaniel (2018); and Antonini (2020).

between fascism and the crisis of capitalism after WWI, the main line of argument being that fascism was an answer to the bourgeoisie's inability to preserve its rule in the midst of capitalist crisis and the emergence of strong proletarian movements and communist/socialist parties. Fascism is described as a specific answer to the structural crisis of capitalism (Pollock 1941a/b), as a new type of 'Bonapartism' (Vajda 1976) – see also Box 4.1 – and as an all-encompassing Behemoth-like state, under which there was only anarchy and policies that favored the richest (Neumann 2009); as a specific and exceptional form of the capitalist state (Poulantzas 1974); or even, in a more culturalist interpretation, as the culmination of the bourgeois destruction of reason (Lukács 2001). Fascism was thus understood primarily as anti-proletarian, pro-capitalist and a form of (petty-)bourgeois reactionary politics.

Marxist critiques emphasize the continuation of the modern capitalist project and the connections between the capitalist class and the fascist state and politics, and also the culmination of the project of rationalization and the domination of instrumental reason (Neumann 2009; Horkheimer & Adorno 1969). On the other hand, liberal thinkers emphasize the uniqueness and discontinuous nature of fascist regimes in relation to the nineteenth-century liberal colonial and capitalist order (Eisenstadt 1964; 1966; Turner 1972).

After World War II, there was a tendency among **totalitarianism** scholars to explain the cruelty and novelty of the fascist regimes. Hannah Arendt (1962), in *The Origins of Totalitarianism,* established the framework for explaining Nazism as a specific emanation of fascist politics, as politically totalitarian, while considering the Italian fascist regime as belonging to authoritarian **single-party regimes**. However, her work is characterized by a major discrepancy: in the first part of the book, she mostly analyzes imperialism and colonialism, whereas the second half of the book is devoted to the analysis of Nazism and Stalinism as totalitarian regimes. Talmon (1952) with Friedrich and Brzezinski (1956) follow Arendt in explaining fascism and Nazism (while also including Stalinism and/or socialism as such) as totalitarian regimes.

Different authors explored the problematics of fascism within the framework of **modernization theory**. In *Political Man,* S.M. Lipset (1960: 137) argues that fascism and populism propose solving problems by taking over the state and running it in a way which will restore the old middle classes' economic security and high standing in society, while reducing the power and status of big capital and big labor.

David Saposs (1935: 395) claims that fascism is *"the extreme expression of middle-classism or populism."* Renzo de Felice (1977) also argues that Italian fascism found its biggest supporters among the lower middle classes.

In their seminal work *Dialectic of Enlightenment*, Horkheimer and Adorno (1969) demonstrate the destructive side of progress, as well as the rational irrationality of modernization and the technological domination of capitalist societies. Culturalist explanations define fascism as a specific movement based on some cultural essentialism. George Mosse (1998: x) argues that one should understand fascism the way it understood itself – as a cultural movement – because *"fascism created a political environment which attempted to encompass the entire man or woman, to address, above all, the senses and emotions, and at the same time to make the abstract concrete as something uplifting and familiar which can be seen and touched."*

Sternhell explains fascism as a specific anti-materialist revision and substitute for Marxism, combined with syndicalism and nationalist mythology. Sternhell (1994) thus emphasizes that fascism was a form of *"alternative political culture"* and that *"fascism, before it became a political force, was a cultural phenomenon. The growth of fascism would not have been possible without the revolt against the Enlightenment and the French Revolution which swept across Europe at the end of the nineteenth century and the beginning of the twentieth"* (Sternhell 1994: 3).

Besides these approaches, Umberto Eco's 1995 essay "*Ur-Fascism*" dissected fourteen elements of fascism, using the concept of 'Ur-fascism' as a broader conception of fascism operative at different times and in different forms. Eco lists the following characteristics of fascism: (1) its cult of tradition and traditionalism; (2) its rejection of modernism; (3) irrationalism and *"action for action's sake;"* (4) its intolerance of criticism; (5) its fear of differences and racism; further noting that Ur-fascism (6) builds on social or individual frustration; (7) on nationalism and an obsession with foreign enemies; (8) while trapped in an inherent paradox that these enemies are simultaneously too weak and too strong; (9)

in order to equate life with struggle, as life is *"permanent warfare;"* moreover, the ideology serves male elites, advocating vertical mobility with (10) its racial, nationalistic and popular elitism and its *"contempt for the weak;"* (11) while maintaining that everybody within the nation is to become a hero; (12) espousing sexism and machismo by instrumentalizing (13) 'selective populism' and (14) Orwellian 'newspeak.'

Ernst Nolte's *Three Faces of Fascism* represents fascism as a strongly anti-Marxist movement: *"Fascism is anti-Marxism which seeks to destroy the enemy by the evolvement of a radically opposed and yet related ideology and by the use of almost identical and yet typically modified methods, always, however, within the unyielding framework of national self-assertion and autonomy"* (Nolte 1966: 20-21). In an almost apologetic fashion, Nolte presents fascism as an overreaction to and merely the stronger copy of the original evil – the Bolshevik regime in Soviet Union. (This also led to the famous *Historikerstreit* ('historians' dispute') in (West) Germany in the late 1980s, most notably, though not confined to them, between Nolte and Habermas on how to incorporate Nazism and the Holocaust into German historiography.)

On the other hand, James Gregor (1976) defines fascism as a specific variant of Marxism, one actually expressed as such in the form of 'national syndicalism' and a specific modernizing dictatorship. Both Nolte and Gregor remain critical of fascism, but Nolte saw it as a response to socialism, whereas Gregor saw a continuity between the two, respectively arguing for equating them or classifying them as similar regime types.

Many thinkers have looked for continuities between fascism and **socialism** – especially in theories of **totalitarianism** – but one fact cannot be overlooked. While it is true that a large number of the first fascists in Italy came from the ranks of trade unionists and socialists, it is a fact that the first victims of both Nazism and fascism were precisely socialists and communists. Fascism, despite its emphasis on the ordinary man, was in essence extremely anti-worker, and (like Nazism) based on a strong connection to the capitalist classes and the disciplining of populations for the expansion of capital and territory. Both required the support of the capitalist class and large industrialists (Adler 1995; Neumann 2009; Mastnak 2019; de Jong 2022) – while socialism was the negation of capitalism.

These accounts match the argument of the famous neoliberal pro-capitalist theoretician, Ludwig von Mises (1881-1973), who praised the advent of fascism while being highly critical of socialism. Von Mises claimed that the rise of fascism *"saved European civilization. The merit that Fascism has thereby won for itself will live on eternally in history. But though its policy has brought salvation for the moment, it is not of the kind which could promise continued success. Fascism was an emergency makeshift. To view it as something more would be a fatal error"* (von Mises 2005: 30).

METHODOLOGICAL ISSUES Despite its present popularity in scholarship and in broader political and societal discourses, fascism remains an ambivalent phenomenon. There are fundamental disagreements about its nature and central characteristics, both regarding its historical forms and its contemporary manifestations. Further, regarding the scope of the phenomenon, there are disagreements about which regimes can properly be included (e.g. Nazi Germany, Fascist Italy, Shōwa statist Japan – see Box 4.2) and which lack one or more crucial features, such as expansive militarism and racist, genocidal policies (e.g. Franco's Spain, Salazar's Portugal, Perón's Argentina).

Additionally, there are fundamental disagreements between the liberal (a) and Marxist (b) theoretical traditions concerning the nature of historical fascist regimes. The liberal tradition (a) perceives fascism as a historical singularity without precedent, antithetical to modernity and its fundamental socio-political and politico-economic structures, institutions, and norms by being anti-democratic, anti-liberal, anti-capitalist anti-individualist and anti-internationalist, racist and totalitarian, and therefore more closely related to Stalinism and communism in general than to Western liberal regimes.

The Marxist tradition (b) understands fascism as a more extreme but logical development of the modern capitalist imperial regime organized through the nation-state and dependent on exploited colonies. For Marxists, fascism is a specific response of the capitalist system and its elites to the radical multidimensional crisis of the interwar period, which endangered the fundamental stability and cohesion of certain capitalist societies and drew from ideologies, practices, and institutions pertinent to modern Western imperialism and liberal regimes. Hence, it cannot be considered as related to Stalinism or communist regimes.

This also bears on the understanding and analyses of contemporary forms of fascism. Scholars in the liberal tradition locate modern manifestations of fascism on the margins of liberal societies or in non-Western authoritarian contexts, or else perceive and analyze them as contrary to the inherent progressive nature of liberal societies, as aberrations, remnants of the past, an ideology for the unenlightened, uneducated parts of the population. Alternatively, Marxist and other critical traditions view contemporary forms of fascism as specific capitalist responses to the contemporary multidimensional crises of the local and global order, which cannot be understood as antithetical to modern capitalist-imperialist structures, institutions and norms but rather draw on them and their history.

Despite these fundamental differences there is general scholarly agreement concerning the novelty of contemporary forms of fascism and, simultaneously, an accord concerning the ongoing usefulness of the analytical term 'fascism' to understand these contemporary phenomena. However, some scholars (see Traverso 2019) claim that it would be more appropriate to use a novel term like 'post-fascism' to frame contemporary fascist phenomena (right-wing **populism**), implying both continuity and transformation in relation to historical fascist regimes, movements, and ideology.

CLASSIFICATIONS While there exists no final, authoritative classification of fascist regimes, the four types listed below are usually treated as separate manifestations.

Italian Fascism After the end of WWI, the Italian bourgeoisie was not satisfied with its territorial gains, while the large gap between its industrialized north and agricultural south fueled social tensions. In the summer of 1920, it seemed that a socialist revolution might take place in northern Italy because of worker mobilization, led by socialists and anarchists during the more extensive *Biennio Rosso* (Two Red Years). Uprisings spread from Turin and the Fiat plants. In response, the workers' councils (blueprints for *soviets*) and their insurrections were crushed. Italy's political landscape changed to meet these difficulties and national disappointment (Adler 1995; Morgan 2004; Finaldi 2008; Vivarelli 2012).

The answer to the failed workers' revolution was the strong rise of fascism and Mussolini's *Partito Nazionale Fascista*'s March on Rome in October 1922 (a mass demonstration followed by a **coup**), which was also backed by Italian capitalists and the landowner class. The *Fasci Italiani di Combattimento* were established in 1919 by Benito Mussolini, a former socialist and trade unionist. He became an advocate of national rebirth and grew stronger in the aftermath of WWI (Snowden 1989; Vivarelli 2012).

Under fascist rule, all political parties were forbidden by 1926. The crucial body was the *Gran Consiglio del Fascismo* (Fascist Grand Council), and most power was in the hands of the party and state leader Mussolini, who was proclaimed *il Duce*, although, on paper, Italy remained a monarchy led by Victor Emanuel III, who wielded little power.

Italian fascism was based on **corporatism**, and its organizational basis lay in collaboration between syndicates and associations of employers, resulting in the pacification of the labor movement, whose leaders were either imprisoned or executed. It adopted the *Carta del Lavoro* (Labor Charter) in 1927, which entailed the complete depoliticization of trade unions. In 1929, with the signing of the Lateran Treaty, it also reached an agreement with the Vatican. These reorganization measures, combined with the elimination of political opposition, especially from the left, were the key foundations for the fascist attempt to gain new territories (Finaldi 2008; Albanese 2019).

Special focus was given to expansionism (in Europe and Africa) and the '*spazio vitale*.' Moreover, in 1938 the fascist regime also adopted race laws, which were openly antisemitic. Although initially afraid of the *Anschluss* (the German annexation of Austria), because it would bring Germany to the border of Italy, the Rome-Berlin Axis was quickly established, later additionally strengthened by Japan. Italy officially entered WWII in June 1940, when Germany almost completely crushed France's resistance in the *Blitzkrieg*. The fascist regime lasted until 1943 under the leadership of Mussolini and the *National Fascist Party*, and from 1943 until April 1945 under the *Republican Fascist Party* in northern and central Italy, which was occupied by the Nazi regime (Adler 1995; Morgan 2004).

German Nazism Historically, the German Nazi regime can be considered the most extreme form of a fascist regime and the most radical implementation of the central fascist ideals of society and its development. It was a racist, sexist, patriarchal, genocidal, totalitarian, militaristic and imperialistic regime organized around the racist (Aryan) conception of a biologically homogeneous nation (*Die Volksgemainschaft*). This nation was conceived as constantly under biological/racial threats internally and externally (e.g. the Jews, the physically and mentally disabled, Roma, Slavs, etc.), which have to be regulated and/or exterminated (e.g. segregation, sterilization, extermination in concentration camps).

Additionally, the nation was cared for and developed as a 'biological organism' through health and family policies that targeted the proper members of the nation, who were incited to reproduce, while the Nazi regime's military and imperialist policies aimed at providing either the necessary space for the nation's expansion (*Lebensraum*) or the resources (natural resources and slave labor) for the general reproduction of German society and the proper functioning of its economy. The latter was capitalist, with the important distinction that racist-genocidal-eugenic ideas overrode even the central capitalist logic of accumulation of profits. The regime was built on the idea of an all-powerful and all-knowing leader (*Der Führer*) in the person of Adolf Hitler, and rested on the organizational might of the NSDAP (the Nazi party), which constituted a parallel institutional structure having its own security and military forces, part of but not subordinate to the state repressive apparatus. The regime lasted from 1933 until the end of WWII in 1945, a war for which it was directly responsible through its expansionist militaristic policies. Despite the short period of its existence, it was the deadliest known regime in human history, killing more than 15 million people.

Neo-fascism & Post-fascism These contemporary forms can be considered variants of a varied political ideology that combines the old fascist **charismatic rule**, the plebiscitary conception of democracy, and mass gatherings with the cult of the market (not the state); television and social media advertising, presence, and (personal) popularity (rather than mass movements). In comparison with its historical predecessors, they are far from subversive as they are internally contradictory reactionary phenomena whose aim is the recreation of a golden past and not a novel future society. Their main perceived antagonists (e.g. Islamists in Europe) are contrary to historical fascism's main antagonists (socialists, communists). However, some argue that post-fascism contains a specific Utopian synthesis, as it reworks the fascist ideological axes of nationalism, conspiracism and cleansing, charismatic authority, backlash politics, and violent masculinity; hence, there are important continuities with historical fascisms (el-Ojeli 2019). Post-fascist ideology is characterized by internal tensions, such as opposing gay marriage while having openly gay leaders, or using sexist language while rhetorically fighting Muslim oppression of women.

Neo-Nazism is often treated as synonymous with neo-fascism, but can be considered a specific type of neo-fascist movement, with dispersed (fringe) militant groups all over the world adhering to a more fundamentalist interpretation of classical forms of fascism, enamored foremost with Hitler's **personality cult** and Nazi ideology. Their followers blame their nation's issues on minorities, immigration, and Jews. Such groups include the *Rassemblement National* in France and *Golden Dawn* (Χρυσή Αυγή) in Greece. They often engage in criminal activities while promoting white racial superiority, antisemitism, homophobia, and Holocaust denial, some with the political aim of restoring the form and organization of old fascism.

As shown in Box 4.3, it is problematic to classify the case of the contemporary *Ku Klux Klan* (KKK) under neo-Nazism since it evolved from an earlier KKK predating Nazism. Several of the ideas and practices of the KKK are local (homegrown) – the 'lost cause' of the American Civil War, its interpretation of racial hierarchies or formal segregation, as well as its terrorizing tactics of lynching and burning crosses.

As concerns contemporary cases of neo-fascism, there are many instances of conceptual over-stretching and hybridization. However, the new rise of the far-right in the world of the twenty-first century means that the concept of fascism remains relevant. Thus, future research on fascism and post/neo-fascism will certainly have to deal with its existing contradictions, while simultaneously tackling the epistemological pitfall of proclaiming any conservative, reactionary group, movement or party that embraces a right-wing political ideology, etc., to be fascist.

Box 4.2 The Imperial Shōwa Regime: Fascist or not?

It is easy to fight and win, but it is hard to defend what is won.
– Japanese proverb

The Japanese Imperial Shōwa Regime has been considered a dictatorial regime in the Empire of Japan (1868/1889-1945) between 1931-1945. American war **propaganda** later labeled it a **military regime**. (Bisson 1945) During the period leading up to World War II, the Japanese Imperial Government became increasingly authoritarian and adopted policies and practices that aligned with fascist principles (cf. **fascism**). It emerged with some radical calls by the populist political opposition for a return to the traditional organization of the state based on a model of former shogunates (a feudal-like hereditary military dictatorship), with a central role of the emperor in a modernized and industrialized version of statehood (Edwards 2003; Takeuchi 2002). Several crises and **autocratization** led to the marginalization and elimination of a young Taishō democracy of the 1920s that, in the upcoming Shōwa period since 1926, declined with rising voices for a leading Japan in 'Asia for Asiatics' (Szpilman & Saaler 2011).

The upcoming radical military regime reflected the promises and pitfalls of the Great Empire of Japan (*Dai Nippon Teikoku*) and its geopolitical ambitions in East Asia and beyond (Laš & Baar 2014). The Empire of Japan, which emerged after the Meiji Revolution (1868), had evolved from a bureaucratic-military country-based rice economy using Western political and economic models combined with Japanese and regional (Chinese) influences to an imperial and totalitarian regime towards the end of World War II. The three eras of the Empire of Japan from Meiji (明治時代 – *Meiji jidai,* 1868-1911) to Taishō (大正時代 – *Taishō jidai,* 1912-1926) and Shōwa (昭和時代 – *Shōwa jidai,* 1927-1945) presented different regimes and rising imperial ambitions. Emperor Hirohito (Shōwa), who pursued his imperial duties in the post-war modern constitutional democratic system, turned the constitution into a representative figure and not participatory as during the imperial Shōwa regime.

The (oldest serving) Japanese Communist Party, *Nihon Kyōsan-tō*, whose origins can be traced back to the early 1920s, would have had the most difficult position in the Empire of Japan, as **communism** was banned and its members persecuted. The two main opposition parties in the 1920s were the *Democratic Constitutional Party* (*Minseitō*) and the *Association of Friends of Constitutional Government* (*Rikken Seiyūkai*), which emerged as the two most relevant forces at the turn of the 1920s and 1930s but lost their political prominence to opportunists, pro-militarists, rich (often aristocratic) individuals, or ultra-nationalists (cf. **ultra-nationalism**). Next to a plan for total national mobilization, all parties were 'united' under the *Imperial Rule Assistance Association – Taisei Yokusankai* in 1940, resulting in a quasi-**totalitarian** military regime with 'Japanese characteristics,' first led by Prime Minister Fumimaro Konoe. The government tightly controlled the economy and industrial production for the war effort.

The regime used a myriad of approaches, radical ideologies and regionally tailored propaganda and politics. With its right-wing extremism, ultra-nationalism, populism, xenophobia and racism, charismatic leader and militarized party, it is also labeled as 'Fascism with Japanese characteristics.' For deeper analysis, see the edited volume by Alan Tansman (2009). After the war, Japanese and foreign scholars seized upon the concept of fascism as a tool to explain what had gone wrong in pre-war Japan and who should be blamed. (Duus & Okimoto 1979)

Can the Western understanding of 'Fascism' fit into the modern Asian statehood-making process during the imperial period of colonialism? The term 'fascism' can be used to describe a range of authoritarian regimes, but it has a specific historical meaning that should be understood when it is applied to a given historical political system in modern Japan. **Fascism** emerged in Italy in the early twentieth century and was characterized by a highly centralized government, suppression of opposition, aggressive nationalism, and the use of violence to achieve political goals. What are common features of fascist regimes, and how does the Empire of Japan fit in with these?

Fascist regimes are characterized by a highly nationalist and authoritarian **ideology** that emphasizes the need for a strong, centralized government to achieve national greatness. Fascist regimes also often promote the idea of a single, unified national identity and may discriminate against minority groups based on race, ethnicity, religion, or other factors. The Empire of Japan deployed a variety of ideologies bundled under the policy of *Kokutai*. The historical concept of *Kokutai* suggested a certain 'organicity' in relation to the state. Its attribute was sovereignty in relation to the imperial dynasty; it was an imperial-centric ideology that turned ultra-national during the imperial period. *Kokutai no Hongi* – Japan's fundamentals of nationalist policies

developed on categories like sovereignty and national identity or **nationalism** (Laš & Baar 2014).

Another example is the *Shinmin no Michi* – Ministry of Education's doctrine of the 'subjects' way' (people, nation, race). Ideologies such as Asianism, pan-Asianism, *Tennōism* or *Hakkō Ichiu* were only a few layers of a complex ideological narrative deployed by the Imperial Government. The regime sought to promote the Shinto religion as the state religion, creating a strong connection between nationalism, religion, and the state. Through its incorporation of elements from State Shinto and *Kokutai*, *Nichirenism* became one of the strongest nationalist forces in Imperial Japan, having a syncretistic approach to the worship of *kami* (divine spirits) and Buddha in the context of the regime. (Wang 2022) The regime used **censorship** and **propaganda** to control information and shape public opinion. Education was heavily regulated and used to promote state ideology and nationalism. The government placed great emphasis on the idea of a superior Japanese race and promoted the idea of Japan as a dominant world power. This was reflected in the militaristic policies pursued by the regime. (Saaler & Koshmann 2007).

The 'Japanese spirit' (*yamato-damashii*) had been a generalized version of the vision of 'us' that emerged with the Tokugawa era's school about homeland – *Kokugaku*, related to the early concept of Japanese ethnicity. Later, the notion of 'Japaneseness' (*Nihonjinron* – see Box 6.1 on exceptionalism) became popular in the post-war period and developed as a different concept (cf. Lie 2001). However, the two dealt with the multi-ethnic and cultural heterogeneity of the Japanese nation observed through a mono-ethnic perspective of a unique 'Japanese' culture. A special position among the Western concert of powers was to have Japan in Asia after the first Japan-Russian war in 1905 as a recognized entity when Tokyo was seen as an 'equal' imperial power among the Western colonial states for its defeat of the Russian Empire. In Asia, Japan constructed a conviction that it was predestined to lead Asia because of its unbroken imperial line (*Tenjō Mukyū*). (Wang 2022)

'Asianism' and 'Pan-Asianism' were recycled ideologies used instrumentally by Japanese elites partly as their anti-imperial means of struggle connecting such movements in other Asian countries or as a unifying framework in the *Greater East Asia Co-Prosperity Sphere* (*Dai Tōa Kyōeiken* – 1941-1945), where Japanization was part of imperial colonial policies (e.g. in Taiwan as '*Kōminka*'). Pan-Asianism was also promoted by more critical bodies such as the *Shōwa Research Association* (*Shōwa Kenkyukai*), led by researchers such as Masamichi Rōyama, who, with the concept of 'East Asian Community' inspired the idea of the Great Co-Prosperity Sphere.

There were secret Japanese societies that conducted splinter activities in East Asia, including cases against official imperial foreign policy. Here belonged, for instance, a Pan-Asianist group called the *Black Ocean Society - Gen'yōsha*, or the *Black Dragon* (or *Amur*) *Society – Kokuryūkai*, or the *Blossom Society – Sakurakai*, and other underground political forces, such as the illegal Shinto *Sect of Great Origin - Ōmoto-kyō*. This sample represents only partly the complexity of ideological, ideational and imperial frameworks wherein the foreign policy of the Empire of Great Japan (*Dai Nippon Teikoku*) merged with the national domestic politics of 'national identity and sovereignty of the state' – *Kokutai*. For a comparative overview of geopolitical ideologies and imaginations, see Laš & Baar (2014).

Fascist regimes adhered to **charismatic rule** that encouraged a cult-like following among their supporters. These leaders typically wield significant personal power and may use propaganda, violence, and other means to maintain their control over the government and society. Fascist regimes also promoted a **personality cult** around the leader, who was seen as a strong and decisive figure that embodied the will of the people, with an expanding cult suppressing dissenting opinions. The position of the emperor as a 'heavenly figure' was central to Japanese imperial ideologies, which Tennōism promoted. This concept was recycled in propaganda and can be traced to the academic activities of the Kyōto school of geopolitics led by Saneshige Komaki. The emperor was portrayed as a divine figure and the center of the national identity. (Laš & Baar 2014)

After Prince Yoshihito died (1879-1926), his son, Prince Hirohito, under the Meiji Constitution, took over the government. His first year was during the 'Shōwa Financial Crisis,' which deepened the Great Depression. Since then, Hirohito has served as Japanese Emperor during Japanese imperial expansion in Asia-Pacific. The emperor's role was, to a large extent, participatory and representative after the 1920s. Guided by a small advisory board of Meiji, Taishō and Shōwa elders *(Genrō)*, perhaps the most influential figures from the former clans of the Tokugawa period, retired experienced statesmen guided emperors and recognized authorities (cf. Bower 1932). The Institution of the Elders had an extra-constitutional position, and the emperors Mutsuhito and Yoshihito relied on their advice. With the Shōwa period, the influence of the 'politics behind the scenes' shifted from *Genrō* to the Japanese Imperial Headquarters led by the ministers from the army and navy. During WWII, one of Prince Hirohito's brothers, Prince Chichibu (1902-1953), was involved in the planning and execution of some operations in Eastern Asia. He played a role in the Shōwa regime, serving as a military leader, but he sought rehabilitation in the post-war years.

Fascist regimes suppressed political opposition and dissent, resorting to violence. This can include the suppression of free speech, the restriction of civil liberties, and the use of secret police to monitor and control the population. A strong central government characterized the Shōwa regime with little tolerance for dissent or opposition. The economy and society were state-controlled, and individual liberties were curtailed. In Imperial Japan, the political parties were eventually united under the *Imperial Rule Assistance Association* ruled by a prime minister, of which the prominent figures were Fuminaro Konoe and Hideki Tōjo between 1941 and 1944. A special role in dealing with domestic dangers was delegated to the *Kenpeitai* (憲兵隊 – Military Police Corps) that was created in 1881, but in the 1930s and 1940s, their scope and means were expanded to cover East and Southeast Asia. Their staff was known for hunting down and eliminating anti-Japanese groups considered a security threat by the Imperial Government. Known abroad as the main secret police or intelligence opera-

tives, the *Kenpeitai* and their ruthless behavior were notorious in Japanese-occupied territories, such as Korea, Taiwan, China, Indochina and Singapore.

Fascist regimes often prioritize military strength and may engage in aggressive expansionist policies to achieve their political goals. This can lead to conflicts with other nations and can result in the use of military force to achieve political objectives. Japan's military played a central role in the Shōwa regime, with many top government officials coming from a military background. Japan's expansionist policies in the lead-up to WWII were driven in part by a desire to expand its military power and influence. The Japanese military played a significant decision-making role in the government and society, with a focus on expanding the empire through conquest. Expansionist policies were tied to a discourse guided by the Imperial Army and the Imperial Navy. The *Hokushin-ron* and the *Nanshin ron*, or the 'northern' and the 'southern' direction of invasion into Asia.

At the Imperial Headquarters, the Army Department directed the Homeland Army, which consisted of the *Kwantung Army* (関東軍 – *Kantō-gun*), the *China Expeditionary Army* and the *Southern Army*. The most notorious was Unit 731, which specialized in biological and chemical warfare and committed obscure experiments on prisoners. The Navy Department operated with the Combined Fleet. For a decade, the Imperial Navy had been mobilizing resources in Micronesia, which it occupied after Germany entered WWI in 1914. As part of the post-war settlement, the League of Nations recognized the Mariana Islands as occupied territories, the Caroline Islands as self-governing territories, and the Marshall Islands as a South Pacific Mandate under the control of the South Seas Mandate of the Empire of Japan. The Pacific theater was the region of the biggest battles of WWII, such as the battles over Guadalcanal, Tarawa, Saipan, Guam, Tinian, and Iwo Jima., etc. (Laš 2014; Laš & Baar 2014)

Fascist regimes used corporations as a means of propaganda and actors in implementing economic policies and achieving national goals, often having a connection to the industrial-military complex (cf. **corporatism**). The corporations and employers collaborated in groups under Italian fascism, which involved pacifying the labor movement, whose leaders were either imprisoned or killed (Hočevar 2024). In Japan, it was the *zaibatsu* (財閥 – financial cartel) corporations that dominated the Japanese economy from the Meiji period (1868-1912) until WWII (1945). In addition to having significant political influence in Japan, these corporations, including *Mitsubishi*, *Mitsui* and *Sumitomo*, also were involved in banking, mining, and manufacturing. *Zaibatsu* corporations were mostly controlled by a single family (or group of clans) and had significant control over the Japanese economy. *Zaibatsu* corporations initially controlled the government's wartime economic policy but later clashed with the military after the latter nationalized industry (Bisson 1945).

The Fascists' tight control over the media and use of **propaganda** shaped public opinion and maintained their hold on power. Resorting to state-run media outlets, censorship of independent media, and the dissemination of false or misleading information, the Shōwa regime sought to control all aspects of society, including education, the media, and religion. The government placed a high value on conformity and obedience, and dissent was often met with harsh punishment. One example is a Japanese medium that developed after the Meiji period and mainly in the 1930s. It was a form of Japanese theater – Kamishibai, a street art theater performed by a person using a wooden frame, in which they had been changing painted pictures on wooden boards. In these images, often, the military protected the rural area towns. The common people learned how to behave in war situations or how to sacrifice their lives. This concept, later adopted as 'educational *Kamishibai',* was deployed in education and state propaganda in the 1930s. It would serve propaganda goals of self-sacrifice for the sake of the empire. Later it was targeted at adults or kids in the semi-periphery and periphery of the Co-Prosperity Sphere. Unlike American war propaganda that portrayed distorted images of the enemy, Japanese imperial propaganda focused mainly on the royal family to motivate everybody to sacrifice for the nation and the emperor (Horner 2005). It was pragmatic and instructional towards self-sacrificing **indoctrination**.

The regime addressed the domestic and foreign spheres of Japan that were contested and conquered by imperialist politics in front of the military-industrial complex. The domestic objectives were tied to the spatial capacity and statehood-making in the rising New Order in East Asia (1938-1940). Foreign policy was mostly interwoven with the merciless war with China (from 1937), coarse colonization policies in Taiwan, Korea, Manchuria and elsewhere; the 'Triparty Pact' with Germany and Italy in 1940, and preparation for total war with the Western imperial powers in the Greater East Asia and Pacific.

Regarding its classification, the Japanese Imperial regime is unanimously considered one of the twentieth century's more notorious **military regimes**, even if it retained and venerated its **monarchy**. The ideas of radical political thinkers like Ikki Kita (1883-1937) and his ultra-nationalist-militaristic statism *(étatism),* or Shūmei Ōkawa (1886-1957), predicting a cultural clash with the West, merged with Western concepts of fascism and anti-communism (cf. the political thought of General Sadao Araki, 1877-1966). Considering **fascism**, even if the regime never identified as such, never had a revolutionary party that abolished the old order (the monarchy), never quite served a capitalist ruling middle class (due to its nationalization of the economy), and never framed its mission in exclusive anti-communist terms, its style of governance, leader veneration, propaganda methods and level state control over many aspects of society, leads one to conclude that Japan had a (cultural) fascist system, especially after 1936, even though its origins and institutions differed from the European experience. For detailed historiographical overviews of these debates, consult Tansman 2009; Yoko 2018; Macron 2021.

"In a Japan lacking the tradition of a bourgeois-democratic revolution, fascism had to develop from above since mass energy, having never before been a main force in political change, could not serve to bring it to power. But, as in Europe, there was a mass social base for fascism among the 'pseudo-intellectuals' of the middle class who felt threatened by liberalism and were willing to support Japan's mission of expansion in Asia." (Wilson 1968: 405,

citing Maruyama Masao)

However, in order to make the comparison with **totalitarianism**, the Shōwa regime's impressive level of control over society, including religion, the military, the economy, education, and information, does not quite add up to all the needed features because it did not have a transformative ideological mission nor a revolutionary mass **party**.

The Shōwa regime sought to suppress the cultures and languages of the peoples it occupied, often through forced assimilation and cultural genocide. The imperial regime waged aggressive war in East Asia and committed war crimes. These acts have led to widespread suffering and loss of life and have had a lasting impact on Japan's international reputation. The Shōwa regime came to an end in 1945, following Japan's defeat in WWII. The war created millions of casualties in Asia and Japan, communists came to power in China, and lasting dark memories remained. After the atomic disasters in Hiroshima and Nagasaki, Allied forces occupied the country, and a new democratic government was established under a new constitution. In time, Japan transitioned to a democracy with a constitutional monarchy, rehabilitating Emperor Hirohito. The country renounced its militaristic past and focused on post-war reconstruction and growth, leading to an economic miracle.

After an International Military Tribunal, many war criminals were imprisoned or executed. Other figures were rehabilitated, such as Kishi Nobusuke, the economic bureaucrat in Manchukuo (満州国 – *Manshūkoku* – Manchuria) and founding member of the most successful post-war political *Liberal Democratic Party* of Japan. His grandson, the former Prime Minister Shinzo Abe, was assassinated in an attack in public in Nara in June 2022. Abe was known for efforts to reform defense and reinterpret 'Article 9' of the Japanese constitution concerning the renunciation of war and to address the geopolitics of rising China.

Box 4.3 The Ku Klux Klan – Older than Fascism

No one is born hating another person because of the color of his skin, or his background, or his religion. People must learn to hate, and if they can learn to hate, they can be taught to love.
– Nelson Mandela

The KKK is an American white supremacist, racist (proto-)Fascist organization whose origins can be traced to the aftermath of the American Civil War. During its existence, it had various iterations and versions. Scholars have identified four distinctive historical versions of the KKK that were inextricably linked to historically specific socio-political and politico-economic conditions that had substantially different capabilities and power, number of members, societal importance, and reach. The first and second KKK were centrally important for the reorganization of the American polity and the transformation of the state and society, while the third KKK was an important reactionary force against Civil rights and the Black Power movement. The contemporary fourth iteration of the KKK, although the least central, least powerful, and least relevant iteration, is relevant as a part of a wider popularity of far-right and neo-Nazi ideologies and movements.

The first KKK was established between 1865 and 1866 by the former Confederate general Nathan Bedford Forrest as one of the central paramilitary, far-right clandestine (hooded uniforms that concealed the identities of members) organizations operating in the former slavery-defending Confederate states after their military defeat and forceful reintegration into the US as societies without enslaved people. Their fundamental goal was, along with other parts of the former slave-owning elites and their supporters, to delegitimize the post-Civil-war reconstruction political regimes and to establish a reorganized white supremacist socio-political and economic order in the former Confederate states. They utilized various violent and ideological means to fight against the enactment of formal equality for the freed African American population and specifically against their voting rights. They terrorized the freed African American population into subservience to the gradually reestablishing white supremacist order. This was done through lynchings, killings and beatings of those individuals who were perceived as challenging the 'natural' racial hierarchy where the African Americans were deemed as inferior to white Americans. They also utilized violence and the threat of violence against the white Americans who were opposed to the establishment of the novel racist white supremacist regime. The federal government's activities against the KKK were successful in breaking it up between 1870 and 1871.

However, strategic considerations (a fast reintegration of Southern states) and political deals made by the northern politicians with the southern elites meant that these activities were short-lived and fundamentally ineffective in preventing the goals of the KKK from being enacted and the KKK's ideology and violent practices to be integrated and legitimized in the novel regimes. The elites of Southern states gradually developed the latter as formally racially segregationist white supremacist apartheid regimes *avant la lettre* that lasted until the 1960s. Ideologically, the first KKK was instrumental in not only reaffirming white supremacy, racist hierarchies, patriarchy and the 'natural' societal order and the notion of the *Herrenvolk* democracy but also in the gradual process of rehabilitating the Confederacy through the ideas of 'Redemption' and 'the lost cause.' These ideas falsified the historical cause of the Civil War, which was slavery and its abolition, and the nature of the authoritarian, brutal, violent, and exploitative slave regimes of the Confederate states. In these mythologizations, the Confederate states were imagined as fighting for state rights and freedom against the oppression of the Federal government and slavery was imagined as a benevolent system.

The second KKK was officially established in 1915 in the context of a massive expansion of American industries and the growing immigration from all parts of the world that began to substantially transform American society, intensify various societal contradictions, antagonisms, and ills (poverty, etc.), and heighten the appeal of left revolutionary ideas. It was also in 1915 that the first American box office hit, D.W. Griffith's *The Birth of the Nation,* came out that popularized and normalized the white supremacist ideology of the first KKK by romanticizing its role after the Civil War and by representing the freed African Americans as violent, lazy, corrupt and a danger to the purity of the 'proper' white American race.

Contrary to the clandestine nature of the first KKK and similarly to fascist movements in Europe, the second KKK was a mass movement that gained substantial popularity in the 1920s. At its height, it had six million members and was a very wealthy organization. Ideologically, it added specific notions such as anti-Catholicism and similarly to European fascists, it added antisemitism and eugenics as a novel form of white supremacism. Its popularity must be understood in the context of the broader structural features of the US in the first half of the twentieth century. US society, in general, was organized along racist lines, and the life chances of individuals were dependent on their membership in specific racial groups that were hierarchically organized with white Americans on top.

The vast majority of white Protestant Americans held similar beliefs to the KKK, whose activities further normalized novel eugenic ideas. These were broader than the anti-black racist ideas of the first KKK as they were directed towards all populations deemed non-American and non-white (Asians, Latinos, Jews, Eastern Europeans, etc.), to all that were deemed a threat to 'proper, pure' (WASP – White Anglo-Saxon Protestant) Americans. Whiteness and Americanness were reaffirmed and inextricably linked in the novel patriotism and ultra-nationalism and to notions of the white *Herrenvolk* democracy. These ideas made the second KKK appealing to various local contexts and helped it to broaden its scope and gain a foothold in the northern states. Its **ideology** also had right-wing populist quasi anti-elitist ideas that targeted cosmopolitan, liberal elites but made strong

alliances with moneyed interests. The latter was also inextricably tied to the KKK's virulent anti-socialism that was also part of fascist ideology. Generally, it played on and intensified white people's sense of fear, humiliation and victimization and refocused their anger on the already marginalized, thereby preventing any cross-racial solidarity that would challenge the unequal, exploitative nature of the existing order.

The second KKK did not rely primarily on spectacles of violence but utilized a cutting-edge **propaganda** machine (from newspapers to radio stations, movies, mass rallies, and country fairs) and its political position as a very powerful electoral force for popularizing its ideas and reaching its goals of re-consolidating the American racist order. It played a crucial part in the substantial expansion of the capabilities of the US state to regulate people's lives that were directly tied to the novel restrictive quota-based federal immigration policies adopted in 1924. These were based on eugenic racist ideas promoted by the KKK. The KKK must also be understood as a very important part of a broader American fascist movement in the 1930s that, in contrast to European **Fascism,** did not strive for the elimination of marginalized groups but their exclusion. The decline of the second KKK was caused by **systemic corruption** that reached destructive levels and caused the Klan to lose most of its members by the mid-1940s.

The third KKK arose in opposition to the Civil Rights Movement and began in the late 1940s. It was not a mass movement with only several thousand members but had the silent support of the elites of the Southern segregationist states in their fight against the abolition of segregation. Ideologically, it did not differ from the past iterations. It became infamous for executing civil rights protesters, lynchings of African Americans, bombing of African American churches and other violent acts for the reactionary goal of upholding the existing racist order. Despite never being held accountable for their many crimes, they were ultimately not successful in halting the abolition of formal segregation during 1964-1965, which also precipitated their organizational decline and irrelevance. However, their racist segregationist ideas survived informally and became an unspoken part of the formally post-segregationist American socio-political and economic order.

The fourth KKK is the present rather marginalized white supremacist group and one of many varieties of various Neo-Fascist, Neo-Nazi, far-right groups operating in the contemporary US and the West and sharing white supremacist ideology that includes past ideas promoted by the KKK with the additional anti-Muslim and anti-LGBTQ sentiments. It gained public attention in the wider context of the emboldening of far-right groups with the first election of Donald Trump, which itself is a symptom of a destabilization of the US socio-political order and the various right-wing and centrist projects for its reorganization and restabilization along mostly more authoritarian lines.

Studying the various historical variations of the KKK in the context of the study of dictatorships remains relevant from several aspects. First, it is relevant for studying proto-fascistic movements and ideologies in its earliest iteration. It is relevant for understanding the many far-right fascistic movements that were present in the West during the existence of historical fascistic regimes. It is relevant for studying the post-war far-right reactionary movement against more inclusive societies and is relevant for studying the contemporary far-right forces in Western countries and their rising relevance. The study of the KKK is also relevant for understanding the historical adaptability and non-linear development of far-right ultra-nationalistic (proto-)fascistic movements and ideologies. Finally, it is relevant for comprehending the instrumentality of historical and contemporary fascistic movements and ideologies for existing power structures and societal elites in preventing revolutionary changes to the existing order, to enact substantial transformation or to steer these transformations in the direction of strengthening the order.

Legalism (The *Fa* Tradition)

The reality of human beings is that they have things they love and things they hate; therefore they can be governed.
– Shang Yang (商鞅) *The Book of Lord Shang*, (ca. 390-338 BCE)

What gets measured gets managed
– V.F. Ridgway (1956)
(Often misattributed to Peter Drucker)

Legalism (a disputed term as explained in 'origins') is a realist intellectual tradition concerning statecraft, originating in China at a time when warring kingdoms faced great systemic instability. It emerged alongside Confucianism, Daoism and Mohism, and was one of several younger competing worldviews of that era, later termed the 'Hundred Schools of Thought.' Legalist thinkers inspired reforms, centralizing the Qin state to enable the conquest of its rival, the Eastern Zhou, finally establishing the (short-lived) Qin dynasty (秦 – *Qín*, 221-206 BCE) that unified the warring states.

Shang Yang (see below) and Li Si, both prime ministers of pre-Imperial Qin, were instrumental to the process of state-building. Li Si (李斯 – *Lǐ Sī* – ca. 280-208 BCE) was a student of the famous Confucian master Xunzi (荀子 – *Xúnzǐ*), a precursor for advocating laws and punishments as legitimate tools by rulers who demonstrated moral self-perfection (Eno, no date). Li Si was in many ways the first architect of Imperial China. He was also notorious for, allegedly, instigating a massive burning (on this topic, see Box 4.4) in 213 BCE of all books not dealing with agriculture, medicine, or prognostication, excepting the historical records of Qin and the imperial library (Müller 2024). However, there seems to be no evidence for this, and Li Si's bad reputation appears to be the product of anti-Qin propaganda by the later Han dynasty (Ter Haar 2009: 65).

The **ideology** advocated reforms for strong, centralized states with rigid legal and ethical standards, which had a lasting influence on Chinese and other East Asian polities, although this impact remains mostly overshadowed by Confucianism (Hsiao 1976).

DEFINITION Legalism, or *Fa Jia* (法家 – *fǎjiā*), is an ancient Chinese philosophical doctrine that emphasizes the importance of law in governing society. Unlike other Chinese philosophies, such as Confucianism or Daoism, Legalism advocates a system of strict laws and harsh punishments to maintain order and control within a monarchic state, organized according to specific classes of subjects, all with their prescribed roles.

The core belief of Legalism is that human beings (the common people and elites alike) are inherently selfish and short-sighted, and therefore require stringent regulations to curb their natural inclinations and ensure societal stability. In practice, this advocacy for a strong (some say 'totalitarian') state meant imposing a 'tyrannical peace' to deter future transgressions – albeit it under a highly formalized system of the rule of law, without arbitrary punishments (supported by the people). The *Book of Lord Shang* states: *"When the people are weak, the state is strong; when the people are strong, the state is weak. Hence, the state that possesses the Way devotes itself to weakening the people"* (Shang Yang, cited in Pines 2017).

A legalist, absolute monarch is bound by his own rule of law, and should stay within the purview of his own governance, not growing familiar with his ministers, who should fear him and be unable to predict his actions: 'Be immeasurably great, be unfathomably deep' (Watson 2003). In this regard, legalist rule is both absolute and impersonal (Pines 2017) and **power** is formalized and institutionalized in a state **bureaucracy** according to the principle of meritocracy (Box 1.9). In the conferring of ranks and offices, hereditary titles and personal favoritism are destructive to the state's functioning and will end up weakening the monarch. (Note the similar thinking in the *Arthashastra* – Box 2.2.)

Han Fei argues: *"The ruler of men stands in danger of being blocked in five ways. When the ministers shut out their ruler, this is one kind of block. When they get control of the wealth and resources of the state, this is a second kind of block. When they are free to issue orders as they please, this is a third kind. When they are able to do righteous deeds in their own name, this is a fourth kind. When they are able to build up their own cliques, this is a fifth kind"* (Han Fei, paraphrased by Watson 2003).

Anti-corruption measures are crucial, as is objectively matching the responsibilities of an office to a candidate's competence: *"When the common and the private are clearly separated, petty men do not envy the worthy, and the unworthy are not jealous of the meritorious"* (Shang Yang, cited in Pines 2017).

In *The Essentials of the Six Schools* (六家之要指) the classical historian Sima Tan describes the legalist tradition as follows: *"The fajia are strict and have little kindness, but their alignment of the divisions between lord and subject, superior and inferior, cannot be improved upon. (...) Fajia do not distinguish between kin and stranger or differentiate between noble and base; all are judged as one by their fa. Thus they sunder the kindnesses of treating one's kin as kin and honoring the honorable. It is a policy that could be practiced for a time, but not applied for long; thus I say: 'they are strict and have little kindness.' But as for honoring rulers and derogating subjects, and clarifying social divisions and offices so that no one is able to overstep them – none of the Hundred Schools could improve upon this"* (Sima Tan, cited in Goldin 2011)

SEE ALSO The position of the ruler is very distinctive in legalist **ideology**. On the one hand, there are no limits to the power of the ruler, who is always a monarch – see **absolutism**. Unlike **personalist rule** or **patrimonialism**, the ruler upholds a highly formalized regime and state **monarchy (**calling to mind some forms of **totalitarianism**), having a clear hierarchy and rigidly delineating the roles of all those serving under the ruler. Appointments are not made according to personal ties; instead, impersonal meritocracy (see Box 1.9) prevails. As in **patrimonialism**, the state's economy is directly under the command of the ruler, who is not bound by tradition. As with **personalist rule**, the ruler formulates his own laws – 'as needed by the times' – and is their ultimate arbiter and interpreter. But unlike personalism, **despotism** or **tyranny**, a legalist, absolute monarch is impersonal, institutionalized, and bound by his own morality. He is to follow 'the Way' and rein in all selfish desires to govern 'All-under-Heaven' (天下 – *tiānxià*), the realm, for the benefit of the people, not for personal gain.

ORIGIN Legalism emerged during the Warring States period (ca. 475-221 BCE), a time of intense political fragmentation and conflict in ancient China. Its translation into English as the 'School of Law' is inaccurate for two reasons. The *Fa Jia* (法家) label itself is misleading because 家 – *jiā* suggests an organized and self-aware intellectual movement (i.e., school or 'scholastic lineage') comparable to the followers of Confucius (孔子 – *Kǒngzǐ*) or Mozi (墨子 – *Mòzǐ* – 'Micius'). But this *Fa Jia* label – developed by Sima Tan (司馬談 – d. 110 BCE), father of the famous historian Sima Qian (司馬遷) – was primarily a bibliographic label used to catalog intellectually related texts in imperial libraries. While appropriate for organizing texts, its utility diminishes when employed as a major analytical tool. In the first place, no early thinkers identified themselves as members of the 'School of Fa.' Secondly, the term 法 – *fǎ* does not solely mean 'law.' It also encompasses 'standards,' 'models,' 'norms,' and political institutions. The 'legalist' label thus oversimplifies *Fa* thought, focusing too narrowly on its relation to Western 'rule of law' concepts, thus diminishing its complexity. Alternatively, legalists have been referred to as 'realists' (see **political realism**) – but this presupposes the existence of 'idealists' as ideological counterparts. A more neutral designation would be the '*Fa* tradition' (Pines 2023; Goldin 2011).

LITERATURE Classical Chinese political thought evolved significantly by the time of the Warring States and the emergence of the 'Hundred Schools.' The 'Mandate of Heaven' (天命 – *Tiānmìng*), initially tied to a ruler's moral virtue and divine favor, justified the Zhou conquest of the Shang by the shift of the favor of Heaven. 'Heaven' was, originally, considered a moral deity, passing judgment. Over time, it developed into an abstract principle of moral order (and its designs were no longer accessible via divination). With this cosmic order, procedures gained importance and a distinct political realm developed, existing alongside the ethical order that supported it. For instance, Confucianism emphasized rulers' virtue but also recognized procedural norms and political order. Regarding **succession**, Mencius (孟子 – *mèngzǐ* – Master Meng) had highlighted the importance of a proper 'designation' for rulers, but **legitimacy** eventually shifted to a system of (procedural) hereditary **monarchy** (Mou Zongsan, cited in Angle 2022). Some classical thinkers, like the legalists, focused on effective technology for the administration of power and the maintenance of order, at the expense of ethical concerns, but most intertwined ethics and politics, emphasizing their mutual dependence (Angle 2022).

Legalism as a doctrine argues that the greatest benefit to the people and the realm (天下 – *tiānxià*) is order (秩 – *zhì*): *"'benefit (li)' is the standard by which theories of governance are judged, but it also places particular stress on the collective character of 'benefit.' In a war-torn world, we are told, only when the state is strong can its inhabitants flourish. Those who act for their own interests rather than for the 'benefit of the state,' therefore, are to be punished"* (Angle 2022).

Governance thus requires (public, impartial) objective standards (法 – *fǎ*) and specific roles for every class of people, with specific punishments for transgressions and rewards associated with normative behavior. Rulers alone fix these standards based on their assessment of the needs of the age and should neither imitate antiquity nor follow existing standards. They are responsible for settling conflicts when standards diverge (Angle 2022).

The doctrine was developed by several key thinkers, each contributing to its evolution. *The Book of Lord Shang* primarily focuses on strengthening the state in relation to society. In contrast, the *Han Feizi* and the surviving fragments of Shen Buhai's writings (and to a lesser extent those of Shen Dao) concentrate mainly on the dynamics between rulers and ministers, and general administrative issues. These topics receive much less attention in Shang Yang, but his text does touch upon issues like the bureaucratic abuse of power, corruption, dereliction of duty by officials, and the danger of officials undermining the ruler's authority (Pines 2017).

Shang (Lord) Yang (商鞅 – *Shāng Yāng*, originally: Gongsun Yang, ca. 390-338 BCE) An influential statesman and prime minister to Duke Xiao of the pre-imperial Qin state, Lord Shang implemented radical reforms that centralized power and strengthened the state through rigorous laws and military discipline. His work, *The Book of Lord Shang* (商君书 – *Shāng jūn shū*), laid the foundation for legalist thought and Y. Pines (2017) finds him to be *"an architect of the idea of a total state and one of the earliest proponents of radical social engineering in human history."* Shang Yang propounded that the anarchic state of nature, intrinsically plagued by turmoil as populations grew, should move away from a kin-based society toward a stratified, structured state order based on the elevation of the worthy. However, this alone does not suffice to curb human selfishness and nepotism: a 'True Monarch' should be established to set laws, prescriptions and standards, and impose draconian punishments to check the flawed human nature of the ruled (Pines 2017).

Shen Dao (慎到 – *Shèn Dào*, ca. 350-ca. 275 BCE) As a daoist-legalist thinker, he is most remembered for his influence on Han Fei regarding the concept of *shi* (勢 – *Shì* – 'the power of authority'). All remaining fragments of his work focus on the concept of *fa* (administrative methods and standards), a core principle of his school of thought (Thompson 1970; Pines 2017).

Shen Buhai (申不害 – *Shēn Bùhài,* ca. 400-ca. 337 BCE) Serving the Han state, and known for his administrative techniques, Shen Buhai emphasized the importance of bureaucratic governance and the use of impersonal laws to manage the state effectively – with rulers withdrawing after distributing appointments; they 'do nothing' more (无为 – *wúwéi*) than keep the system running smoothly (cf. *laissez-faire* political economics). Shen Buhai's works greatly influenced Han Fei, but none of his original texts have survived. Creel (1982) credits him with the origins of the Chinese examination system – see Box 4.8 on 'mandarins.'

Han Fei (韓非 ca. 280-233 BCE) A (Han) nobleman and a student of the famous Confucian reformer Xunzi (like Han Fei's rival Li Si who drove him to suicide), Master Han Fei synthesized the ideas of earlier legalists (and adapted religious ideas from other schools like Daoism or Mohism), articulating them in his seminal work, named *Han Feizi* (韩非子 – *Hánfēizi*), after himself. He is considered the most prominent of the legalist philosophers ('not its inventor, but its perfecter'), advocating the use of strict laws and centralized authority for bringing about social order by linking prescribed roles to rewards and punishments, and attributing final arbitrage regarding accountability and performance to the ruler (**absolutism**). (Watson 2003)

"The Daoist sage has absolute understanding; the Legalist ruler wields absolute power. In the quality of absoluteness, they are alike. The Daoist sage rises above all conventional distinctions of right and wrong, good and evil; so does the Legalist ruler, for he is a law unto himself. The Daoist sage adopts a course of quietude and deliberately refrains from all forced or unnatural activity. The Legalist ruler, head of a vast bureaucracy, does the same, issuing orders, quietly judging the efficiency of his ministers, but refraining from any personal intervention in the actual affairs of administration; he sets up the machinery of government and then allows it to run by itself. The Daoist sage withdraws from the world to a mysterious and transcendental realm. The Legalist ruler likewise withdraws, deliberately shunning contacts with his subordinates that might breed familiarity, dwelling deep within his palace, concealing his true motives and desires, and surrounding himself with an aura of mystery and inscrutability" (Watson 2003).

IMPACT ON POLICY Legalism became particularly relevant during the Qin dynasty (秦 – *Qín*, 221-206 BCE), when it was adopted as the guiding philosophy for statecraft. Under the leadership of Qin Shi Huang, the first 'Emperor' of China, legalist principles were implemented as a means to conquer and unify the warring states and establish a centralized empire. The Qin Dynasty's adoption of Legalism led to significant administrative and legal reforms, including the standardization of laws, weights, measures, and the written script. However, harsh legalist policies and authoritarian rule also contributed to the dynasty's downfall. The brutality and rigidity of legalist governance led to widespread discontent and rebellion, culminating in the collapse of the Qin dynasty shortly after Qin Shi Huang's death. Legalism and its leading thinkers were largely discredited because as a result, and other schools of thought regained prominence. Legalist thinking did not altogether disappear from imperial political discourse, resurfacing during military, political, or economic crises as a model for re-empowering the state. Ultimately, it was Mao Zedong who dusted off Shang Yang's legalist works in the 1970s to legitimize his Great Proletarian Cultural Revolution (1966-1976), aimed at breaking China's (Confucian) traditions (Pines 2017).

After this period of turmoil and the abortive reign of the Qin dynasty, the succeeding Han dynasty made significant contributions to social and political philosophy by integrating various classical schools of thought. They systematized the inheritance of the classical era by editing and standardizing earlier texts, and by categorizing different schools of thought such as Confucianism, Mohism, Legalism, and Daoism. Despite distinguishing these schools, Han thought and practice were highly synthetic, aiming to harmonize insights from all schools. This synthesis involved creating a state that relied on laws and standards (Legalism) as well as on rituals and the ethical character of rulers (Confucianism). (Angle 2022)

KEY SIGNIFICANCE Legalism provides a distinctive perspective on **political regimes** (and statecraft). It emphasizes the necessity for strong state control, the rule of standards and meritocracy, from a historical-dialectical perspective, meant to cultivate 'the utmost virtue' in 'All-under-Heaven' (天下 – *tiānxià*), a Utopian end-goal, after the subjugation of domestic and foreign enemies (and resonating with the works of Mao Zedong). It proposes that a well-ordered society can only be achieved through the enforcement of clear, impartial laws and the centralization of authority. *"Violence and oppression are the necessary evil en route to universal good"* (Shang Yang, cited in Pines 2017).

This approach contrasts sharply with Confucianism, which is preoccupied with governance based on moral virtue and ethical self-cultivation. Legalism's view of human nature is fundamentally pessimistic. It asserts that individuals are inherently selfish and prone to wrongdoing, necessitating strict laws and harsh punishments to maintain social order.

This belief in the inherent evil of human nature underpins the legalist argument for an authoritarian government that prioritizes state control over individual freedoms (like Thomas Hobbes or John Locke almost two millennia later). Han Feizi clearly states that 'private' and 'public' are irreconcilable and that the great good (order) trumps private ambition and needs.

Legalism's emphasis on strict laws and centralized

Box 4.4 Book Burning – The Pinnacle of Cultural Barbarism

Das war ein Vorspiel nur; dort wo man Bücher verbrennt, verbrennt man auch am Ende Menschen
(That was only a prelude, where they burn books, they ultimately burn people)
– Heinrich Heine (1820)

The burning of libraries and books is a notorious practice associated with dictatorships and extremist movements, and serves as a potent herald of extreme **censorship** and ideological control, aimed at suppressing dissenting ideas and reinforcing a regime's ruling ideology. This practice is particularly prevalent in **totalitarian regimes**, where absolute power is centralized, and control over both public and private life is extensive. Historical instances, such as those in Nazi Germany and under General Augusto Pinochet's dictatorship in Chile, vividly illustrate the dynamics of book burning as both a form of **repression** and **spectacle politics** (Fishburn 2006). The issue provokes such strong emotions in authors writing on the topic that they lose their scholarly tone when referring to the perpetrators (Chodorow 2007, on Bosmajian (2006) and Knuth (2006)).

Christianity, in particular, has been both a victim and perpetrator of book burning. In what is known as the 'Great Persecution' of Christians (303-311 CE) in the Roman empire, emperors Diocletian and Galerius sought to suppress the growing influence of Christianity, which was seen as a threat to traditional Roman religious practices and the quasi-divine status of the emperors. Public burnings of Christian books were staged in marketplaces, and houses containing these books were also destroyed, deeply imprinting an identity of martyrdom on the religious movement.

Once in charge, however, Christian authorities played a significant role in the suppression and destruction of books in Late Antiquity. The impact of their practice remains under-explored today. D. Rohmann (2013; 2016) plunges into the involvement of Christian institutions, writers, and saints in book burning, analyzing a wide array of literary and legal sources, and highlights that, beyond targeting heretical, magical, astrological, and anti-Christian texts, Christian authorities also censored or destroyed other genres. These included materialistic philosophical works, which later influenced modern philosophy and science. By prohibiting the copying of certain manuscripts (since 1560 blacklisted on the 'Index' – *Index Librorum Prohibitorum* or *Index of Forbidden Books*), Christian ideologues aimed to suppress ideas and texts from the late classical era until 1966.

Other **theocracies**, like the Taliban regime and ISIS (cf. **Islamic States**) are also infamous for irreparable cultural destruction, targeting heritage they deem 'un-Islamic.' The Taliban notoriously destroyed the ancient Bamiyan Buddha statues in 2001 and ravaged libraries and museums during their first rule from 1996 to 2001. Similarly, ISIL (ISIS) obliterated the historic Mosque of the Prophet Younis in Mosul, Iraq, and carried out extensive destruction in the ancient city of Palmyra, Syria, including the Temple of Bel and the Arch of Triumph. Additionally, ISIL demolished numerous pre-Islamic, Jewish, Christian, Sunni, and Shi'a spiritual and sepulchral buildings across the Levant. These actions reflected a broader strategy to erase historical and cultural identities that conflict with their extremist ideologies.

The act of book burning in dictatorships represents a direct form of repression, targeting works and ideas perceived as threats to the regime, especially in **ideocracies** that do not tolerate ideational dissidence to their worldview. This extends beyond the physical act to encompass broader strategies of intellectual and cultural control, including **censorship** and the persecution of intellectuals. For example, the Nazi regime's book burnings aimed to purge German culture of 'un-German' elements (read: Jewish, communist, socialist or other unaligned political thinkers), while Pinochet's regime in Chile targeted books considered subversive to "extirpate the Marxist cancer." These acts also play into **spectacle politics**, serving as public demonstrations of the regime's power and commitment to ideological purity, often drawing international attention and condemnation (Knuth 2003; 2006).

Regimes with a ruling political **ideology** (often combined with a **personality cult**) are most closely associated with book burnings, seeking to control not just the political and economic spheres but also the cultural and intellectual life of their citizens. The suppression of dissenting ideas, the public nature of the book burnings, and the international condemnation these acts attract, highlight the fundamental violation of intellectual freedom and human rights. Book burning, therefore, stands as a powerful symbol of the lengths to which rulers may go to break with the past, impose a single, ideological narrative, and create a new order.

power resonates with contemporary discussions on autocratic legalism, in which legal frameworks are used to legitimize and perpetuate authoritarian rule. The **ideology**'s focus on the utilitarian application of law to achieve state objectives provides a historical precedent for social engineering, prompting several twentieth-century scholars to draw parallels to **totalitarianism**. As examples of the latter, Pines (2017) cites Creel 1953: 135-158; Rubin 1976: 55-88; Fu Zhengyuan 1996. Pines (2017) also expands on the question of **education** (keeping the masses ignorant in order not to corrupt them and distract them from their work) and the legalist distaste for **indoctrination** (rather than deceiving the masses, policies should harness the intrinsic and immutable selfishness of the people, incentivizing them with rewards and inescapable punishment should they fail to obey).

Legalism's legacy in Chinese political thought continues to influence modern governance models. The integration of legalist principles with other philosophical traditions, foremost among them Confucianism, has shaped a unique approach to statecraft that balances legal authority with ethical considerations. This synthesis offers a nuanced understanding of how ancient philosophies can inform contemporary political systems and reveals why there is a significant disparity between northeastern Asian countries and legal systems in the West.

While long understudied (see Shaw 1980), more recent works tentatively tackle the history of Legalism in Korea. Lee (2013) highlights the legalist roots in (South) Korean law. Levi (2020) explores the particular (hidden) legalist legacy in North Korean ideology, focusing on collective guilt and mass purges.

Modernization Theory

Restlessness is discontent and discontent is the first necessity of progress
– Thomas Edison

I have seen the future and it works
– Lincoln Steffens (1919)

Modernization theory is an umbrella concept for several interconnected and mainly state-centric theories that address how societies, especially states, gradually progress from lower to higher stages of development, and – in doing so – open themselves to greater economic wellbeing and democracy. Modernization theory is thus connected to other evolutionary, progressive and/or teleological social theories, such as Marxism, which account for how societies either adopted or transitioned to economic practices associated with modernity, such as industrialization. It further presumes that societies develop or progress by distinct levels or stages, most of which possess causal primacy in explaining political, social and cultural advancements; as well as in accounting for the challenges that specific systems of rule, people or social organizations face at any given period. What separates modernization theory from other equally progressive social theories is its place and period of origin, the United States (US) in the mid-twentieth century, and the extent to which it embraces, rather than disparages, capitalism and liberal democracy as benign means of development.

Despite its prevalence and influence in the 1950s and 1960s in US social science, modernization theory was heavily criticized in the following decades. Yet,

even as it ceased to be of major scholarly interest for the remainder of the twentieth century, its impact extended far beyond academia. US social and foreign policy – not to mention the policies of other international organizations, such as the UN – still connects the attainment of modern liberal democracy to social economic development. In any case, modernization theory never lost its intellectual prominence, inspiring key post-Cold War works, such as Francis Fukuyama's (1992) renowned *The End of History and the Last Man*. It has also informed authoritarian studies, by addressing the underlying conditions that promote or prevent the development of democracy.

DEFINITION Modernization theory mainly refers to a set of theories – as opposed to a single, coherent body of work – that determine the social, political, and economic effects of a transition from a lower stage of development to a higher stage, consisting of capitalism and secular liberal democracy. That said, like most intellectual endeavors, modernization theory is difficult to pin down with in a single, definitive definition, not least because contemporary uses of the term self-consciously incorporate sundry critiques directed at the classical version of modernization theory (Tipps 1973; Inglehart & Welzel 2010). Moreover, there is no shortage of theories that deal with the repercussions of modernity and the means by which it was attained. Hence, a comprehensive definition must not only make sense of its objects of inquiry, including how they are assessed, but also the period and location in which they arose. Otherwise, it would hardly be possible to differentiate modernization theory from other progressive social evolutionary theories.

Attentive to these caveats, Ronald Inglehart and Christian Welzel (2005: 17) conceptualize modernization theory as follows: *"In the postwar United States, a version of modernization theory emerged that viewed underdevelopment as a direct consequence of a country's internal characteristics, especially its traditional economies, traditional psychological and cultural traits, and traditional institutions. From this perspective, traditional values not only were mutable but could – and should – be replaced by modern values, enabling these societies to follow the (virtually inevitable) path of capitalist development. The causal agents in this developmental process were seen as the rich, developed nations that stimulate the modernization of 'backward' nations through economic, cultural, and military assistance."*

It is worth noting that Inglehart and Welzel (2005) purposely separate the theory from other versions of modernization. As the term itself suggests, modernization theory stems from the concept of the 'modern' or 'modernity,' which have both been a major object of academic and intellectual discussion for nearly three hundred years. 'Modernity' usually refers to a period or stage of significant socio-economic transformation, characterized by secularization, industrialization and nationalism, which encompasses most European polities from the late eighteenth to the twentieth century (Nisbet 1980; Giddens 1991; Habermas 1996; Inglehart & Baker 2000; Armitage 2012). For historians, modernity usually designates, however loosely, the period into which Middle Age Europe transitioned, when European states expanded beyond the Western hemisphere, began to question the basis of feudalism (see Box 1.14), and looked into the nature of empirical and scientific inquiry (Giddens 1990; Habermas 1996).

For Anthony Giddens (1990), modernity is associated with three broad characteristics, all connected to change: the *Pace of Change*, the *Scope of Change* and the *Content of Institutions*. As its name implies, modernity presupposes the development of major and accelerated change. The pace of that change is further compounded by a broad swath of transformations, affecting almost all aspects of political, social and economic life. From the family unit to political routines, communities under modernity cannot but experience a major social and material transformation.

Finally, it is not merely the experience of change that constitutes modernity; rather, it is the direction toward which those changes tend. In this regard, modernity, according to Giddens (1990: 6), pertains to specific social forms *"that are simply not found in prior historical periods – such as the political system of the nation-state, the dependence of production upon inanimate power sources, or the thoroughgoing commodification of products and wage labour."* This is not to say that modernity replaces all past institutions, many of which – such as the city – existed prior to the modern age. But it does change them. That said, further research into modernization has also enlarged the scope of the phenomenon to include distinct cultural manifestations of modernity, not least how different people coped with its social, political and economic transformations. Shmuel Eisenstadt (1986; 2000), for instance, propounds the notion of multiple modernizations to account for the distinctive ways in which societies adapted to large-scale cultural change. Nevertheless, the term has been criticized, with some suggesting that varieties of modernization – as opposed to multiple modernizations – are more a suitable way to locate the differences to which Eisenstadt and others are sensitive (Schmidt 2006).

In view of the unprecedented change spawned by modernity, modernization theory seeks to address the multifaceted issues that came to shape that process, although in a manner different from other relevant socio-economic theories, such as Marxism. Walt Rostow's (1960) seminal work, *Stages of Economic Growth: A Non-Communist Manifesto*, sought to make sense of the sweeping social and economic changes that first enveloped Europe and North America without reference to Marxist ideas, and even less to a worker revolution that would abolish private property. While accepting that not all the consequences of modernity are positive, Rostow envisages a sequential process of modernization that would be compatible with capitalism and democratization.

SEE ALSO For alternative theories of modernization (beyond modernization theory itself), see world-systems theory, dependency theory, Gramscian theory, and third worldism. For more on modernity itself and its many facets, see Ulrich Beck's work on Risk Society, Anthony Giddens on Modernity and Reflexivity, and Habermas's *The Philosophical Dis-*

course of Modernity (Wallerstein 1976; Giddens 1990; 1991; Habermas 1996; Berger and Weber 2014). Many twentieth-century **ideologies & worldviews** adhered to the paradigm of modernization when formulating the regime's guiding **ideology**, a practice sometimes followed by scholars in the study of comparative authoritarianism (see, e.g., Box 5.3 on transitology).

KEY SIGNIFICANCE Modernization theory derives its significance from its object of study and the influence it wields beyond the intellectual circles from which it initially arose. Despite the initial criticism to which it was subjected, modernization theory provides a means to ascertain political and economic development in ways that do not always succumb to Marxist theory. Consequently, it provides an alternative way to address socio-economic growth and the transition to democracy. In this connection, ongoing research into the relationship between development and democracy has drawn significantly from modernization theory. Lipset's (1959) foundational work on the relationship between democracy and development contributed to an ongoing interest in the connections between modernity, democracy and authoritarianism. Research on the threshold for democracy, for instance, frequently refers to a degree of economic growth or wealth as necessary for democratic development, though such findings are often disputed in comparative politics and political sociology (Mainwaring & Pérez-Liñán 2003; Ciftci 2010; Coppedge 1997). Likewise, those who refer to multiple modernities, rather than to a common form of modernity, have frequently contested the relationship between modernization and democracy, thus demonstrating the ample debates provoked by political change across various societies, especially those outside Western Europe (Eisenstadt 1986; Mainwaring & Pérez-Liñán 2003; Arjomand 2011; Spohn 2010; Wittrock 2000).

Besides comparative politics, modernization theory is also a useful intellectual tool to consider the origins of US aid programs – not to mention liberal European ones – across the globe, many of which presume that that the constitution of democracy requires, among other things, the transition to a higher stage of economic development.

ORIGIN The origins of modernization theory itself are distinct from, albeit connected to, academic studies of the nature of modernity and modernization. Starting with the Enlightenment thinkers of the eighteenth century and continuing into most European intellectual circles in the nineteenth century, modernity was a topic discussed by various scholars, politicians, public intellectuals and philosophers, giving rise to key political and academic traditions, such as liberalism, socialism and Marxism. In addition, sociology as a burgeoning field of inquiry, particularly via the contributions of Max Weber, dealt with the consequences of modernity, such as its impact on individualism, modern **bureaucracy**, *anomie* (erosion of ethical standards due to an absence of common purpose) and economic wellbeing (Weber 1964).

While intellectually indebted to those contributions, modernization theory is a later development, deriving from the context of the Cold War. As a strand of thought, it arose in US academic circles in the 1950s and 1960s, mainly as a response to the geopolitical context. Because of the Cold War and the so-called 'red scare,' US policymakers actively sought to support political-economic development in war-ravaged Europe. The Marshall Plan of 1948 materialized that overall concern (Tipps 1973; Baber 2001).

Nearly a year later, President Truman's Inaugural Address outlined the need to assist societies worldwide in their pursuit of socio-economic development, in particular to curtail the spread of **communism** and **socialism**: *"I believe that we should make available to peace-loving peoples the benefits of our store of technical knowledge in order to help them realize their aspirations for a better life. And, in cooperation with other nations, we should foster capital investment in areas needing development. Our aim should be to help the free peoples of the world, through their own efforts, to produce more food, more clothing, more materials for housing, and more mechanical power to lighten their burdens"* (Truman 1949).

Only through modernization could prosperity and, more importantly, peace be achieved: *"Greater production is the key to prosperity and peace. And the key to greater production is a wider and more vigorous application of modern scientific and technical knowledge. Only by helping the least fortunate of its members to help themselves can the human family achieve the decent, satisfying life that is the right of all people. Democracy alone can supply the vitalizing force to stir the peoples of the world into triumphant action, not only against their human oppressors, but also against their ancient enemies – hunger, misery, and despair"* (Truman 1949).

As the US political establishment propounded support for international economic growth, in an effort to contain the spread of **communism**, scholarly communities in the US sought to make sense of the relationship between developmental stages and economic and political progress (Lipset 1959; 1960; Rostow 1960). It was in this social and political situation that a key, perhaps defining, contribution to the burgeoning field of modernization theory was published. Walt Rostow's *Stages of Economic Growth: An Anti-Communist Manifesto* (1960) speaks to a broader academic context which espoused the links between development and politics. By doing this, his work seeks to *"to dramatize not merely the uniformities in the sequence of modernization, but also – and equally – the uniqueness of each nation's experience"* (Rostow 1960: 1). Nearly a decade later, he published another book, *Politics and States of Economic Growth*. In this text, Rostow , among other things, seeks to understand how development can potentially assist humans with what he claims to be the principal, if not universal, tasks of government: "*Whether in an African tribe ruled by custom and the elders or a Greek city state, whether in Nixon's America or Mao's China, men look to government to find an acceptably balanced way to do these three things: protect them from others; provide acceptable standards of welfare; settle quarrels among themselves, peacefully, on terms judged equitable,*

holding the community together?" (Rostow 1971: 11).

Rostow's work helped to spell out the main aims of modernization theory, including the language by which it was constituted. It also provided an impetus to strengthen US support for underdeveloped countries, a policy already inaugurated by Truman (Baber 2001).

As political and academic interests increasingly intertwined, modernization theory formed a key academic undertaking until around the 1970s, when it underwent major scrutiny and criticism (Tipps 1973; Wallerstein 1976). Most scholars refer to mid-twentieth century theories (Inglehart & Welzel 2005; 2010; Goorha 2010) when speaking of classical modernization theory. Despite criticism, however, modernization theory never completely faded away; it has resurfaced as a dominant mode of inquiry across the globe, not just in US academic institutions.

METHODOLOGICAL ISSUES As modernization theory focuses primarily on development, especially economic growth, most of its different iterations take production – usually measured by GDP – to be its principal object of inquiry. Based on increasing income, different modernization theories address the impact of economic transitions on politics, democracy and other social practices.

Classical modernization theory, which was propounded in the mid-twentieth century, was criticized on account of its problematic assumptions, many of which were methodological in nature. Those criticisms were addressed by the theory's later proponents.

One criticism of classical modernization theory is that it tends to presume that a specific social, political and economic trajectory is universal and thus extends to vastly different cultural communities (Tipps 1973; Wallerstein 1976). Inglehart and Welzel (2005), to take one example, seek to counter this criticism by developing a modernization theory sensitive to cultural heterogeneity.

Classical modernization theory was also criticized for the way it dealt with the process of modernization itself. It was considered to be either too open-ended – based on a key variable, such as industrialization – or too goal-oriented, that is, determined by reaching a certain point. The problem with reliance on a leading variable to translate the sequence of modernization is that it could be easily replaced by another concept, such as industrialization, GDP growth, to name just two. Put differently, the only original aspect to modernization would be the concept on which it was based. On the other hand, if it avoided a critical variable and was simply concerned with how one stage is achieved after another, the theory would reduce empirical complexity to a loose sequence of stages (Tipps 1973). In this connection, cultural factors, rather than economic or institutional variables, have often been sidelined in accounting for the development of democracy as opposed to authoritarianism. The notion of multiple modernities was propounded precisely to explain the potentially distinct ways in which societies other than European ones adapted to major economic and social change (Eisenstadt 2000).

Another methodological concern has to do with the state-centric nature of economic development. Causal primacy, besides being determined by economic growth, is spatially bound to the state; that is, modernization is assumed to spring almost exclusively from developments within the state (Tipps 1973; Rostow 1971; Huntington 1968). In this connection, modernization theory has been criticized for not considering external sources of development, mainly the way that global economic structures hinder or foster development. Dependency theory and world-systems theory gained prominence at the expense of modernization theory precisely to the extent that they sought to account for uneven, if not unjust, political economic endowments within a global market (Wallerstein 1976; Arat 1988).

IMPACT ON POLICY Modernization theory had and continues to have a major impact on policy decision-making, especially in the US establishment and in international politics broadly defined. From the moment the US government linked economic development to peace and democracy, as was central to the Truman administration in the aftermath of World War II, modernization theory – and not least the concepts it advanced – became a means to legitimate aid, and support state-building, **democracy promotion** and peace-building. Even after the theory ceased to gain much academic support, it remained the conceptual benchmark to advocate US global initiatives after the Cold War (Fukuyama 2004; Duffield 2001).

As the Soviet Union and the US authorities overcame their geopolitical hostilities in the late 1980s, modernization theory partly constituted the general *Zeitgeist* or spirit of the age, a set of ideas subsequently subsumed in Fukuyama's (1992) work, which claimed that the triumph of liberal democracy and capitalism was conclusive. In any case, as the optimism of the age increasingly came under scrutiny, the international response, mainly from the United Nations (UN), was still articulated with reference to modernization theory. Not only did the UN's 1994 *Agenda for Development* claim that development was a *"fundamental human right,"* but that it was *"the most secure basis for peace"* (United Nations 1994). Democracy was also considered to be the crucial means to prevent long-term conflict. In that respect, what came to be known as liberal peace-building, a form of post-conflict construction developed by the UN, was indebted to the ideas initially advanced by modernization theory (Pugh et al. 2008; Richmond 2014; Chandler 2017). However, the very connection between modernization and democracy has been the subject of major intellectual dispute, not least because of the scrutiny of the notion of modernity itself. In response, some refer to multiple modernities, rather than a single version of modernity, as sparking cultural backlashes against massive social transformations (Arjomand 2011; Wittrock 2000; Eisenstadt 2000).

Most of the ongoing policy critiques of state-building and peace-building, particularly its liberal variants, partly address the assumptions advanced by modernization theory. They question the universalization of liberal peace, especially the notion

that most societies are advancing to the same end (MacGinty & Richmond 2013). They also emphasize external sources of underdevelopment, such as capitalism (Pugh 2004). Consequently, they unsettle the state-centric assumptions put forward by most modernization theories; and, hence, also dismiss increasingly prevalent concepts like **state fragility & failure**. Even though such notions do not necessarily form a part of modernization's theory jargon, they nevertheless reflect the need to foster economic and institutional development to promote peace and democracy in states that were failing or which had succumbed to armed conflict (Call 2008).

At a more conceptual level, ongoing policy debates about the US and the UN's approach to peace critically address the extent to which development has become a security issue. As long as armed conflicts are considered to be a matter of uneven development, this precisely justifies global interventionism to prompt modernization among war-torn states or to prevent them from becoming violent in the long run (Barnett 2001; Duffield 2001; Lake 2016).

Nationalism

Nationalism is an infantile disease. It is the measles of mankind.
– Albert Einstein

Nationalism is a modern belief system, dividing the world's population into large identity groups (ethnos) which naturally (and perceptibly) correspond to specific delineated spaces or territories. Human settlement impacts the occupied territory and turns it into *"a poetic landscape that is an extension and expression of the character of the ethnic community and which is celebrated as such in verse and song"* – an 'ethnoscape' (see Smith 1998: 63).

Each group of 'people' (ἔθνος – *ethnos* in Greek) commands the primary allegiance of its members, its group boundaries being more inclusive than the local identities of kin-groups: 'nations,' 'ethnic groups,' and larger 'tribes' (although the latter term carries some pejorative connotations). By definition, each group (radically) excludes foreigners, migrants, and members of other nations, as well as identity groups 'othered' due to their culture, perceived origin, beliefs or customs.

Nationalism is also a powerful *political doctrine* (**ideology**) stating that a nation should coincide with the (modern) state – or at least expressing the desirability that the extent of the state should be determined according to ethnographic principles (Kohn 2023). This (modern) state has a centralized authority that controls its *own* territory and enjoys sovereignty in the international system (see **external legitimacy**). Given the current ubiquity of this belief system, it is difficult to imagine that, historically, people were not driven by nationalism. Their devotion and loyalty belonged to community identities, ancestral traditions, their native soil, and local (feudal) lords.

While the genesis of nationalism continues to be heavily debated, several key factors contributed to its rise, among them the spread of Enlightenment ideals, which emphasized individual rights and self-governance, concepts that resonated deeply with emerging nationalist movements. Economic changes brought about by the industrial revolution further fueled nationalist feelings as people began to increasingly identify with emerging nation-states. The growth of commerce and industry necessitated larger, more centralized political units and a state **bureaucracy**, which facilitated the development of a national consciousness. Additionally, political centralization under **absolutism** helped erode old feudal allegiances, paving the way for national unity.

Cultural movements, particularly Romanticism, fostered a sense of cultural identity and pride in a shared history, language, and traditions, essential components of nationalist ideology. As feudal and religious ties frayed, this cultural renaissance encouraged people to see themselves as part of a distinct national community with a unique heritage.

Since the rise of nationalism at the end of the eighteenth century (the French **revolution**), the focus on a 'people' abetted the shift toward sovereignty, slowly ousting **monarchies** all over the world. The concept was elaborated, rationalized and instrumentalized by new regimes in the spirit of **modernization theory**.

The academic debate on nationalism encompasses several perspectives. Primordialism (I), largely rejected today (but still often propagated by nationalist movements), posits that nations are ancient, perennial, fixed and a natural part of human society. P. Van den Berghe's *The Ethnic Phenomenon* (1987) argues that ethnic identity is biologically rooted (see Box 1.1 on 'nepotism'), instinctual, and evolutionary. He emphasizes cultural markers for group differentiation and critiques modernist views that see ethnicity as purely a social construct. He also highlights the role of ethnic myths in sustaining group identity, arguing that ethnicity is an adaptive behavior enhancing survival and cohesion. This perspective underscores the enduring and natural basis of ethnic affiliations.

In contrast, modernism (II), a widely accepted canon of theories, suggests that nations are 'imagined communities' and the result of an 'invented tradition' (see Hobsbawn & Ranger 1983), a necessary stage in political development (Ozkirimli 2017). E. Gellner's *Nations and Nationalism* (1983) posits that nationalism is a product of modernity, arising from the need for cultural homogenization in industrial societies. He argues that a shared education system and a standardized language are essential to the functioning of modern states. Conversely, B. Anderson's *Imagined Communities* (1983) conceptualizes nations as constructs formed through shared narratives and symbols. He emphasizes the role of print capitalism in disseminating a common national consciousness and the decline of religious communities to the benefit of secular ideologies.

Ethnosymbolism (III), another approach, emphasizes the role of symbols, myths, and traditions in the formation of national identity. This perspective bridges the gap between primordialism and modernism by acknowledging the importance of pre-modern ethnic ties even as it recognizes the modern nature of the nation-state. Anthony D. Smith (2009) argues that nations are deeply rooted in pre-modern ethnic communities and that national identities are formed through shared symbols and myths. Smith's approach highlights the continuity of ethnic traditions and their role in modern nationalism. J.A. Armstrong (2017) contributes the concept of 'myth-symbol complexes,' emphasizing the long-term historical processes in the development of national identities. J. Hutchinson (2000; 2009) stresses the cultural and historical dimensions of nationalism, emphasizing the role of collective memories and myths. Critics argue that ethnosymbolism risks conflating ethnic groups with nations, and may overemphasize the continuity of ethnic traditions. Some suggest it overlooks the role of political power and state institutions in shaping national identities. Despite these criticisms, ethnosymbolism strives for a nuanced understanding of nationalism by integrating his-

torical, cultural, and symbolic elements, offering a valuable counterpoint to more modernist and functionalist theories

Nationalism has profoundly shaped political, social, and cultural landscapes, leading to the unification of countries and the dissolution of empires. Initially cosmopolitan, over time nationalism became more parochial as it displaced older belief systems, finally becoming unstoppable. It has been a driving force behind significant historical events, from the unification of Germany and Italy in the nineteenth century to the decolonization movements of the twentieth century, fueling centrifugal forces in composite polities, disintegrating empires, and reshaping modern international relations.

For the study of modern dictatorships and the instrumentalization of ethnic identities for political survival, consult **ultra-nationalism** (also referred to as 'hyper-nationalism'), **ethnic politics**, and **racism** in the section on **ideologies & worldviews**.

Nazism

The best political weapon is the weapon of terror. Cruelty commands respect. Men may hate us. But, we don't ask for their love; only for their fear.
– Heinrich Himmler

Nazism, or National Socialism (*Nationalsozialismus* in German), was a political **ideology** and fascist movement and a racist, nationalist rebranding of **socialism**. For the ideational treatment of the phenomenon, as a doctrine, consult the main entries on **fascism** and **ultra-nationalism**; for its organizational aspects, as a regime type, see **personalist rule** and **totalitarianism**.

The movement was led by Adolf Hitler as head of Germany's Nazi Party from 1920 to 1945. It emerged in the aftermath of World War I and the Treaty of Versailles, when Germany was left politically unstable and economically devastated. This context provided fertile ground for several radical ideologies, including Nazism, to take root and gain support. The German Nazi regime can be considered the most extreme historical form of a fascist regime, and the most radical implementation of the central fascist ideals concerning society and its development. It was a racist, sexist, patriarchal, genocidal, totalitarian, militaristic, and imperialistic regime organized around the racist (Aryan) conception of a biologically homogeneous nation, known as the *Volksgemeinschaft*. This nation was imagined as under continuous biological and racial threat from internal and external enemies – such as Jews, the physically and mentally disabled, Roma, and Slavs – who had to be regulated or eliminated by segregation, sterilization, and extermination in concentration camps (see Box 1.19 on 'genocide').

After World War I, Germany faced significant economic hardship. The Treaty of Versailles imposed heavy reparations, leading to hyperinflation and mass unemployment. The Weimar Republic, established after the war, struggled with political instability, frequent changes of government, and social upheaval. The global economic downturn of the late 1920s and early 1930s further destabilized Germany, increasing support for extremist parties like the Nazis. Hitler's skillful oratory and the effective use of **propaganda** by figures like Joseph Goebbels helped the Nazis gain mass support. Using legal means and cooperating with right-wing political elites and major industrialists (major corporations), they capitalized on the weaknesses of the Weimar Republic to gain power. Hitler was appointed Chancellor in 1933; following President Hindenburg's death in 1934, he consolidated his **dictatorship**.

Nazism was characterized by several core principles and beliefs, explained in detail in the entry on **fascism**. Central to Nazi ideology was the belief in the racial superiority of the Aryan race, especially ethnic Germans, who were seen as the pinnacle of human development. Jews were considered the primary racial enemy, depicted as a parasitic race responsible for Germany's problems. This racial antisemitism led to the Holocaust, the systematic extermination of six million Jews. The Nazis adopted

Social Darwinist ideas, believing in the survival of the fittest and the natural right of superior races to dominate inferior ones. Nazism rejected **democracy** and liberalism, advocating a **totalitarianism** in which the *Führer* (leader) had absolute power. The ideology emphasized the subordination of the individual to the state, demanding strict obedience to the leader and the party.

The Nazis aimed to expand German territory, particularly eastward, to provide living space for the Aryan race, a policy known as *Lebensraum*. This justified aggressive military expansion and conquest. Building up the military was a priority, both to reverse the restrictions of the Treaty of Versailles and to prepare for territorial expansion. The Nazis vehemently opposed **communism**, which they saw as a Jewish conspiracy to undermine nations. Their anti-communist stance helped them gain support from various segments of German society, including the business community and the military. Nazism's devastating impact was felt globally, culminating in World War II and the Holocaust.

Political Islam

The life of words is not independent of the life of ideas. The word civilization, which our ancestors did very well without, perhaps because they had the thing itself, spread during the nineteenth century under the influence of new ideas.
– René Guénon (1886-1951), *Orient et Occident*, 1924

Often used interchangeably with 'Islamism' and 'Islamic fundamentalism,' political Islam refers to a wide range of political thinking and movements for which the Islamic faith goes beyond the confessional-cultural in the sense that it also drives political mobilization to make Islam a cornerstone of the political-societal order. Usually associated with actors as diverse as the Muslim Brotherhood and its many offshoots and affiliates, Salafism, the governance system in Iran, the Taliban and armed Sunni jihadist groups like al-Qaeda, the term originated and gained prominence in the early 1980s. Although an entire encyclopedia could easily be devoted to this topic alone, we examine a number of key components and characteristics here.

DEFINITION According to Andrew March (2015: 104), *"political Islam should be understood in the broadest sense possible as the range of modern political movements, ideological trends, and state-directed policies concerned with giving Islam an authoritative status in political life."* For John Voll and Tamar Sonn (2011: 5), the term refers generally to *"any interpretation of Islam that serves as a basis for political identity and action [and more specifically] to the movements representing modern political mobilization in the name of Islam, a trend that emerged in the late twentieth century."* Finally, in the words of Jocelyne Cesari (2018: 2, 7): *"political Islam is 'multifaceted religious nationalism' which first emerged as a modern technique of governmentality with the adoption of the nation-state and the westernization and secularization of Islamic tradition. (…) It is not the outcome of an impossible clash between Western modernity and authentic noncolonized Islam [but] rather results from grafting the concepts of religion, nationalism, and secularism in Muslim territories. It must be understood in terms of its own cultural premises and not as a mediation of forces from elsewhere, whether it is a transfer of economic grievances, a medium for old class politics, or a vehicle for new political identities."*

SEE ALSO As an **ideology** and a form of **legitimacy**, political Islam belongs to worldviews of **traditional rule**, even when blended with modern realities. As a **political regime**, it often supports **monarchy**, although more radical versions can be considered to operate in the realm of **ideocracy** and **totalitarianism**, like some **Islamic States**.

ORIGINS If we speak of the origins of the term itself, the one author believed to have first coined it is Martin Kramer in a 1980 essay with that title. A proper interest in research of what would eventually be called political Islam started in the 1960s, often in connection with an interest in pan-Arabism and anti-leftist movements in the Arab world (Hasche 2015: 26). If we speak of the origins of political thought and of movements that qualify as political Islam – even if the latter mostly do not use this term, considering it pleonastic since Islam comprises many dispositions to organize and steer the worldly and the societal, and has thus always been political in nature – then it can be traced to the second half of the nineteenth century.

While it is popularly often believed to group surviving remnants of 'traditionalist' and 'medieval' ideas, movements and forms of social organization, political Islam is, in fact, something closely intertwined with modernity and modern political thought. The emergence and development of political Islam has been shaped by five historical shifts and impetuses. First (i), even if it is too easy to attribute everything quasi-exclusively to Western European colonialism as a cause, its establishment and maintenance of colonies, protectorates and trusteeship over much of the Islamic world (ca. 1810-1960), created, along with pre-colonial societal crises, a number of conditions and circumstances that engendered the coming into being of political Islam. These include elite westernization and the introduction of a number of European institutions, concepts like the nation-state and secularism, technological modernization and the disruption of precolonial socio-economic pat-

terns, and a contact of some sectors of society with Western European political thought through modern telecommunications and education.

Second (ii), there is the long decline and eventual demise of the Ottoman empire between roughly 1800 and 1922, an empire that, before the arrival of the Western European imperial powers, ruled in some form over large parts of the Islamic world; as well as the abolition of the Ottoman caliphate by secular Turkish nationalists in the spring of 1924. The anti-Ottoman Arab uprisings of 1916-1918 finally failed to establish a pan-Arab polity to replace the Ottoman empire as the leading power in the Islamic world (see Roy 2007: 89-144). Third (iii) is the founding of Israel and the repeated Arab defeats in the Arab-Israeli wars of 1947-1949, 1956, 1967 and 1973. Fourth (iv) is the growth of opposition, eventually leading to revolution in Iran against enforced, elite-driven modernization (1965-1979) and the establishment of an Islamic republic, which clearly showed the limits of a paradigm of westernization and secularization too long taken for granted. And fifth (v) there is the failure and waning of leftist movements and societal experiments, both homegrown and Soviet-backed, in the Islamic world.

For Jocelyne Cesari (2017), the origins of political Islam are closely entwined with the rise of modern nation-states and nationalism in the Muslim world. *"The emergence of nation-states from the collapse of the Ottoman Empire irrevocably changed the dynamic between Islam and society,"* the author states. *"The transformation wrought by the adoption of Western concepts of nation and state led to an unprecedented fusion of religious and national identities. Although most of the founders of Muslim-majority countries were secularized, they nevertheless incorporated Islam in the institutions of the new states. That process accelerated the politicization of Islam by turning it into a national ideology that served as a common denominator for all political forces, secular or otherwise"* (Cesari 2017: 31)

Mohamed Mosaad Abdelaziz Mohamed (2023) traces the origins of political Islam to the impact and aftermath of the earlier brief Napoleonic French campaign in Egypt, and its intentions to 'civilize' and transform the Orient through social engineering and the promotion of Enlightenment ideals; as well as to scholars whose work, Mohamed claims, was integral to the emergence and development of the modern Egyptian state. However, if political Islam has any 'founding fathers', then these include, arguably, the Iranian-born scholar, Sayyid Jamal al-Din Asadabadi, better known as al-Afghani (1838–1897) and his Egyptian disciple, Muḥammad Abduh (1849-1905), among others. Torsten Hasche (2015: 236-237) points out that the context for the coming into being of Asadabadi and Abduh's pan-Islamic modernist thought was influenced by Egypt's 1805 acquisition of quasi-independence from the Ottoman empire. The rule (1805-1848) of the Greek-born former Ottoman officer Muhamed Ali was marked by a European-inspired attempt to turn Egypt into a modern nation-state by reforming its bureaucracy, military and economy (including industrialization).

"In the context of this political and social structural changes," Hasche continues, *"Islamic modernism emerged (...) as a synthesis of a return to the Islamic tradition and the expansion and aspiration of Western European modernity. This emulsion of Islamic tradition with the growing cultural and political influence of the emerging European powers prepared the ground for pan-Arab nationalism. The latter's main representative Sati al-Husri (1882-1968) took over European ideas and concepts on nationalism and applied them on the formerly religiously-coined concept of the Islamic community or Ummah to come to a collective concept of a pan-Arabic nation, which was then adopted by the numerous national movements that emerged in the declining Ottoman empire."*

For Abba Idris Adam (2017: 40-41), *"Islamic modernity was an effort to give a befitting interpretation of Islam that fits the modern world. These ideas were formulated during the nineteenth century as an intellectual response to Western colonial influence in the face of declining Islamic civilization. Islamic modernism objected to Western colonial exploitation of Muslim countries and the imposition of Western secular values. Many Islamic modernists argued that Islam and modernity were compatible, and that all it takes is to re-interpret and re-apply the principles and ideals of Islam to formulate new responses to the political, scientific, and cultural challenges of the West and of the modern life."* Al-Afghani and Abduh's pan-Islamism, advocating the unity of the Muslim *Umma* (أمة) on the basis of a shared identity and predicament in reaction to Western (threats of) encroachment, eventually added an anti-colonial layer to Islamic modernity. Essentially, for the founders of what came to be known as political Islam, since traditionalist Islam and traditionalist structures and institutions were unable to prevent European encroachment on the Ummah and the Ummah's humiliation, Muslims had to eclectically acquire modern European techniques and knowledges to use them to regain control of their own destiny.

SEE ALSO This entry on **ideologies & worldviews** illustrates the ongoing crisis of **traditional rule** and modernity in political regimes with large Muslim communities. The search to integrate some form of political Islam into political regimes has skewed (Western) opinion that the default outcome is always non-democratic, eventuating in a mix of cultural pessimism and autocratic cultural atavism known as 'Arab exceptionalism' (see Box 6.1) – erroneously stating that political Islam is incompatible with democracy.

Note that although the term 'political Islam' is very often used interchangeably with *Islamism*, a number of authors, like Jocelyn Cesari (2021), argue that Islamism more narrowly refers to Islamic political parties, whereas political Islam covers a broader and more complex range of Islamic political action and governance. Another term commonly used interchangeably with political Islam is Islamic fundamentalism. In the strict sense, however, Islamic fundamentalists declare that what they consider the original foundations of the Islamic faith – the Quran and the *Sunna* or the tradition of sayings and practices attributed to the prophet Muhammad –

should be the sole sources of knowledge, religious practice, law and societal organization; *bid'a*, or later innovations, are distortions, divisive and heretical. Although fundamentalists can get involved, and as a matter of fact often are involved, in the political, this does not make fundamentalism a synonym for political Islam. Lastly, though nowadays less prevalent, another term used to designate political Islam is 'integralism' or 'integrism.' In its proper sense, however, this refers to a traditionalist-restorationist movement within Roman Catholicism especially present in historically Catholic Latin countries, which argues that the Roman Catholic faith should be the basis of public law and public policy in society.

MEASUREMENT Approaches used to study and measure political Islam and examine the wide range of movements, parties, etc., that qualify as such range from discourse and (social) media analysis (for an example, see Kadivar 2020), focusing on databases with election results and armed actions, to qualitative field-based case study research (for an example, see De Cordier 2010). In terms of theoretical frameworks, social movement theory has been popular in this field (for a critical examination, see Bayat 2005). In terms of categorization and the establishment of typologies, a number of general typologies of religiously-oriented parties (see Ozzano 2013) are relevant to the study and measurement of political Islam. In terms of public support and opinion, there are comparative quantitative surveys on the position of Islam and Shariah law in public life, or what this position should be, on minority rights, on preferred forms of governance, and on attitudes towards democracy in Muslim countries and communities. Though it needs to be updated, one example is the *Pew Research Center* study (2013).

CLASSIFICATIONS In terms of organization, mobilization, political activity and its relation to the state, political Islam can come in many forms. Samir Amghar (2010: 529-541) identifies three basic types of political Islamic movements, parties and approaches: (a) so-called 'managing' parties, (b) opposition or protest parties, and (c) parties existing outside the system that may or may not be considered revolutionary. 'Managing' parties (a) are generally parties situated close to power and which claim to exercise power, without however always managing to do so. They thus have a routine vocation, depending on the vagaries of democratic alternation. These parties try to build majorities, join government coalitions or control municipalities. Their exercise of public affairs or their hope of one day taking power utterly influence their language and their strategy (Amghar 2010: 529-541). This also includes co-optation by essentially secular regimes.

As regards opposition or protest parties (b), the co-optation by a number of regimes of certain Islamist groups and the participation strategy of some in political life (and parliaments) have led to the institutionalization of part of Islamism. This leads to the trivialization and routinization of the discourse of Islamist parties, *ipso facto* causing a dilution of their ideology's scope of protest. In response to the criticisms of a part of the electorate, denouncing certain Islamist groups for their possible political compromise with a regime whose functioning they had previously vilified, other Islamist parties have decided to remain in opposition. They participate in the political system, but refrain from any form of governmental participation. It is a question of integrating into the political game without compromising themselves, and of preserving their 'opponent' character as Islamists while playing the card of political inclusion, even if they are associated with power. So, in contrast to the so-called managerial Islamist parties, the so-called opposition Islamist parties are characterized by the distance they keep from the centers of power (Amghar 2010: 529-541).

Finally, there are the parties existing outside the system (c). Some may be considered revolutionary, others are 'voluntary outsiders.' While the so-called managing parties and protest parties share a recognition of the dominant political system, parties outside the system position themselves as in confrontation with the incumbent political regime. Because they are very critical of it, they have a revolutionary potential that the protest parties do not have. They then find themselves in three types of situations: either they are banned and continue their activity clandestinely, or they are forced into exile, or they are tolerated but cannot organize into a political party. Some prefer to voluntarily situate themselves outside the political system (Amghar 2010: 529-541). We can add that some parties, or at least factions within them, eventually opt for armed struggle or organize parallel and informal forms of governance in areas or among populations that they control or where they have a following. Furthermore, some actors are anchored and active in a clearly-defined territory, while others are deeply de-territorialized and internationalized.

Traditionally considered as being on the Right or even the radical Right on the conventional Left-Right political spectrum, some authors (Karagiannis & Mccauley 2013) see a growing symbiosis between political Islam and the (radical) Left, especially in Western Europe and North America. In the last ten to fifteen years, a number of Islamist movements (for an example, see De Cordier 2010: 482) have adopted the sort of anti-capitalist and alter-globalist parlance and slogans long considered to be typical of if not exclusive to the militant Left. More recently, investigative journalists and think-tank researchers examined Qatar's role in funding Muslim Brotherhood activities in Europe (Chesnot & Malbrunot 2020) and the instrumentalization and co-optation of wokeism and so-called decoloniality activism in Western Europe by the Muslim Brotherhood and its affiliates (Vidino 2022). Islamists and political Islam actors themselves usually consider the conventional Left-Right classification irrelevant.

REGIONAL VARIATION In terms of major contemporary currents and movements, we identify and hereby examine the following six: Ikhwanism, Salafism and Wahhabism, Takfirism, Khomeinism, Deobanism, and Jamaatism.

Ikhwanism – الإخوان translating as (*al-'Ikhwān*

– 'brethren') 'Brotherhood-ism,' it can also refer to Islamic insurgents in early twentieth-century northern Arabia. Here, however, following Khalil al-Anani (2016: 118-134), it refers to world views, ideology, identity codes and political methodologies of the *al-Ikhwān al-Muslimūn* or Muslim Brotherhood. Founded in the spring of 1928 by Hassan al-Banna (1906-1949), a teacher, in Ismailia in what was then the Kingdom of Egypt, the Muslim Brotherhood is often considered to be the 'ideal type' of a political Islamic movement and a trailblazer of modern political Islam. Initially a social-caritative and educational movement – as it still is – it rapidly politicized through its opposition to the British occupation of Egypt (1882-1956).

There is considerable debate (for examples, see Heggy 2011; Rogler 2011) about what the Brotherhood's current ideology and true aims are. In general, the movement seeks to permeate the organization of state and society with Islam and bring Islam into the secular. Historically, much of its ideological framework and political thought is based on the writings of both Hassan al-Banna, its founder, and Sayyid Qutb (1906-1966). The latter argued that Egypt and modern Muslim societies in general essentially needed to go through a process of re-Islamization (Lagervall 2021: 76). Qutb's ideas eventually also inspired violent jihadist movements, yet most of what we can categorize today as Ikhwanism is non-violent. Arguably, some Ikhwanist elements, such as the concept and role of the elite vanguard party, are Leninist.

For al-Anani (2016: 99; see also Lagervall 2021: 84), *"one of the key characteristics of the Brotherhood's organization is its elasticity and adaptability. [It] has evolved over time in response to both internal and external factors (…) and reflects the movement's responsiveness to contextual changes."* Since, for a long time, the Brotherhood's Egyptian mother organization as well as its branches in other Arab countries were regularly curtailed or outlawed, the movement, through a history often marked by a (semi-)clandestine existence, came to operate through a wide range of affiliates and semi-affiliates (parliamentary and non-parliamentary political parties, charity foundations, non-governmental organizations, community organizations, social media, think-tanks, etc.) and independently-operating national sections.

In general, many Brotherhood affiliates are active in the field of social welfare and charity in Arab societies (see Benthall 2018; Vannetzel 2017), thus acquiring a presence and also a certain popular legitimacy for Ikhwanism in the grassroots. They essentially fill a gap left by the absence or the withdrawal of the state from the social field, a recurrent effect of neoliberal policies and conditionality imposed by international financial institutions.

Politically, the position of Ikhwanism varies considerably by country. In Jordan, for example, the local Brotherhood's political arm, *Jabhat al-ʿAmal al-Islāmī* or *Islamic Action Front*, traditionally has a base of support among Jordanian citizens of Palestinian descent. Since it was founded in 1992, the party has run in elections, with representatives in parliament, and has conducted social work through its welfare arm. For the monarchy in Jordan, its presence and position has been a way to the channel political-religious sentiment in society. In Gaza and Cis-Jordan, Ikhwanism has historically converged with Palestinian nationalism in the form of *Ḥarakat al-Muqāwamah al-Islāmiyyah*, better known as Hamas and is as such contextually-engaged in armed struggle with Israel (Hroub 2009; Aby-Amr 1993).

In Egypt, the Brotherhood and its affiliates played an active and leading role in the 2011 protests – see **Arab Spring** – and the Tahrir uprising in 2011, and its political arm, the *Ḥizb al-Ḥurriyyah wal-ʿĀdāla* or *Freedom and Justice Party*, subsequently led an elected coalition government until it got outlawed and dissolved after el-Sisi's **coup d'état** in the summer of 2013. Since then, its followers and structures have been repressed and dismantled. In a number of other countries and places, Ikhwanist movements and parties operate in some way in practical alliances with non-Ikhwanist actors considered to be *ahl an-nuṣrat* or 'people of support.'

Historically, this expression refers to the Bedouin tribes that backed the prophet Muhammad when he took power in Medina in the year 622. In modern usage, it refers to existing groups, institutions and actors that are deemed capable – whether technically, militarily or through influence over key players (e.g. the military, tribes and clans, etc.) – to influence or remove present authorities and establish, secure and maintain an Islamic alternative (Karagiannis & Mccauley 2013: 326-327). In Yemen, for example, Ikhwanism thus embeds itself in tribalism through *al-Islah,* a coalition of Sunni tribal and religious factions and groups that is also present in parliament.

In Libya, where the Brotherhood was outlawed and repressed under Qaddafi, only again able to operate in the open after the downfall of the regime in the autumn of 2011, *Ḥizb al-Adāla wal-Bina* or *Justice and Construction Party*, the local Brotherhood's political arm, numbers as one of the better-organized political parties. It is represented in parliament where, operating in the context of state disintegration, absence of central governance and local power centers, it has been trying to boost its influence through strategic alliances with independents who often run on a tribal-regionalist line. It has also organized logistical support for humanitarian aid from neighboring countries (see also Trautig 2018).

Some authors (Vidino & Altuna 2021; Vidino 2022) argue that since the Brotherhood and Ikhwanism have increasingly come under pressure in their cradle (Egypt in particular) and are losing some clout in the Arab world, they have re-oriented their efforts, allegedly with Qatari support, to Muslim immigrant communities living in (Western) Europe, thereby often linking up with leftist minority rights and anti-racist movements. Arguably this could be considered a form of entryism, a method traditionally attributed to Leninism and Trotskyism, whereby one anonymously joins other organizations with the intention of influencing their agendas and methods.

Salafism & Wahhabism Often mentioned in the same breath, the two currents have similarities but different genealogies. What is now known as

Salafism came into being in Cairo in the Khedivate of Egypt, then under British control, around 1880. It originated as a puritanical Islamic reform movement which advocated the implementation of Islamic law and a return to the essence of Islam as contained in the Quran and as it existed in the time of the prophet Muhammad and the *al-salaf aṣ-ṣāliḥ*, the prophet's companions and the first generations of Muslims. In line with the modernist ideas of al-Afghani and Abduh, it endeavors to combine this with the embrace of modern science and technology.

Salafism (السلفية – *al-Salafiyya*) is considered to be one of the fastest-growing Islamic movements in the world, including among migrants and converts in Western Europe, not least because of funding by nongovernmental foundations from the Gulf and because its champions and actors discovered the use and effectiveness of the digital realm and social media early on (Roy 2004: 145-178). It basically comes in four forms; however, the lines between them are not always clear and they can sometimes be combined. The first (i), the *pietist*, propagates 'proper Islamic' devotion, practice and lifestyle at the individual level as well as in specific communities of Muslims and converts, or expresses devotion through social welfare and relief work.

The second (ii), the *proselytist* or *da'wa*-ist, actively propagates the Salafi interpretation of Islam with the purpose of winning reverts and converts. Examples include *Da'wa Salafiyya* in Algeria and the *Turati* movement on the Indonesian island of Java. The third (iii), the *political-activist*, participates in the political realm and institutions, often also in combination with welfare and relief work. Examples include the *Ḥizb an-Nūr* or *Party of Light* in Egypt, which is given a place in parliament to boost the el-Sisi regime's Islamic credentials as well as its relations with the Gulf emirates; and the *el-Isla* or *Reform Front Party* in Tunisia. The fourth (iv), finally, is the *armed jihadist*, one example being the *Jama'a es-Salafiyya li Da'wa wal Qital* (*Salafist Group for Preaching and Combat*), which was active in the Sahel region from 1998 to 2007. For investigations into and case studies of the different manifestations of Salafism in politics, see Meijer (2009), Woodward et al. (2013) and Ali (2019).

Wahhabism (آلُو هَابِيَةُ – *al-Wahhābiyya*), in contrast, came into being in central Arabia, then loosely situated on the edge of the Ottoman sphere of influence, around 1740. Originally a movement led by Muḥammad ibn ʿAbd al-Wahhāb, which propagated a literalist-puritanical form of Sunnism based on a literal understanding of the Quran and rejection of *bid'a*, or novelty, among the Nejd Bedouins of central Arabia, it became the official doctrine of the emirate of al-Diriyya – the precursor of what was to become the kingdom of Nejd and Hijaz in 1926 and eventually, in 1932, Saudi Arabia – and the ruling al-Saud tribe in 1744 (Tehami 1997; Nevo 1998). Historically, Wahhabism has fueled and legitimated campaigns and uprisings against Shias and the Ottomans in the area.

So, whereas Salafism was internationalized, from its very beginning Wahhabism was closely intertwined with the polity and the state of the emirate of al-Diriyya and then of Saudi Arabia. Although there are no official statistics on the issue and many Wahhabi do not call themselves such, followers of Wahhabism are believed to form a dominant minority of – perhaps – one-quarter of the population of Saudi Arabia. It is also present, influential and (semi-) official in Qatar, Kuwait and among the indigenous minority of the UAE and particularly Abu Dhabi.

Despite their different origins and contexts, a 'Salafo-Wahhabi' synthesis did come into being when, in the 1960s and 1970s, Saudi Arabia, the custodian of the holy pilgrimage sites of Mecca and Medina, grew worried at the growing influence of leftism in the Arab region, and – fueled by oil revenues – started to boost its influence in the Islamic world through pan-Islamic diplomacy and soft power. The credibility of Nejd Wahhabism being too limited in the wider Islamic world, it sponsored the development of a more sophisticated pan-Islamic form, often with the help of Egyptian Salafist scholars who had fled the (then) leftist-secular nationalist government at home (Stanley 2005). Since 1962-1978, the *Rabitat al-Alam al-Islami* or *Muslim World League* and *al-Igata* or *International Islamic Relief Organization* have been channels for the propagation of Salafo-Wahhabism in combination with welfare and relief work (see, among others, Woodward et al. 2013: 65). Another vector for its influence in the Arab region and, in particular, Africa are returnee labor migrants from the Gulf. For examples and case studies, see El Obeid (2020) and Karakoç et al. (2017).

Takfirism Sometimes considered to be an offshoot of Salafism, Takfirism's origins actually go back to the seventh-century Kharijite movement, which emerged in Arabia during a succession crisis after the death of the prophet Muhammad, and to some of the work of the thirteenth-century scholar ibn Tamiyyah (Poljarevic 2021). Modern Takfirism originated in Egypt under the influence of the writings of Sayyid Qutb (1906-1966) and especially of the impact of the Arab defeat by Israel in the Six-Day War of 1967. Its followers basically believe that the primary cause of the weakness of the Ummah is internal decay and corruption; therefore, those they see as 'heretics,' 'apostates' and 'hypocrites' must be excommunicated – which is what the Arabic word *takfīr* (تكفير) means: excommunication. Enemies include Muslim secularists who collaborate with the infidels, but also Shias and Sufis (Kadivar 2020), and pretty much anyone who practices Islam 'improperly.' Takfiri consider the prophet Muhammad's polity in Medina, which lasted from 622 to 632, to be the sole model of true Islamic governance, and maintain that sincere Muslims must leave countries and societies ruled by apostates and infidels or at least withdraw from them. Though some Takfiri societal withdrawers' groups are non-violent, the current's main political manifestation today is of the violent revolutionary type. Examples of Takfiri movements or groups influenced by Takfirism include *ad-Dawlah al-Islamiyah* – better known as the Islamic State – and parts of *al-Shabaab* in Somalia (see **Islamic States**).

Khomeinism Named after ayatollah Ruhollah Musavi Khomeini (1902-1989), the leader and iconic

Box 4.5 Baʿath Party: The Broken Dream of Arab Unity

Umma Arabiyya Wahida Dhat Risala Khalida
(One Arab Nation with an Eternal Mission)
– Baʿath Slogan

The *Baʿath* movement was established in 1943 in Syria. *Baʿath* (البعث – meaning 'resurrection' or 'renaissance' in Arabic) was inspired by pan-Arabism and born against the backdrop of Western colonialism in the early twentieth century. It adopted its party charter in 1947 and merged with the *Syrian Socialist Party* to become the *Arab Socialist Baʿath Party* in 1953. Branches were created in Jordan, Lebanon and Iraq between 1948-1951.

Michel 'Aflek (1910-1989, an Orthodox Christian) and Ṣalāḥ ad-Dīn al-Bīṭār (1912-1980, a Sunni Muslim) were the founders of the party. (Note that Zakī al-Arsūzī (1899-1968) and his ideas on Arab identity were very influential for the movement, even if he never joined the party.) Both Syrian thinkers were inspired by the powerful appeal of pan-Arabism and the revolutionary, social, and emancipatory message it had. Both founders had been exposed to pan-Arabism early in their lives under colonial rule, as a great deal of Syrian education at the time included Arabism in the curriculum. It was during their careers as teachers that they decided to dedicate themselves to propagate and preach the principles of Baʿathism. While 'Aflaq, like Hassan al-Bannah (the founder of the Muslim Brotherhood in Egypt in 1928) preferred to educate people through pamphlets and meetings, al-Bīṭār pushed for a political manifestation of these Arabist, anti-colonial and socialist principles. Their slogan, 'Unity, Liberty, Socialism,' resonated with many young Arabs who were sympathetic to the Soviet Union, and resented the Western colonial presence that had been such a salient reality in their youth. They embraced the non-aligned movement and espoused their own version of 'Arab Socialism,' independent of the USSR.

The Baʿath worldview rejected the colonial order and shamed other Arab parties that followed 'national' delineations (accepting colonial borders). The Baʿath refused to acknowledge these colonial creations, referring to these Arab national states as *quṭr* (region) (Rabinovich 1972). The goal was the creation of a unified Arab state (uniting all Arab regions), with the Baʿath leading a revolutionary socialist struggle whose goal was to bring enlightenment to Arab culture, free of class discrimination, exploitation, capitalist or feudal domination. The socialist aspects focused on emancipation, equality and justice, but did not embrace the communist, atheist materialism of the USSR, despite their commitment to secularism (Hanna & Gardner 1969).

Initially, the Baʿath movement found its champion in Nasser, who took over Egypt in 1952 with a **coup**. The Baʿath leadership announced that their party would strive for union between Egypt and Syria as a first step to achieve pan-Arab unity, successfully pushing the issue in the Syrian parliament (Devlin 1991: 1396-1399). After two successful national plebiscites, the *United Arab Republic* (UAR), joining Egypt and Syria, came into being in 1958, but it did not last. Dissatisfied by unequal power distribution, the marginalization of the Baʿath Party in favor of Nasser's appointees, and unpopular (land) reforms, a 1961 coup d'état by military officers led to the (uncontested) secession of Syria from the union. The UAR itself was formally dissolved in 1971.

Despite this enormous blow to pan-Arabism, the Baʿath party (and its various branches) reinvented itself after the exit of the Nasserites, although temporarily reduced in size. The reshuffle at the top in all four branches (Syria, Iraq, Jordan and Lebanon) admitted a new generation (about twenty years younger), putting a stronger accent on the party's socialist component. Notably, this influx of new members included many army men predisposed to a military chain of command, initially at the local and regional levels, but soon dominating the top command. This effectively replaced the consultative culture with authoritarian selection, and paved the way for military control (Devlin 1991: 1400-1403).

Coups followed in Syria and Iraq in 1963 and 1968, respectively, after which the Baʿath consolidated power (with an earlier attempt in Iraq in 1963, known as the 'Ramadan Revolution'). In 1963-1966 the struggle between military and civilian control culminated in the 1966 palace coup by the military command, expelling the old (civilian) guard into exile. This automatically resulted in a schism between the Syrian 'neo-Baʿathists' – who tweaked the ideology to confirm their supremacy and put pan-Arabism on the back burner – and the Iraqi branch that still (nominally) recognized the original, exiled, (ideological) leadership, offering them safe haven in Baghdad after 1968.

Some of the most notable members of the Baʿath party were the young Hafez al-Assad, who joined the party as a teenager and launched a bloodless palace coup against his rival faction in 1970, and Saddam Hussein, who made his first appearance on the Arab political scene as a young Baʿathist militant involved in the 1959 assassination attempt against the then Iraqi president Qassim for being too sympathetic to socialism. Both presidents competed for leadership of the Baʿath party as this implied (relatively speaking) leadership of Arab nationalism after Egypt had been discredited by their peace deal with Israel in 1978. The Baʿath party grew exponentially since citizens of both Syria and Iraq joined the party both as a display of their loyalty to their regimes and, especially in Iraq, as a pre-requisite for obtaining public sector jobs. In time both presidents reverted to **personalist rule**, but their respective Baʿath parties remained important pillars supporting regime **patronage**, **indoctrination**, and upholding **personality cults**. For Hafez al-Assad, the party was instrumental in institutionalizing the **succession** of his son, Bashar al-Assad, in 2000. The Iraqi patronage system was so entrenched that the 2003 de-Baʿathification campaign (and disbanding of the army) during US Operation 'Iraqi Freedom' led to violent insurrection. Former Baʿathists and members of the military rebelled after the decision

to bar them from public service in the new regime. This fallout was considered a major strategic US policy blunder and a direct trigger of the civil war that followed the US occupation (Pfiffner 2010).

For a broader perspective on the Arab Left before 1970, see Guiguis (2020); for the disintegration of these movements after 1970, and their position at the time of the **Arab Spring**, see Abisaab (2016), Haugbolle (2017); and for a survey of the Arab Left today, consult Resta et al. (2018), Browers (2021).

The party archives constitute an interesting case for historians: With the ouster of Saddam, the Iraqi Baʿath archives, key to untangling the regime's inner workings, were seized and transferred to the US, leading to a contested debate about ownership, collective memory, and cultural property (Montgomery 2011; Caswell 2011; Wilkinson 2019; Brill 2023).

figure of the Iranian revolution of 1979, Khomeinism, a term which appeared around 1990, is now part of the ideological framework of the Iranian Islamic republic as well as of a large number Shia political movements in other, Arab and non-Arab Muslim countries. It is based on state, polity and society ideas and precepts held Khomeini himself, but also borrowed from other thinkers, including nationalist and leftist ones. Although its protagonists and advocates will insist that what came to be known as Khomeinism is neither specifically 'Shia' nor 'Iranian' but destined for the wider Ummah, it is undeniably rooted in Shia political theology and in the societal and political conditions of prerevolutionary Iran.

As Yann Richard (1995: 207-208) explains, *"some distinctive theological features of Shiism take on a particular emphasis as they are used in a political context: the eschatological wait for the (Mahdi or Savior) (...), the justification of rebellion against an iniquitous government, secrecy and clandestinity, and obedience to a religious leader chosen by oneself."* Richard also mentions clearly social-revolutionary elements such as the notion of a vanguard class that has to take the lead in the emancipation and uplifting of the downtrodden community of believers – its own interpretation of the Marxist proletariat if you wish – as a precursor to the whole of humanity.

Since the Iranian revolution was essentially the social and nationalist (see Richard 2005: 62-65) uprising of the working classes and middle groups against the enforced westernization policies of native elites increasingly disconnected from societal reality – something indeed still recognizable outside Iran – Ervand Abrahamian (1993: 13-38) considers Khomeinism a form of radical populism. Khomeinism (or variants of it) form part of the ideological armature of Shia communitarian movements, often Iranian-backed, that champion the rights and uplifting of Shia majorities or minorities.

Examples of the latter include Hezbollah (the 'Party of God') in Lebanon (Kanaaneh 2021) and the *Kataʾib Hizballah* ('Hezbollah Battalions'), the *Harakat Hizballah fi Iraq* or 'Hezbollah Movement' in Iraq, and the *Jamʿīyah al-ʿAmal al-ʾIslāmī* or 'Islamic Action Society' in Bahrain, which was outlawed after the largely Shia-driven protests in 2011 (see **Arab Spring**). Although it is now at odds with Iran, the Iraqi *al-Tayyār al-Sadri* or 'Sadrist Movement' was also, initially, inspired by Khomeinism.

Deobandism Deobandism is a scholastic Sunni revivalist movement found primarily in India, Pakistan and Bangladesh and in countries with large diasporas from the Indian subcontinent. It came into being in the *Dār al-ʿUlūm* seminary which was

founded in 1866-1867 in the small town of Deoband, located north of Delhi – whence the name. Marked by the dramatic failure of earlier Indian uprisings against British colonial encroachment, and the sidelining of the Islamic judiciary and administrator class after the introduction of new British forms of governance in northern India, the movement's pioneers blamed the decline, powerlessness and serial humiliations endured by the Muslim Ummah on the internal corruption of Islam by folk practices and Shia influences (see Metcalf 2002: 5-6). Rather than confronting British colonial rule head-on, the Deobandi movement aimed to preserve and revitalize Indian Islamic identity and to 'properly' re-Islamize Indian Muslims through its network and model of madrassas, or Islamic seminaries, which it set starting in 1880.

Initially a pan-Indian movement opposed to the creation of a separate Pakistan (and later Bangladesh), it adapted to the new reality after the Indo-Pakistani partition of 1947 and the Bengali secession from Pakistan in 1971. Its center of gravity expanded from Uttar Pradesh in India to include Pakistan. From 1965-1970 onwards, the Deobandi current also came under influence and reach of Gulf Salafism (see Pease & Hess 2021). Once anticolonial, Deobandism's current intention is the development and uplifting of the Indian, Pakistani and Bangladeshi Muslim populations and communities. The madrassa system is still its core activity. Figures on the current numbers of Deobandi or Deobandi-inspired religious seminaries vary widely; however, some estimates number them between fifty and sixty thousand on the Indian subcontinent alone. However, although many are considered or self-identify as 'Deobandi,' they function independently of the historical mother institution in Deoband (Tareen 2014).

A considerable network of religious seminaries, often attached to vocational-technical schools, easily accessible by the poorer strata of society, is something with which even non-Islamist political parties and their clientelist networks have to reckon to gain or maintain a foothold in society, and among certain electorates. Deobandism's political clout further comes from its own political arms (the *Jamiat Ulama-i-Hind* in India, the *Jamiat Ulema-e-Islam* in Pakistan and its namesake in Bangladesh), their breakaway factions, and affiliated social associations, rights unions and legal platforms. In India, where Muslims form a sizable minority, they rally, among other issues, against communitarian violence and in favor of minority rights and the multi-confessional character of society. In Uttar Pradesh, for example, Deobandi-connected candidates have run under the *Bahujan Samaj* Party, a political party that arose from the emancipation movement of the Dalits or lower castes. In Pakistan, Deobandi or Deobandi-backed candidates regularly win seats in parliament or participate in electoral alliances. It is also in Pakistan that Deobandism has become most controversial for its alleged and real connections with Sunni jihadism and anti-Shia violence. The first generation of Taliban leaders attended Deobandi madrassas in Pakistan, though the Deobandi movement itself is divided in its stance *vis-à-vis* the group. According to Stéphane Dudoignon (2020), Deobandism has also built a presence in Iran as an anti-Shia counterculture, especially among the Baluchi minority in the southeast.

Jamaatism Jamaatism is largely confined to the Indo-Pakistani and Bengali regions as well as to the diasporas from these countries and societies. Resembling Ikhwanism in its worldview and approaches (see Gani 2023), its name comes from *Jama'at-i Islami* (*Jamaat-e Islami* – جماعتِ اسلامی in Urdu) or 'Islamic Society.' The original movement was founded in Lahore, now in Pakistan, in 1941 under the leadership of the journalist and scholar Sayyīd Abū al-A'lā al-Mawdūdī (1903-1979). The movement, later to be a party, was formed in reaction to what was felt to be the growing Hindu and secularist domination of the Indian anti-colonial movement, and the failure of traditionalist Sufism and secular Muslim nationalists to properly address the concerns and interests of the Indian Muslims and Islam.

The latter, it maintained, could only be done through the establishment of parallel genuine Islamic structures and leadership for Indian Muslims. The creation of an educated elite of devout Muslim leaders would, as the vanguard of a vanguard party, lead the way to the revival of Islam in India (see De Cordier 2010: 48). Founded as a pan-Indian Islamic party, and initially opposed to the creation of an independent Pakistan and Bangladesh, after the partition of India in 1947 and the secession of Bangladesh from Pakistan in 1971, it reorganized itself into national Indian (*Jamaat-e-Islami Hind* – in Arabo-Urdu), Pakistani (*Jamaat-e-Islami* – in Urdu) and Bangladeshi chapters (*Bānglādēsh Jāmāyatē Islāmī* – in Bengali), which accommodated their work and activities to national frameworks and circumstances.

The promotion of education through networks of party-affiliated schools and colleges, in an effort to reconcile Islam and Western science and uplift Indian, Pakistani and Bangladeshi Muslims remains one of Jamaatism's core activities. In India and Pakistan, in particular, the Jamaat is especially active and influential through its social welfare and charity services, community development and disaster relief through its social departments, students' and women's wings, and a wide range of affiliate foundations and non-governmental organizations like the *al-Khidmat Foundation* in Pakistan, *Falah-e-Aam* in Uttar Pradesh and the *Islamic Relief Committee of Gujarat* in India.

In Pakistan and Bangladesh, where it sometimes had representatives in parliament and provincial councils, *Jama'at-i Islami* has historically maintained ties to sectors of the military, and participated in coalitions with political parties issued from military rule, or taken part in electoral alliances with other Islamic parties. In India, against the backdrop of the rise and coming to power of Hindu nationalism, the *Jama'at-i Islami Hind* actively opposes neoliberal and privatization policies by the central government, and campaigns for religious freedom and for civil and minority rights.

KEY SIGNIFICANCE The significance of the study of political Islam and its various forms and manifestations, including those in Europe, lies first in its connections to local conditions and forms of populism and nationalism and, second, in the importance of identitarian movements. The rise and expansion of political Islam also challenges the long-taken-for-granted paradigm of linear, teleological secularization and westernizing modernization (see **modernization theory**).

Political Islam's relevance in the study of authoritarianism appears at several levels. To start with (i), movements, parties and associations that qualify as 'political Islam' often participate in or lead opposition to secular dictatorships. Second (ii), the real or perceived threat that political Islam poses, in whatever form, is often instrumentalized by secular dictatorships to legitimize themselves as guarantors of secularism and stability (e.g. Uzbekistan, Tajikistan, Egypt until early 2011). Furthermore (iii), some parties or factions are co-opted by dictatorships so as not to alienate religious sectors of society or to boost relationships with patron countries (e.g. el-Sisi's Egypt). And lastly (iv), Islamic parties and movements, through their affiliates, often provide social services and relief where governments with neoliberal economic policies – not necessarily or exclusively authoritarian ones – have withdrawn from the social field.

METHODOLOGICAL ISSUES As political Islam is a quite loaded subject, there are a few methodological issues, some of a practical and others of an ethical nature. To begin with, there is the issue of positionality. This is perhaps more vexed for Muslim researchers, or those with a Muslim background, than for atheist-agnostic or Christian European and Anglo-American scholars, since they may be confronted with questions by respondent activists and militants on where they themselves stand.

Further, research on the topic often involves work in conflict areas, anything from war zones like Syria to turbulent French *banlieues* (suburbs), or in places with authoritarian regimes, like Egypt or Uzbekistan for example. In such cases, the issue is naturally how to protect and deal responsibly with contacts and respondents, who run a risk, and how to cope with government attempts to bureaucratically impede or control research.

Furthermore, there are language barriers. Not everyone has a sufficiently good command of Arabic (in particular) to directly access written sources or interact directly with informants. This raises the issue of dependency on and reliability of in-person interpreters and translation apps. Finally, since political Islam has periodically attracted a lot of attention from academic and policy researchers over the last twenty years or so, there is, quite understandably, a growing 'researcher-weariness' and frustration with the lack of reciprocity between (potential) respondents, as well as the growing suspicion that research may be an alibi for intelligence gathering.

LITERATURE There is an enormous body of literature on political Islam, much of which has come in waves as the subject grew (again) topical, if not fashionable, in the wake of the Iranian revolution, terror and the war declared against it in 2001, the electoral breakthroughs of Islamic parties, the umpteenth escalation in Gaza or Israel, the (aftermath of the) **Arab Spring** uprisings, and so on. However, if we have to pick a handful of essentials, the following will serve. For a decent, in-depth discussion and extensive literature review of the various concepts and forms just examined ('fundamentalism,' 'Islamism,' 'militant Islam,' 'political Islam,' etc.), we recommend R.G. Mainuddin (2007). Likewise, J. Cesari (2018) helps to understand the many aspects and forms of political Islam, looking beyond the clichés surrounding the term. For an in-depth overview of relevant movements, we recommend M.A. Upal & C.M. Cusack (2021). Although not all of its case-chapters treat movements and currents that qualify as political Islam, several do. This work has the additional advantage of dealing with political and non-political forms of Islam, allowing the reader to assess the difference or, rather, the often-vague gray border between the two. Olivier Roy (2004; 2006) is a must-read as he identifies and examines a number of trends that shape contemporary political Islam: migration and the formation of diasporas, the trans-nationalization of movements and the rise and expansion of the digital sphere, and Western Europe (as well as North America) as a space for political Islam.

Woodward et al. (2013) challenges the erroneous stereotype that Sufism is by nature tolerant, moderate and pacifist, and Salafism by nature violent and extremist. This is not unimportant as the regimes of some Muslim-majority successor countries of the Soviet Union, like Uzbekistan, have sometimes promoted state-aligned forms of Sufism to counter 'extremism.' Lastly, Maréchal & Zemni (2013) is good study of the (politization of) the Sunni-Shia factor and dynamics, comprising chapters on both general topics and more specific case studies in the Arab and non-Arab world, and the issue's impact on the Arab uprisings.

Populism

The secret of the demagogue is to make himself as stupid as his audience so they believe they are clever as he.
–Karl Kraus (1874-1936)

It has been very truly said that the mob has many heads, but no brains.
–Antoine Rivarol (1753-1801)

Especially since 2016 – with the Brexit referendum and the first victory of Donald Trump in the US elections – 'populism' has become one of the most widely used terms, both broadly and in academic circles. Numerous recent books, articles and edited volumes have appeared tackling the phenomena of populism and populist politicians, and analyzing the crisis of liberal democracy, and how and why state functioning and transformation is under attack, notably by populist politics (Mouffe 2018; Mounk 2018). In strictly numerical terms, Roodujin has demonstrated the rise of interest in populism in both the media and the academy. In 2015, *The New York Times* used the word 'populism' 671 times, 1,399 times in 2016, and 2,537 times in 2017. In 2010, if we look at the *Web of Science* database, 76 articles with 'populist' or 'populism' in the title were published; in 2015, there were 155 articles and as many as 332 articles in 2017 (Rooduijn 2018: 1). So, as the 'populist moment' some authors write about (Mouffe 2018; Mounk 2018) seems likely to turn into the 'populist century' (Rosanvallon 2021), it is not surprising that the word 'populism' became the Cambridge Dictionary 2017 Word of the Year.

DEFINITION Like most notions in political science, populism is *"an essentially contested concept"* (Mudde & Rovira Kaltwasser 2017: 2). Some approaches consider populism to be either a specific discursive style, a political strategy, or an ideology. Below we discuss only one of the most common definitions in today's social science research.

Cas Mudde supplies the conceptualization of populism that is probably the most used. He argues that populism is a specific ideology, based on the separation of society into two homogeneous and antagonistic groups: the pure people and the corrupt elite (Mudde 2004: 543). However, this ideology is a 'thin' ideology, because it has a *"restricted morphology, which necessarily appears attached to – and sometimes is even assimilated into – other ideologies. In fact, populism almost always appears attached to other ideological elements, which are crucial for the promotion of political projects that are appealing to a broader public"* (Mudde & Rovira Kaltwasser 2017: 6). Similarly, Albertazzi and McDonnell argue that populism is a specific ideology *"which pits a virtuous and homogeneous people against a set of elites and dangerous 'others' who are together depicted as depriving (or attempting to deprive) the sovereign people of their rights, values, prosperity, identity and voice"* (Albertazzi & McDonnell 2008: 3). Populism is based on *"people-centrism and anti-elitism"* (Rooduijn 2018: 3). This is the basic element of populism since *"all forms of populism include some kind of appeal to 'the people' and a denunciation of 'the elite.' Accordingly, it is not overly contentious to state that populism always involves a critique of the establishment and an adulation of the common people"* (Mudde & Rovira Kaltwasser 2017: 5).

SEE ALSO Today, populism is mostly associated with strongly anti-elitist and anti-establishment politics. Moreover, in its right-wing variant, it entails elements of xenophobia, **ultra-nationalism**, **racism** and sometimes **fascism**. Left-wing populism, on the other hand, is close to anti-capitalism, anti-globalism, class politics and internationalism, and often resonates with various interpretations of **socialism** or **communism**. For more on the (now) pejorative label 'demagogue,' see Box 4.6.

ORIGINS Although the concept of populism is more than a century old, it has gained prominence in recent decades, as neoliberal capitalism and the unipolar post-Cold War world system entered a series of crises. Moreover, the concept has changed significantly over the last century – once a positive phenomenon, it is today mostly referred to negatively, except for the few attempts to use it in connection with left-wing politics. However, as shown below in 'methodological issues,' unclear definitions, conceptual stretching and conflation with other concepts diminish its validity.

At the end of the nineteenth and beginning of the twentieth century, the term 'populism' was introduced to describe specific political movements in two very different countries. In the US, it was used to explain the rise of the agrarian movement, which later, in the 1890s, formed the *People's Party* in the South and Midwest US. Another political phenomenon closely associated with populism was the Russian *narodnichestvo* (народничество), a political movement aimed at mobilizing the peasantry as the revolutionary class (Moffit 2016; Fuentes 2020).

The first political movement labeled as populist was in the US. The political and economic state of affairs following the American Civil War only increased the North-South divide. Southern farmers felt exploited and wanted to bring about change through militant politics. A movement began to emerge – it started in Texas, coalescing into the *Farmers' Alliance* – that in 1892 consolidated in the People's Party. This political actor broke the two-party political system in the US: *"The rise of the Populist movement and the People's Party represented the mobilization of a particular regionally-based defense of agrarian radicalism against the economic and political power of the North and against the failure of the party system to represent this new force"* (Taggart 2000: 31). This specific popular movement and party was

formed and organized by farmers themselves, but it lacked a clear strong leader – which is today regarded as one of elements of populist politics. (For the seminal works on the *People's Party* and populism, see Goodwyn 1976; Hicks 1931).

The second important political movement understood as populist was the Russian narodnik movement at the beginning of the twentieth century, which began gaining support in the 1860s. This movement was based on a romanticized conception of the peasantry and the countryside. The *narodniki* (народники) *"who went to the people in 1874 lacked a written program or organization. They came from intellectual urban circles and were relatively inexperienced in the business of political work. Moving from village to village, they distributed revolutionary pamphlets and talked indiscriminately to the peasants who crossed their path about the need radically to redistribute land and engage in revolution"* (Taggart 2000: 51). However, in contrast to the populist movement in the US, the promotion of the peasantry was based on the Russian urban elite's idealizing of the 'other,' perceived as pure and uncorrupted.

In the 'West,' the term *narodnichestvo* was translated as 'populism' only in 1912 (it was translated into French as *populisme*), and limited to the Russian experience. However, in Russian, the Western concept is translated as *populizm* (популизм), while *narodnichestvo* remains in use for the specific Russian experience. This has led Fuentes to claim that the *People's Party* was not just the pioneer of populist politics in the US but that *"the People's Party and its political role in the 1890s"* was the *"the founding moment of populism in the world."*

KEY SIGNIFICANCE From the concept's initial use until recent times, in both Shils (1956) and Lipset (1960), there has been a concern about the potentially negative role populism may play in democracies. Mainstream analyses, grouped around Mudde's 'thin-centered ideology' approach, tend to view the relationship between populism and democracy as ambivalent, with populist impetus in favor of the 'popular will' giving preference to minimal or procedural democracy, at the expense of liberal democracy and its rule of law, separation of powers, and minority rights (Mudde & Rovira Kaltwasser 2018: 1670). For Mudde (2004: 561) populism is *"inherently hostile to the idea and institutions"* of liberal democracy, while Zakaria (2003) views it as one form of 'illiberal democracy.' From this perspective, although populism can be pro-democracy, it is always against liberal democracy (Mudde 2021: 579). The main normative implication of such approaches is their underlining of the claim that populism is a threat to liberal democracy *in toto* (De Cleen & Glynos 2021: 184). In condemning populism as an assault on democracy, authors reference memories of supposedly well-functioning democracies diminished by the actions of leaders such as Viktor Orbán in Hungary or Donald Trump in the US (Azmanova 2019: 1191).

However, this position's main assumption and shortcoming is that it postulates that democracy has not had other challenges – a slip avoided by radical-democratic approaches that acknowledge the deep-rooted contestations of the principles of modern democracy and focus on how populist projects operate democratically from below (Kempf 2020: 284). This also entails assessing how populist leaders often utilize the discourse of democracy to consolidate their power and build their position, regardless of their ideological standing.

In an even greater contrast, in Laclau and Mouffe's (1985) theory of radical democracy, populism does not at all aim to renounce liberal democracy, *"but on the contrary to deepen and extend it in the direction of a radical and plural democracy."* Hence, rooted in the principle of democratic equivalence, populist mobilizations can also be assessed in terms of their struggle to construct various demands in accordance with the values of freedom, equality and solidarity, in a way that overturns the possibility of oppression and exploitation (Howarth & Roussos 2023: 313). What Laclau and his proponents make clear is that, while some populist movements can indeed be anti-democratic, even totalitarian or fascist, there is a much broader spectrum of potential articulations of populism beyond that suggested by the democracy/anti-democracy split (Laclau 2005: 166).

This means that populism can also be a democratizing response to a crisis of representation (Laclau 1977). Moreover, populist tactics are used by political actors operating within the bounds of democratic institutions and their policy objectives can be beneficial for democratic stability (Bonikowski 2017: 190). Thus, for some authors, populism cannot be studied without acknowledging its democratic potential. For instance, Goodwyn (1978) argues that populism offers a vision of democratic participation more advanced than the existing one: *"far from being a threat to democracy, populism was democracy's zenith."*

In any case, we cannot understand populism outside of the scope of democracy, since it always *"belongs to democratic politics but has an uncomfortable relationship with it"* (Arditi 2015: 102). In this sense, populism is always a moment internal to (liberal) democracy, however much it disrupts or deviates from it. In Hobbesian terms, populism is democracy misliked, *"democracy with foreseeably malignant consequences"* (Dunn 2019: 55). One such observed consequence has been its fusion with **nationalism** and **authoritarianism**. It is precisely its proclivity for authoritarianism that has been repeatedly regarded as characteristic of populism (at least in mainstream approaches). This association can be traced to two supposed elements of populist mobilization: **personalization** and weak institutionalization. The **personalist rule**-style of populist leaders relies on the premise of a strongman, further characterized by nationalistic, xenophobic, anti-establishment and anti-pluralist rhetoric, who connects to their supporters in a quasi-direct way (de Jonquires 2017: 555). So as to maintain their own promise, namely of their personal autonomy and power, personalist populist leaders rely on political tools which propel them in authoritarian direction, depicting themselves as saviors of 'the people' and turning the political arena into a site of struggle between the forces of good

and evil (Weyland 2019: 324). Thus, the assumption is that populism thrives in authoritarian contexts (Caiani & della Porta 2011), or rather, that a tendency to authoritarianism is inherent in populism itself (Weyland 2019: 326). However, here we see a kind of paradox emerging. Research has noted that, in both democratic and authoritarian regimes, populist mobilization can threaten democracy but also constitute the means of democratization (Peters & Pierre 2020). As Koch (2021: 401) explains, since populism essentially addresses issues of representative practices, it may function as a democratic corrective and not exclusively as an authoritarian threat. This also means being careful to contextualize the cases being assessed, making a clear distinction between populism as operative in democratic systems and populism as utilized by authoritarian regimes in their quest for self-legitimation (see **legitimacy**).

LITERATURE As already mentioned, populism is a highly contested concept. Both its historical usage and the theoretical concept of populism have undergone certain changes, but the crucial ambiguities remain. We have already highlighted one of the most common definitions of populism, as a thin **ideology**. However, there are many other definitions of populism. Some authors claim that populism should be seen as a specific political movement (di Tella 1965; Dix 1978), characterized by the *"political mobilization of mass constituencies by personalistic leaders who challenge established elites"* (Roberts 2006: 127). Other scholars argue that populism is a distinct political or communication style, based on a strong connection between the leader and the people (Knight 1998: 227; Jagers & Walgrave 2007: 322). A third group of researchers have defined populism as a discourse. Laclau (1977: 172-173), most notably, argues that populism is a specific antagonistic *"popular-democratic interpellation"* in relation to the dominant ideology (see also Kazin 1995; de la Tore 2000). In contrast to these definitions, Weyland conceptualizes populism as a specific political strategy, used by a strong leader to either gain or exercise political power, usually based on the direct and unmediated support of a larger number of non-institutional and unorganized supporters (Weyland 2001: 14).

After World War II, only two political phenomena could be characterized as populist: *Poujadisme* in France and McCarthyism in the US. 'Poujadism,' named after Pierre Poujade (1920-2003), was a French populist and right-wing movement in the 1950s that mobilized the lower middle classes, shopkeepers, artisans, and peasants, against tax collection and modernization while promoting a corporatist, anti-parliamentarian, and xenophobic ideology. 'McCarthyism' was a period in the 1950s characterized by intense anti-communist suspicion and widespread investigations, led by Senator Joseph R. McCarthy (1908-1957), targeting alleged communists and subversives in the US government and other institutions.

Two important theoretical interpretations of populism, connected to these processes, arose in the US. Shils (1960) writes about populism in underdeveloped and developed countries and about the role of intellectuals, while Lipset (1960) addresses the specific rise of McCarthyism as a form of populist politics. Shils even argues that populism is not a historical phenomenon, but rather a part of daily political life. It should be understood as a relatively wide-ranging political phenomenon, occurring every time that there is popular ideological resentment against the existing order and the ruling classes, which are perceived to exercise a monopoly on property, power and culture (Shils 1956: 100-101). Lipset connects the rise of populism to economic hardship, claiming that a common 'social base' was characteristic of those supporting populist politics. These followers were *"declining 'liberal' classes living in declining areas,"* who were discontented with their economic situation and whose *"discontent leads them to accept diverse irrational protest ideologies – regionalism, racism, supernationalism, anticosmopolitanism, McCarthyism, fascism"* (Lipset 1960: 173).

By the 1960s the concept was used mostly to explain specific political developments in Latin America, especially the political movements in Argentina, Mexico, Brazil and Ecuador (Di Tella 1965; Smith 1969). It is important to note that Latin America remains a mandatory reference point for discussions of populism. It is the region that gave birth to modern populism and produced its most paradigmatic cases, *Peronismo* (Argentina) and *Chavismo* (Venezuela). Moreover, Latin America has a rich experience with populist regimes and populism in power, initiating the contemporary populist revival in both theory and practice (de la Torre & Peruzzotti 2018). In addition to Di Tella (1965) and Roberts (1995), who discuss populism in Latin America, Goodwyn (1976) and Kazin (1995) analyze populism in the US, and Laclau (1977) partly focuses on Europe. In the first decade of the twenty-first century, numerous comparative works were also published: Roberts 2006; de la Torre 2010; Weyland 2001; Stavrakakis et al. 2016 (on Latin America); Albertazzi & McDonell 2008; Mény & Surel 2002 (on Europe). However, recently, there has been a shift from studying populism in the 'Third World' to exploring populism within the core of the global capitalist system.

In 1967, Ionescu and Gellner organized a conference at the London School of Economics. The aim of the conference was to engage with the problem of how to define populism. Their edited book (Ionescu & Gellner 1969: 1), stated: *"There can, at present, be no doubt about the importance of populism. But no one is clear what it is."* This volume covers different approaches to populism: as a political movement, an ideology, and a specific political phenomenon.

In 1981, Margaret Canovan identified seven different types of populism. However, she does not list a single common feature in these seven types that would enable comparative research. Canovan (1982) takes a different approach to populism, which she calls 'phenomenological,' one less concerned with explaining what populism is than with describing it. She develops a descriptive typology of populism, in which she points to differences between political and agrarian forms of populism.

In the 2000s, many researchers adopt a compara-

tive focus on populism. They analyze different Latin American cases (Roberts 2006; de la Torre 2010; Weyland 2001); European populism and populists (Albertazzi & McDonnell 2008; Mény & Surel 2002). In the 2010s, several important and influential works appeared: Moffitt 2016; Müller 2016; Van Kessel 2015; Kriesi & Pappas 2015; Rovira Kaltwasser et al. 2017; Wolinetz & Zaslove 2018; Akkerman et al. 2014; Bonikowski & Gidron 2015; Müller et al. 2017; Norris & Inglehart 2019.

With this scholarly boom, the focus has shifted from the supply side to the demand side, that is, to how specific politicians, political parties and movements try to mobilize the 'pure people' against corrupt elites. For specific treatment of how economic hardship and insecurity can move people, disappointed by the established parties, to vote for populists (either right-wing or left-wing), as well as for works that also emphasize the importance of cultural variables in relation to economic crises, see Acemoglu et al. 2013; Becker et al. 2016; Foster & Frieden 2017; di Tella & Rotemberg 2016; Norris & Inglehart 2016; Algan et al. 2017; Rodrik 2017; Guiso et al. 2017.

Although most scholars view populism in relation to reactionary political movements that are inherently a threat to democracy, a different legacy emphasizes the possible emancipatory character of populist politics. This tradition is more in line with the views of early twentieth-century scholars and their assessment of the character of the first US populist movement. Today, this positive view is associated with the discursive approach of (post-)Marxist scholars. For example, Laclau and Mouffe argue that progressive populist movements can bring about necessary correctives to existing capitalist societies, especially given the declining influence of working-class politics (Laclau 1977; 2005; Mouffe 2005; 2018). Hence, Mouffe argues, one should differentiate between right-wing reactionary populism and left-wing emancipatory populist politics: *"it is necessary to establish a political frontier and that left populism, understood as a discursive strategy of construction of the political frontier between 'the people' and 'the oligarchy', constitutes, in the present conjuncture, the type of politics needed to recover and deepen democracy"* (Mouffe 2018: 11).

METHODOLOGICAL ISSUES As with all '-isms,' populism is very difficult to define and measure. Canovan claims that the difficulties of exploring and explaining populism boil down to one common problem: *"Methodological problems arise not so much in recognising similarities among these movements as in trying to decide what is 'populist' about them and what, if anything, they have in common with other past and present political phenomena known by the same label"* (Canovan 2004: 243). Here we list only a few:

Scope One of the crucial problems is that scholars of populism explore and compare different things. They focus on parties, ideologies, politicians, political strategies, modes of representation, styles, etc. In this way, it is impossible to compare 'populism as an ideology' to 'populism as a political movement.' Although some of their features may appear similar, the research object differs.

Context specificity Spanning more than a century, populism has meant completely different things in extremely varied political, historical, economic and cultural contexts. We often fail to understand the different meanings of populism both historically and in specific locations.

Conceptual stretching Claiming that populism has some essential attributes that can be identified in most cases, if not in all, is certainly problematic. It leaves aside many important concepts (like ideology, for example) to get a 'lowest common denominator' definition. Moreover, many features that are presented as 'essential elements' of populism are also listed as essential to other political phenomena, like **nationalism**, religious movements, right-wing extremism and even **fascism**. Hence, vastly different politicians, parties and movements are often labeled 'populist.' Yet what do left populists like Jeremy Corbyn (UK), for example, have in common with Marine Le Pen (France), Donald Trump (US) or Viktor Orbán (Hungary)? Not much besides an oppositional stance toward the *status quo*. Canovan (1981: 6) writes, *"The more flexible the word has become, the more tempted political scientists have been to label 'populist' any movement or outlook that does not fit into any established category."* Consequently, this conceptual stretching, with its claims about essential features, will have to be addressed and tackled in the future: *"To avoid stretching the concept of populism to a point of meaninglessness and get instead a 'general' concept with worldwide applicability requires that we reduce the number of its necessary properties, or qualifying attributes"* (Pappas 2016).

Operationalization Another troubling issue is that concept lacks a negative counterpart. If populism is on the one side, what is its other pole, elitism? As Pappas (2016) argues, and Mudde (2004) and de la Torre (2013) show, elitism is not always the counterpart of populism, because populists can often claim a technocratic regime. Furthermore, if we disregard the construction of the opposite of populism, we still have a problem with degrees on the continuum of more or less populist. This would require the exact operationalization of the concept, which is very difficult, and additionally poses many challenges for comparative study due to the many different definitions.

MEASUREMENT & CLASSIFICATION As mentioned above, one of the pressing issues in populism studies concerns the lack of data measuring voters' populist attitudes and the populism of political actors, as well as of comprehensive classifications accounting for multiple dimensions and a full range of mobilizations of what can be defined as populist. As Meijers and Zaslove (2021) note, researchers mostly employ Large-N studies of populism, relying on classifications based on literature reviews or country expertise, which may result in issues of reliability and validity. In this respect, most works tackle the 'supply side' of political party research; however, in

Box 4.6 Demagogues: From Cleon of Athens to Adolf Hitler

The most powerful modern demagogues are sincere and fanatic believers in their mission as 'saviors' of their people. They are not tortured by skepticism or self-doubt. This very defect in self-valuation makes them the heroes of the masses who are harrassed by uncertainty. The real demagogue gives them faith and security because he is so sure of himself. He regards himself as God-sent, almost God-like.
– Sigmund Neumann (1938)

Demagogue (from the Greek δημαγωγός – 'leader of the populace') as a term has shifted in meaning to that of 'rabble-rouser.' It is an old term used in political science, though it foremost carries a negative connotation today. Historically, in ancient Greece, it described charismatic leaders who appealed to the emotions and prejudices of the masses, often manipulating public sentiment for their gain. Over time, the term has evolved to refer to political leaders who use inflammatory rhetoric, fear-mongering, and divisive tactics to gain and maintain power. (Gustainis 1990)

The term is inherently linked to democracy and its subversion. Patricia Roberts-Miller (2005) explains that for democracy to function, people must engage in conversation. For it to function well, that conversation must be of high quality. In other words, a fundamental principle of democracy is that the public's ability to make sound decisions largely depends on the quality of public discourse. The more the public can collectively debate issues of shared concern, the closer society comes to achieving what political theorists refer to as 'deliberative democracy.' The aim of such discourse is not merely to impose one's will or to coerce others through bargaining or threats but rather to engage in a discussion where citizens and their representatives move beyond self-interest and narrow perspectives to reflect on the general interest or common good.

In this setting, a demagogue is typically seen as a leader who undermines democratic institutions by stoking fear, hatred, and division among different social groups. They often present themselves as champions of the people while exploiting popular anxieties or grievances. Demagogues are known for their ability to manipulate public opinion through emotional appeals rather than rational argumentation, routinely falling back on an 'us vs. them' dynamic that exacerbates social and political polarization: **racism**, **ultra-nationalism**, **fascism**.

The concept of demagoguery differs from **populism** because the former is narrower and subscribes to a politician's oratory skills as a source of power (**charismatic rule**), while the latter is broader, touching upon the anti-establishment sentiments and the claim to 'represent the people.'

Oral skills are one thing, but beliefs seem to matter more, as clearly shown by Donald Trump in both election campaigns: Hahl et al. (2018) find that the 'lying demagogue' (someone who deliberately tells lies and appeals to non-normative private prejudices) can still attract authentic appeal by those electoral segments of the populace if these are convinced that the political system is flawed or illegitimate.

The emergence of populism, in general, has also renewed interest in the study of demagoguery and its exact dynamics: Roberts-Miller 2005; Lawler McDonough 2018; Petersen 2020. For Athenian examples (Finley 2013); for American examples, see: Luthin (1951).

Throughout history, demagogues have risen to power by exploiting popular emotions and undermining democratic norms. One of the earliest examples is Cleon of Athens (died in 422 BCE), a general who gained influence during the Peloponnesian War by attacking the aristocracy and advocating extreme measures, such as the brutal punishment of the Mytilenean people, nearly derailing Athenian democracy.

In modern times, Adolf Hitler stands as one of the most infamous demagogues, using antisemitic scapegoating and ultra-nationalist fervor to consolidate power in Nazi Germany, leading to catastrophic consequences during World War II. Similarly, Benito Mussolini employed populist rhetoric and authoritarian tactics to present himself as Italy's savior while dismantling democratic institutions and establishing his fascist regime.

In the US, Huey Long, a Louisiana governor and senator, used his charisma and promises of wealth redistribution under the slogan 'Every Man a King' to amass power, all while engaging in corrupt practices and silencing opposition. During the Cold War, Joseph McCarthy capitalized on anti-communist hysteria to gain political influence through unsubstantiated accusations and personal attacks. Meanwhile, Father Charles Coughlin, a Catholic priest and radio personality in the 1930s, built a large following by promoting antisemitic conspiracy theories and criticizing both capitalism and communism.

recent years, an increasing number of case studies have addressed the 'demand side.' In the latter, one of the most widely employed instruments to measure voters' populist attitudes is a scale proposed by Akkerman et al. (2014), which operationalizes three elements (populism, pluralism and elitism) through measurement of corresponding attitudes and voting preferences. Assessing the 'supply side' of populism is more diverse in terms of methodology and in the choice of attributes and dimensions to be measured. Authors employ everything from content analyses (speeches of political leaders, press releases, party literature) to computer-based studies of party manifestos and even machine learning coding procedures (Olivas Osuna & Rama 2022). Frequently observed categories include the Manichean (absolutist, black-and-white) worldview, people-centrism, anti-elitism, the 'will of the people,' as well as support for conservative or progressive values, environmental issues and migration. Authors also rely on projects such as the 2014 *Chapel Hill Expert Survey* or *Global Party Survey* run by Pippa Norris, which rest on expert surveys measuring the degree of populism in political parties and leaders. Another useful tool is the *PopuList* project, organized by several comparativists working on populism (including Matthijs Rooduijn, Andrea Pirro, Stijn van Kessel and Cas Mudde), which offers a large database of populist parties in Europe classified into categories of populist, far-right, far-left, and Eurosceptic.

One of the earliest classification attempts was by Canovan (1981), who develops seven categories of populism, including three varieties of 'agrarian' populism – (i) farmers' radicalism (e.g. the US *People's Party*), (ii) peasant movements, and (iii) intellectual agrarian socialism (e.g. *narodnichestvo*) – and four varieties of 'urban' populism: (iv) populist **dictatorship**, (v) populist **democracy**, (vi) reactionary populism, and (vii) politician's populism.

The initial and most common classification of populism, however, is the one that establishes it along partisan lines: the literature regularly speaks of left-wing and right-wing populism. Mudde and Kaltwasser (2013) extend this classification by dividing the concept into categories of inclusionary and exclusionary populism, with left-wing populism subscribing to the former, and right-wing populism to the latter. Further classifications have been developed over the years and new categories continue to emerge. For instance, Hall (1978) coins the term 'authoritarian populism' to analyze Margaret Thatcher's rule in Britain. McGuigan (1992) writes of 'cultural populism' in his investigation of the role populists play in popular culture. Bickerton and Accetti (2021) argue for 'technopopulism' as a new category of political logic hinging on the traditional struggle between left and right. The DEMOS project (2020) analyzes four categories of populism in Europe: (a) radical left-wing, (b) radical right-wing, (c) illiberal, and (d) anti-establishment or 'empty populism.' In the literature, most other classifications follow similar, lines echoing nuances of populist mobilization along the left-right axis.

Although it often seems only a buzzword to discredit political opponents, populism is clearly a real phenomenon, although not easily definable or comparable. However, in order to increase explanatory power and analytical validity, more attention needs to be paid to resolving the methodological and empirical contradictions of the concept. To gain clarity, more empirical evidence and a definition of populism would be required before undertaking empirical research. However, it is very difficult to achieve coherence when some authors understand populism as a corrective to liberal democracy, and others see it as a great threat to it. Greater clarity about populism would be gained by using clear adjectives like 'left-wing' and 'right-wing,' which would greatly assist in achieving methodological and epistemological clarity, but would not resolve the problem of conceptual stretching. One should be careful not to conflate more common political phenomena: social-democratic politics with left-wing populism, for example, or xenophobic right-wing extremism with right-wing populism. If populism is simply everything not aligned with the mainstream liberal *status quo*, then as a concept it has very little value.

Racism

Racism is not easy to define (...) Short, tight definitions mislead (...) Although racism is a multidimensional phenomenon, it has suffered from formulaic and clichéd thinking from all sides of the political spectrum.
– Ali Rattansi

Racism is a political tool of colonialism and imperialism (...)
– bell hooks (Gloria Jean Watkins)

Racism is like a Cadillac; they make a new model every year.
– Malcolm X

Racism is dominantly understood as an inherently anti-democratic **ideology** that considers humanity as divided into superior and inferior races. According to some scholars, the world was heading towards the 'end of history' or a general hegemony of post-racial national and international liberal regime(s) (Bonilla-Silva 2010). However, the rise of far-right political forces since the 2010s, boosted by societal popularity, electoral success and their impact on public policy relied upon the utilization of virulent and explicitly racist discourses. For too long these were deemed to be politically irrelevant, even as they have severely complicated a whiggish (teleological) history of the present. However, these processes took place on a global scale and can be observed in varied liberal-democratic, authoritarian and hybrid political regimes; they transcend simple geopolitical and geo-economical divisions.

At the same time, the rise of far-right political forces has also reinvigorated anti-racist movements (e.g. Black Lives Matter). These processes nevertheless demonstrated the multidimensionality, complexity, heterogeneity, and varied logics of racism. They showed that, though racism has local peculiarities concerning racial categorizations and hierarchies, it is universally present, and that racisms in specific contexts share specific commonalities. These interrelated processes demonstrate the fundamental ambivalence of racism in modern societies as well as its persistence, despite long-standing national and international anti-racist policies. Recent political changes have also demonstrated that racisms only become visible (to mostly unaffected majorities) in times of crisis, when they erupt in intense and extreme displays. Since our present and future will be characterized by the intensification of multiple crises, we can expect that racism will continue to be relevant, not only as a socio-political phenomenon, but also as a field of study.

There is a fundamental lacuna in mainstream analyses and theories of racism. They generally fail to address and reflect on racism's historical and contemporary systemic role in the development, transformation and functioning of modern politico-economic regimes. Similarly, studies of political regimes hardly ever address racism as a relevant and crucial dimension of a regime's characteristics, development and functioning. For a critique and overview of mainstream research, see Bonilla-Silva (1997), Goldberg (2004), Guillaumin (1995) and McWhorter (2009).

DEFINITION Framing racism can never be understood as a neutral undertaking. It is inextricably tied to one's understanding of the broader social, political and economic order, and connected to a specific vision of society and politics (Bonilla-Silva 2015). Many scholars regard racism as an **ideology**, a set of beliefs, a dogma, or a doctrine that leads individuals to develop negative attitudes towards an entire group of people, and this can potentially incite individuals

and groups to specific racist practices of exclusion and discrimination against racial minorities. These scholars differ about its rationality, its function in modern societies and its structural underpinnings. The liberal American thinker Ashley Montagu (1945) provides one of the most influential definitions of racism. He defines it as a modern murderous irrational doctrine, a collective pathology built upon a modern race myth (the existence of naturally distinct racial groups), whose purpose is to abolish democratic politics. According to Montagu, racism runs contrary to all the central elements of **democracy** (rights, freedoms, accountability, etc.), goes against Western moral standards and is antithetical to the 'natural' egalitarian tendencies of capitalism and **nationalism**. The liberal sociologist Pierre Van den Berghe (1967) defines racism as any set of beliefs that organic, genetically transmitted differences between human groups are intrinsically linked to the presence or absence of certain socially relevant abilities or characteristics. Consequently, these differences are considered a legitimate basis for systemic discrimination between groups socially defined as races.

Marxist, postcolonial and structural understandings of racism see it as a rational, and not merely rationalizing and legitimizing, ideology. They see it as a system or structure tied to capitalist accumulation and to modern forms of wielding power over and organizing, ruling, and regulating populations. One of the most comprehensive definitions is provided by the pioneer of the Marxist analysis of racism, Oliver Cox (1959), who influenced the understanding of later Marxists (Carmichael & Hamilton 1967; Fields & Fields 2022; Haider 2018; Hall 1996; Miles 1993; Reed & Chowkwanyun 2011). Cox sees racism as a single complex modern phenomenon, which originated in the European context and was later introduced into practically all human societies via colonialism and the establishment of the global capitalist system. It is a complex system developed by the bourgeoisie, a structure that includes ideology, material practices and institutions and is constitutively connected with modern social formation. This complex system constantly dehumanizes and rationalizes and legitimizes the exploitation, subjugation, enslavement, expropriation, and extermination of populations deemed racially inferior, while ensuring the continuous division of the working classes. Its genesis and development are inextricably tied to the development of the modern order in all its interrelated spheres and dimensions, running through the capitalist mode of production, the modern colonial project (**colonial states**) based on colonial genocide and the slave system, modern scientific thinking, religious transformations, and modern political forms, as well as through the nation-state and national ideologies and identities.

Franz Fanon (2021), the father of the postcolonial tradition, offers another similarly comprehensive, but distinct, definition; although it is derived from colonial experience, it is adaptable to a wider context. He defines racism as a totalizing system intrinsic to capitalist and colonial relations. As a system, it affects and is perpetuated through political and economic structures and institutions, practices and ideologies, as well as through the process that constitutes the colonized (as racially inferior) and the colonizer (as racially superior) at the level of the body and the psyche. This produces a constant neurosis in both. Hence racism includes economic exploitation, the denial (or limitation) of political rights for the subjugated (racially inferior), and the systematic production of cultural representations (language, books, films, scientific discourses, and popular culture) that belittles the colonized (those deemed racially inferior).

Structural/systemic understandings define racism as constitutive of the social formation, as ultimately a non-individual, historically dynamic phenomenon, not predicated or dependent on irrational thinking or overt behavior, and not a remnant of a less enlightened past. Scholars in this tradition (Bonilla-Silva 2010; Feagin 2010; Goldberg 2004; Omi & Winant 1994) draw a distinction between racism as an extreme ideology, on the one hand, and a generalized modern racial national and international order organized, regulated, and reproduced through the continuous racialization of individuals (and populations) into specific categories (naturalized race thinking), on the other. For instance, Alana Lentin (2020) defines racism as beliefs, attitudes, ideas, and morals built on an understanding of the world as ordered into discrete races, even as she stresses that racism's condition of possibility is a racialized assemblage in the form of discourses, practices, desires, infrastructures, languages, technologies, sciences, economies, dreams, and cultural artifacts that together ensure the maintenance of political structures and institutions in ways that bar 'non-white subjects' from being considered fully human. These racialized assemblages are not uniform or static but historically and geopolitically dynamic. As Eduardo Bonilla-Silva (2010) emphasizes, there is a wide variety of historical and contemporary racialized systems that differ substantially concerning their level of racialization. The more a system is geared towards substantial differentiation of the life-chances of individuals, as ascribed members of specific racial groups, the more they are racialized, and explicitly racist ideas and practices are more prevalent and extreme. Although all historically racialized systems are hierarchical, there are substantial differences in the way that racial hierarchies are established, inscribed, policed, and perpetuated.

SEE ALSO This entry connects with **ethnic politics**; together, the two contain important, salient structural variables that **political regimes** use to formulate their **ideology** and worldview, driven by their quest for **legitimacy**, as well as providing their justification for **repression**. Almost always, racial discrimination coincides with **nationalism**, with an 'in-group' constructed around 'a people' and 'their state' – extreme versions like **fascism** or **ultra-nationalism** turn racism into the ordering principle of their **ideocracies**.

ORIGIN The origin of the term 'racism' is inextricably connected with the rise of **Nazism** in Germany

and the rebuttal of Nazi racist ideology. We first encounter it in the works of the German Jewish sexologist Magnus Hirschfeld (1933; 1934) to describe and criticize the Nazi racist ideology and belief that humans can be divided into races, and that there are superior and inferior races. But American scholars played a central role in the early study of racism. The American historian Jacques Barzun (1937) and the anthropologist Ruth Benedict (1940; 1945) broadened the initial focus on antisemitism to include reflection on anti-black and anti-indigenous racism(s). The central coordinates of the research field were from the outset built on the notion of racism as a specific ideology or doctrine, supported by the scientifically false conception that, biologically, there exist human races which can be clearly defined and hierarchically ordered. This tendency gained strength in the aftermath of the Word War II and the greater institutionalization of racism research, as an academic field, in connection with national and global institutionalizations of anti-racist policies that were intended to prevent future genocides (see Box 1.19) – like the fascist racist genocides of WW II – through education and the demystification of racist ideology. The work of Ashley Montagu (1945) can be considered as central in setting the foundational coordinates for the future academic study of racism. This process of academic and policy institutionalization was not without controversy, some critics considering it an instrument to distance Western imperial regimes from the Nazi regime (see Cox 1945).

There is little scholarly disagreement regarding the modern origins of the phenomenon of racism. However, substantial disagreement exists concerning exactly when, where, why and how it appeared, and how it developed, transformed, and consolidated. Some locate its beginning in the early modern period, in the context of the Iberian Peninsula and the first modern European colonial projects (Blackburn 1998; Cox 1945). Others place it in the (early) Enlightenment period in France and England (Hall 1995), in the nineteenth century, even the late nineteenth century (US and Western Europe) (Arendt 1944; Montagu 1945). Some see it as inextricably connected with modern colonial occupation, genocide and expropriation; or with modern slavery, the slave trade and a slave economy; or with the genesis of the modern state, modern **nationalism**, modern capitalist systems, modern scientific thinking (specifically evolution theory), modern representative political institutions, modern disciplinary, punitive institutions and modern **bureaucracies**, modern immigration policies, modern health, and medical policies, modern urbanism and transportation, modern security and policing institutions, and modern mass media (pamphlets, books, newspapers, etc.) (Balibar & Wallerstein 1991; Fields 1990; Fredrickson 2002; Guillaumin 1995; Williams 1944). There is also wide disagreement concerning the role it played in modern societies, where it appeared and what kind of relationship it had with central socio-political, economic, cultural, and other societal structures and institutions at the local and regional/global level. There are disputes over its (non)centrality for the (development and functioning of) modern order and whether it is constitutive of modern structures and institutions, policies and practices, ideologies, and beliefs – an inherent, indivisible part of them – or rather has an accidental, historically contingent, ambivalent, non-constitutive relation to them, one easily abolished as its utility for elites, power structures, societal stability, cohesion and the reproduction of the social formation(s) was either limited and not crucial or else useful solely in a more irrational past (see Stoler 1997).

LITERATURE The field of racism(s) research is vast. There are numerous approaches (A-D) associated to a diverse range of fundamental understandings of the phenomenon. Not only are there disputes between various approaches, but even within individual approaches many central debates are unresolved. Research in the liberal tradition can still be considered the dominant framework for analyzing and understanding racism in formal anti-racist policies. The conceptualization of racism(s) developed in the works of the pioneers of the liberal approach (e.g. Montagu 1945) still form the foundation for contemporary liberal understandings of racism that frame it as a set of beliefs, prejudices and stereotypes, an **ideology**, a doctrine that is irrational, anti-scientific, anti-liberal, anti-democratic and antithetical to the presupposed inherently egalitarian tendencies of capitalism and **nationalism**, one held by certain fringe groups made up of irrational, uneducated, unenlightened individuals, and groups (the racists) or which characterizes various forms of authoritarian states.

The contemporary main developments of the liberal tradition (A) can be traced to the 1980s and 1990s, when today's most salient liberal approaches were developed, namely (I) 'critical race theory,' (II) 'intersectionality,' and (III) 'privilege theory.'

Privilege theory (III) was developed by Peggy McIntosh (1990) and based on the concepts of white and male privilege. It addresses the ways that whites and males (in the US) benefited from their position in racial and gender hierarchies, both in the past and the present. This approach is based on introspection and personal change (via shame and guilt) of the privileged subject. Collective action to radically change the system is a non-issue. Privilege theory is one of the cornerstones of modern corporate diversity training and mainstream anti-racist education.

Critical race theory (CRT) (I), the best-known liberal approach, was first popularized in the 1990s but especially in the twenty-first century. It was developed by the legal scholar Kimberlé Williams Crenshaw (2010). It presupposes that US political, legal, and economic institutions are formally non-racist, diverse, and inclusive; and that equality can be achieved via the fight for formal rights and by the re-education of whites. Racism is understood as a psychological deficiency of whites. Anti-black ideas or the symbolic subordination of blacks, denies them social and political equality, which in turn creates material disadvantages or material subordination. The CRT framework also popularized the term 'white supremacy' to conceptualize this symbolic

and material subordination of black (and brown) people in a white-centered system (Delgado & Stefancic 1997).

Crenshaw (2017) was also central in the popularization of intersectionality (II). She was the first to use the term to describe employment experiences specific to black women, indicating that that race and gender interact in multiple ways that contribute to the multidimensional exclusion, the marginalization and disempowerment of those at the bottom of intersecting racial and gender hierarchies. Other scholars later extended the notion to include other forms of discrimination and oppression in other spheres of life. Today, intersectionality today covers a very heterogeneous set of approaches, some differing substantially from each other, and some retaining their radical, Marxist, post-structural, postcolonial roots.

The Marxist approaches (B) to the study of racisms began in a systematic manner in the 1930s and 1940s when Eric Williams (1944) and Oliver Cox (1945) published their foundational works, systematically demonstrating the role that race played in the constitution of the modern capitalist order, as an organizing principle and structure as well as a rationalizing and legitimizing ideology. Later (neo-) Marxist thinking further developed the crucial insights of these pioneers in complex and contested ways. Substantial theoretical-methodological and ontological disagreements concerning the nature of racism and its relationship to the modern capitalist social formation and its general (re)production persist. There is general recognition of the relevance of colonialism, modern slavery and rationalizing racist ideology and practices in the genesis of a modern capitalist global order defined by nation-states. But there is also disagreement concerning the nature of this relevance. Some (Blackburn 1997) argue that it was foundational and necessary; others argue that, though it was not foundational for the capitalist logic of accumulation, racism was historically necessary (Reed 2002). Some (Wood 2002) tie it exclusively to the pre-capitalist process of primitive accumulation, characterized by violence, dispossession, occupation, enslavement, genocide; others situate it firmly in the (re)production of the capitalist societal formation, which reproduces past violence via internal colonial racist material and ideological structures (Carmichael & Hamilton 1967). Some understand it as inextricably linked to the genesis and consolidation of nationalism as the central ideology of the capitalist nation state (Balibar & Wallerstein 1991). Many (Haider 2018; Reed & Chowkwanyun 2011) stress the primacy of class and class antagonism in the functioning of the capitalist system over categories such as race and racist ideologies. Others do not see the relationship as one of primacy and subordination, but as mutually constitutive and central to the general reproduction of the capitalist social formation (Kundnani 2014).

Dissatisfied Marxist activists who sought to transcend class reductionism were the first to developed an intersectional approach (III). The black radical feminist Combahee River collective and the Black Panther activist and Marxist scholar Angela Davis (1981) were the first to systematically theorize intersectional oppression and exploitation, and argue for the simultaneous critique of capitalism, imperialism and patriarchy, which they understood as mutually constitutive and reinforcing structures that must be abolished to attain real equality and freedom.

Scholars working in the systemic/structural tradition (C) demonstrate the constitutive nature of racism in the modern socio-political and economic order, functioning either at the level of specific nation states – their political, legal, and economic systems, and political ideologies (Feagin 2010) – or in the regional transatlantic context (Gilroy 1993), or at the global level of the international system (Grovogui 1996). Other scholars focus on the changing nature of specific racial systems. Omi and Winant's (1994) racial formation framework, which understands these changes as the result of the specific racial/racist project of specific political forces, was and continues to be very influential. Others stress the simultaneous and dynamic relation between the fluidity of and changes in the racial/racist system and the relative stability of asymmetrical power relations, practices, and structures, identifying specific substantial local and global changes over time. Colorblind racism (Bonilla-Silva 2010), new racism (Barker 1982) and neo-racism (Hall 1996) were introduced to designate a novel articulation of racism in the context of substantial societal changes that perceptibly delegitimized overt, biologically conceived racist hierarchies. Others (Feagin 2010) stress the relative stability of specifically racially ordered systems regarding the dominant and subjugated groups.

Foucauldian frameworks (D) (McWhorter 2009) specifically stress the productive relations between the operation of power (practices, discourses), the historical establishment of racial categories, and the historical and contemporary relevance of racism for the modern functioning of state/societal power at the local nation-state level or the level of the international system, dividing populations into the normal and abnormal, nurturing and developing the normal and excluding, disciplining and regulating the abnormal. Many scholars working in structural and postcolonial frameworks focus on the discursive dimension of the development, transformation, fluidity, and stability of racisms: the development of ideas, notions, beliefs concerning race(s), their nature, characteristics, differential capabilities, accompanying concepts and notions (Curtin 1964; Ignatiev 1995; Mudimbe 1988; Said 1978; Vukovich 2013).

These insights were utilized and expanded in further studies that addressed the developments and characteristics of racist systems in various socio-political contexts and societal spheres, ranging from formal politics, political movements (far-right), (neo-)fascist movements, legal systems, labor markets and employment, wealth distribution, general economic systems (racial capitalism), urbanization (segregation practices and policies), scientific theories, practices and institutions (essentializations), migration policies and security policies and anti-ter-

rorist policies, developmental policies, popular culture, newspapers and various online content, social media discourses and practices, the racist/racial nature of contemporary digital technologies and their development and applications (Kundnani 2014; Lentin 2020; Lipsitz 2011; Traverso 2019).

KEY SIGNIFICANCE Racism continues to function as a critical tool for the survival of authoritarian regimes, bolstering their **legitimacy**, justifying **repression**, and facilitating **co-optation** (creating exclusive **patronage** networks). In **ideocracies** (especially in **totalitarianism** and **fascism**), the creation of a common enemy or scapegoat (see **populism**) can unite a segment of the population against perceived threats, thereby consolidating power over this group – see Box 4.7 on Apartheid. Historical narratives and national identity are often manipulated to glorify the race of the 'nation' while demonizing minorities, and this helps to legitimize the ruling elites' rule and policies.

Repression of minority groups and rival elites is another way that racism supports authoritarian regimes. Because of their functional nature (from the viewpoint of the regime), the literature refers to such policies as **ethnic politics** (sometimes **clan politics**). In **coup-proofing**, leaders protect themselves against violent ousters through 'ethnic stacking' and (ethnic) **purges** of state institutions, which they may justify on racist grounds.

Racist ideologies provide a justification for state violence and legal discrimination, making it easier for a regime to maintain control and suppress dissent. Laws and policies that institutionalize racial discrimination limit the rights and freedoms of (minority) groups, ensuring they remain marginalized and less able to challenge a regime's authority.

Racism also informs the **foreign policy** of authoritarian regimes. Racism can lead to aggressive actions to protect the interests of the regime's in-group, extend regime ties to the diaspora abroad (**linkage & leverage theory**), form alliances with states that share similar racist ideologies, and use racist **propaganda** to justify their actions on the international stage. **Colonial legacies** similarly offer anti-colonial discourses that can be instrumentalized by the ruling elites for geopolitical and geostrategic purposes, contributing to regime **longevity, stability & resilience** by way of alliance building in the international system.

METHODOLOGICAL ISSUES The study of racism perennially runs against the ambivalent nature of present national and global systems, which simultaneously acknowledge the existence of racism (anti-racist policies) and relativize their importance outside select racialized systems (e.g. Nazi Germany, segregation in the US South, the Apartheid regime in South Africa) and events (e.g. 'race' riots, civil rights movements, Black Lives Matter protests). Despite numerous studies that demonstrate the centrality of racism in the development of modern societies, racism is still seen as non-central to the development of fundamental theoretical frameworks and the normative and empirical study of societies, their processes, structures, institutions, and relations.

Another central methodological issue is Anglo-American dominance of the field, which affects theoretical reflection and empirical studies. The US context is established as paradigmatic. Due to the hegemonic position of the US in the academic sphere, it exercises a great influence on how racism is conceptualized and analyzed around the globe. This has the effect of flattening the substantial differences between racialized orders in various parts of the world, and poses an obstacle to developing and implementing a more nuanced, comprehensive framework attuned to local specificities (see Stoler 1997).

A further central issue concerns the initial understanding of racism (ideological/symbolic vs. material/structural/systemic), its nature (aberration, irrationality vs. rational, modern), its history, development and transformation (linear vs. dynamic development), its historical and contemporary relations (the constitutive and strategic function it has within modern orders) that substantially affect the ways that the research is carried out (e.g. discourse analysis vs. analysis of political economy), its scope (e.g. focusing on racist individuals or groups) and potential insights (the relevance of fringe phenomena vs. its fundamental relevance for politics, economy and society).

A central methodological issue also relates to what the fundamental unit of study of the phenomenon of racism should be. There is a sharp divergence between approaches. Some individualize racism, others attribute it to specific groups, and other still perceive it as societal phenomenon tied to discourses, structures, institutions, practices, and identities. When researching racism as a social phenomenon, there is disagreement concerning the scope of the object of analysis. Although the predominant focus is specifically on the nation-state, competing epistemological currents either stress the importance of an initial comparative focus, or else emphasize the always-already relational nature of racism in its historical development and its contemporary nature and operation, acknowledging the central role of the nation-state yet stressing racism's constitutive relational nature both locally and globally (Gilroy 1993; Goldberg 2004; Stoler 1997).

The weak connection between theories of racism and the study of comparative authoritarianism can be attributed to several factors. Firstly, each has mostly developed its conceptual framework in isolation. Racism is traditionally studied within the context of social psychology and sociology, focusing on prejudice, privilege, discrimination, and systemic inequality; whereas **authoritarianism** has been analyzed primarily through **comparative politics** and **political regime** theory, emphasizing elite control and political repression. This disciplinary separation has hindered the integration of the two fields, despite their overlapping dynamics and the importance of racism in constructing a political **ideology** that serves a regime.

Secondly, the role of racism has been historical

Box 4.7 Apartheid – The Unique South African Cold War Racist Regime

The policy of separate development is merely to ensure there are no grounds for envy or envy-creation.
– Hendrik F. Verwoerd, the 'architect' of Apartheid, Speech in Parliament (1958)

Apartheid was a specific political, economic, and cultural regime that was established in South Africa (SA) in the second half of the twentieth century. It was a system of total racial domination by the white minority, the Afrikaners, over the Black majority, implemented and perpetuated through formal racial segregation that was built on the denial of citizenship to the Black majority. It involved the whole system of access to work, access to land and the control of all movement of the black South Africans and was underwritten by systemic violence against the oppressed Black majority. It was formally established by the *Nasionale Party* (National Party – NP), which was the major political power among the white South Africans that held power between 1948-1994.

The movement had its roots in the short period of the late nineteenth and early twentieth century when South Africa was a part of the British Empire. The Apartheid regime is a generalization of key features of the early system of segregation that was similar to other settler colonies established by the British Empire (e.g., the USA, Canada, and Australia). The latter was based on the migrant labor system under which Black people, who worked in the mines and represented the core of the SA economy, were required to return to their place of origin in the rural areas. Apartheid was a variation of racial capitalism and served the interests of the dominant section of capital in SA (the mining and gold industry). Internal and external economic and political crises and factors led to its downfall in 1994.

The Apartheid regime was historically unique as it contradicted both the mainstream liberal modernization and Marxist theories of the development of states and economies. Contrary to the prevalent theories where capitalist social modernization through the development of market forces should lead to the gradual abolishment of formal racist segregation, this did not happen in SA. Similarly, the regime was also an outlier when compared to the conventional historical developmental trajectories of modern states, as it actually strengthened formal segregation instead of developing more sophisticated and informal practices by adapting its **ideology** of discrimination. With the post-independence development of the white-ruled SA and its industrial development, racial segregation became even more pronounced and central to the functioning and legitimacy of the regime.

Despite being an outlier, the regime's ideology was in line with far-right and right-wing ideologies in the Anglo-American and broader Western context. This ideology was built on inextricably interconnected elements such as white supremacy, white civilizing mission, anti-Black **racism**, eugenic ideas of racial purity and the fear of (biological, cultural, social and political) 'contamination' as well of Black retribution and violence (i.e., the 'Black danger' or 'Swart gevaar'), and virulent anti-communism and anti-socialism ('red danger' or 'Rooi gevaar') seen as crucial for upholding the 'natural' socio-political hierarchies. The ideology was a direct continuation of nineteenth-century Western ideologies when racism and anti-communism/socialism became firmly interrelated, and anti-racist ideas and movements were conflated with the communist/socialist danger of overturning the societal order (**revolution**).

On the other hand, its decades-long survival cannot be understood outside the Cold War framework of alliances and support by the West, specifically European colonial powers such as Portugal. Although the West supported SA as a crucial actor in their (global) struggle against anti-colonial uprisings and/or communist insurrections, this support was ambivalent as it clashed with their promoted ideological principles of liberal **democracy** and **human rights** and encountered global and national condemnation by progressive civil society forces. The stability of the Apartheid regime was also built on strong alliances with friendly neighboring regimes. It collaborated with the Portuguese colonial administrations in Angola and Mozambique and had established an alliance with its sister white supremacist regime in Rhodesia (Zimbabwe) until the latter's fall in 1979. The regime was also engaged in continuous military operations and wars (e.g., The South African Border War 1966-1990) against various states and independence movements in Southern Africa (Angola, Namibia, Zambia) that it considered as a danger to its stability and power. The regime strived to legitimize these brutal operations as part of its ongoing containment of **Communism** and regional Soviet-Cuban expansionism. It was also directly engaged and/or supported other struggles of (former) colonialist powers against the newly independent postcolonial regimes. For instance, in Congo, along with the former colonial power (Belgium), SA supported the short-lived but important secessionist State of Katanga, a breakaway province of the newly independent Republic of the Congo (later renamed Zaire and DRC). This precipitated the fall (and **assassination**) of its first prime minister, Patrice Lumumba (Box 5.1), one of the heroes of African independence struggles.

The Apartheid regime began to unravel in the late 1980s when an internal economic crisis precipitated the intensification of the political opposition to the Apartheid organized by the *African National Congress* (ANC) led by Nelson Mandela and other prominent leaders. This subsequent political crisis intensified once the West cut support for the regime. The end of the Cold War removed the West's strategic need to support the racist, anti-communist Apartheid regime. In combination with growing internal and external pressure the regime had crumbled by 1994.

From the point of view of the study of dictatorships, the Apartheid regime and its ideology are relevant as a specific historical form of a racist settler-colonial capitalist regime that managed to survive far longer than

similar regimes due to specific geopolitical and internal politico-economic conditions (cf. **gatekeeping**). Its study is also relevant for analyzing the long shadow of past **authoritarian legacies** on present political systems. Even 30 years after its demise, its imprint still has a negative effect on the present nominally liberal-democratic South African political system.

underestimated in authoritarian regimes. For much of the twentieth century, the study of authoritarianism was dominated by analyses of **fascism** and **totalitarianism**, which, while acknowledging racial ideologies, did not systematically integrate them into broader theories of authoritarianism. By the 1990s, ideology (as a whole) seemed to become less salient and other **classifications & typologies** of political regimes became more mainstream. The comparative intersections of racism and political regime types remain understudied.

Lastly, empirical challenges and methodological issues have contributed to this weak connection. The complexity of measuring and comparing racism across different authoritarian regimes, coupled with the difficulty of accessing reliable data from closed or repressive states (**censorship**), limits comprehensive studies. Additionally, the focus on macro-level analyses of authoritarian regimes often overlooks the micro-level manifestations of racism, like everyday discrimination and social intolerance, which are crucial to understanding the full impact of racism in the functioning of these regimes.

REGIONAL VARIATIONS Across specific geopolitical contexts, there are similarities and differences between racisms, their development, consolidation and key transformations; the central racial categories and hierarchies; the discourses, practices, structures. Racial orders have a longer period of development in (post-)colonial geopolitical contexts than in contexts that never experienced colonization, like China, or in non-Western imperial contexts like Japan – see **colonial legacies**. Despite the late start in the latter, their racialized orders and racisms are in many ways similar to those developed in the West, though with specific modifications adapted to local contexts (e.g. 'superior' Han vs. 'inferior' Uyghurs; 'superior' Japanese vs. 'inferior' Ainu and Koreans), even as they incorporate some elements of Western imperial racisms relatively unchanged (Dikötter 1997; Shih 2013; Zhu 2021). Anti-black racism drawn from Western colonial and imperial discourses was and is present in China and Japan, as well as other Eurasian states (e.g. Russia), that did not participate in the modern slave system or colonize the African continent (Cheng 2011; Rainbow 2019) – see **imperial legacies**.

Antisemitism and anti-Muslim racism, which draws from Western racist discourses, can also be found in various contexts. These dimensions of local racism have a more direct strategic function tied to the specific political, economic, and societal needs of a particular context, and to the specific global migration, security, economic and identity politics of Western liberal regimes (Kundnani 2014). Antisemitism in Arab and Muslim countries, especially in the Middle East, plays a strategic function in the workings of these politico-economic regimes (**foreign policy**), being utilized in their power struggle with Israel and to consolidate their internal cohesion and stability. Anti-Muslim racism has a central strategic function in the workings of the states of Israel, China and India, and their general societal orders, in their striving for cohesion, stability and capital accumulation (El-Haj 2010; Jaffrelot 2005; Qian 2021; Webman 2010).

The development of a local variation of the racialized order is predicated on the type and time of the connection between the local context and the Western-dominated capitalist inter-imperial global system (Genovese 1969). However, the particularities of local racisms are also tied to local relations of power pertinent to these orders (van den Berghe 1967). There is also a substantial difference between racisms developed in the context of settler-colonial regimes (the US, Canada, Australia, Apartheid South Africa – see Box 4.7) and those in other geopolitical contexts. The racialized orders of the former have a brutal genocidal history, which specifically affects their contemporary societal hierarchies, their relations of power, the distribution of wealth and the health of specific populations (Wolf 1982). Despite the relational nature of different types of racism and their present universality, the racist discourses, practices, hierarchies and structures and institutions developed by the Western imperial powers still have a disproportionate global effect. These different forms of racism continue to be perpetuated in a Western-dominated global capitalist and inter-state system, and in various transnational political, economic, finance and cultural institutions (Mignolo 2000).

Religions of the World & Statecraft

Just as a candle cannot burn without fire, men cannot live without a spiritual life.
– the Buddha

Worship is a way of seeing the world in the light of God.
– Abraham Joshua Heschel, Polish-American Jewish theologian

As major world religions, Hinduism, Buddhism, Confucianism, Judaism, Christianity, and Islam all propose different prescriptions for state organization, even as they share common themes of ethical leadership and the welfare of the people. Their differences lie in the basis of authority (see **traditional rule**) and the **legitimacy** they bestow on the political order, the conduct prescribed to rulers and their subjects, the extent of political engagement and influence of religious institutions, their historical evolution, and their view of the ideal society or state, reflecting their unique religious and cultural contexts.

All religions urge ethical leadership as a moral duty to ensure the wellbeing of and justice for the populace. Confucianism and Buddhism focus on ethical and moral virtues, while Christianity, Judaism, Islam, and Hinduism often incorporate divine or religious authorities to assist rulers. Buddhism is less known for its political engagement, seemingly more preoccupied with the spiritual realm. Confucianism emphasizes moral governance without detailed legal structures, in contrast to Christianity, Judaism, Islam and Hinduism, which have more structured political prescriptions, often blending legal and theocratic elements. Historically, Judaism and Christianity have evolved significantly to incorporate modern democratic principles, while Islam, Confucianism, and Hinduism retain stronger ties to their traditional frameworks and older **political regimes**.

The scope of this entry can only serve as a modest 'selective introduction.' The diversity of many religious traditions is too great to be captured within the confines of a single entry. Whole shelves have been filled with books on topics like the plethora of pre-colonial, pre-Islamic African 'ontocracies' (see Arend van Leeuwen), sacralizing authority and power with the effective integration of altar and throne (Bediako 1993); or the Mayan intermediary divine rulers, communicating directly with deities; or Aztec warfare as a sacred act in the service of the gods (see Pennock 2023); or the shamanistic and animist practices found in a variety of forms ranging from Native American belief systems to Tengriism. Similarly, there is no space to cover Jainism, Sikhism, Daoism/Taoism, Shinto or Zoroastrianism or to untangle mutual influences. Also, this entry fails to account for the many innovations and spin-offs of the last few centuries. (Some of these topics resurface in the entries on **monarchies**.)

Instead, this entry offers a short overview of select world religions and their ideational contributions to statecraft, political legitimacy, and prescriptions for ideal polities. First of all, it presents some of the foundational early writings that provide the rudimentary basis for their original political thought about rulers, subjects and statehood. Most of these belief systems developed alongside **monarchies** and, while some remain uniquely favorable to this type of governance, many were revolutionary in their time, advocating for greater consultation in policy-making and linking royal mandates to popular support, countering **absolutism**, and especially **tyranny** and **despotism**.

HINDUISM The classical theory of statecraft in early India was based on a millennial religious-literary tradition, and included such notions as the divine mandate of rulers, the 'absolute' power of the monarch, and the superiority of the upper class – the Brahmins. These ideas, characteristic of Hindu philosophy, were well documented in Hindu mythology, in such works as the epics *(itihasa) Rāmāyana* and *Mahābhāratha* (ca. 700-ca. 300 BCE), tracing back to the Vedic texts (ca. 1500-ca. 800 BCE) (Callewaert & Goddeeris 2010).

Hindu political thought is deeply rooted in the concept of Dharma (duty/righteousness) and the *varna* and *jāti* system (social hierarchy in classes and castes). The ideal ruler, *Rājarṣi* (philosopher-king), should govern according to Dharma, ensuring justice, prosperity, and the spiritual welfare of the people. The Vedas refer to four types of sages (*ṛṣi*). A ruler can achieve the status of *Rājarṣi* through self-actualization during their reign; it does not require asceticism or giving up kingship.

Later, during the reign of Chandragupta (Ashoka's grandfather – see 'Buddhism' below), in the fourth to third centuries BCE, these Brahminic ideas of politics and statecraft were given formal expression in the writings of the influential political theorist Kautilya (Jayasuriya 2008: 48). (For a detailed treatise on Kautilya's *Arthashastra*, consult Box 2.2)

The mythical Manu (Svayambhuva) is the reputed author and narrator of the *Manusmriti* (मानव धर्मशास्त्र – *Mānava-Dharmaśāstra* or *Laws of Manu*), an ancient legal text, dating no later than the third century AD, which outlines the duties of rulers and the organization of society according to Dharma. The *Manusmriti* provides detailed guidelines about law, governance, and social hierarchy, emphasizing the importance of ethical leadership and the welfare of the populace (Scharfe 2022).

According to Manu, the (Vedic) 'state' was (instantaneously) created by the God Brahma to end the chaotic and lawless state of nature; he emphasizes that its necessity arose from human evil and uncontrollable habits rather than economic need. The king, seen as a divine entity endowed with the qualities of various gods, is tasked with maintaining social harmony, peace, and welfare. Manu outlines the

king's duties, including law enforcement, taxation, justice, and interstate relations, emphasizing the importance of a council of ministers for effective governance. The king must rule with self-control, intelligence, and the consent of the governed, guided by the Brahmans. Additionally, Manu's thought is deeply intertwined with the *varna* system, which he views as essential for social order, each caste being assigned specific roles and duties to preserve societal harmony.

Hinduism thus espouses a symbiosis between the earthly and the divine orders, even if some thinkers (e.g. Kautilya – Box 2.2) distinguish between *raison d'état* and the spiritual mission of rulers. The Vedic state (as a form of rule) is sacral and meant to uphold Dharma (the divine order); lawlessness is inimical to this purpose. Ghoshal (1923: 6) conceptualizes the Vedic state according to a horizontal division (between orders) and a vertical one between classes (*varnas*). Rao (1958: 75) classifies this a 'qualified monism,' in which the autonomy and diversity of the various social groups residing within the boundaries of the state were recognized, and in which subjects had multiple loyalties:

"An individual weaver might have to recognize the rules of his guild, the directions of his village council, and the orders of the temple that owned the village land, as well as the obligations of his caste, as directed by the shastras. Guilds agreed upon rules to regulate their working practices, including sanctions for anyone who breached them; groups of potters and weavers regulated the materials, quality, and styles of their products; and merchants got together to set prices and fix standards for quality and weights" (Pirie 2021).

Historically, this complex worldview eluded Western scholars, who for too long belittled original Indian political theory as irrational and dogmatic, and undeserving of the label 'political.'

As a godly creation, the Vedic state is thus virtually an end in itself, securing not only the socio-political sphere, but upholding the very existence of the people (Ghoshal 1923: 5). Brahma, the creator, also gave the people their ruler, tasked with upholding law and order, and with carrying out justice. Such divinely-bestowed **monarchies** thus meet many criteria associated with **absolutism**; nevertheless, such **traditional rule** constrained rulers as they were bound by their own Dharma, and were not its sole interpreters. Both the king and the office of kingship were human(-made), not divine. The king was not a godly incarnation or a prophet. The ruler's **power** as described by Kamandaki (a pupil of Kautilya) in his *Nītisāra* (*Essence of Statesmanship*) came from three sources: *Prabhuśakti* (the power of the army and the treasury), *Mantaśakti* (the counsel of wise men, specifically the Council of Ministers) and *Utsahśakti* (see **charismatic rule**) (Prakash 1993). Law was derived from four sources: Dharma (sacred law), *Vyavahāra* (evidence), *Carita* (tradition and custom), and *Rājaśāsana* (edicts of the king) (Sharma 1976). Their level in the hierarchy is debated and probably evolved from kingdom to kingdom, but whenever *Rājaśāsana* trumped Dharma, absolutism would increase.

BUDDHISM Buddhist political thought generally views political engagement as secondary to spiritual development. It promotes ethical governance that minimizes harm and fosters compassion. The ideal ruler, often depicted as a *Dharmaraja* (righteous king), should rule justly and ensure the welfare of all beings. Political involvement is seen as a means to support a peaceful and just society, but not as an end in itself.

Buddhism has a reputation for minimizing political engagement, focusing instead on spiritual development for several foundational reasons. Key among these is the emphasis on individual liberation from suffering. Even in different variants of Buddhism, the common central core is enshrined in the three fundamental axiomatic principles of the phenomenal world (*anicca*, *anatta*, *dukkha* (impermanence, no-self, and suffering) and the 'Four Noble Truths' (चत्वार्य् आर्यसत्यानि – *catvary āryasatyāni*): the existential state of suffering, its cause, its cessation; and the path leading to its cessation (Jayasuriya 2008: 44). Buddhism prioritizes personal spiritual growth and the attainment of Nirvana over worldly concerns like politics (Anderson 2016). Political power is thus viewed with caution in Buddhism, as it often involves greed, hatred, and delusion – elements contrary to the Buddhist goals of morality, purity, and faith. The Buddha himself avoided political power, believing that true religion is based on moral and ethical standards, not the pursuit of power.

Buddhism has a complex interplay with statecraft. Its origins in India were revolutionary, challenging a traditional order marked by political systems that had institutionalized a class- *(varna)* and caste-based society *(jāti)* that denied individual autonomy, human freedom and legitimized inequalities (Jayasuriya 2008: 47). At other times, it was very comfortable with **monarchies** and **absolutism**, which were a natural stage in the (cyclical) evolution of the world (toward increasing materialization and back to spiritual elevation with each *kalpa* – each cycle of cosmic recreation) (Tambiah 1967: 9-18). Buddhist concepts of karma and rebirth provided another powerful source of **legitimacy** for rulers: hereditary descent from a great historical 'wise' ruler was cherished. And to be reborn into the royal family as heir-apparent implied the accumulation of positive karma over innumerable lifetimes, and thus as being well on the way to Buddhahood.

The ideal Buddhist ruler is the cakravartin (चक्रवर्तिन् – 'wheel-turning monarch') or universal ruler, whose historical model is Ashoka Maurya. In Buddhism, the *cakravartin* is seen as a secular counterpart to a Buddha. While the Buddha brings spiritual enlightenment, the *cakravartin* brings order and justice in the material world. A sage ruler's reign is characterized by moral governance, and his authority is believed to be supported (solely) by the turning of the Dharma wheel, a symbol of righteous rule and the spreading of Buddhist teachings. (In Hinduism, there is a similar concept of an ethical sage king, but the corresponding domain of Dharma exists alongside three others: *Ashtra*, *Kama* and *Moksha* – see also Box 2.2). The *cakravartin* is also

associated with the concept of a bodhisattva, a being who seeks enlightenment not just for themselves but for all sentient beings. (A *cakravartin* embodies the virtues of a bodhisattva by ruling with compassion, wisdom, and justice) (Ladwig 2022; Tambiah 1976).

Ashoka (ca. 304-232 BCE), the Mauryan emperor, is a significant figure in Buddhist political thought. He was the grandson of Chandragupta, the dynasty's founder, and employer of Kautilya (see Box 2.2). As a warrior king, Ashoka suffered a crisis of identity when he witnessed the carnage of the Kalinga War (262 BCE). Afterwards, it is believed, he fully embraced Buddhism and became its great patron. Ashoka's new approach to statecraft gave primacy to Dharma over 'Danda' (force), espousing restraint and non-violence (*Ahimsā*) (Tambiah 1976: 57). His *Edicts of Ashoka* are inscriptions on pillars and rocks throughout his empire, promoting Buddhist principles of governance, non-violence, and welfare. Ashoka's edicts emphasize the importance of ethical leadership, compassion, and the welfare of all beings, reflecting his commitment to Buddhist values in statecraft. It is noteworthy that Ashoka did not declare Buddhism a state religion, but adhered to religious tolerance.

Until recently, the political philosophy of Siddhartha Gautama, the Buddha, who advocated the election of rulers and framed kingship as a 'social contract' (two thousand years before European Enlightenment thinkers), was virtually unexplored. Rulers were to be elected by the people, not for their ability to wage war, but for their nobility of character and form. In addition, the 'natural state' of humanity ('deprived' vs. 'harmonious') was not static in Buddhist thinking. Humanity (cyclically) evolved into different stages of order (influenced by external factors like lack of resources). During eras of social upheaval, state-imposed order was justified and necessary (Ilaiah 2002; Omvedt 2001).

The ultimate goal of Buddhist practice is to guide individuals to enlightenment through ethical conduct, meditation, and wisdom. The three heterogenous 'schools' or 'traditions' of Buddhism (Mahayana, Theravada and Vajrayana) provide different paths to enlightenment, vary in monastic practice, their reliance on scripture, ritual and esoteric texts (Tantras), and therefore calibrated with local customs differently as they spread geographically.

Of course, elites always had political considerations when adopting a (state) religion, even when choosing between 'schools.' For instance, the bodhisattva ideal in Mahayana Buddhism provided a framework that proved highly compatible with the values and needs of (East) Asian monarchies. By promoting compassion, ethical governance, and social harmony, the bodhisattva position allowed Buddhism to integrate seamlessly into ruling practices, thus enhancing the coherence between religious ideals and political authority. This alignment helped rulers legitimize their power (as semi-divine beings) and provided a moral and ethical foundation for governance that resonated deeply with their subjects.

Political systems, regardless of their ideals, cannot achieve the inner peace and happiness Buddhism seeks, which are found through personal transformation. Historically, Buddhism has thrived in apolitical environments, allowing communities to focus on monastic life and teaching, without political distractions. Nevertheless, an 'Engaged Buddhism' has emerged, advocating for the application of Buddhist principles in social and political activism. Figures like B.R. Ambedkar (1891-1956), an Indian jurist and statesman of Dalit (the 'outcasts' or 'untouchables') descent, and Thích Nhất Hạnh (1926-2022), a Vietnamese monk and peace activist, have championed this modern adaptation as a way to address social injustice (Gleig 2021; King 2009). Buddhist teachings on governance, such as the *dasavidha-rājadhamma* ('tenfold virtue of the ruler'), emphasize ethical leadership and non-violence, but, all in all, political goals remain secondary to individual spiritual liberation.

CONFUCIANISM As a Western term with no counterpart in Chinese, 'Confucianism' can be many things: a worldview, a social ethic, a political **ideology**, a scholarly tradition, and a way of life (Tu 1998: 3). There is some debate about whether Confucianism is a religion, since it does not meet all of the Western-centric defining criteria. It does not identify a supreme, personal deity (although it does include the (imperial) sacral concept of Heaven, within a cosmic order). It never had a formal clergy or centralized religious organization; it fails to offer a detailed cosmology explaining the origin of the universe; and it emphasizes moral and ethical development in the real world over spiritual (transcendental) experience.

Confucianism was labeled a religion by early Jesuit missionaries in the late sixteenth century, who hoped to sought to advance their proselytizing mission by accommodating the existing cultures and belief systems they encountered. Their initial attempts to co-opt Buddhist practices failed (in China). Consequently, they turned to the predominant culture of the elites, who were all educated in the Confucian classics. The ascribed label of Confucianism as a religion stuck in the Western imagination, even if the Catholic Church abandoned this approach, and it was cemented by the advent of comparative religious studies in Europe. Of course, the debate about the religiosity of Confucianism is beyond the scope of this entry. For an overview, see Chen 2012; Goldin 2014.

'Confucianism' is the Latinized term for *Kong fuzi*, meaning 'Revered Master Kong.' In Chinese, followers of his thinking are called *Ru* (classicists – 儒 – *rú*), a name they eventually monopolized, but one initially also applied to adherents of other philosophies who studied classic texts. 'Confucianism' is referred to in Chinese as *Ru Studies* (儒学 – *Rúxué*), sometimes *The Ru School of Thought* (儒家 – *Rújiā*), although 'school' was added centuries later as a bibliographic frame to sort authors and texts. Since Confucius' tradition did influence statecraft and guidance for rulers in and beyond China, it is included in this entry.

Master Kong (孔子 – *Kǒngzǐ*, ca. 551-ca. 479 BCE) was a ritual master, like many before him. Born in the sixth century BCE, the details of his life remain very scant, and this led to his active deification in time.

(In many ways, this is the closest that Confucianism comes to venerate a personal God.) The ritual culture of ancient China, evidenced by the earliest bronze artifacts, required ritual masters to teach its use and incorporate moral principles into practices. Confucius was the first whose teachings were documented. He emphasized the moral aspect of rituals, transforming the role of ritual masters into that of moral philosophers. Confucius himself abhorred the idea of fixing his tailor-made sage advice in writing, devoid of context or nuance, and therefore did not leave behind written works. All works attributed to him were compiled posthumously by his disciples, who wished to preserve his intellectual contributions for posterity; hence, their title, *Analects* (論語 – *lún yǔ* – 'selected sayings') (Goldin 2014: 7-9).

Confucius was not the only thinker in the tradition that carries his name. Mencius (孟子 – *Mèngzǐ* – Master Meng, ca. 371 – ca. 289 BCE) similarly did not leave any written texts. His contributions only survive in selected works by his commentators. Later followers, the so-called neo-Confucians, elevated him to the status of 'last sage' in the Song dynasty (960-1279). Along with other topics, Mencius is attributed with the elaboration of the concept of life-force (*qì*), and for considering human nature as intrinsically good, thus making 'the people' and their welfare central to Confucian thought. He argued that by implementing concrete public policies that ensure the wellbeing of the populace, a ruler could create an environment where moral and ethical behavior would naturally flourish. This would allow the ruler to govern with minimal intervention (*wúwéi*), as the people would be self-regulating and harmonious (Kim 2010; 2014).

Another famous Confucian master was Xunzi (荀子 – *Xúnzǐ* – Master Xun, ca. 310 – ca. after 238 BCE). By the time the Jesuits arrived, he had been disavowed by most Confucian scholars, and thus has no Latinized name. Recently, he has re-emerged as probably the most complex (and controversial) philosopher that China has ever produced. Xunzi composed a robust theory of the universe and its relation to moral philosophy, and (in contrast to Mencius) believed that people are not naturally good – meaning that humans are born with innate tendencies that, if left unchecked, lead to negative behavior and societal discord. So, goodness is not inherent in human nature but is instead the result of conscious effort and education. He argued that with the guidance of teachers, the practice of rituals, and adherence to societal norms, individuals could cultivate virtue and moral behavior (Sungmoon 2011; Goldin 2014: 67-76; Gu 2022).

Confucianism has profoundly influenced Chinese culture and other East Asian societies. As a philosophy it aims to socialize society and provide a framework for **indoctrination** at the grassroots level to achieve a harmonious society, fostering virtuous citizens and just rulers, based on a rigid social hierarchy emulated in the political sphere. The model for this ideal society is Confucius' imagination of the Zhou dynasty.

Confucianism prescribes good governance through a framework centered on moral virtue, benevolence, and the ethical conduct of rulers. Confucianism advocates a government led by virtuous rulers who act as moral exemplars. The ideal ruler, or *Junzi* (君子 – *jūn zǐ*), should embody and promote virtues such as righteousness, propriety, and benevolence. (Note that there exists a higher level of sainthood (聖– *sheng*) that very few individuals ever attain.)

Governance should be based on ethical principles rather than strict legal codes, emphasizing moral education and the cultivation of virtuous citizens. In this respect, this philosophy goes against **legalism**, a contemporary ideological framework that emerged by the end of the Warring States period and is also classified as one of the 'Hundred Schools of Thought' of that era.

The **legitimacy** of rulers in Confucianism is deeply rooted in the concept of the 'Mandate of Heaven' (天命 – *Tiānmìng*). This principle holds that rulers' right to govern is granted by Heaven based on their virtue and ability to govern justly. If rulers fail to uphold these standards, they risk losing their mandate. A legitimate ruler must demonstrate personal virtue and benevolent governance. This includes being just, compassionate, and attentive to the needs of the people. Confucianism asserts that the governed have the right to expect benevolent governance, and rulers must earn their loyalty through virtuous conduct. This framework creates a moral obligation for rulers to prioritize the wellbeing of their citizens and maintain social harmony. According to some interpretations, rulers' transgressions give the people the moral right to remove them – e.g. if they establish a **tyranny** or fail to uphold Confucian principles.

Mencius is most vocal about this (unlike Confucius, who has little to say about the legitimacy of rulers), and identifies three modes of **succession**: abdication, hereditary succession, and **revolution**. Abdication involves the voluntary transfer of power to a virtuous minister, while hereditary succession passes power to the ruler's son, and revolution establishes a new dynasty by deposing the incumbent ruler. Mencius emphasizes that Heaven's will, discernible in the people's acceptance and the ruler's moral conduct, ultimately determines the method of succession (Goldin 2014: 61-64).

Heaven's approval is indicated by successful governance and the people's peace. Though the people's approval is significant, Heaven's mandate is paramount. Mencius argues that if Heaven favored abdication, it would endorse it; however, in his time, hereditary succession was more common, reflecting Heaven's will then. Thus, Mencius' views integrate both divine command and popular approval, with Heaven's mandate being the ultimate determinant of a ruler's legitimacy. This is a far cry from the proto-democrat label sometimes conferred on Mencius (Nuyen 2013; Richey, no date).

Confucianism provides specific advice for rulers, elites, and citizens. For rulers, the emphasis is on self-cultivation and continuous learning. Starting in the Han dynasty, Chinese emperors were expected to study Confucian texts and be guided by Confucian scholars. This education aimed to instill a sense of

moral responsibility and the importance of benevolent rule. For elites, Confucianism advocates a meritocratic system (see Box 1.9) in which officials are selected based on their virtue and ability. This ensures that those in positions of power are committed to public service and the wellbeing of the people. The Confucian-inspired state examination system for mandarins (see Box 4.8) dates to the Han dynasty, and was designed to identify and promote talented individuals who demonstrated these qualities.

For citizens, Confucianism emphasizes the importance of moral education and the cultivation of virtue. The philosophy suggests that a well-ordered society begins with the moral development of individuals, which then extends to the family and ultimately to the state. Citizens are encouraged to practice filial piety (*xiào* – 孝) respect for elders, and social harmony. This bottom-up approach to governance underscores the interconnectedness of personal virtue and societal wellbeing. By fostering a culture of mutual respect and ethical behavior, Confucianism aims to create a stable and harmonious society in which both rulers and citizens contribute to the common good, but always within the hierarchical system of a **monarchy**.

JUDAISM Jewish political thought has evolved from biblical models of tribal federations to charismatic movements by prophets, monarchies, theocracies, and modern democratic participation. Jewish political ideas have their roots in traditional Judaic discourse, often legal or homiletic rather than philosophical. The discourse on governance evolved with and adapted to different historical settings.

Historically, Jews lacked a state, yet central political issues were addressed within the medieval *Qahal*, an autonomous, theocratic urban Jewish community. The covenant at Sinai, where God and the Israelites established a bond, is pivotal in Jewish political thought, signifying God's authority and the Israelites' commitment to the Torah.

Solomon ibn Gabirol (1021-1058; Avicebron in Latin) was a Jewish philosopher and poet whose work, *Fons Vitae*, explores the nature of existence and the ethical responsibilities of rulers. Ibn Gabirol emphasizes the importance of wisdom, justice, and ethical governance, arguing that rulers should act as moral exemplars and ensure the welfare of their subjects. His works influenced Jewish philosophers such as Moses ibn Ezra and Abraham ibn Ezra.

Moses Maimonides (1135-1204) was a medieval Jewish philosopher and legal scholar, who codified Jewish law. His other opus magnus, *Guide for the Perplexed*, addresses the relationship between religion and philosophy – integrating Aristotelian thinking, Arab-Islamic thought and Jewish theology – and includes prescriptions for political governance. Maimonides emphasizes the importance of justice, ethical leadership, and the covenant between God and the people. He argues that rulers should govern in accordance with divine law and ensure the welfare of the populace (Lorberbaum et al. 2003). (For the influence of Arab-Islamic thought on Jewish thinkers, see Zonta & Manekin 2024.)

Jewish teachings prioritize justice and ethical governance, urging leaders to pursue justice and maintain integrity, fearing God and rejecting ill-gotten gains. Community welfare is also crucial; the prophet Jeremiah encouraged Jews in exile to seek their cities' peace and prosperity, highlighting the importance of prioritizing communal wellbeing (*Holy Bible*, *Jeremiah 29*: 5-7). Additionally, Jewish tradition emphasizes responsibility and accountability, with leaders being answerable to both divine authority and the people. The Talmud and other rabbinic texts stress that leaders should be chosen with the consent of the governed and be held accountable for their actions, ensuring they serve justly and ethically.

Jewish political discussions were influenced by the Talmudic legal tradition, biblical memories of Israel's monarchy, and messianic prophecies. The tradition also includes justifications for human political agency based on popular consent, reflecting proto-democratic elements. (There were always debates about divine sovereignty, with some views excluding human authority and others allowing it through agents like kings, priests, prophets, and rabbis, who interpreted God's words and made decisions by vote.) The Hebrew Bible, particularly in *Deuteronomy*, outlines a separation of powers among judges, kings, priests, and prophets. This early form of constitutional government aimed to balance religious and civil authority.

Living as minorities under non-Jewish rulers, Jews dreamed of redemption and a messianic king. In order to minimize tensions with the sovereign government of the land where they resided; they developed the principle *dina de-malkhuta dina* (the law of the land is the law) (Joskowicz & Katz 2015: 4). In addition, Jewish communities often organized themselves into autonomous entities known as *kehillot*, managing their internal affairs, including religious, educational, health, and welfare needs. This self-governance allowed them to maintain their cultural and religious identity while meeting civic obligations like taxes and military service, without direct state interference. *Shtadlanut* (intercession) involved Jewish leaders, known as *shtadlanim*, negotiating with state authorities on behalf of their communities. This practice, prominent in medieval and early modern Europe, aimed to protect Jewish interests and secure favorable conditions through diplomacy and negotiation, rather than through direct political means (Klieman 2008).

Since 1948, the state of Israel has prompted a re-examination of Jewish political tradition, exploring its relevance in a modern democracy with a Jewish majority and significant non-Jewish minorities, balancing theocratic and democratic principles. In response to the rise of modern nation-states in the Middle East, Jewish thinkers have revisited a variety of legal doctrines, theories, and historical experiences to explore whether there are authentic warrants within their tradition for separating religion and the state. Jewish law, or *halakha*, has traditionally envisioned a unified religious polity where political authority is subject to and enforces divine law. However, this model was not always adhered to

in practice, and in medieval times, both Islam and Judaism developed doctrines that permitted extra-legal powers in political authority, diverging from scriptural norms (Last Stone 2008: 631-632).

Even though original Zionism was a secular revolutionary movement, its undercurrent contained a religious variant that slowly rose to the surface as a major force by the 1970s. Alexander Kaye (2020: 1-23) argues this religious Zionism is a modern invention, spearheaded by Yitzhak HaLevi Herzog (1888-1959), Chief Rabbi of Ireland from 1921 to 1936, whose political ideas were greatly influenced by the Irish struggle for independence and constitutionalism. Herzog and his followers transformed *halakha* from a hitherto decentralized, fragmented body of legal traditions, each interpreted by local rabbinical courts, into a unified, hierarchical legal system modeled on the legal codes of modern European states. They innovated the legal system (e.g. with appeals courts) to meet modern demands and expanded its jurisdiction to all citizens, whatever their religion. The halakhic state is a **theocracy**, rejecting constitutional secularism (in the tradition of Locke) and espousing the inherently legal character of Judaism, its legitimacy coming from God, as interpreted by rabbis. This fundamentalist system discriminates, and does not allow women and non-Jews to hold political or judiciary positions. Based on pre-modern law, it has few provisions for real-life modern polities regarding mass representation, the structure of government, the role of the army, or foreign policy.

The establishment of the state of Israel as a constitutional, secular, liberal democracy has pushed the question of the separation of religion and the state to the forefront, particularly given the rise of religious Zionism. The arguments for legitimizing Jewish theocracy revolve around the supremacy of divine law, the preservation of Jewish identity, and the belief in moral governance. However, these arguments meet with substantial opposition in democratic values, in inclusivity, and in practical governance issues (of imposing such rule against the will of the people, both Jews and non-Jews) (Tzfadya 2022). This debate intersects with numerous issues, including land for peace, the conduct of war, personal status law, the Law of Return, religious legislation, the construction of an egalitarian civil society, the treatment of non-Jewish populations under Jewish governance, and the role of Jewish law in the state's legal culture (Joskowicz & Katz 2015; Cohen 2003).

CHRISTIANITY The concept of the separation of religion from politics has a historical background rooted in Christianity. This idea emerged out of the experience of European Christendom, whose Christians, from early on, perceived church and state as distinct entities with separate jurisdictions, powers, and logics. As Mark Lilla (2008) has argued, the notion of divided sovereignty aligns more closely with the Christian understanding of a triune God (the Holy Trinity), which inherently suggests a division within the divine itself (Last Stone 2008: 631).

The evolution of Christian political thought can be traced through several key periods. Early Christianity focused on the distinction between the spiritual and temporal realms, emphasizing the ultimate authority of God. Initially, it exhibited a kind of non-conformism, resisting Roman political religion and emphasizing a kingdom "not of this world" (*Holy Bible, John 18*: 36). However, with the conversion of the Roman Empire to Christianity, the relationship between church and state evolved into a model known as *symphonia* (συμφωνία – 'accord'), in which the two were seen as complementary entities working harmoniously together (Hovorun 2023; Ostrogorsky 1956).

In the early stages of Christian political thought, St. Augustine (354-430) emerged as a pivotal figure. In his seminal work *City of God*, Augustine introduced the concept of two distinct realms: the divine and the temporal (the City of Man). He argued that while Christians should engage in earthly politics, their ultimate allegiance lies with the City of God, the heavenly city. This dualistic approach laid the foundational groundwork for the later concept of the separation of church and state, stressing that earthly governance should not overshadow spiritual commitments. Augustine's ideas were revolutionary for his time, offering a framework for understanding the role of Christians in a predominantly secular world.

Byzantine **theocracy** was unique in that emperors (as priest-kings) often saw themselves as both political and spiritual leaders, mediating between God and the people. The *symphonia* model was idealized, with church and state seen as emanating from a single divine source, akin to the soul and body of a human being (Hovorun 2023). This adaptation was not without problems, as Byzantine emperors attempted to navigate their Roman secular legal legacy and the Greek philosophical tradition, with its non-religious prescriptions for just governance – see **Plato & Aristotle** (Runciman 1977).

Similarly, since its establishment in the fourth century, the Ethiopian Orthodox Tewahedo Church has been deeply intertwined with the Ethiopian state. The church and the **monarchy** were seen as two sides of the same coin, with the church providing religious legitimacy to the rulers and the state supporting the church's authority and influence. The church espoused the concept of Ethiopia as a 'covenant nation,' a theological and philosophical idea that portrayed the nation as chosen by God, with a divine mission to uphold Christian values and unity. This idea has been instrumental in promoting national identity and social cohesion, especially during times of foreign invasion (Ademe 2023).

The Great Schism of 1054, the breaking away of the Roman Catholic Church, reinforced the centralization of authority in the papacy in the West. The Pope's role as the supreme spiritual and temporal authority was consolidated, leading to the development of the doctrine of papal supremacy. As a result, the Western Church grew increasingly centralized and legalistic. The influence of Roman law shaped the Western approach to theology and governance, emphasizing the Pope's authority over both ecclesiastical and secular matters. In the East, the concept of *symphonia* ('accord') between church and state continued to dominate. The Eastern Orthodox

Church maintained a more collegial and conciliar approach. Decisions were made collectively by bishops and councils, reflecting a more decentralized ecclesiastical structure.

Medieval thinkers synthesized biblical revelation with Greek and Roman philosophy, notably through Augustine and later scholars influenced by Aristotle. Thomas Aquinas (1225-1274) further developed Christian political theory in his comprehensive work, the *Summa Theologica*. He proposed a natural law theory, asserting that human laws should reflect divine law. He believed that rulers have a moral obligation to govern justly, promoting the common good and aligning their policies with Christian ethical principles. Aquinas' synthesis of faith and reason provided a robust intellectual foundation for the governance models that would influence medieval and later political thought.

Medieval political theory was more sophisticated than often perceived, as detailed in the entry on **medieval classifications of constitutions**. The translation of Aristotle's works, especially in the twelfth century Renaissance, had a significant impact. As regards regime types, medieval scholars were especially interested in the concept of a 'mixed constitution,' which combined elements of monarchy, aristocracy, and democracy. Innovations in medieval political thought included the development of jurisprudence in universities, which led to concepts such as individual rights, due process, and the notion of a corporation. These legal developments contributed to a political environment that valued the rule of law and the consent of the governed, distinguishing between good and corrupt constitutions.

The medieval period laid the groundwork for later developments in the relationship between church and state. The integration of Aristotelian philosophy into Christian theology led to the development of natural law theory, which influenced the governance models of the time. The period of the Reformation (starting in 1517) brought significant shifts in Christian political thought, with Martin Luther (1483-1546) playing a central role. Luther's doctrine of the 'two kingdoms' posited that God governs the world through two distinct realms: the spiritual (church) and the temporal (state). He argued that Christians should obey secular authorities in matters of civil governance, while maintaining spiritual independence. This doctrine underscored the importance of respecting earthly authorities without compromising religious convictions, marking a departure from the more integrated, hierarchical church-state models of the medieval period.

John Calvin (1509-1564) further advanced Reformation political thought in his influential work, *Institutes of the Christian Religion*. Calvin emphasized the sovereignty of God over all aspects of life, including politics. He advocated for a **theocracy** in which civil authorities would be subject to divine law and be responsible for enforcing moral order. Calvin's vision of governance was one where the state played a crucial role in upholding and promoting Christian values, reflecting his belief in the pervasive influence of divine sovereignty over human affairs.

Protestant political thought is diverse, reflecting a wide range of denominations. Common themes include the emphasis on individual interpretation of the Bible, salvation by faith alone, and a rejection of certain Catholic practices. Protestants generally advocate the separation of church and state, emphasizing the authority of the Bible over the institutional church. Some branches, like the Anabaptists, advocate separation from worldly politics, emphasizing pacifism and communal living. Pentecostals often focus on personal salvation and spiritual renewal, with varying degrees of political engagement depending on the denomination.

Catholicism, on the other hand, emphasizes human dignity, the common good, and the principle of subsidiarity, which advocates engaging with social issues at the most local level possible. The Catholic Church maintains a hierarchical structure with the Pope as the ultimate authority. It encourages active participation in politics, including voting and defending one's country.

Finally, Orthodox Christianity, emphasizes the ontological goodness of the created order and the transcendence of God. Orthodox political thought often criticizes political leaders who act for themselves rather than the common good. Historically, Orthodox churches have been closely associated with nation-states, and there is a greater acceptance of state support for religion in Orthodox-majority countries. *Symphonia* remains a central tenet of Orthodoxy, dating back to Constantine I (ruled 324-337), prescribing that religious and political authorities should work together – in a symphonic agreement – for the material and spiritual welfare of the faithful (Leuștean 2011). For its application under Tsarist and post-Soviet Russia, see Prosic 2014; Antonov 2020; for a history of the evolution of the concept, see Hovorun 2023.

In Africa, Christianity and politics remain deeply intertwined, influenced by the African religio-cultural context, in which power is often seen as spiritual. During the colonial period, missionary Christianity introduced a more secular Western worldview, yet political and spiritual power continued to connected. After independence, African nations formally separated church and state, but church leaders often criticized governments, and aided democratic development. Contemporary Evangelical and Pentecostal Christianity in Africa blurs the lines between secular and religious realms. 'Political spirituality' shapes Christian engagement in politics, national redemption, and views on issues like Christian-Muslim relations, homosexuality, and abortion, and will continue to do so for the foreseeable future (van Klinken 2018; Meyer 2004; Bediako 1993). For comprehensive overviews, see Maxwell 2000; Katongole 2011; Asamoah-Gyadu 2015 (for West Africa); Elphick et al. 1997 (for South Africa).

Liberation Theology in Latin America originated in the late 1960s, a period characterized by widespread social and political turmoil, in the context of military dictatorship and geopolitical interventionism following the Cuban revolution. This theology was born out of profound ethical and spiritual out-

Box 4.8 Mandarins: Promoting Competent and Loyal Staff

One person becomes a mandarin, his whole clan benefits.
– Vietnamese proverb

A *mandarin* is a Western name for a Chinese-style scholar-bureaucrat or scholar-gentry employed in the hierarchic royal administration in East and mainland Southeast Asia. The practice of state exams in China goes back to the Han dynasty (202 BCE-220 CE), but the innovation of imperial exams (in Chinese: 科举 – *kējǔ*) as a precondition to enter the state bureaucracy was implemented in 607 under the Sui dynasty (589-618 CE) and later expanded under the Tang (618-907 CE) to counterbalance the sway of aristocratic families over emperors and centralize imperial power. By countering the power of birth with proof of merit, the imperial bureaucracy saw an influx of new, bright and most of all loyal elites, owing their careers to this system after passing state exams and receiving recommendation from peers.

Initially, the system was still skewed in favor of noble families but, by the time of the Song dynasties (960-1276), the state bureaucracy was dominated by *jinshi* degree-holders (in Chinese: 進士 – *jìnshì*, imperial degrees) from various middle-class and elite backgrounds. The system waxed and waned over time, but became more formalized under the Song and Ming dynasties (1368-1644), being streamlined with Confucian values. It was abolished in 1905 just before the fall of the Qing dynasty (1644-1911), but many of its features have become stable elements of Chinese political culture: e.g. its bureaucratic jargon, hierarchical stratification of bureaucratic levels, the rotation of senior officials, etc.

The competitive civil service exam system created a curriculum that brought gentry, military and merchant families together into one culturally defined status group, sharing a language, a canon, and a literary style. Inviting applicants from all backgrounds, the open recruitment broke the monopoly of the hereditary nobility in the civil service and boosted its efficiency and loyalty. By custom, mandarins were sent to strengthen the government in provinces that were not their own, avoiding the pitfall of dual loyalty when executing their mandate.

By opening the doors of the **selectorate** even a crack, emperors and kings could select staff from a loyal and competent pool of candidates in order to centralize their hold on power. Even if at times only fewer than two percent of applicants were eventually drafted into the Chinese state bureaucracy, the competition itself fostered legions of classically literate men (and women) who applied their talents elsewhere (Elman 2013).

Lui Haifeng (2007) finds that the practice spread from Tang China to Japan in the seventh to the eighth centuries, but remained the prerogative of nobles and incumbent bureaucrats and their offspring. Hence, its practical value faded by the eleventh century, and the exam system remained in form alone, with candidates (all nominated) passing the exam unconditionally. True to its original form and purpose the system was adopted in Korea for almost a millennium (from 958 until 1894) and most rigorously applied, and introduced to Vietnamese kingdoms in 1075 (and kept in use as late as 1919), with other Southeast Asian polities borrowing some of its elements. European states also reformed their civil service recruitment processes based on the Chinese experience.

The word 'mandarin' originated from the Malay *'mantri'* (through Portuguese) meaning 'councilor' and has a Sanskrit origin (*'man-'* meaning 'to think') (Britannica 2021). The name of the classical Chinese spoken by such bureaucrats became the label for the standard 'Mandarin' Chinese: 官话 – *Guānhuà* (literally: speech of public officials) (Ter Haar 2009: 8). In the popular jargon of the 1970s and 1980s it was used to refer to scheming senior state officials and top-level advisers, especially in British and Commonwealth polities.

rage at the extreme poverty and systemic oppression faced by the majority. Influenced by the renewal of the Catholic Church after the Vatican II reforms (1962-1965), theologians like Gustavo Gutiérrez sought to reinterpret Christian teachings to emphasize social justice and the liberation of the oppressed (Sigmund 2019; Sung 2024).

The rise of Liberation Theology was characterized by a radical stance against both local and global structures of oppression, especially capitalism. It employed socio-analytical tools, including Marxist theory, to critique these structures and advocate systemic change. Central to its message was the 'preferential option for the poor,' which underscored God's special concern for the marginalized and called for the Church to align itself with their struggles (Sung 2024).

Politically, Liberation Theology had a profound impact on Latin American societies. It inspired grassroots movements, influenced political discourse, and often put the Church at odds with authoritarian regimes. The theology's emphasis on praxis

– action informed by reflection – led to significant social and political activism, directed to transforming unjust structures and promoting human dignity. Despite facing opposition and declining with the rise of neoliberalism, Liberation Theology remains a vital framework for addressing contemporary issues of inequality and social justice in Latin America. For overviews, see Hartch 2014; Freston 2008 (select countries); González & González 2007 (chronological overview).

ISLAM This world religion is also covered in two other entries: **political Islam** and **Islamic States**, both multifaceted expressions of how Islam has engaged with and adapted to modernity in post-colonial and de-colonial ways, respectively. 'Political Islam' provides an overview of contemporary Islamic thought and its engagement with secularism and modernity in post-colonial polities, under the pressure of Western notions of statehood. 'Islamic States,' on the contrary, delves deeper into contemporary **theocracies** or Islamic **ideocracies**, and how such radically unique polities present a challenge to the international system. This section complements these entries and elaborates on Islamic legal prescriptions regarding the selection of leaders and succession. In addition, it presents some key historical political theorists of Islamic governance.

Islamic political thought is based on the principles of *sharīʿah* (Shariah, Islamic law) and the concept of *khilāfa'* (caliphate). Governance should be conducted in accordance with the Quran and Hadith, emphasizing justice, consultation (*shūrā*), and the welfare of the Ummah (the Muslim community). Sovereignty belongs to Allah, and rulers are seen as His representatives on earth, responsible for implementing divine law. Despite popular belief, Orientalist biases, and an abundance of examples of authoritarian rule in the Arab and Muslim world (Khatab & Bouma 2007), there is generally no historical claim to rule by divine right, least of all by the Prophet.

Azizah Y. al-Hibri (1992), Parray (2012) and many others demonstrate that Islamic thought provides several principles of government that emphasize elective, consultative, and other democratic elements. The process of *bayʿah* (pledge of allegiance) involves the community's consent to a leader, signifying a contractual agreement. As head of an Islamic state, the ruler ruled in accordance with the laws of God, not as His incarnation on earth.

Historically, there was a two-stage process. The 'Wise Ones' – the *Ahl al-ḥall wa-l-ʿaqd* or 'the people who loosen and bind [a contract]' – first nominated a caliph. This was followed by the general public's endorsement (Zaman 2007). *Shūrā* (consultation) is thus a fundamental principle in Islamic governance, mandating that leaders consult with knowledgeable and just individuals. This principle is enshrined in the Quran and the Sunnah (in the Hadith), emphasizing collective decision-making and preventing autocratic rule. However, the holy scriptures do not provide a procedure for selecting or removing the Wise Ones; they were simply recognized within their society. In the early Muslim community, this recognition was straightforward. However, the expansion of Islam required new selection methods, but these were not developed. Instead, Islamic governance evolved differently (al-Hibri 1992).

Such consultative practices also apply in the rather rare method of succession called *istikhlāf* (a caliph choosing one's own successor). Sunni tradition holds that the Prophet did not use this method; after his death, Muslims chose his successor through *bay'ah*. However, some early rulers did choose their successors, and this practice eventually became established. Some jurists approve of *istikhlāf* only if it involves extensive consultation, citing early Islamic precedents (al-Hibri 1992).

Though not explicitly detailed in early Islamic texts, the separation of powers is implied through the roles of different authorities. The Quran and Sunnah guide the legislative, executive, and judicial functions, ensuring that no single entity holds absolute power. Islamic law allows for *ijtihād* (independent reasoning), enabling scholars to interpret and adapt laws to contemporary contexts. This flexibility supports the development of governance systems that align with democratic principles while adhering to Islamic values. Al-Hibri (1992) concludes that Islamic governance is based on the consent of the Ummah (Muslim community), akin to democratic systems where legitimacy is derived from the will of the people.

Abu Nasir al-Farabi (*al-Fārābī* – 872-950, 'Alpharabius' in Latin), known to later generations as the 'Second Teacher' after Aristotle, wrote extensively on a wide range of topics, including political philosophy, building on neo-Platonism and on Syriac Aristotelian thinkers. His work *Al-Madina al-Fadila (The Virtuous City* or *Ideal State*) describes an ideal polity ruled by a philosopher-king who embodies both wisdom and virtue. He integrated Greek philosophical traditions (see **Plato & Aristotle**) with Islamic thought, emphasizing the importance of a just and virtuous ruler for the wellbeing of the 'state.'

Al-Farabi categorizes cities into five distinct types based on their ethical and moral orientations rather than their political structures or ideologies. These types are the virtuous city (i), the ignorant city (ii), the wicked city (iii), the erring city (vi), and the diverted city (v).

The *virtuous city* (i) is the ideal city whose inhabitants collectively pursue true happiness and virtue, guided by a ruler who embodies wisdom and moral excellence. This city is analogous to Plato's concept of the 'ideal city' but is rooted in Islamic ethics. In contrast, the *ignorant city* (ii) is characterized by its inhabitants' lack of understanding of true felicity, with subtypes including cities focused on basic necessities (survival), wealth (see **oligarchy** and plutocracy), pleasure (hedonism), honor (see **timocracy**), power (see **tyranny**), and unconstrained freedom (see **democracy** according to **Plato & Aristotle**). The *wicked city* (iii) comprises citizens who know the truth but choose to act against it, while the *erring city* (iv) consists of people who have deviated from the right path due to incorrect beliefs. Lastly, the *diverted city* (v) includes those who have altered the truth to suit their desires. Despite its idealistic

nature, al-Farabi's vision emphasizes the importance of moral and ethical considerations in the governance and organization of societies, offering a timeless perspective on the role of virtue in political life (Azzhuri 2022; Germann 2021; Kurmangaliyeva & Azerbayev 2016).

Al-Ahkam al-Sultaniyyah (*The Ordinances of Government*), by al-Mawardi (972-1058), is a seminal work that outlines the principles of Islamic governance under **monarchy**. Al-Mawardi discusses the roles and responsibilities of the caliph, the judiciary, and other state officials, emphasizing the importance of justice, public welfare, and adherence to Shariah. In *Nasihat al-Muluk* (*Counsel for Kings*), al-Ghazali (1058-1111) offers ethical and practical advice for rulers to be just, pious, and attentive to the needs of their subjects. Ibn Taymiyyah (1263-1328) addresses the balance between Sharia and practical governance in his *Al-Siyasah al-Shar'iyyah* (*The Governance of Islamic Law*), arguing for a system of governance that upholds Islamic principles while being flexible enough to address contemporary issues.

Nizam al-Mulk ('Orderer of the Realm' – *Nezām al-Molk*) is the honorific for the Persian vizier, jurist and scholar of the Seljuk Empire, known as Abu Ali Hasan ibn Ali Tusi (1018-1092). He took over the reins of power after the **assassination** of Sultan Arp Aslan (1029-1072) by a rebel during a military campaign in Central Asia. His contributions to statecraft, righteous governance, and guidance for rulers are encapsulated in his seminal work, the *Siyasatnama* (*Siyāsat-nāmeh – Book of Government* or *Rules for Kings*) (Horák 2021: 586). He adeptly combined Persian administrative practices with Islamic values, unlike his peers who focused solely on Islamic jurisprudence. For instance, he propagated the Persian *iqta*-system *(iqṭā')*, a practice of distributing (non-hereditary) fiefs for optimal tax collection. His commitment to education was unparalleled; he established the *Nizamiyyah* schools (madrassas), promoting education as essential for statecraft. Unlike his contemporaries, Nizam al-Mulk stressed *Realpolitik*, in particular the importance of a comprehensive intelligence network to pre-empt threats (rebellion, sectarianism) and maintain stability. His concept of justice extended beyond legal frameworks to include social welfare. He established public complaints courts, ensuring transparency and fairness, even allowing the ruler to be held accountable. His *Siyasatnama* is thus pragmatic advice on governance, emphasizing consultation with wise advisors and effective delegation, and contrasted with the more idealistic writings of his peers (Al-Mulk 2002; Islam 2020).

Ibn Khaldûn (1332-1406) is renowned for his *Muqaddimah* (Introductions), which is considered a foundational work of sociology and historiography. As shown in Box 6.7, he was an unparalleled scholar who analyzed the rise and fall of states, emphasizing the role of social cohesion and economic factors in maintaining political stability. His theories on the cyclical nature of political power remain influential and his intellectual legacy is currently being reappraised.

The relation between state and religion in modern times remains central to Islamic thinking. Jawad (2013) illustrates that some influential Islamic thinkers (i.e. Rachid al-Ghannouchi, a Tunisian politician, 1941-) believe that an Islamic model of democracy will eventually come from a marriage of Islamic ideals and democratic tools, especially after the **Arab Spring**. Many scholars have identified dependency relations with the West as a crucial factor impeding this process (Muqtedar Khan 2006). But an endogenous factor remains the routine dismissal of the need for secularization: Many modern Islamic thinkers argue that there are no tensions between Islam and secularism and modernity, and believe that – unlike the West – Muslim countries do not need this separation: Islam is inherently political and democratic, making the separation of religion and state unnecessary (Jawad 2013: 338-3396).

Republicanism

REPUBLIC, n. A nation in which, the thing governing and the thing governed being the same, there is only a permitted authority to enforce an optional obedience. In a republic the foundation of public order is the ever lessening habit of submission inherited from ancestors who, being truly governed, submitted because they had to. There are as many kinds of republics as there are gradations between the despotism whence they came and the anarchy whither they lead.
– Ambrose Bierce, *The Devil's Dictionary*, 1911

Republicanism is a forgotten doctrine, one that liberalism and **democracy** have completely displaced in the last fifty years. More recently, however, some scholars have developed high hopes for republicanism making a comeback (Lovett 2022: 7). This does not bode well for liberalism and democracy, but, since **socialism** has already bowed to neoliberalism, a discussion about a once-powerful doctrine and practice of the penetrating bourgeoisie is welcome, even if it can only provide a temporary solution to the question about the fundamental orientations of political communities and the world. The Italian political thinker Viroli (2002: 103) was convinced, in the midst of the unchallenged rule of Silvio Berlusconi, that *"republicanism in democratic multicultural countries can be offered as a new political vision of the civic ethos, which reconnects the concepts of freedom and responsibility."*

DEFINITION Republicanism, in its broadest sense, is opposed to **monarchy**. Manfred Schmidt (1995: 835) contrasts the republic with **despotism** and group rule (*Gruppenherrshaft*). He also notes that the republic was used as a synonym for a 'free state,' which primarily meant a state in which the monopoly of violence was limited by the constitution. A further dimension of a republic is related to the limitation of the mandate and elections. In republics, mandates are limited, and rulers are elected. In contrast to this, a monarchy has no term limit, but is lifelong and (often) hereditary, and the ruler takes power by **succession** rather than elections.

Since its beginnings, doctrinal relations within a republic have not been made clear. Polybius in the second century BCE described the Roman Republic as a *"mixed rule in which aristocracy, monarchy and democracy balanced each other, ensuring stability and preventing the constant transition of regime from one form to another"* (Saxonhouse 2001: 13193).

On the great stage, republicanism got its biggest boost from the French Revolution. The American one, though earlier, was then less important in the constellation of the world due to its distance and fragility. But the US carried the torch of republicanism through all the fluctuations in France (Owen 2010: 126). This fact is 'true,' paradoxically, even though, until 1865, the American republic tolerated slavery, the highest degree of unfreedom – see also **revolution**.

Confusion about the relationship between republicanism and democracy is worsened by the situation in the US, whose main parties call themselves by the names Republican and Democratic. The US is an anti-monarchical republican republic, which means that the spirit of republicanism is still very much alive and dominant in political processes.

ORIGINS The republic is a political practice of Roman origin; linguistically, therefore, it has its home in Latin. *Res publica* means a public thing, a common good, a thing that cannot be traded. The Roman political thinker Cicero translated the ancient Greek concept of *politeia* into Latin as *republica*. He introduced the distinction between *res publica* (common good) and *res populi* (thing of the people). 'Republic' was used to denote the bourgeois order in the Greek polis and the Roman city-state, respectively.

The first republic was the Roman republic, but it was a republic under conditions of slavery. It was created after the expulsion of the seventh and last Etruscan king, Tarquinius Superbus, in 509 BCE, and it lasted until the emperor Gaius Octavius Augustus, the first Roman emperor, in 27 BCE. Livy wrote that freedom reigned at that time because the law was stronger than man. During the long period of its existence, this republic could be described as aristocratic or patrician, with fluctuating influence from the plebeians. It pursued freedom, as **Machiavelli** saw it, and this passion for freedom was worthy of emulation by medieval political practice as well. The essence of what the term *civis*, or 'citizen,' carried in the Roman Republic was freedom as opposed to slavery. The main tendency of this arrangement was the common interest, and the actors were the richest class in the cities.

The first slave-free republics arose in the northern part of the Apennine Peninsula (now Italy) in the Middle Ages. Previous forms of political life were useless for the political life of cities. Living together in cities meant a high degree of interdependence. This required a higher degree of equality and free-

dom, and thus also cooperation in the exercise of power, which had to make and implement decisions faster than classical feudalism (see Box 1.14). Pisa in 1085 was the first documented new form of city government. Milan, Genoa, and Arezzo followed by 1100, and then Bologna, Padua, Florence, Lucca, and Siena by 1140. These cities elected their own consuls and conferred judicial authority on them. The highest values of city life were inner peace and unity.

Republicanism was also a powerful political movement that prepared the March Revolution of 1848. The main goal of this movement in Central Europe was the abolition of monarchies and the introduction of republics modeled after the First Republic in the French Revolution. The republic would introduce the values of freedom, equality, and fraternity. Opponents of republicanism, liberals, and conservatives accused republicans of introducing republican terror (Nohlen 1998: 559).

The republican tradition was eventually unified by a common enthusiasm for ideals and a set of institutions: the rule of law, an order where different forces operated as checks and balances of each other, and a regime of civic virtue where people were willing to serve in public office honestly (Pettit 2010: 20).

LITERATURE Quentin R.D. Skinner (cited in Farrelly 2007: 149) argues that republicanism surpassed liberalism in five key points: an oath to the doctrine of the 'invisible hand' (of *laissez-faire* free market economics), an oath to the primacy of rights over duties, a flawed concept of law, a hostility to utilitarianism and a misunderstanding of negative liberty. For James Bohman (2007: 169), the difference between liberal and republican cosmopolitanism lies in the fact that the liberal stops at *"the moral status of individuals independent of political institutions."*

Patten (1996: 36), however, asserts that this could not have happened at all because republicanism *"failed to identify any philosophically significant distinction between these two positions,"* i.e. in relation to liberalism. According to Patten, republicanism is deeply embedded in liberalism, so that there is no significant difference between the two. These are both bourgeois ideologies, which start and stop with the crucial interest of the bourgeoisie in relation to the nobility and the working class.

Viroli (2002: 6) establishes that republicanism is not the opposite of liberalism, but most of the ideas that form the basis of liberalism were developed by the theory of republicanism – the idea of power-sharing, the idea of individual freedom, the idea of limiting power through the constitution and laws. However, republicanism differs from liberalism in that it sees the state as the protector of the life, liberty, and property of the individual. From a theoretical point of view, liberalism is *"an impoverished or incoherent republicanism and by no means an alternative to republicanism"* (Viroli 2002: 61).

Liberalism introduced the idea of natural freedom and the natural rights of the individual. The idea of nature is an absolute argument in the main political battle between the bourgeoisie and the nobility, between capitalism and feudalism. The individual is a free being by nature. People are equal by nature – at birth and in death. Market laws are natural laws. Legitimation by God maintained and still maintains **monarchies**, and the liberal idea of legitimization by nature therefore has more support from natural science than social science.

Republicanism, however, is a political doctrine (**ideology**). It does not refer to nature, but to the public good. The republic is a political community; the republic has a political structure, a hierarchy, an army, a power to protect individual freedom. In accordance with ancient tradition, it builds on the idea that man is a *zoon politikon* (ζῷον πολιτικόν – *animal politique* (in French) – a social animal) and not just a natural being. According to liberal thought, man is free if no one interferes with him. In republicanism, he is free as long as he is not dependent.

As a doctrinal movement, republicanism experienced a renaissance at the end of the twentieth century in the US, as part of the doctrine of communitarianism, which opposes the strict possessive individualism of neoliberalism and neoconservatism. Republicans emphasize the following as their ideals: community values, public good over private interest, positive freedom that necessitates people's participation in managing common affairs, civic education and, last but not least, special care for minorities and patriotism (Nohlen 1998: 560). The two main streams of republicanism differ in whether the virtues of the people lie in their having more power and authority, or whether they are more interested in freedom and stability. Madison was closer to the latter position, believing in aristocratic values because they provided the greatest stability. Jefferson's concept of public happiness was closer to the former.

For liberals, any law is a limitation of freedom, whereas republicans understand that the law is the best barrier to protect freedom and reduce the weight of arbitrary power and domination (Viroli 2002: 62). Republicanism is more pro-democratic than Liberalism. Republicanism is *"committed to the public good, which helps to protect individual freedom from the abuses of arrogant rulers and citizens"* (Viroli 2002: 64). Viroli (2002: 67) points out that classical republicanism supported people's participation in government and the education of citizens, but put the importance of good leaders above participation.

Viroli tries to prove, like Rousseau, that republicanism also promotes a sense of equality. No one in the republic should be so poor as to be forced to sell themselves into slavery. Similarly, no one should be so rich that they could command submission from others in a republic. Republicanism thus has a human face, at least to the extent that it is aware of inequality; however, it does not develop any tools against it, as **socialism** desires. As Viroli states, *"A republic is not a profit-oriented corporation, but a way of living together that wants to ensure the dignity of its citizens"* (Viroli 2002: 67).

The republic also has a special relationship with the concept of **democracy**. Viroli (2002: 10) is convinced that the democratic idea is only a radicalization of republicanism. For both doctrines, freedom is the absence of domination and not just non-interference; both also assume that government

exercises the will of the people. He even insists that republicanism is a *"self-governing political community."* The *Encyclopedia Britannica* points out that a republic is a country in which *"power is not directly in the hands of the people, or a thing wholly controlled by the people, in contrast to a democracy"* (Munro 2024).

CLASSIFICATIONS The debate on republicanism has given rise to two main concepts: classical republicanism and neo-republicanism or 'civic republicanism' (Lovett 2022: 1). Classical republicanism is represented mainly by **Machiavelli**, the English republicans, **Montesquieu**, and the American thinkers Jefferson, Madison, and Adams. Its common features are *"the importance of civic virtue and political participation, the dangers of corruption, the benefits of a mixed constitution and the rule of law"* (Lovett 2022: 1). Neo-republicanism is built mainly on the value of *"political liberty, understood as non-domination or independence from arbitrary power"* (Lovett 2022: 1). The first type of republicanism draws from the tradition of the Greek polis, while the second builds on the experience of Roman jurisprudence. Civic republicanism *"reduces the distance between classic republicanism and the mainstream liberal tradition"* (Lovett 2022: 7). In this sense, neo-republicanism is much more easily reconciled with existing political processes and serves as a more convincing apologetic theory of existing liberal democratic political systems.

Owen (2010: 29) presents two types of nineteenth-century republicanism: radical, or even socialist, and conservative. The first was prevalent until 1848, whereas the second prevailed after the victory of the monarchist reaction won, and constitutional monarchy was settled as the dominant system of government.

REGIONAL VARIATIONS The relationship between a republic and a democracy developed particularly dynamically in the US. The US is a republic because it refused to be a democracy. Madison justified a republic as the more appropriate form of government than direct democracy. It reduces the possibility of corruption and, as a representative form of government, it enables operational authority over a greater territory. He also favored the separation of powers and the mechanism of checks-and-balances rather than democracy and the excessive influence of the majority on decision-making. The main idea behind these solutions was to *"limit the power of the state as a factor of legitimate domination"* (Vatter 2001: 13200). Even the Democratic Party itself does not contribute very much to the spread of democracy and thus the softening of the republic. The leading doctrine of both parties is republicanism, the rule of the richest class in the form of some democratic approaches. Even in this context, the idea of revitalizing republicanism is welcome because it better describes the actual situation in the US and the modern world.

The early US republic was decentralized and even federal. At the beginning of the twentieth century, national markets, following the logic of capital concentration, supplanted the denationalized economy, and the early models of the decentralized republic proved inadequate. The new phase of the development of capitalism also required a new political form, a new republic. The formation of great and mighty nations, whether in the form of a monarchy or a republic, were the order of the day. The process of nationalization, of unification into closer nation-states, and the processes of imperialism and nationalism thus laid the ground for the new republics. In the US, this project was most clearly established by Roosevelt with the New Deal. In the second half of the twentieth century, the project stalled and was redirected. According to Sandl (2004: 25), *"the common philosophy of common goals turned into a philosophy of just procedure, the politics of the good into the politics of rights, and the national republic into a procedural republic."* For modern republicans, besides negative freedom and the rule of law, the most important considerations are trade and financial systems (Vatter 2001: 13203).

The republican idea did not have such a great impact in the core of Europe, in Western Europe, in democratic Europe, where many monarchies ruled: Spain, the United Kingdom of Great Britain and Northern Ireland, Belgium, Netherlands, Luxembourg, Sweden, Norway, Monaco, Liechtenstein, the Holy See in the Vatican (elected Monarchy), Denmark, and Andorra. Monarchism also got under the skin of political science. At the end of the twentieth century, Foucault rightly called for the need to 'kill the king:' to eliminate the idea of monarchy, which locates power in a specific person, a specific building, and is therefore unable to understand power relations beyond the mechanistic – for political thought on 'regicide,' see **assassination**.

KEY SIGNIFICANCE Republicanism radically upgraded the idea of enlightened **absolutism** and constitutional monarchy, demanding the abolition of the **monarchy** as a prerequisite for the rule of the bourgeoisie. Drawing on the traditions of ancient Greece and Rome, it influenced smaller republics, especially those on the Apennine peninsula. Republicanism's first major victory was the American Revolution, followed by the French Revolution. The latter nurtured radical Republicanism until the Spring of Nations in 1848, after which republicanism withdrew its demand for the abolition of monarchies. However, the concept greatly contributed to the **transition** of forms of government from more absolutist versions of monarchies to constitutional monarchies, and finally to the abolition of monarchies and the transition to democratic systems (Owen 2010).

Republicanism lost its revolutionary momentum in the twentieth century when it was replaced by **democracy**. Monarchies agreed to constitutions and thus adapted to the influence of the bourgeoisie. Thus, the idea of democracy was driven not by the bourgeoisie, but by the labor movement, which sought to increase its influence and reduce the influence of the bourgeoisie. The key idea of democracy is a fairer and more equal distribution of wealth in society. The idea of democracy is based on universal suffrage, which admits people into the political process regardless of their social status or wealth, something that is hidden in the idea of republicanism.

Increasingly, the twentieth century flattened the idea of democracy into a narrow republican idea: the absence of arbitrariness and coercion in government (see **tyranny**, **despotism** and **absolutism**). Democracy surpasses the republic only in that it is about positive freedom, which is expressed in direct participation in sovereign debates (Viroli 2002: 11).

NEW FRONTIERS As concerns the understanding of freedom, the relationship between republicanism and **anarchism** should be explored, as both doctrines defend freedom from arbitrary power. For anarchism, the centers of power are mainly the state, capital, and the church, whereas this is not clearly defined in republicanism. It would also be necessary to investigate the relationship between republicanism and democracy, since democracy is a phenomenon linked to the explosion of the labor movement, while republicanism is rather a doctrine of the bourgeoisie and trapped in the defense of 'aristocratic' capitalism. Special attention should also be paid to the relation between republicanism and the accelerated concentration of capital, in individual countries and in the world as a whole, since the latter favors a less democratic political system. It would also be necessary to examine the relationship between **socialism** and republicanism and see if the development of a concept of socialist republicanism is possible.

Socialism

Socialism and **communism** are connected ideologies that promote collective ownership and aim to reduce social inequalities (like **anarchism**). Yet they differ markedly in their core principles and methods of implementation.

Socialism is an economic and political system in which the means of production, such as factories and resources, are owned and controlled by the state or cooperatives. It allows for some degree of private property and market mechanisms. The government plays a significant role in regulating the economy and redistributing wealth to ensure social welfare. Socialism can coexist with capitalist elements, leading to a mixed economy in which both public and private sectors operate.

Communism, on the other hand, seeks to establish a classless, stateless society where all property is communally owned. In a fully realized communist society, there is no private property, government, or currency. The production and distribution of goods are based on the principle of 'From each according to his ability, to each according to his needs.' Communism aims to abolish all class distinctions and create a society where everyone is equal. This ideology often requires the revolutionary overthrow of existing power structures to establish a single-party state that controls all aspects of life.

While this entry does not delve too deeply into the (ideological) distinctions between socialism and communism, understanding them is crucial to the study autocratic regimes for several reasons: Depending on their achieved level of socio-economic transformation, socialist and communist regimes are often referred to as **ideocracies** – a regime type that tends to be more durable than other autocratic systems. This durability is attributed to their strong ideological foundations, which provide a robust basis for regime **legitimation** and elite cohesion. The ideological commitment to a classless society helps maintain internal stability and justify the regime's actions.

Both socialist and communist regimes employ various mechanisms of control and **repression** to maintain power. Autocratic socialist states, such as those following the Soviet model, use a combination of ideological **indoctrination** and violent repression, under the leadership of **single-party regimes**. This blend of external controls and ideological **propaganda** creates a stable, albeit repressive, political environment, keeping both elites and the masses in check. Regimes that transform society according to their political **ideology** – centralizing power in one monistic organization, the vanguard party, rooting out all opposition and dissent – are considered to be totalitarian (see **totalitarianism**).

Box 4.9 provides a basic comparison of socialist and communist movements in all world regions. Studying them in different historical and regional contexts provides insights into how these regimes adapt and evolve over time. Transnational research perspectives highlight the long-term impact of cross-border linkages and transfers on socio-political developments within the Soviet camp (**authoritarian collaboration** and **authoritarian learning**), challenging the traditional view of communist regimes as isolated entities. The effects of their socio-economic transformations can last for decades (see **totalitarian legacies** and **revolutionary legacies**).

Box 4.9 Fifty Shades of Socialism

If a lie is only printed often enough, it becomes a quasi-truth, and if such a truth is repeated often enough, it becomes an article of belief, a dogma, and men will die for it.
– Isa Blagden, *The Crown of a Life*, 1869.
The African is not 'Communistic' in his thinking; he is – if I may coin an expression – 'communitary.'
– Julius K. Nyerere, President of Tanganyika, 1960.

Socialism is a large family of movements and ideologies. Their common denominator is their doctrine for public over private ownership, especially regarding the means of production (thus opposed to Capitalism) and their conviction that the yardstick for social and political organization is the community.

Socialism can thus refer to revolutionary socialism, advocating for a swift and radical transformation of society as found in Marxism; it can also refer to social democracy, striving for a correction of the society by fostering equality and justice through democratic means while upholding a capitalist system. On another side of the spectrum, one can find **anarchism** rejecting a centralized role for the state aiming to reinvent society based on voluntary associations and decentralized decision-making.

With many variables, and since different strands of socialism have evolved, it is impossible to provide a static overview of this ideological family. Movements have differed greatly and clashed gravely about the following five dimensions: (a) the degree of private ownership allowed; (b) the centralization of **power**, ranging from (i) monism (e.g., **single-party regimes** espousing Leninism, Stalinism, Maoism, *Juche*) and, (ii) pluralism, to (iii) anarchism (e.g., Bakunin's anarcho-communism); (c) the chosen mode of struggle (peaceful and legal vs. violent, armed struggle; with additional nuances: e.g., proletarian **revolution** vs. *foquismo* – see Box 5.9); (d) the intended scope of transformation: solely domestic (e.g., Stalinism, *Juche*) or also international (e.g. Leninism, Trotskyism, etc.); (e) their tolerance for religion and local customs and traditions; with on one end Hoxha's

atheist Albania and on the other Arab Socialism.

Marxism-Leninism was the official state ideology adopted by the Union of Soviet Socialist Republics (USSR) and also the official ideology of the vast majority of the socialist regimes in the twentieth century. The name is derived from Lenin's (re)interpretation of some of the elements of Marx's political, economic and social theory. Marxism-Leninism was based on the idea of the necessity of class struggle in capitalist societies and the need for revolution.

The basic elements of Marxism-Leninism (as adopted in the USSR) were laid out in Lenin's works, especially in *What is to be Done?*, the *April Theses*, and *State and Revolution*. Imperialist wars, as predicted by Lenin (1917) in his book *Imperialism, the Highest Stage of Capitalism*, would lead to the collapse of capitalism and make revolution inevitable. One of the basic elements was also the question of the timing of revolutionary efforts. Lenin reinterprets Marx's rather teleological and technological premises but emphasizes the potential of revolutionary struggle in different contexts. He emphasized the vanguard party of professional revolutionaries who could lead the masses of the working classes in the struggle against the bourgeoisie. The basic elements of Marxist-Leninist ideology, as adopted in the USSR and later modified by Stalin, were based on dialectical materialism, the thesis of the necessity of party rule instead of the rule (dictatorship) of the proletariat (cf. Box 1.3).

Unity in the ranks was paramount. Already, under Lenin, factionalism was not forgiven. The 'Mensheviks' (меньшевики – *mensheviki*, derived from the Russian word for 'minority') – initially (1903) a faction in the *Russian Social Democratic Labor Party*, but later a separate political party after their 1912 split-off from Lenin's 'Bolsheviks' (the 'majority') – clashed with Lenin over party membership criteria, the search for political allies (bourgeoisie, centrists vs. peasants), geopolitics (WWI), and mode of struggle (legal vs. violent). After the October Revolution (1917) the Mensheviks were ousted in a **coup** together with the other parties in the Provisional Government. They were declared illegal after the 1921 Kronstadt rebellion, a naval insurrection in the Gulf of Finland near Petrograd (Leningrad/Saint-Petersburg). Afterwards, Menshevik party members either emigrated, changed sides or ended up arrested in the Russian Civil War. Still, for many who stayed, their past came to hunt them, as former Mensheviks were among the early victims of Stalin's Great Purge. Even emigration did not equal safety, as illustrated by the fate of Trotsky. (Liebich 1997; Broido 2019)

The *Comintern*, or the *Communist International*, was established in March 1919 in Moscow with the primary aim of promoting world **revolution**. This initiative sought to unite communist parties globally in the fight against capitalism and the establishment of a global communist society. However, it quickly became a tool for Soviet control over the international communist movement, evident through its administrative structures and the loyalty foreign communists felt towards the Soviet Union. As global political realities shifted, the *Comintern* adapted its strategies, supporting anti-fascist efforts and becoming instrumental in shaping early twentieth-century communist movements. Nevertheless, it eventually dissolved in 1943 under Stalin's directive, partly to alleviate fears of communist subversion among the Allied powers during WWII.

After Lenin's death, Stalin's interpretation of Marxist-Leninist ideology became prevalent and solidified in the *Comintern*'s political doctrine. One should not disregard the apparent differences between Marx's thought and the later use by certain Bolsheviks. In particular, Stalin's 'codification' of the true doctrine of Marxism-Leninism was instrumentalized in legitimizing his regime. The reinterpretation was nothing new. Different interpretations of Marxism had even distanced Karl Marx (1818-1883) from his own literature during his lifetime – so much so that he famously declared that "he was certain he knew that he was not a Marxist" *("ce qu'il y a de certain c'est que moi, je ne suis pas marxiste")*.

Differences with Leninism also manifested themselves in the former's revolutionary drive. Defended by Trotsky but abolished by Stalin, who formulated the idea of 'socialism in one country' in its stead. Stalinism thus embraced *"an intense parochialism closely associated with the traditional patterns of Russian history: a fear and suspicion of the West – even with Western Communist parties and socialist regimes – and a belief in the self-sufficiency of the Russian society. The initial internationalist impetus of the Revolution was followed (…) by an intense nationalism."* The outcome and model were Russian and "to be imitated in a servile way manner and never questioned." (Macridis 1952: 220)

With all rivals out of the way, there was no ideological opposition left to stop Stalin's name from being added to the pantheon of formative thinkers, hence: 'Marxism-Leninism-Stalinism,' while a reformulation in the form of Marxism-Leninism-Maoism was adopted in China after the Sino-Soviet split (cf. Box 3.9) in the 1960s.

The transition from the *Comintern* to the *Cominform* in 1947 marked a significant shift in international communist strategy. The *Cominform*'s establishment reflected the intensification of the Cold War and Moscow's desire to consolidate control over European communist parties, particularly amidst tensions with the United States. The expulsion of the *Yugoslav Communist Party* from the *Cominform* in 1948 highlighted its role in enforcing Stalinist orthodoxy. Unlike its predecessor, the *Cominform* focused on coordinating communist governments in the Soviet bloc according to Stalinist principles, aligning with the emerging Cold War dynamics. Its dissolution in 1956, amidst de-Stalinization (cf. Box 3.4) and Soviet efforts to improve relations with Yugoslavia, signaled Moscow's understanding of a changed geopolitical order with a growing group of prominent (East) Asian communist regimes.

When the satellite states in Eastern Europe disobeyed the directions of Moscow, brute force was used to ensure they kept in step with the official Marxist-Leninist agenda. For instance, the crackdown on Czechoslovakia's ideological aberration of 'Socialism with a Human Face' (*socialismus s lidskou tváří* in Czech, *socializmus s ľudskou tvárou* in Slovak). It had started with economic and political reforms (under the auspices of the *Communist Party of Czechoslovakia*) with the fresh chairmanship of Alexander Dubček after January 1968. The reforms aimed at liberalization (including press freedom) and rebuilding popular support for communist rule but swiftly got out of control, resulting in party factionalism,

anti-Soviet polemics, and unsanctioned grassroots initiatives. This 'Prague Spring' was brutally suppressed with an invasion by the Warsaw Pact troops in August 1968.

Enforcing the orthodoxy of 'scientific Marxism' was only possible under conditions of direct control (or the credible threat of force). In its international relations, the USSR had to tolerate uncontrollable neighbors (like Tito) and be more pragmatic with far-away allies regarding their homegrown *couleur locale* like *Juche* or Arab Socialism.

The origins of Titoism (and Maoism, for that matter) were partly rooted in personal animosity. Josip Broz Tito's clash with Stalin is a story of an exemplary pupil going rogue, rejecting Soviet authority after the latter attempted to control the hard-won Yugoslav gains after WWII. Tito broke ranks by defecting from the *Comintern* in early 1948 and ideologically challenged Stalinism by positing that there were multiple roads to the paradise of Socialism, even when some ran against the path chosen by the USSR. Titoism is not so much a cohesive ideology but more a state-oriented offshoot of the scientific Marxist branch, in which Tito safeguarded the right to ideological adaptation for himself – just like in ultra-nationalist regimes like Kim Il-Sung in North Korea after de-Stalinization (see Box 3.4) – as well as the freedom to pursue his alliances (e.g., with the West). It is also a rejection of Russian dominance in the *Comintern*, where its member states refused to allow Stalin to appropriate to himself the right of the ultimate decision. (Macridis 1952: 220).

Titoism was based on three predominant ideological and practical elements. First, the brotherhood and unity concept aimed at superseding the national identities alongside the construction of the supranational Yugoslav identity. The second important element was the negation of the state ownership of the USSR and other real-socialist regimes. Namely, the accusation in Yugoslavia was that the USSR was an imperialist power, which also meant that it did not implement the proper form of socialism if it was socialism at all – imperialism was, according to Lenin, the highest stage of capitalism. Therefore, a new concept of workers' self-management was introduced, which was based on social ownership of the means of production and companies as well as on the many different levels of workers' councils and of workers' representatives within the political system (Kirn 2019; Jakovina & Previšić 2020). The third element was a practical move toward creating and leading the non-aligned movement with many Asian, African and Latin American countries, as opposed to the bipolar split between the US and the USSR, while clearly advocating for a left politics, but different from the Stalinist practice (Jakovina 2011; Stubbs 2023).

Communism in Southeast, East and South Asia emerged as early as 1920 (Indonesia), 1921 (China) and 1925 (India and Vietnam), respectively, and diverged from its European counterparts due to the region's unique historical and socio-political conditions. In Southeast Asia, communism evolved within anti-colonial struggles and national liberation movements, with communist parties in countries like Vietnam, Laos, Cambodia, and Indonesia emerging as leading forces against colonial rule. In South Asia, its offshoots were founded primarily in response to colonial oppression and exploitation under British rule, and the *Communist Party of India* had direct ties to British communists. In East Asia, communist networks were formed through a combination of peasant uprisings, intellectual ferment, and revolutionary fervor with ties to Russia, hardened by partisan warfare against Japanese occupation and domestic rivals. (Guan 2018)

All these movements adapted communist ideology to local contexts, integrating elements of nationalism, anti-imperialism, and agrarian reform, with a significant reliance on peasant support. In contrast, European communism was influenced by industrial and class struggles within advanced capitalist societies, emphasizing the industrial proletariat as the vanguard of revolution and focusing on Marxist-Leninist principles. Southeast Asian communist movements engaged in prolonged armed struggles, such as the First and Second Indochina Wars, while post-WWII European communism largely participated in electoral politics within existing state structures.

Maoism and *Juche* are adaptations of communist ideology shaped by unique national and regional geopolitical contexts, characterized by their distinctive principles and emphasis on specific revolutionary strategies.

Maoism, developed by Mao Zedong (毛泽东 – *Máo Zédōng*, often spelled as 'Mao Tse-tung' when using the Wide-Giles transliteration) in China, diverges from traditional Marxist-Leninism in its emphasis on the peasantry as the main revolutionary force, with the concept of the People's War advocating rural-based guerrilla warfare. Mao conceptualized the peasantry as both a revolutionary subject and a main revolutionary force, distinguishing between the leadership role of the proletariat and the mass revolutionary potential of the peasantry. He saw the peasantry's numerical strength and their direct interest in overthrowing the feudal structures as key to the success of the revolution. Mao's strategy involved mobilizing the peasantry through peasant associations, promoting land reform to redistribute land from landlords to peasants, and engaging the peasantry in guerrilla warfare and other forms of struggle (Hočevar 2019). Mass mobilization, expressed through the 'Mass Line' method, is crucial in Maoism, involving consulting the masses, interpreting their suggestions, and enforcing resulting policies (thus making ideological deviation from scientific socialism possible). Continuous revolution under the dictatorship of the proletariat, exemplified by the Cultural Revolution, is another key aspect. Mao believed that class struggle continued under socialism and that the bourgeoisie could re-emerge within the Communist Party itself, necessitating periodic cultural and political campaigns to prevent capitalist restoration. Maoism also advocates for self-reliance in economic development.

Juche (주체 – 'self-reliance'), developed (but not coined) by Kim Il-Sung in North Korea, focuses on political independence, economic self-sustenance, and military self-defense. It is an ultra-nationalist adaptation of Stalinism, upholding political independence (*Chajusŏng* – independent spirit) from imperialist powers, promoting self-sufficient economic policies, and maintaining a powerful military capability for national defense. (Koo 1993) A distinctive feature of *Juche* is its leader-centric philosophy, with a strong cult of personality around the Kim family. The ideology has led to North Korea's policy

of isolationism, with the country largely cut off from the outside world. This isolation serves to protect the regime from external influence and control the flow of information to the populace.

Both Maoism and *Juche* differ from traditional Marxism-Leninism. Maoism diverges by prioritizing the peasantry over the urban proletariat as the main revolutionary force. Both ideologies incorporate strong elements of nationalism and self-reliance, departing from the original internationalist outlook of traditional Marxism-Leninism. Additionally, both Maoism and Juche developed strong **personality cults** around their leaders, which is not inherent to Marxism-Leninism.

Latin American strands similarly adapted to their unique historical, social, and economic conditions, integrating their revolutionary history (*Bolivarismo* – see Box 3.8). Latin American communist movements tailored their strategies to address issues such as land reform, indigenous rights, and colonial legacies, employing diverse revolutionary tactics from armed guerrilla warfare to electoral participation. The Cuban Revolution, particularly Fidel Castro's leadership and Che Guevara's *foco* theory of guerrilla warfare (see Box 5.9) profoundly influenced communism on the Latin American continent, shaping its trajectory. Moreover, while some Latin American communist groups received support from the USSR, others upheld their independence or even critiqued Moscow, especially after events like the Cuban Missile Crisis or the Soviet invasion of Czechoslovakia in 1968. The region's communist movements were also greatly impacted by US interventions, including military coups, economic sanctions, and support for anti-communist regimes, the latter of which arguably pressed their mark much deeper on Latin American history in many cases. Latin American communism often intertwined with broader social movements, incorporating peasants, Indigenous groups, and marginalized communities, reflecting the region's complex social hierarchies and ethnic diversity. (Field et al. 2020; Brands 2012)

African Socialism emerged across various African nations post-colonization, blending Marxism with indigenous values and modernization ideals. It served as a guiding philosophy for leaders seeking national unity, economic growth, and independence from Cold War influences. This ideology, distinct from Marxism-Leninism, amalgamates Marxist principles with traditional African communalism, allowing for a mixed economy and diverse political strategies, often adopting non-alignment in global affairs. African Socialism prioritizes cultural identity and socioeconomic heritage, fostering a unique path to development while being receptive to foreign investment and cooperation with both Eastern and Western powers.

In contrast to Marxism-Leninism, which is centered on the class struggle between the proletariat and the bourgeoisie as the driving force of historical development, African Socialism focuses on preventing the emergence of class divisions and exploitation. It seeks to integrate socialist ideas with African communal traditions and modernization efforts, aiming to create a modern variety of socialism adapted to the African environment. Its take on class is rooted in the traditional values and practices of African society, many of which were disrupted during colonial rule. African socialists generally deny the existence of classes or a class struggle in African society, as they are understood in Marxist theory. Instead, they acknowledge the presence of 'social groups' competing for influence but reject the notion that these groups constitute classes in the Marxist sense. For instance, Léopold Sédar Senghor, the first president of Senegal, argued that there was no exploitation of man by his fellow in Africa, and the challenge was not to end such exploitation but to prevent it from ever happening. (Friedland & Rosberg 1964; Klinghoffer 1969)

African Socialism's take on religion was generally accommodating and sought to integrate religious beliefs with socialist principles rather than opposing or seeking to eliminate religion. This approach was notably different from the atheistic stance of early Marxism-Leninism, which often viewed religion as an opiate of the masses that needed to be eradicated or at least marginalized in a socialist society. Soviet thinkers modulated their stance, finding that socialism was not incompatible with Islam or other religions and that the latter would eventually fade under established Socialism. (Klinghoffer 1969)

Arab Socialism (see also 'Baʿathism' in Box 4.5) was a blend of pan-Arabism, Arab nationalism, anti-feudal and decolonial fervor with Islamic thought (especially its prescriptions about social justice). Epitomized by leaders like Gamal Abdel Nasser in the mid-twentieth century, this amalgam merged pan-Arabism with socialist principles, aiming to foster social justice, economic progress, and political autonomy within an Arab nationalist framework. Key economic strategies included the nationalization of foreign-owned enterprises, land redistribution to peasants, and centralized planning to steer development. Politically, it championed Arab unity, expanded social welfare, and advocated for workers' rights through legislative measures. Distinguishing itself from Marxism-Leninism, Arab Socialism emphasized nationalism over class struggle, integrated Islam into its ideology, and represented a departure from both Western capitalism and Soviet communism, seeking to forge a path tailored to the specific historical and cultural context of the Arab world. Ultimately, Arab unity was abandoned for more narrow nationalist projects as the *Baʿath* party split across territorial lines.

The decline of Arab Socialism and African Socialism was driven by internal factors such as incomplete socialization, shifts in class alliances (e.g., the Arab militaries abandoning the worker class), and economic challenges, as well as external pressures including the global ideological shift towards neoliberalism and the influence of international financial institutions. These factors led to a reorientation of economic and political policies away from socialist principles towards neoliberal models, contributing to the end of the socialist era in these regions (Kadri 2016).

In conclusion, communist regimes stand apart from other forms of dictatorships due to their possession of an ideological framework aimed at profound societal and socioeconomic transformation. Rooted in Marxist-Leninist thought, these regimes often face the necessity of defending their revolutions against counter-revolutionary forces, resulting in the development of robust military apparatuses and stringent political control. Due to their violent origins (cf. **revolutionary legacies**), most communist regimes acquire tight political control over their armed forces and tend to be less susceptible to **coups**.

While adhering too closely to this ideological blueprint may limit flexibility and adaptation, moments like de-Stalinization (cf. Box 3.4) have marked significant shifts, leading to intense reinventions of Marxist-Leninist ideology after 1956 in allied regimes. Despite the collapse of the Soviet Union, surviving communist regimes have displayed enormous resilience and adaptability, fostering a distinct class of elites often generationally tied to the original revolutionaries. **Personalist rule** and **personality cults** have been most common among founding revolutionary leaders, but over time, most regimes tend to evolve towards more collegial governance. Notable exceptions such as North Korea and concerning trends like the **personalization** under Xi Jinping in China underscore alternative paths.

Ultra-Nationalism

One dreads to contemplate the world that the new nationalism is producing: a world of illusions, of mysteries of 'Blut und Boden,' of spiritual emptiness, and of maddening excitement.
– Joseph Sidney Werlin

We don't want to fight but by Jingo if we do
We've got the ships, we've got the men, we've got the money too
We've fought the Bear before, and while we're Britons true
The Russians shall not have Constantinople!
– British nationalist pub ballad, written by G.W. Hunt
and popularized by G.H. MacDermott (1878)

Ultra-nationalism or hyper-nationalism are, of course, an extreme version of **nationalism**, treating nationalist tenets as absolute. This can translate into aggressive foreign policies and the justification of violent means in domestic and international politics. It is most commonly associated with **fascism** as the **ideology** of an authoritarian **political regime**.

DEFINITION Ultra-nationalism can be defined as a far-right **ideology**. It is an excessive form of nationalist ideology and identity that is characterized by extreme positions concerning the nature of the nation and its relationships with other nations, and is a fundamental part of fascist ideology (Griffin 2015). It can be government-promoted or the ideology of specific movements (Rockman 2019). This ideology rests on imagining the nation simultaneously in primordial terms as a 'natural' organism, to which every member is naturally connected, and which is 'naturally' tied to a specific territory. In historical terms, it is conceived as having a glorious past and a potentially glorious future. Its essence is not only a presumed common heritage but also a specific way of life, and an ultra-conservative, hierarchical, patriarchal, sexist, heteronormative, racist and classist organization of society in which all people play their 'natural,' unequal, social roles (Griffin 2015; Stanley 2021).

This situation is mirrored at the international/global level, where nations are imagined hierarchically, and the home nation considered superior to other nations. The latter are not only imagined as inferior but also perceived as a threat that must be confronted (Gröppmaier 2019; Mearsheimer 1990). Hence, ultra- or hyper-nationalism is characterized by a suspicion of other nations as well as by the fear that the nation's greatness, its essence, can be harmed by external and internal enemies or threats (Jackson 2021; Zhao 2000).

That the nation is constantly under threat is a central notion. It serves to rationalize and legitimize aggressive rhetoric and violent action against any imagined threat. Unflinching loyalty, devotion and allegiance to the nation and the nation-state is therefore a fundamental element of ultra-nationalism, and any perceived deviation is imagined as a threat to the glory and/or rejuvenation of the nation (Leidig 2020). Ultra-nationalism is inherently against diversity; it is anti-individualistic, intolerant, anti-democratic, anti-international; it can be militaristic and expansionist and also protectionist (Peucker & Smith 2019). It is generated and/or magnified by chauvinistic myths (Van Evera 1990).

SEE ALSO The concept of ultra- or hyper-nationalism as an extreme form of **nationalism** is closely connected with the doctrines of **fascism**, **Nazism**, jingoism and other far-right political ideologies, and their over-politicization of society in black-and-white and populist terms (see **racism** and **populism**). This dichotomized political **ideology** is applied to justify both domestic policies of **repression** and a **foreign policy** defending the nation's sovereignty and militantly dealing with perceived threats, including **foreign invasion**.

KEY SIGNIFICANCE The concept of ultra- or hyper-nationalism was developed and utilized to analyze both historical and contemporary political regimes, movements and ideologies. These can differ substantially but are organized around an excessive form of far-right nationalist ideology. Ultra- or hyper-nationalism is an older and broader concept than **fascism**, which continues to form a part of the analyses of political regimes and of conflicts, violence and wars.

ORIGIN Historically, ultra- or hyper-nationalism has been closely connected with the development of the concepts of chauvinism (a) and jingoism (b) and the social movements to which they refer. From the French *chauvinisme* (a), the former refers to an exaggerated and irrational belief in the superiority of one's own group, often coupled with a disdain for other groups. This ideology can manifest itself in various forms, including national, gender, and cultural chauvinism. The term derives from Nicolas Chauvin, a legendary (perhaps fictional) soldier, reputedly one of Napoleon Bonaparte's most zealous and loyal supporters. Jingoism (b) is characterized by extreme nationalism and aggressive **foreign policy**. It involves a fervent belief in the superiority and righteousness of one's own nation, often accompanied with the willingness to use military force to achieve national objectives. (Note: the epigraph of G.W. Hunt's popular war song, above, was the direct inspiration for the term 'jingoism,' coined by G.J. Holyoake (1817-1906) in 1878. 'By jingo' is a euphemism for 'by Jesus' – cf. *par Dieu* in French) (Harper, no date).

The two movements and their related concepts

developed in the nineteenth century in France and Britain. They involved an excessive, irrational patriotism and an aggressive militarism in foreign policy (Demiashkevich 1930; Paton 1915). Ultra-nationalism was and is used to describe the ideology of the far-right precursor movements of modern fascism, such as the *Boulanger*, *Maurras* and *Sorel* movements; and also of the fascist movements and regimes of the first half of the twentieth century themselves (Tucker 1955). It has also been utilized in the analysis of nineteenth-century German nationalism and the interrogation of the causes of WWI and WWII (Latour 1955; Werlin 1939). It was further utilized to analyze the nature of the Japanese fascist regime (see Box 4.2) and its imposition of a particular hyper-nationalist ideology that helped establish a restrictive and particularistic modernity project (Fujiwara 1956; Maruyama 1969).

LITERATURE Modern scholarship on ultra-nationalism in the period since WWII has continued to study far-right movements, regimes, phenomena and ideological characteristics addressed by the first studies, which were mainly focused on the West European and wider Western context, including Japan. For example, some scholars argue that the ultra-nationalist movement of the late nineteenth and early twentieth centuries was an artificial phenomenon engineered by elites, serving to persuade publics to tolerate the great stratification of European societies of the time (Van Evera 1990: 28). Fascist regimes from Nazi Germany to the ultra-nationalistic Shinto Japanese empire have been subject to even more systematic study, focused on their various characteristics, including their ultra- or hyper-nationalist nature (see Skya 2009). Yet there has also been a significant expansion in the number of analyses addressing and interrogating the geopolitical scope of and causes and conditions for the (re)appearance of ultra- or hyper-nationalist ideologies, movements, political parties and even regimes. This was and is inherently and inextricably connected with broader socio-political and politico-economic transformations that affected specific local geopolitical contexts and/or global structures and relationships as a whole since the 1950s.

For instance, decolonization processes, anti-colonial movements and the development of post-colonial political regimes in Asia and Africa have been analyzed in terms of the ultra- or hyper-nationalist analytical framework, as scholars perceived a specific transformation of an earlier nationalist ideology into a 'degenerative' hyper-nationalist form that was reactive and exclusionary, and which dismantled its initial universalist character (Olorunsola & Vaitheswaran 1970; Fanon 1961). Ultra- or hyper-nationalism was also studied in the context of the post-World War II Zionist movement, focusing on far-right Zionist factions and on the politics of the newly created state of Israel, which established an ultra-nationalist exclusionary regime with respect to the Palestinians (Zureik 2020).

EXAMPLES & REGIONAL VARIATIONS Intensifying economic globalization since the late 1970s, linked to far-reaching multidimensional local and global political and economic transformations and crises, especially in 'Third World' and 'Eastern bloc' societies, established a novel context for the development of ultra- or hyper-nationalist movements and ideologies and regimes. This ushered in an intensification of research into ultra- or hyper-nationalism. In the European context, there was a focus on Eastern Europe, including Russia, and the movements that appeared in the fraught transition from state socialism to a liberal-democratic capitalist system, one characterized by radical social upheaval, suffering, economic and political crises, and rising poverty and inequality. Study turned to the exclusionary, anti-liberal, racist, sexist, and xenophobic nature of these movements and parties, and to the appeal and popularity they gained as they provided 'simple solutions' (excluding and removing specific groups of people) to complex problems (Higley & Pakulski 1995; Katsiyiannis 1996; Miller 1992; Mudde 2000).

The modern Yugoslav wars (1991-1995) constituted a specific field of ultra- or hyper-nationalism research. Here, ultra-nationalism served as the central analytical framework for understanding the causes of these wars. Rather controversially, mainstream research understood them as having direct roots in the dormant ultra-nationalism of the Balkan wars of the early twentieth century (Gallagher 2003). In the late 1990s and especially in the 2000s, there was an increased focus on the West European context and the rise of movements, parties, and ideologies opposed to the further EU integration enacted in the early 2000s. These movements perceived the latter as further eroding national sovereignty. The global financial crisis and its aftermath – the Euro crisis and the various austerity policies that were implemented to address it – severely impacted the living standards of Europeans and people around the world, established the conditions for and fostered the growth of ultra- or hyper-nationalism around the world. Both the phenomenon itself and analyses of it substantially intensified and increased by the 2010s. In a context especially marked by the appearance and success of far-right movements and right-wing populist movements, parties and leaders were analyzed. Ultra-nationalism was perceived as one of the crucial elements in their ideologies and policies. Analyses focused on far-right, neo-Nazi, racist, xenophobic parties like the Greek 'Golden Dawn' (Χρυσή Αυγή – *Chrysí Avgí*) and the Hungarian *Jobbik* (translated as both 'better choice' and 'more to the right'). The ruling Hungarian right-wing party and its leader Viktor Orbán represented a specific focus of research along with other prominent right-wing populist leaders in Europe (Kyriazi 2016; Lamour & Varga 2020; Vasilopoulou & Halikiopoulou 2015).

As regards leaders and regimes outside of the European context, R.T. Erdoğan's Turkey, Narendra Modi's India, Jair Bolsonaro's Brazil, Mohammed bin Salman ('MBS') al-Saud in Saudi Arabia, V.V. Putin's Russia and Xi Jinping's China have been analyzed from the perspective of their ultra-nationalist character (Friend & Thayer 2017; Juneau 2019; Leidig 2020; Öniş 2004; Sajjanhar 2022; Shlykov 2021; Zhu

& Berry 2009). In these cases, many studies extended the understanding of earlier historical political processes considered crucial to explaining contemporary political developments in various part of the world. For instance, Modi's rise and the rise of his *Bharatiya Janata Party* (BJP) have been linked to the Hindu ultra-nationalist *Hindutva* movement and its various organizations and their long-term development since the early twentieth century (Leidig 2020; Mayaram 2022).

There is continuous interest in the Trump phenomenon in the US (Haider 2018; Jackson 2021) and the various far-right populist movements and parties in other non-European Western states, like Australia (Peucker & Smith 2019).

METHODOLOGICAL ISSUES One of the central issues affecting many analyses of ultra-nationalism is the absence of a firm and comprehensive definition of the term, which is mostly treated as self-evident and seldom critically scrutinized as a concept. Consequently, in many studies, the concept lacks clarity and has limited analytical potential. Little space is devoted to define and delineate it clearly in connection to 'normal,' 'non-excessive' and 'non-extreme' forms of **nationalism** and nationalist ideologies. Some critical scholars (Sanchez 1999) argue that the term has historically been applied by Western powers, especially the US, in their political, policy and academic discourses to delegitimize any national interests or popular policies in 'Third World' countries that were contrary to the interests of (specific) Western powers.

Beyond the lack of a specific delineation of ultra-nationalism, the concept is mostly linked to **fascism** (treated as a regime type), which – due to its own methodological issues – further complicates advancing the field of comparative authoritarianism beyond in-depth case studies. As in the case of **racism**, the majority of scholars of ultra-nationalism have a background in history, sociology, or cultural studies; whereas mainstream dictatorship studies are dominated by political science, political philosophy and area studies. This hinders the cross-fertilization of insights.

The present socio-political, politico-economic, geopolitical, and ecological situation is characterized by multiple and multidimensional crises destabilizing the existing order at the local, national and global levels. As this is likely to continue, we can expect that the phenomenon of ultra- or hyper-nationalism will not only remain an object of study, but gain even more attention in the future.

1 Rupee, Nepal (1974), depicting King Birendra Bir Bikhram, Shah Dev.

Assassination

Es ist nichts … es ist nichts … es ist nichts
(It is nothing … it is nothing … it is nothing)
– Last words of Franz-Ferdinand, Archduke of Austria, after being shot (on 28 June 1914), as accounted by Count Harrach.

(…) it is lawfull, and hath been held so through all ages, for any who have the power, to call to account a tyrant, or wicked king, and after due conviction, to depose and put him to death.
– John Milton, *The Tenure of Kings and Magistrates,* 1649.

Political assassination conjures up romantic images from a range of Shakespearian plays covering tyrannicide or its aftermath *(Macbeth, Richard II, Hamlet,* and *Julius Caesar*) to movies on regicide like *Richard III* (1995) and *To Kill a King* (2003), or those like *V for Vendetta* (2005) that depict related political terrorism. Most famous of all is Frederick Forsyth's novel *The Day of the Jackal* (1971) with its sensational plot to kill Charles de Gaulle, the French president. Less well-known but intriguing are the award-wining novels *The Feast of the Goat* by Mario Vargas Llosa (2000; 2001), dramatizing the assassination of Rafael Trujillo, the dictator of the Dominican Republic, and Mohammed Hanif's *A Case of Exploding Mangoes* (2008), which explores the mysterious 1988 plane crash that killed General Muhammad Zia-ul-Haq, then the strongman of Pakistan.

SEE ALSO Political killing is a practice with a long tradition in many domains of comparative politics: The assassination of rulers (A), the selective killing of political rivals (B), and the high-profile murder of state officials as an act of terror (C), the targeted elimination of foreign threats (D). All of these are forms of political violence – within their respective analytical domains of **transitions** and **succession** (A), **repression** (B), **terrorism** (C), and security studies or foreign policy analysis (D). However, this entry will primarily focus on the political assassination of (autocratic) rulers (A), the motivations behind such actions, the impact on regime outcomes, and the canon of ideas justifying 'regicide' or 'tyrannicide' – justifications drawn from **religions** or anti-monarchic **ideologies** like **republicanism**, **anarchism**, and **ultra-nationalism**.

As concerns actors, **intelligence services** have been associated with all four types of these covert activities; however, sometimes **paramilitaries & death squads** are enlisted to eliminate political rivals (B) or sow terror (C). Logically, **terror groups**, mainly resonate with the murder of state officials (C) and sometimes even kings or presidents (A), as in the case of anarcho-communists and their 'propaganda of the deed.' Militaries (and **presidential guards**) have been known to kill rulers (A) by accident or design, as part of a larger plot to execute a **coup**.

DEFINITION For a long time, scholars have struggled to untangle this concept by separating it from related and overlapping phenomena (cf. Esquivel 1979; George 1988). A complete overview of the evolution of definitions would be tedious. Therefore, this entry aspires to show that small variations in some defining elements drastically alter the scope and interpretation of what constitutes political murder, as indicated by categories A to E in this entry.

Ford (1987: 2) defines 'political assassination' as *"the intentional killing of a specified victim or group of victims, perpetrated for reasons related to his (her, their) public prominence and undertaking with a political purpose in view."* All other forms, any 'homicide related to the body politic and its governance,' fall under the broader label of political murder, and are thus the lethal outcome of various forms of political violence, covered in categories B, C, D.

An attempted political assassination of a ruler (A) takes place when, for political reasons, one or more perpetrators take concrete, illegal actions to kill the incumbent leadership. There are a lot of nuances to unpack. For starters, (i) how many assailants are there? Is the attack the work of a lone wolf or a conspiracy? Second, (ii) are the perpetrators regime insiders or not? If they are insiders, and politically motivated, was the assassination meant to destabilize the regime (and hopefully result in its collapse (a)), seek (abrupt) policy change (b), initiate the **succession** to a more favorable candidate (c), or was it retribution for the betrayal of ideological or political or religious values (fanaticism (d))? If the killers were outsiders, was their goal political chaos and instability (a), policy change (b), revenge (c) or to win publicity for a cause or demonstrate the vulnerability of a government (C).

Next (iii), if the killing was executed by 'state actors' and operated in the framework of a larger plot to seize power, it falls under a **coup** and thus has radically different domestic and international implications**.** In this case, the killing itself is secondary to the conspiracy to usurp power, and could be accidental (e.g., the Diệm brothers in South Vietnam in 1963; Salvador Allende in Chile in 1973), improvised (Prime Minister Inukai Tsuyoshi in Japan in 1932), or deliberate. In **monarchies**, 'regicide' was usually part of the package of putting a preferred candidate on the throne (executing a coup for the purpose of forcing a **succession** – c). In Europe this practice was largely abandoned with the systematic introduction of hereditary succession, legitimate birth and primogeniture (cf. Box 5.10), accompanied by divine laws against murder, although Bagge (2019) finds that the practice continued unabated in strong monarchies with robust bureaucracies, like Byzantium, where succession was not in peril. In the latter, regicide may have provided a safety valve against bad rulers,

Table 5.1 – The Spectrum of Political Assassinations

Number of assailants (i)	**Regime-organized (ii)**	**Coup or not (iii)**	**Foreign conspiracy (iv)**	**Motivation (v)**	**Perpetrator(s)**	**Target (vi)**	**Classicifation** *(See LEGEND)* ***Example*** *(if applies)*	
One	Outsider	No	(-)	Political	Lone wolf Fanatic/ zealot	Supreme ruler	A (a, b, d)	I
						Supreme ruler + other elites	C	
				Criminal	(-)	Felony murder		
				Personal	(-)	Vendetta, mental illness		
	Insider	No	(-)	Political	Lone wolf Fanatic/ zealot Defector	Supreme ruler	A (b, c, d)	II
					Regime insider	Other elites	E	
				Criminal	(-)	Felony murder, 'settling a score,' silence a witness		
				Personal	(-)	Vendetta, mental illness		III
Few / Many	Insider	Yes	(-)	Political	Inner circle	Supreme ruler	Palace coup	
					Crown prince		Royal coup	
					Other regime actors		Regular coup	
		No	(-)	Political	Inner circle	Supreme ruler	A (b, c, d)	IV
					Defectors		A (a)	V
					Other regime actors		A (b, d)	VI
					Supreme ruler	Other elites	B-D (consolidation of power)	VII
					Inner circle		B (purges), E	
					Other regime actors		E	
				Criminal	(-)	Felony murder, 'settling a score,' cover-up, turf war		
				Personal	(-)	Vendetta		

	Outsider	Yes	No	Political	Non-regime actors	Supreme ruler + other elites	Regular coup	
			Yes			Supreme ruler + other elites	Foreign backed-coup

			No/Yes	Personal	(-)	Vendetta		

LEGEND: (-) not specified or relevant for this type.
A – the assassination of the supreme powerholder(s)
  a) destabilize the regime
  b) seek instant policy change
  c) initiate succession
  d) retribution
B – the selective killing of political rivals (repression)
C – high-profile murder of state officials as an act of terror
D – targeted elimination of foreign threats
E – elite infighting

Source: Author's own work.

as long as it did not lead to prolonged civil war.

(Note that perpetrators who are 'state actors' can be regime insiders (see 'palace coup' or 'royal coup'), but need not be. If, in a plot to seize power, the perpetrators are not state agents, the whole action would rather fall under **revolution** or **foreign invasion**.)

Moreover, (iv) if the perpetrators are part of a larger conspiracy, initiated and planned abroad, the political assassination (A) is usually linked to forcible **regime promotion**, thus falls under extreme measures of **authoritarian promotion** within wider consideration of International Relations. A good example would be the killing of communist ruler, Hafizullah Amin on 27 December 1979, during *Operation Storm-333* (Шторм-333), when (Russia-led) Soviet special forces stormed the Tajbeg Palace in Kabul. This operation marked the beginning of the Soviet military invasion in Afghanistan (1979-1989). Amin was replaced with Babrak Karmal, a rival communist leader, as part of the Kremlin's strategy to stabilize Afghanistan under a more controllable regime.

Sometimes, such foreign-backed assassinations are just (extreme) attempts to destabilize regimes (D), especially during periods of heightened tension, like the many attempts on South Korean leaders (e.g., Park Chung-Hee in 1968; Chun Doo-Hwan in 1983) by the North Korean regime (BBC News, 2017). In the context of the (currently ongoing) Russian-Ukrainian war, President Volodymyr Zelenskyy has reportedly been the target of more than a dozen such attempts (Lister et al. 2023).

'Political assassination' remains a valid term even when the supreme ruler is not the target, but other figures holding high office (v), although the dynamics change drastically. In the latter case, such killings can be integral to elite infighting (E) in the regime (cf. competing patronal pyramids; see **patronalism**); the opening gambit of a 'creeping coup' (cf. **coups**); when executed by outsiders, the preamble to a greater overt action to oust the regime (**revolution**); 'propaganda by the deed' to spread terror (C), expose regime weaknesses or solicit popular support for the political organization responsible for the killings.

When the targets are not state agents, but key figures in non-state political organizations, branded as hostile or terrorist groups, such orchestrated killings usually fall under national security threats (D), and responses are executed by the pointy end of security agencies (cf. **intelligence services**). The identification of targets constitutes a gray zone – and here B and D overlap – because different regime types describe these threats according to their own logic. For instance, (powerful) democracies (today) are more likely to act against foreign terrorist groups or rival armed movements. Dictatorships, on the other hand, are inclined to increase the scope to inimical targets abroad, e.g., dissidents in exile, former regime insiders who defected and fled, critical investigative journalists, political rivals or opposition members. This is beyond dictatorships' focus at home, including some (or all) forms of opposition and dissent perceived as affecting regime stability (or simply as an exercise in pure intimidation and state terror). In the latter cases, political assassinations of targets, when ordered by the regime itself, clearly fall under **repression** (B), like that of Leon Trotsky, the communist revolutionary and ideologue, murdered with an ax in Mexico on 21 August 1940 at the hand of Ramón Mercader, an NKVD agent, on Stalin's orders.

The different factors – the number of killers (i); whether or not they are regime insiders (ii); if assassination is part of a larger coup-plot (iii); whether the conspiracy is backed or planned by foreign actors (iv); the exact intended target(s) (v) – affect the interrelating dynamics of political murder and how they are studied. The final factor is the motivation (vi) of the plotters, which can be political, criminal or personal. This is difficult to disentangle, especially when there is overlap between conspirators and the assassins (no murder for hire) and the motives are unclear. Similarly, sometimes the distinction between repression (B) and terrorism (C) hinges solely on the nature of the perpetrator. Regimes can engage in 'state terror,' where the goal is no longer the selective, strategic elimination of political challengers, but expands into mass murder, displaying a visceral nature that is meant to shock and intimidate the population as a whole.

EXAMPLES All numbered examples correspond to a type of political assassination in Table 5.1 (or serve as counterexamples of killings that were not politically motivated, but had great political consequences).

(I) Fanatic lone wolves Gabriel Narutowicz, the first president of Poland, was shot by Eligiusz Niewiadomski, a nationalist painter, at the *Zachęta National Gallery of Art* in Warsaw on 16 December 1922, just five days after taking office. Niewiadomski was motivated by antisemitic and nationalist sentiments. He was against Narutowicz's presidency, which had been marred by intense right-wing opposition and propaganda.

On 30 August 1918, Fanny Kaplan (born Feiga Haimovna Roytblat), a member of the *Socialist Revolutionary Party* (SR), attempted to assassinate Soviet leader Vladimir Lenin outside the Michelson Factory in Moscow. She shot Lenin three times, seriously wounding him in the neck, jaw, and shoulder. Kaplan, who viewed Lenin as a traitor to the revolution, was immediately arrested and later executed by the *Cheka*, the Soviet secret police. The assassination attempt led to the Bolsheviks unleashing the 'Red Terror,' a campaign of mass arrests and executions targeting political opponents.

On 4 November 1995, Israeli Prime Minister Yitzhak Rabin was assassinated by Yigal Amir, a right-wing extremist opposed to the Oslo Accords. The assassination occurred at the end of a peace rally in Tel Aviv's Kings of Israel Square. Amir shot Rabin twice in the back as he was walking to his car. Rabin was rushed to Ichilov Hospital but succumbed to his injuries. The assassination shocked Israel and the world, leading to a period of national mourning and significantly impacting the Israeli-Palestinian peace process.

(II) Ambitious followers The Roman Emperor Claudius was reportedly poisoned by his wife Agrip-

pina the Younger in 54 CE. Agrippina allegedly used poisoned mushrooms to kill him, paving the way for her son Nero to become emperor. Note: there are very few examples of regime insiders acting alone and personally killing the ruler, without a plot to immediately take over the regime.

(III) Personal fallout On 25 March 1975, King Faisal of Saudi Arabia was assassinated by his nephew, Prince Faisal bin Musaid al-Saud, during a royal audience in Riyadh. Prince Faisal approached the king under the guise of paying respects and shot him twice in the head with a revolver. The king was rushed to a hospital but succumbed to his injuries. The assassination was reportedly motivated by a personal vendetta, possibly related to the death of Prince Faisal's brother, Prince Khalid, killed by Saudi security forces years earlier. Prince Faisal was later executed by beheading after a Sharia court found him sane and guilty. This is a rare instance of a counterexample, a lone wolf insider executing a premeditated, but non-political assassination (Asmar 2020).

(IV) Ultimate betrayal The archetypal example of this form of political assassination is the stabbing of Julius Caesar, the Roman dictator, on 15 March 44 BCE, by a group of Roman senators, including his one-time allies Brutus and Cassius. The conspirators feared Caesar's growing power and his potential to become a monarch and tyrant, which they believed threatened the Republic.

(V) Lethal defection South Korean President Park Chung-Hee was assassinated on 26 October 1979 by Kim Jae-Gyu, the director of the *Korean Central Intelligence Agency* (KCIA) and a close associate. Kim claimed he killed Park to restore democracy to South Korea, under Park's authoritarian rule since the 1961 coup. Chung-Hee feared being marginalized by rival hard-liners in Park's increasingly personalized regime (Ching et al. 2022).

(VI) Irreconcilable differences Egyptian President Anwar Sadat was assassinated on 6 October 1981, during a military parade in Cairo. The assassins, radicalized soldiers, led by Lieutenant Khalid Islambouli, a member of the *Egyptian Islamic Jihad*, were part of the Egyptian military and opposed Sadat's peace treaty with Israel.

Another example of revenge is the assassination of Indian Prime Minister Indira Gandhi on 31 October 1984, by her trusted Sikh bodyguards, Beant Singh and Satwant Singh. The killing was in retaliation for *Operation Blue Star*, a military operation ordered by Gandhi to remove Sikh militants from the Golden Temple in Amritsar.

(VII) Consolidating power This scenario is rare today but was routine in **monarchies** until medieval times, before primogeniture (Box 5.10) became the norm and world religions made murder anathema. Many aspiring or new monarchs were forced to eliminate their uncles, siblings and cousins as (potential) contenders for the throne. Without firmly established **succession** rules, and some civilizational complexes actually encouraging open competition, the killing of 'pretenders' with an equally strong claim was a common feature of power consolidation (cf. Ehlers 2004). This practice overlaps with domestic repression (B), when victims lie within the same kingdom, but can be construed as targeted assassination (D) if they reside in neighboring polities, which was often the case in feudal constellations (cf. Box 1.14).

A contemporary example is North Korea's Kim Jong-Un targeted assassination of his half-brother in February 2017. Kim Jong-Nam lived in exile in Malaysia and was assassinated with a nerve agent at Kuala Lumpur's airport. This daring murder followed the **purges** of around 140 senior officials, including members of Kim Jong-Un's own family, most prominently his uncle Jang Song-Thaek, who was executed in December 2013 (Kwon & Westcott 2016; Lee 2017).

(VIII) Infiltration On 14 April 1865, President Abraham Lincoln was assassinated by John Wilkes Booth, a well-known actor and Confederate sympathizer, as he attended a play at *Ford's Theatre* in Washington, DC. The shooting took place just days after the surrender of General Robert E. Lee, signaling the end of the American Civil War. Booth, along with his co-conspirators, initially planned to kidnap Lincoln but opted for assassination following the Confederacy's defeat.

(IX) Spectacle terrorism Tsar Alexander II of Russia was assassinated on 13 March 1881, by members of the revolutionary group *Narodnaya Volya* (Народная воля – 'The People's Will'). They threw bombs at his carriage in St. Petersburg, killing him and several others (cf. **anarchism**). The group opposed the autocratic rule of the Tsar and sought to incite a revolution.

Other notorious examples of this kind of **terrorism** are: Archduke Franz-Ferdinand and his wife, shot by Gavrilo Princip an anti-imperialist, Yugoslav nationalist on 28 June 1914; and Benazir Bhutto, the former prime minister of Pakistan, who died in a combined shooting and bombing attack on 27 December 2007 that was caught on camera.

(X) Targeted terminations The CIA made numerous unsuccessful attempts to assassinate Cuban leader Fidel Castro, including using exploding cigars and a scuba-diving suit lined with poison. The US admitted to eight assassination attempts, although Castro himself put the figure much higher, with one estimate in the hundreds. Castro once said: "If surviving assassinations were an Olympic event, I would win the gold medal" (MacAskill 2017). Margaret Thatcher was targeted by the IRA at the Brighton Hotel in 1984. Patrice Lumumba (Congo-Kinshasa) was also targeted by the CIA (with a plot involving poisoned toothpaste) but his rival Mobutu (see Box 1.7) got to him first, assisted by the secessionist leader Moise Tshombe and the Belgian secret service. Brincat (2009b) ponders the tenuous legal frameworks of such interventions.

ORIGIN The term 'assassin' originates from the Arabic *hashīshīn* (twelfth century), used for the Nizari Ismaili sect led by Hasan ibu-al-Sabbah in Lebanon during the Crusades. The sect was believed to carry

out murders under the influence of hashish – they did not – and was notorious for sending out death squads to eliminate enemies of their faith in their historical context of political **terrorism**. The plural suffix '-in' in *Hashīshīn* was mistakenly thought part of the word itself in Europe, leading to variations like *hassais* and *assasis* in Middle English and Old French. In the fourteenth century, the Italian language played a role in the generalization of the term 'assassin' to refer to any type of murderer (Harper, no date).

'Regicide' and 'tyrannicide' both have their roots in Latin, *rex* (king) and *-cida* (from *caedere* – to kill), thus king-slaying and tyrant-slaying. (For the etymology of 'tyrant,' see **tyranny**.) These terms also denote the person doing the slaying. 'Regicide' is additionally the name of the crime, the gravest of infringements on royal *majestas,* the supreme sovereignty of the state and (the personal integrity) of the monarch.

In the case of Europe, Ford (1987) and Cottret (2009) trace the mainstream theoretical-philosophical treatises on these practices to the Jewish Old Testament and Roman political intrigues. The most prominent (although not the first) was the devout Jewish widow Judith, from the apocryphal *Book of Judith*, who won fame by killing Holofernes, the Assyrian general who besieged Bethulia. She tricked Holofernes by charming him, then beheaded him during a banquet when he was intoxicated. According to myth, this act led to the defeat of the now leaderless Assyrian army by the Israelites. Her story was a model for regicide, emphasizing divine justice and virtue triumphing over tyranny. Judith's political assassination was viewed as a heroic act of delivering her people from oppression, inspiring resistance against unjust rulers.

Marcus Junius Brutus – as briefly described in the 'examples' (IV) above – took part in the murder of Julius Caesar, and became the most famous member of this larger conspiracy due to his close friendship with the victim – a betrayal worthy of Judas Iscariot. Throughout history, this political murder was lauded for saving the Roman republic, and safeguarding its citizens against the emergence of monarchs and tyrants.

REGIONAL VARIATION There has been no systematic survey of non-Western political assassinations of rulers. In the non-European part of *Eurasia*, Van Auken (2014) untangles political killings in classical China from 722 to 481 BCE. Carreiro (2013) deals with classical thinkers' political thought on tyrannicide. For the late imperial period, see Chan 1987. On the translation of regicide from the Chinese and its nuances, see Defoort 1998. McMullen (1987) covers early modern Japan. For *Latin America* as a world region, Menjívar & Rodríguez (2005) and Green (2015) provide comprehensive overviews of repression (B) by targeted assassination and the elimination of ideological threats (D). For historical cases in *Sub Saharan Africa* and the nuances of (ritual) regicide and succession plots, see Rowlands 1993; Salokoski 2005; Ayittey 2010. For modern times, the most notorious political assassination would be that of Patrice E. Lumumba (1961) in Congo-Kinshasa (De Witte 2015), maybe followed by that of Juvénal Habyarimana in Rwanda (1994). Although the Burkinabè revolutionary Thomas Sankara (Box 5.1) also lives on in collective memory, his assassination was part of a coup by Blaise Compaoré. Attention has recently been given to the (growing list of) political killings of Rwandan dissidents (in exile) by the Kagame regime, which falls under **repression** (B) (see, e.g., Jalloh 2021).

LITERATURE & CLASSIFICATIONS Within the (narrower) scope of the political assassination of rulers (A), two concepts have extensive political-philosophical traditions: 'regicide' and 'tyrannicide.' They are not at all synonymous, the former being either a capital crime or a political justification, depending on one's perspective (and ideological background), while the latter has only ever been a vindication for killing the ruler.

Regicide In more neutral terms, the act (or crime) of killing a king can form part of a 'palace coup' (i), in which regime insiders depose a disliked or incompetent king to allow the **succession** of a preferred candidate (if the conspiracy includes the crown prince as a key member this is a 'royal coup'). Alternatively, regicide can be performed by a new ruler (or usurper) to eliminate rival claimants to the throne, consolidating power (ii) by killing royal family members considered legitimate monarchs by their respective factions (see 'example VII' above). In this case, it is considered an **ouster** and regime change, and can be a **coup** if the usurper's fellow conspirators come from state agencies.

Moreover, regicide executed by regime outsiders can be justified on ideological grounds, either by those espousing **revolution** (iii) and aiming for fundamental regime change by overthrowing **monarchy** as an institution. Alternatively, it can be the result of **foreign invasion** (iv); however, battle deaths are excluded. Regicide can also be a form of **terrorism** (C), its short-term goal being intimidation and rallying support for one's cause (v), regime ouster being the long-term end goal.

So, 'regicide' is an umbrella term for targeted killings aimed at securing power or leader turnover in a **dynasty** (i, ii) or the default outcome in the process of overthrowing monarchy as a regime type (iii, iv, v). Philosophical justifications in favor of regicide are found in (radical) republican thinkers and advocates (e.g., Cicero (106-43 BCE, *De Officiis*), Seneca (ca. 4 BCE – 65 CE, *Hercules Furens*), Plutarch (ca. 46 – ca. 119 CE, *Timoleon; Pelopides*), etc.), anarchists, (ultra-) nationalists, and in other adherents of anti-monarchical **ideologies**. Their commitment to regicide is usually unconditional and uncompromising ('abolishment or death'). In contrast, when political assassins target the ruler (as a person) and judge the latter's alleged transgressions, their justifications are conditional on evidence and the legitimacy of their action. Thus, in the latter case, regicide overlaps with tyrannicide.

Tyrannicide This term's target scope extends beyond monarchs and incorporates any ruler pejoratively labeled as a 'tyrant' (see **tyranny**). Although

this label is too commonly used gratuitously, the case for tyrannicide (either before or after the act) demands justification, and different (mostly Western) historical contexts have elaborated philosophical arguments for when rulers can be deposed (and killed) with **legitimacy**.

Shannon K. Brincat (2008; 2009) identifies three models (a,b,c) of tyrannicide. The classical model (a) is rooted in the works of philosophers like Socrates, **Plato & Aristotle**, and emphasizes the importance of public life and the functional role of leadership. Tyrannicide is justified when a ruler fails to serve the public good, becomes (morally) corrupt, abandons the rule of law or tradition, and elevates private desires above all else. For Plato, **tyranny** was seen as a malady of the soul, the tyrant's soul being corrupted by enslavement to passion and succumbing to the temptation of profiting from injustice. This (moral) corruption spreads to the polity, causing it to suffer a similar affliction. Consequently, tyrannicide was considered the natural remedy to address this anomaly in the *polis*, and even as ending a tyrant's personal psychological torment. For Aristotle, tyranny was a perverse political regime, which eroded the egalitarian status of citizens before the law (Brincat 2008: 216-217).

Roman legal philosophy similarly finds that tyrants transform free citizens into slave-like subjects, and were unable to formulate just laws because they were not in accord with natural law (Ford 1985; Brincat 2008: 218). Polo (2006) investigates and questions the alleged universal acceptance of tyrannicide as a legitimate practice in Roman times, arguing that it was actually an illegal, radical measure frequently contested and opposed by significant segments of Roman society. (Forced exile *(regifugium)* was the traditional Roman solution.)

The medieval model (b) is derived from thinkers such as St. Augustine, John of Salisbury (1159), Thomas Aquinas, Jean Petit (1408) Francisco Suarez (1613), and Juan de Mariana, who justified tyrannicide through natural law doctrine (Dillinger 2015). Scholars like Nicolas d'Oresme clearly distinguish **tyranny** and **despotism** (Turchetti 2008). Tyrannicide is permissible only when a ruler acts against divine and natural laws, failing to ensure the common good and violating the moral order. This model resonates with non-Western religious prescriptions of just rule (see **religions**). However, the model's reliance on natural law is subjective and unverifiable, making its consistent application difficult. Also, the invocation of divine morality limits its applicability to contemporary secular contexts (Brincat 2008).

Finally, the liberal model (c) – influenced by thinkers like John Milton (1649), John Locke (1689), and Jean-Jacques Rousseau (1762) – is based on social contract theory. Tyrannicide is justified when a ruler breaks this contract, acting beyond the authority granted by the people and undermining (proto-)democratic principles. In this time period, **despotism** became equaled with **tyranny**, ignoring conceptual differences – with notable exceptions like Jean **Bodin** and Locke. Still, there was never any 'despoticide' (Turchetti 2008: 160). For Locke, it was only when the sovereign failed to provide necessary security (of life, liberty and property) that a rationale existed for subjects to transfer authority (Birn 1977: 139). Others were less demanding (Brincat 2008).

Shannon K. Brincat (2008; 2009a) rightly distills the (legal) arguments common to all three models into 'self-defense,' either stemming the corruption of the *polis* (a), restoring divine order and natural law (b), or exercising the right to resist after a breach of the social contract (c). Brincat (2009a/b) extends this logic to contemporary justifications for tyrannicide, informed by a modern understanding of self-defense and combined with universal human rights.

Detailed chronological overviews of diverse cases can be found in Ford (1987), Burleigh (2021) and (in French) Cottret (2009). For the specific application of regicide as the political assassination of rulers (A) in modern contexts, see Iqbal & Zorn 2006; Iqbal & Zorn 2008; Serban et al. 2018; Escribà-Folch 2024. For tyrannicide from the point of view of **terrorism** (C), consult Bowden & Davis 2008; Dillinger 2015; Dietze & Verhoeven 2021.

KEY SIGNIFICANCE Royal political assassination declined once monarchies switched to procedural succession models (Ehlers 2004; Bagge 2019). By the eighteenth century, republican, nationalist and other non-monarchical **ideologies** led to a surge in regicides which lasted until the collapse of most world empires during the two world wars. Thereafter, a different dynamic involving authoritarian leaders followed, and this is still being studied. Serban et al. (2018) show that social conflict significantly increases the probability of leader assassination. In their sample from 1789 to 2011 they found that the probability of assassination peaked around 1945, and steadily declined afterwards. The reasons for this remain unclear.

Between 1946 and 2010 there were 117 standalone assassination attempts against autocratic rulers (not part of coups) (Escribà-Folch 2024: 262). In modern times, the concurrence with coups is rarer than one would expect: only 7% of attempted coups included the killing of the ruler. Most of these took place in the Middle East and North Africa (Chin et al. 2022).

The impact of political assassination varies enormously depending on the political regime type affected, but this was not studied before the advent of Large-N research. Regimes having institutionalized procedures for incumbent incapacitation or death – those closer to the ideal type of legal-rational rule – are likely to experience shock, outrage and crisis, but can still rely on their institutions to enable leadership turnover (**succession**).

Conversely, systems in which leadership succession largely occurs through internal struggle or guile are substantially more likely to experience turmoil following the forcible removal of the head of state. In such a system, the assassination of the head of state creates a power vacuum that is not immediately remedied through institutionalized channels, with various factions vying for power, often using violent means. In addition, the demise of a strongman may afford opportunities for protest and unrest (Iqbal & Zorn 2008: 387-388). Van den Bosch (2024: 282-287)

confirms this finding for **personalist rule**. Sudden leader incapacitation (by assassination, a health setback or an accident) brings down regimes if they are caught unawares and have no procedural precedent to deal with such a shock. Chin et al. (2022) find that with increased **personalization** (and thus **coup-proofing**), rival elites, less able to coordinate coup attempts, turn to assassination, which does not require the same level of elite coordination. (**Coups** require more communication, coordination, equipment, and trust to mobilize multiple actors in order to seize power.)

Iqbal and Zorn (2006: 495) find evidence that previous leader assassinations increase a country's likelihood of experiencing another such killing in the future (see 'coup traps' in Box 5.2 and 'regimes and repertoires' in Box 5.8).

MEASUREMENT The *Archigos* dataset distinguishes between coups and assassinations (Goemans et al. 2009). Using newspaper sources, Jones and Olken (2009) built on an older version (2.5) of the *Archigos* database, and count 298 assassination attempts, of which 251 were 'serious attempts' and 59 resulted in the leader's death, between 1875 and 2004.

The *Combating Terrorism Center* (CTC) created a database of political killings understood according to a broad definition – as an action that directly or indirectly leads to the death of an intentionally targeted political actor, in order to promote or prevent specific policies, values, practices or norms pertaining to the collective – thus covering A, B, C and D. The CTC dataset is global in scope, covering political assassinations between 1945 and 2013, and identifies 758 attacks by 920 perpetrators that resulted in the death of 954 individuals (not counting 'bystanders') (Perliger 2015).

The *Global Initiative against Transnational Organized Crime* (2020) created the *Global Assassination Monitor*, a dataset that includes more than 2700 cases of successful or attempted assassinations reported in the media since 2019. Their global coverage deals with contract killings foremost, and includes political, criminal and economic motivations (Kaysser & Oliveira 2021).

Combining datasets, Chin et al. (2022) identify 210 potential assassination attempts against dictators from 1946 to 2010; their coding criteria are listed in appendices.

METHODOLOGICAL ISSUES The literature on leaders' assassinations is fragmented and limited, leading to insufficient insights into the political conditions that precipitate such events. This limitation arises from inconsistencies in concepts, data, and samples used in prior research (Iqbal & Zorn 2006; Jones & Olken 2009; Torgler & Frey, 2013; Perliger 2017; Serban et al. 2018). Many studies fail to account for the differences in power struggles and political dynamics between dictatorships and democracies. Additionally, they often focus on successful assassinations, overlooking failed attempts and the unique factors influencing them; sometimes they include non-leader assassinations, which likely have different causes (Escribà-Folch 2024: 266).

Lone wolf attacks are notoriously hard to classify (political or personal?). Take, for instance, Thomas Matthew Crooks' failed assassination attempt on US presidential candidate Donald Trump on 13 July 2024, during a campaign rally near Butler, Pennsylvania. At the moment of this writing, there is no evidence of a conspiracy or foreign involvement. The attempt involved a lone assailant, who was shot by Trump's protection detail. Any political motives behind Crooks' actions remain unclear, as investigators have so far not identified a definite motive; there is no evidence of strong political beliefs or affiliations that would suggest a politically driven assassination attempt. Investigators posit that Crooks may have been looking to carry out a high-profile shooting (for notoriety), and the Trump event's proximity and timing offered him the most accessible opportunity. Whatever the case, had Crooks succeeded, the political fallout would have been enormous (Biesecker et al. 2024; Cohen et al. 2024).

IMPACT ON POLICY Over the centuries rulers have lost a lot of sleep over regicide. Even Kautilya's *Arthashastra* (see Box 2.2) offers advice on how to assassin-proof the ruler's living quarters as early as the fourth century BCE. During historical periods when regicides have peaked, or after escaping some failed attempts, monarchs could easily become paranoid. Crown Prince Friedrich Wilhelm of Prussia once told a minister that *"Whenever I get out of my coach, I wonder whether the shot will come from the right or the left"* (Burleigh 2021). With potential assassins everywhere, new counter-terrorism units were created and **intelligence services** innovated tactics for covert work and infiltration. With modern armies and new technologies, **coup-proofing** techniques evolved with successful innovators, while unsuccessful (slain) rulers have become the objects of **authoritarian learning**.

Box 5.1 Assassinated Visionaries: Lumumba, Sankara, and Their Enduring Impact on Africa

Without dignity, there is no liberty, without justice, there is no dignity, and without independence, there are no free men
– Patrice Lumumba

You cannot carry out fundamental change without a certain amount of madness
– Thomas Sankara

Patrice Lumumba and Thomas Sankara, two towering figures of African liberation, remain enduring symbols of resistance against imperialism and neocolonialism. Lumumba, the first prime minister of Congo (now DRC), and Sankara, the revolutionary leader of Burkina Faso, shared a vision rooted in pan-Africanism, social justice, and economic self-determination. Though their lives were tragically cut short by assassinations linked to both internal and external rivals, their legacies continue to inspire movements for justice, unity, and transformation across Africa.

CONGO Patrice Lumumba (1925-1961) was a Congolese national leader, fighter for independence, and the first prime minister of the independent Congolese state from June to September 1960. Originally an advocate of colonial power and a colonial postal officer, in 1958, he was elected as a leader of the *Mouvement National Congolais* (MNC), which later advocated for national liberation and independence (Zeilig 2016). Lumumba's pan-Africanist and nationalist visions collided with the Belgian effort to maintain an influence over Congo. Belgium's delegitimization campaign against the Congolese struggle for independence led by Lumumba is described in Quinonez & Murillo (2021). They stressed that the colonial Belgian government prioritized its economic benefits over the liberties and human rights of the Congolese people. For these reasons, Belgium supported the separatism of Katanga led by Moise Tshombe, the province rich in mineral resources, after Congolese independence in 1960. Prime Minister Lumumba and President Kasavubu requested the deployment of UN troops to Congo to calm the situation. After the Kasai province declared secession in August 1960, Lumumba was dismissed as prime minister. He was accused of communism and committing genocide in Kasai and was assassinated on 17 January (see, e.g., Nzongola-Ntalaja 2002).

Hochschild (1999: 301-302) mentions that Lumumba not only argued for the political independence of Africa but also stressed the need to emancipate economically. He also described the murder of Lumumba and the role played by Joseph-Désiré Mobutu (Box 1.7) with the financial and political support of the US, France, and Belgium which later helped Mobutu to consolidate power and become Congolese ruler. Mobutu's **coup** after the **assassination** of Lumumba is mentioned by Kombeto et al. (2021), who presented a comparative study of bad governance in CAR, DRC, and Uganda. The complicity of the CIA in enabling Lumumba's assassination is described by, e.g., Quinonez & Murillo (2021). Mountz (2014) claims that US intervention in Congo during the crisis between 1960 and 1965 ended up with support for Moise Tshombe to become prime minister in 1964 and Mobutu to become dictator in 1965 not "*only because of a commitment to contain the communist threat, but also because of a commitment to a liberal ideology.*" He argues that the US administration participated in a plot against Lumumba and used various strategies for Cyrille Adoula to become prime minister in August 1961. Kennedy's administration supported a territorial unity of Congo because it believed that an independent Katanga would mean the fall of Congo under the Soviet interest sphere. The US was also worried about the criticism from the Afro-Asian bloc.

In contrast to US cooperation with other African leftist leaders, such as Kwame Nkrumah of Ghana or Sékou Touré of Guinea, Patrice Lumumba was considered by US administration to be "*a rabble-rousing speaker, a shrewd maneuverer with clever left-wing advisers, aided and encouraged by Soviet and Czech Ambassadors*" who would "*continue to cause difficulties in the Congo whether he is in control of the government, in jail or released.*" (Telegram from the Embassy in the United Kingdom to the Department of State, 3 September 1960, in FRUS 1958-1960, 14: 486-487, cited in Mountz, 2014: 156).

Even before Lumumba's death, the US embassy and the CIA established relations with Cyrille Adoula despite his lack of broader political support (Mountz 2014: 158). The US cooperated closely with the UN, whose Secretary-General Dag Hammarskjöld hoped that the government of reconciliation would end Katanga's claims for secession and remove the need for the UN peacekeeping mission in Congo (the first of its kind for the UN).

There has been a debate on the role of the Western countries in the assassination of Lumumba. The publication of the book *The Assassination of Lumumba* by Ludo De Witte in 2002 caused a scandal in Belgium for openly accusing Belgian troops of involvement in Lumumba's death. It even led to the Belgian Parliament deciding to set up an official commission to investigate Lumumba's murder (Bustin 2002). The investigation results and the commission's report are evaluated in the book *Lumumba: Un Crime d'État* by Colette Braeckman (2002). Since then, several other books and journal articles critically evaluating Lumumba's life and death have been published (Bustin 2002; Reid 2023; Weissman 2014; Zeilig 2015). The role of the British during the first years of Congolese independence has been evaluated by Alan James (1996), for instance.

Lumumba's thoughts are recorded in the volume *Lumumba Speaks: The Speeches and Writings of Patrice Lumumba, 1958-1961*, edited by Jean Van Lierde, with an introduction written by Jean-Paul Sartre (Lumumba 1972). Lumumba is the author of the book *Congo, My Country* published in English in 1962 (Lumumba 1962).

Lumumba's speeches were analyzed by Olivier Klein and Laurent Licata (2003) from a social-psychological perspective. They claim that the social context affects the content of group representations and show this with the example of portrayals of Belgians and Congolese in Lumumba's speeches.

BURKINA FASO In contrast to Lumumba's overwhelming electoral victory, Thomas Sankara (1949-1987) came to power through a **coup d'etat** which took place on 4 August 1983, in which he and Blaise Compaoré overthrew Jean-Baptiste Ouédraogo (Sawo 2017). Military coups had been part of Burkina Faso's politics since independence from France in 1960. After the coup in 1983, the supreme governing body of the new regime became the *Conseil de Salut du People* (CSP – People's Salvation Council), comprised of army officers (Skinner 1988). The new leadership declared that a new direction for the country was not inspired from abroad (or by any ideology) but was based on local realities. However, Sankara established close relations with like-minded African leaders, such as Jerry Rawlings of Ghana or Colonel Mathieu Kérékou of Benin (formerly Dahomey) (Skinner 1988).

Sankara declared the creation of the *National Council of the Revolution* (CNR) and became its chairman. Several leftist groups and their leaders who supported the coup also took up posts in the newly created government. The CNR and government were hybrid military-civilian formations. Still, the August 1983 coup leaders, Sankara, Compaoré, Henri Zongo, and Jean-Baptiste Lingani maintained the most significant influence (Harsch 2013: 361). Sankara appealed to people to establish *Comités de Défense de la Révolution* (CDRs, Committees to Defend the Revolution) that were supposed to "participate in the great patriotic battle of rehabilitating the nation" (Skinner 1988: 443).

As for Sankara's ideologies, he proclaimed himself to be Marxist and was inspired by the French Revolution, Paris Commune, and Russian Revolution (Harsch 2013: 361). He was labeled a *"Pan-Africanist, anti-imperialist, communist, anti-corruption crusader"* (Harsch 2013: 363). His speeches and works have been collected into the volume *Thomas Sankara speaks* by Michel Praire. In the introduction, Praire claims that *"Sankara stood out among the leaders of struggles for national liberation in Africa in the last half of the twentieth century because he was a communist"* (see Praire's introduction in Sankara 2007). David Gakunzi (1991) claims in the preface to the collection of Sankara's speeches that *"profoundly Burkinabe, Sankara was also profoundly pan-Africanist, internationalist, and attached to the struggles of the Third World"* (Harsch 2013: 363). He also proclaimed his anti-imperialist and anti-colonial stances. He advocated for supporting liberation movements elsewhere – from Southern Africa to the Western Sahara and Central America to New Caledonia (Harsch 2013: 362).

After the Sankara came to power through the coup, the US and France cut off support and material aid intended for Burkina Faso. Therefore, the new regime turned to the USSR and Libya for support provided only in a limited amount (Skinner 1988: 445). Sankara's revolutionary regime also became a source of mistrust among the leaders of neighboring countries, such as Seyni Kountché of Niger and Gnassingbé Eyadéma of Togo. The relations between Burkina Faso and the Ivory Coast were also bitter due to a large Burkinabè diaspora in the latter, a legacy of French colonial rule. The relations between Burkina Faso and Mali were also complicated due to the competing national interests of these two countries. (For a treatise on Burkina Faso-Ivory Coast and Mali relations, see, e.g., Skinner 1988).

Murrey (2016: 215) defines Sankarism or Sankarist tradition as follows: *"a Pan-African, anti-imperialist, and communist-inspired political praxis that emphasizes holistic social transformation through the permanent dismantling of (neo-)imperial structures of dispossession. According to Sankarist tradition, this emancipatory social transformation is possible only through the collective energies and everyday actions of the Burkinabè"* Sankara was convinced that the transformation of relationships between the state and the post-colony was inevitable. After he came to power, he abandoned the symbols of power and strategies used by postcolonial Burkinabè elites, advocated for the transformation of the whole society, and supported the country's sustainable development (Murrey 2016).

Sankara's regime can be considered nationalist and pan-Africanist. In 1984, as part of his revolutionary actions, he renamed the country from Upper Volta to Burkina Faso, which means the '*Land of the Upright Men*' (Sawo 2017: 10; Skinner 1988). Through this shift, the Burkinabé government aimed to craft an African identity for the new state and embrace the ethnic and language diversity of its people (Harsch 2013: 363). Sankara also introduced reforms in education, health, and agriculture, and his government invested in building roads, schools, and houses. Additionally, he advocated for women's rights, which was considered rare for an African president then. He even appointed several women to his cabinet (Harsch 2013: 366), declared 22 September 1984 as the day for husbands to do their family shopping, and banned prostitution (Skinner 1988, 444).

In the economic agenda, the new Burkinabè government under Sankara opposed and rejected the IMF and World Bank's programs (even though at the beginning, they unsuccessfully sought funding from the IMF for building the railway from Ouagadougou to Tambao (Skinner 1988: 445)), because of their neoliberal policies and instead, proposed alternatives to economic globalization (Harsch 2013: 364). He opposed the dependence on international aid (Murrey 2020) and instead supported development through social mobilization and community-led projects, especially through *Committees for the Defense of the Revolution* (CDRs) established for collective labor mobilizations. Even though the CDRs were supposed to represent popular participation, there were no plans to introduce democracy in Burkina Faso. On the contrary, all political parties were banned (Harsch 2013: 367).

As for the social policy, Sankara promoted programs on healthcare (vaccination campaigns) and education of Burkinabé children and proposed a higher education reform, which was unsuccessful. The educational system's reform was motivated by Sankara's assumption that *"the colonial schools were replaced by neocolonial schools, which pursued the same goals of alienating the children of our country and reproducing a society funda-*

mentally serving imperialist interests" (Sankara 2007: 81-82, cited in Murrey 2016: 216). He also supported building housing infrastructure (Cité II and Cité III) provided for people living in informal settlements (Murrey 2020).

Thomas Sankara was assassinated on 15 October 1987 during a military coup orchestrated by his former ally and fellow revolutionary, Blaise Compaoré. Sankara was gunned down by a commando unit at a meeting of the *National Revolutionary Council*, along with 12 of his colleagues. Compaoré, who immediately assumed power after the coup, denied involvement in the **assassination** for decades. However, following his ouster in 2014 and subsequent trial, he was found guilty *in absentia* in 2022 for his role in Sankara's murder.

Compaoré served as president of Burkina Faso from 1987 until 2014, when he resigned amid mass protests against his attempt to amend the constitution to extend his rule. To justify the coup, Compaoré and his supporters portrayed Sankara as *"an autocrat who wanted to rule alone and was against the unification of the revolutionary political organizations"* (Harsch 2013: 369).

SHARED VISION Certain ideological and political commonalities between Patrice Lumumba and Thomas Sankara can be identified. Both leaders were staunch proponents of pan-Africanism and resolute opponents of Western colonialism, neocolonialism, and imperialism. Their policies were deeply rooted in promoting social justice and reducing inequality, with a focus on uplifting marginalized and impoverished sections of society. Sankara's government, for instance, implemented radical economic reforms, including land redistribution, nationalization of resources, and initiatives aimed at achieving self-sufficiency. Similarly, Lumumba advocated for the control of Congo's vast natural resources to benefit the local population rather than foreign powers.

Both leaders actively engaged with the masses and sought to mobilize popular support for their transformative policies. Sankara emphasized participatory governance, involving the public in decision-making processes, and his administration was particularly progressive in advancing women's rights and youth involvement. While Lumumba's tenure as prime minister was brief, his rhetoric also called for the inclusion of all societal segments in the process of nation-building.

During the Cold War, both Lumumba and Sankara adopted a non-aligned stance, striving to navigate an independent path free from the influence of major power blocs. They championed solidarity with other newly independent nations in Africa and beyond, aligning themselves with leaders and movements across the Global South that were resisting colonialism, imperialism, and neocolonialism. Their revolutionary rhetoric advocated for radical changes to the entrenched social, political, and economic structures inherited from colonial rule.

However, both leaders faced significant opposition domestically and internationally. Lumumba was ousted in 1960 and assassinated in 1961 during a crisis fueled by internal rivalries and Cold War geopolitics. Western powers, particularly Belgium and the US, played a role in his downfall due to his anti-imperialist stance. Similarly, Sankara was overthrown and assassinated in 1987 during a coup led by Blaise Compaoré, with suspicions of external involvement from France due to Sankara's radical reforms and rejection of **foreign aid** dependency.

LEGACIES Thomas Sankara and Patrice Lumumba left enduring legacies and are regarded as near-mythical heroes, particularly among young Africans. Sankara is remembered as "the most celebrated leader" within the Burkinabè revolutionary context (Harsch 2013) and was officially rehabilitated and declared a national hero in 2000. His legacy continues through the activities of 'Sankarist' political parties, which have participated in Burkina Faso's elections since the 1990s. The largest of these groups is the *Union pour la Renaissance/Parti Sankariste* (UNIR/PS). Youth opposition in Burkina Faso often draws on Sankara's ideas to protest against corruption and entrenched elites, advocating for democracy rather than communist ideology. As a charismatic leader and pan-Africanist, Sankara has been added to the pantheon of prominent African anti-colonial leaders such as Kwame Nkrumah, Sékou Touré, Modibo Keita, Jomo Kenyatta, and Patrice Lumumba (Skinner 1988).

Patrice Lumumba's legacy is similarly profound. His assassination in 1961 became a symbol of Western rivalries during Africa's decolonization process, highlighting neocolonial interference in newly independent nations (Monaville 2019). Lumumba's death framed reinterpretations of the Congo Crisis in the 1960s and inspired generations of Congolese student activists. While Mobutu Sese Seko's regime (Box 1.7) proclaimed Lumumba a national hero to leverage his international popularity (Nzongola-Ntalaja 2002; Petit 2020), it simultaneously suppressed anti-Western protests inspired by Lumumba's ideology, most notably during the violent crackdown on 4 June 1969 (Monaville 2013). Outside of student movements, Lumumbism has had limited influence on Congolese politics. One notable exception is Antoine Gizenga's *Parti Lumumbiste Unifié* (PALU), which joined President Joseph Kabila's ruling coalition in 2006. However, Monaville (2019) argues that efforts to restore Lumumba's legacy by Mobutu and the Kabila administrations were largely superficial.

Lumumba's intellectual contributions have had a lasting impact on decolonial thought and liberation discourse across Africa. His emphasis on African unity, solidarity, and cooperation continues to inspire contemporary scholars such as Walter Mignolo, Sabelo J. Ndlovu-Gatsheni, Emnet Woldegiorgis, and Achille Mbembe (Monari 2024). His life and ideas have been explored in academic works (Zeilig 2016), novels, films, music videos (Ndaliko 2019), and artistic representations (Monari 2024). For example, the Museum for African Art in New York hosted an exhibition in 1999 titled *A Congo Chronicle: Patrice Lumumba in Urban Art*, featuring portraits of Lumumba by Congolese artists. Pierre Petit (2016; 2020) analyzed Lumumba's iconography on coins, stamps, banknotes, and postcards, noting that his international legitimacy has only strengthened over time. Today, Lumumba remains a fierce symbol of African independence and unity.

Both Sankara and Lumumba are remembered for their revolutionary ideals and their uncompromising opposition to imperialism and neocolonialism. Their legacies continue to inspire movements for justice and

liberation across Africa and beyond.

Authoritarian Legacies

My name is Ozymandias, King of Kings:
Look on my works, ye Mighty, and despair!
– Percy Bysshe Shelley, *Ozymandias*, 1819

The study of authoritarian legacies is essential for understanding the long-term impacts of autocratic rule after dictatorships have fallen. The target is mostly countries transitioning to democracy. Authoritarian regimes leave lasting marks on political, economic, and social institutions, shaping future governance and the prospects for democratic consolidation. Examining these legacies reveals how the patterns of behavior, norms, and values developed under authoritarianism influence both elite and public attitudes toward democracy. By analyzing the persistence of 'authoritarian enclaves' – such as militaries, (regional) political parties, and judicial systems – scholars can identify the challenges faced by new democracies in overcoming entrenched authoritarian practices. These studies provide crucial insights into the dynamics of democratic backsliding and the struggle for sustainable governance, particularly in countries where authoritarian memories linger in the collective consciousness (**authoritarian nostalgia**). Understanding these legacies is key to fostering more resilient democracies and preventing the resurgence of autocratic rule.

DEFINITION Authoritarian legacies are the particular long-term impact of authoritarian rule. Studies of authoritarian legacies pay special attention to how an authoritarian period affects the prospects for democracy and democratic consolidation. Samuel Huntington (1991: 270-271) argues, for example, that the *"longer and more recent experience with democracy is more conducive than is a shorter and more distant one."* The underlying argument is that earlier experience with democracy reduces uncertainty about the new regime, mitigating elite opposition to change. Huntington further notes that, among third wave democracies, those that had prior experience with democracy were more likely to be stable.

SEE ALSO This entry focuses on authoritarian legacies in a broad sense, referring to societies with authoritarian memories (**authoritarian nostalgia**), authoritarian 'enclaves' (see below), authoritarian residues, or authoritarian vestiges, with political systems unaccustomed to democratic values and practices, operating with authoritarian bureaucracies. **Colonial legacies** and **imperial legacies** look more closely at general (structural) historical burdens that countries carry with them; **revolutionary legacies** and **totalitarian legacies** engage their respective literatures in greater depth than this entry. (Some sources on 'personalist legacies' are covered under **personalist rule**.)

KEY SIGNIFICANCE Historical legacies can also have an impact on how values are formed, as shown in the **colonial legacies** and **imperial legacies** entries. Studies have examined how exposure to autocratic institutions, values and practices shape people's political beliefs and behavior. This has important implications for democratic backsliding today. Many democracies have had an authoritarian past that their citizens can remember.

LITERATURE There is a rich body of literature looking at the legacies of authoritarian rule (Bratton & Van der Walle 1997). Many scholars have investigated how a country's prior experience with democracy and autocracy matters (Donno & Russet 2004). Studies of authoritarian legacies look at patterns of behavior, norms, values, relationships, as well as at social and political institutions, rules and procedures. These values and institutions can grow entrenched, and this affects the post-autocratic period. For this reason, post-authoritarian regimes with some experience of democracy have an advantage in making democracy work.

In contrast, new democracies that experienced long periods of authoritarian rule struggle in numerous ways. Parties and party systems struggle to operate. Politicians lack the legislative experience to collaborate, formulate laws and check the executive (O'Donnell 1994). Judicial institutions lack experience in interpreting the constitution and challenging the executive, while security institutions lack experience in upholding the rule of law and protecting civil liberties. Local governments are often totally unprepared to make the transition. Citizens who endured autocratic rule also lack a meaningful attachment to democracy (Pridham 2000).

Institutional legacies or 'authoritarian enclaves' often recreate the habits and processes of the past. Authoritarian enclaves designate the persistence of non-democratic institutions, unresolved **human rights** issues, and the political and social actors who refuse to comply with democratic rules (Gilley 2010). They are institutional spaces within the state and society that adhere to authoritarian norms at odds with democracy. The term was first used by Merino Garreton (1991; 1995) in his analysis of Chile's transition to democracy, and much of the early work on authoritarian enclaves focused on legacies in Latin American third-wave democracies. Authoritarian enclaves could consist of institutions such as the military, the senate, courts and the monarchy. For instance, the Chilean constitution has often been cited as an example of an authoritarian enclave.

CLASSIFICATIONS & EXAMPLES Studies have also looked at the duration of authoritarian rule (see autocratic spells – Box 2.4) and the intensity of the authoritarian system. Myanmar's military has been in power for over five decades, and citizens have been exposed to intense **indoctrination** and surveillance. When Myanmar began to open up its regime somewhat in 2011, there was a great hope that the

country might finally be on the road to democracy. Myanmar embarked on a series of political and economic reforms, and the first multi-party elections were held. In 2016, elections resulted in victory for the civilian opposition party, the *National League for Democracy*. But hopes for democracy were short-lived. Myanmar lacked the institutional and political cultural legacy that could facilitate the transition. By contrast, Uruguay experienced a repressive interlude of military rule from 1973-1984. But this was not of sufficient duration to affect its return to democracy. Within five years, Uruguay's democracy was back to where it had been before, with a two-party system, a constitution and a commitment to democratic norms and principles by both the public and elites.

When it comes to classifications, scholars have noted that the character of the previous regime (A, B, C) has an effect on the **exit options** and the nature of **transitions**, but can also have an effect on the process of **democratic consolidation**. Smaller distinctions matter as well.

Military regimes (A) face the additional task of de-politicizing the armed forces. Milan Svolik (2008) finds that a military past has a significant, negative, and independent effect on a democracy's susceptibility to reversal. In other words, military regimes have an impact on a democracy's chances of consolidating. Other scholars confirm that a military legacy is particularly bad for democracy (Cheibub 2007).

This finding would appear to contradict the results from Geddes' earlier work that military regimes are especially prone to breaking down. Geddes argued that military dictatorships differ from other forms of authoritarian rule in that the military values its own survival more than staying in power (Geddes 1999). Military elites are more likely than other civilian authoritarian elites to step down voluntarily (see **exit options**), if staying in power impairs their corporate unity and effectiveness (Kieh & Agbese 1993). For this reason, the military is more likely to initiate and negotiate its own exit, making room for democratic elections.

Although a democratic transition from military rule is often a smooth process, the road to democratic consolidation is not. Because the military often negotiates its own exit, it retains a lot of bargaining power (due to its capacity for **repression**). The military uses this power to ensure that safeguards are in place to protect its financial interests (**rents**), its autonomy and its immunity from prosecution. The military will often dictate who can run for office, who can hold important cabinet positions and the types of policies that can be implemented. In Latin America, the military retained many privileges after democratization. The outgoing military elites were able to construct a protective version of democracy that hampered the chances of democratic consolidation.

Much of this depends on the degree of the military's involvement in political affairs. Some military regimes ruled for a short period of time, and were less extensively involved in politics. In negotiating their exit, they had a hands-off attitude to the **transition**, only focused on safeguarding their own interests, public order and national security. Where it is a question of more durable military regimes transitioning to democracy, it is important to implement comprehensive reform of the military and national security agencies. In the case of South Korea, rapid democratic breakdown was avoided by purging a politicized group from the military in order to reassert firm civilian control over the military. Two former military presidents were put on trial and national security came under the control of elected representatives. Cleansing the military deprived the security apparatuses of any privileged status (Im 2004).

However, many military regimes were not able to remove politicized elements from the military. As a result, the military wanted to remain involved in politics, undermining democratic consolidation (Diamond 1997). Years of military rule made it difficult for the military to accept subordination to civilians. For example, after more than two decades of military rule in Brazil, the military can still control its own affairs, free from civilian interference and congressional oversight, and continues to influence economic and social policy (Stepan 2015). In Honduras, the 1957 Constitution stipulated that the military could select the chief of the armed forces, maintain control over the military command and deny executive budgetary oversight (Albertus & Menaldo 2014). In Guatemala, the military instituted legal boundaries that put the military above the rule of law (Karl 1995). Egypt's military gave up power only to reassume it once again, with the election of General Abdel el-Sisi in 2014.

Returning to the example of Myanmar, the military (*Tatmadaw* – 'Grand Army') became a stubborn obstacle, aborting the country's democratic transition. The 2008 Constitution places limits on civilian power, requiring more than 75% approval for any constitutional amendment and stipulating that 25% of all seats in both houses of the legislature are to be filled by the *Tatmadaw*. The *Tatmadaw* also retain control of three key ministries: defense, home affairs and border affairs.

The character of the military also matters. Countries with professionalized militaries may have a better chance of consolidating democracy than those with non-professionalized militaries, or those whose militaries are praetorian in nature. Praetorian militaries are often poorly trained and funded. Characterized by high levels of corruption, they want to take advantage of the spoils of office (Perlmutter 1986). Their recruitment is often based on communal ties and loyalty rather than expertise and merit. Praetorian militaries are not trained to respect civilian politics. Because of this, they frequently intervene in politics.

Professionalized militaries are well trained, organized and cohesive (Finer 1962). More professionalized militaries tolerate the development of political opposition (Barany 1997). In countries with professionalized civil-military relations, the transition to democracy has a better chance of consolidating. For example, in the case of many Eastern European countries, there was no involvement by the military in the transition to consolidated democracy,

making the transition a smoother process (Barany 1997). In the **Arab Spring** the level of professionalization of the militaries proved to be a significant tipping point (Barany 2011). Tunisia's military was a small but professionalized force that did not intervene in the democratic process. In contrast, Syria's military, whose recruitment was mostly based on sectarian identity, chose not to exit but to fight alongside the Assad family (Makara 2013).

The legacy of military rule may also be dependent on whether a presidential or parliamentary system is chosen during the transition. Presidential democracies, which follow military rule, last on average 17 years, compared to 24 years for civilian authoritarian regimes. Although there is only a handful of cases of parliamentary democracies following military rule, these have lasted much longer (Cheibub et al. 1996). Most military regimes deliberately opt for presidential systems over parliamentary ones precisely because they can help to perpetuate the military's active role in politics.

Military institutions vary in influence but remain relevant, at times interventionist, and have to be dealt with. Authoritarian legacies influence a broad range of political, economic and social institutions (Hite & Cesarini 2004) and are often most visible in the operation and behavior of the security forces. In Greece, the lack of full civilian control over the armed forces for a sustained period constitutes one of its most important legacies.

Authoritarian **party rule** (B) may also be able to survive the transition to democracy without losing power through elections. Democratic institutions may disadvantage newer parties, and serve the interests of the incumbent autocratic parties. Loxton (2015) shows that the institutional inheritance of authoritarian successor parties, such as the *Institutional Revolutionary Party* (PRI) in Mexico, shapes their prospect of remaining major actors under democracy. The same could be said of communist parties in Eastern Europe (Grzymala-Busse's 2002). The way that parties are organized and institutionalized during the authoritarian period affects the development of political parties in the post-authoritarian era (Grzymala-Busse 2002). **Revolutionary legacies** matter as well.

There is no consensus about the impact of authoritarian parties. Self and Hicken (2018) argue that the more institutionalized the parties in the authoritarian period are, the more institutionalized they will be in the democratic period, which they see as a benefit to new regimes. They claim that there is greater evidence that an authoritarian successor party may play a positive role, rather than a negative one, by contributing to democratic stability. The reason for this optimism is that the authoritarian successor party may be an institutionalized organization, which is critical to democratic governance. Although authoritarian parties may have previously adhered to authoritarian principles, their experience can support democratic consolidation. Miller (2021) counters, however, that when authoritarian parties flourish, there is a negative impact on democratic survival and quality. Authoritarian ruling parties that incorporated some groups were more successfully able to persist after the transition to democracy, contributing to the entrenchment of **patronage** practices. These authoritarian incorporation strategies can have a powerful legacy (Riedl 2014). For example, in Ghana and Senegal, authoritarian parties' dependence on rural strongmen left parties in a stronger position to compete after democratization.

The impact of prolonged **personalist rule** (C) is covered in the entry devoted to it. Its most prominent characteristics are hollowed-out state institutions, deep distrust, **systemic corruption** and a high probability of violent **transitions**. This combination of structural factors, along with the high risk of political violence, makes democratic transitions unlikely, and, even when they succeed, democratic consolidation remains extremely challenging.

Elections under authoritarian rule can also bequeath a legacy. Some argue that this legacy is positive in that it can develop habits that lead to democratization (Donno 2013). Others see competitive authoritarian regimes manipulating elections in ways that have negative implications for democracy. In Venezuela, Hugo Chávez instituted a biased regulatory agency for elections called the *National Electoral Council* (CNE). In the 16 elections held while Chávez was president, there were 45 incidents of electoral irregularities. There was also biased enforcement of electoral laws, including allowing the ruling party to spend over the limit, arbitrary bans on candidates, inducing state employees and welfare recipients to vote for the regime, harassing voters, and threatening to deny funds to districts that elected opposition candidates. This has had a lasting impact on the quality and legitimacy of Venezuelan elections (Corrales 2015).

Past experience with authoritarianism may mean that elites are not loyal to democracy (O'Donnell 1994). Some studies have looked at authoritarian incumbents' privilege. The more privileged and wealthier they were, the greater the potential of a negative influence. Katherine Hite and Leonardo Morlino (2004) have argued that the more powerful and centralized the previous authoritarian regime was, the greater the chance of authoritarian influence in the subsequent regime. Elites perceive the advantages of certain arrangements and act to ensure their persistence well into the future.

Studies have also looked at the impact of authoritarian and totalitarian forms of rule on **civil societies**. One study demonstrates that countries with longer exposure to such forms will have weaker civil societies; totalitarian regimes suffer comparably more (Bernhard & Karakoç 2007) – see **totalitarian legacies**. Bela Greskovits (2015) demonstrates the weakness of civil society under Central Europe post-communist rule in spite of surveys that reveal support for democracy. Marc Howard (2003) argues that citizens in post-communist countries are less active or interested in joining new organizations than citizens in democracies.

Studies of authoritarian legacies may also consider the mode of **transition**. The mode of transition concerns the way that the transition from authori-

tarian rule favors **incumbents** over others. To what extent can the political elite still appeal to their constituencies (Schmitter & Karl 1991; Linz & Stepan 1996; Munck and Leff 1997)? How violent was the transition? Did authoritarian regimes lose power in crisis or non-crisis conditions (Haggard & Kaufman 2008)? Additionally, how strong were the military, political parties and civil society in this transition, and what role did they play? Frances Hagopian (1993) demonstrates that authoritarian regimes affect the pace and scope of economic reform by directly supporting the economic success or failure of the successor regime and indirectly altering the bargaining power of key actors along with the institutional arrangements under which they operate.

Historical memories of authoritarianism are also important. These memories can be activated and manipulated by social and political actors at given moments. Individuals living in countries that have had negative experiences with authoritarianism, particularly repression coupled with economic failure, will encounter fewer attempts to overthrow the democratic regime when it faces a crisis (O'Donnell et al. 2013). The repression that took place in Uruguay under military rule is an example of this. Nigerians also have memories of high levels of corruption, mismanagement and repression (Ojewale & Appiah-Nyamekye, 2018). The highest level of support for democracy is found in Namibia, which has strong historical memories of being ruled by South Africa's Apartheid regime. Over 70% of Namibia's population supports democracy according to the 2015 Afrobarometer survey. At the time of independence, Namibian elites were committed to democratic institutions. Democratic consolidation is more likely when different sectors' evaluations of the past lead to accommodating attitudes among political forces (Diamond 2015).

But historical memories can cut both ways. Authoritarian regimes unleash polarizing responses, inviting caution, retreat or revulsion and anger, and memories of these regimes can present an interesting set of paradoxes. Legacies can be either a reaction to the past or its continuation (Hite & Cesarini, 2004). While there are countries with positive past experiences of democracy, there are also others with negative memories of democratization. A prior failure may weaken future attempts to pursue democracy. If a regime's prior democratization effort was plagued by conflict and instability, re-democratization efforts will be hampered by any recurring images of crisis. Citizens may respond to the legacy of repression by turning away from politics (Maravall 2016).

Chaotic democratization may unite social actors' support for authoritarian regimes (Slater 2010). The timing of conflict and disarray is also important. Singapore and Malaysia both experienced a bloody, stateless and chaotic prelude to authoritarian rule (Slater 2010). Russian politics experienced upheaval after the break-up of the Soviet Union, which eroded confidence that a democratic system could preserve order. In contrast, much of the contentious politics in South Korea and Taiwan took place prior to democratization.

Authoritarian regimes may also have left positive impressions on citizens. They often use **propaganda** to shape citizens' image of the regime. Studies of Eastern European countries have shown that many Eastern Europeans are nostalgic for authoritarian rule (Neundorff et al. 2023). The authoritarian period is associated with stability, predictability, security and employment. This can lead to positive attachments to an authoritarian leader who is deified, often in a **personality cult**. Longer periods of authoritarian rule also leave more durable imprints on citizens (Pridham 2000).

An authoritarian political culture usually leaves a much more embedded and persistent legacy. How citizens were involved in and socialized into politics is incredibly important. Authoritarian values persisted for many decades after Italy's experience with **fascism**. A 1972 opinion poll showed that 21.5% retained a positive attitude to Mussolini (Morlino 2013). By 1985, only about 6.5% of Italians thought that the fascist experience was positive. According to Morlino (2010), this illustrates that there was no full consensus for democracy in the Italy of the 1950s, which still held diffuse positive opinions regarding the fascist period.

Authoritarian Nostalgia

There is no greater sorrow than to recall in misery the time when we were happy.
– Dante Alighieri (ca. 1265 – ca. 1321)

Nostalgia is a file that removes the rough edges from the good old days.
– Doug Larson (1926-2017)

Authoritarian nostalgia refers to a nostalgia about, or romanticization of, one's past life under authoritarian rule. Such skewed memories influence voter behavior and political preferences even in post-authoritarian contexts.

DEFINITION Authoritarian nostalgia refers to sentimentalizing life under past authoritarian rule. Contrary to early expectations, citizens who grew up under a dictatorship may be likely to yearn for a return to this period for a variety of economic,

psychological, sociological and political-cultural reasons. There may be different specific things that citizens are nostalgic for, such as a specific type of leadership, a sense of community, certainty, security, or just the past in general. Around the world, this nostalgia has impacted support for democracy in new democracies. The extent to which citizens are nostalgic is debatable, along with the reasons for their nostalgia, but mass surveys of citizens in former autocracies have revealed that there is a nostalgia for life under authoritarian rule.

In some cases, citizens aren't nostalgic for an authoritarian past *per se*, one that they lived through themselves; instead, citizens are nostalgic for a period in their country's history, which may have been illiberal and which they may not have experienced first-hand, but which feels like the 'golden age.' This helps to explain the effectiveness of 'make our country great again' campaigns, and appeals for a revival of the 'Golden Age of Islam.'

SEE ALSO This topic relates to authoritarian imprints resulting from socialization, **indoctrination**, **education** and **propaganda**. The most common form is communist nostalgia, which has received special attention, even in film and culture. Its lingering effects are part of **authoritarian legacies** and they are known to negatively impact **democratic consolidation**.

KEY SIGNIFICANCE The concept of authoritarian nostalgia puts citizens at the center of attention of authoritarian research, to better understand the relationship between dictatorships and their populations. The concept also brings into focus the legacies of authoritarian regimes along with the feelings and beliefs, not compatible with democratic values and principles, that may persist in post-authoritarian societies. It highlights the challenges facing new democracies in achieving democratic consolidation and illuminates the lasting legacy and imprint of authoritarian regimes.

ORIGIN Nostalgia for strong leadership has been explored in the past (Epstein 1968; Chase 1987; Lapidus 1983; Von Beyme 1988). This has been mainly nostalgia for a specific leader: Stalin, Mussolini, Mao, Saddam Hussein. The term nostalgia comes from the Greek words νόστος (*nóstos* – 'return') and ἄλγος (*álgos* – 'pain'). The term was first coined by the Swiss physician Johannes Hofer in 1688 to describe the symptoms felt by Swiss mercenaries who served European monarchs. By the second half of the twentieth century, it was more often used to describe a yearning for old times (Davis 1977).

LITERATURE Most of the literature on authoritarian regimes has focused on elites and institutions, but there is less understanding of what life was like for citizens who endured authoritarian rule, and the impact of authoritarian rule on citizens of new democracies.

A small but growing literature has shown that people who lived their impressionable years under autocracy tend to become nostalgic for such a regime. The literature on authoritarian nostalgia builds on work by scholars of socialization to better understand why new democracies have struggled so much to form democratic political cultures. It argues that citizens' experience with autocracy presents a barrier to **democratic consolidation**, as they are more likely to be more critical of and less satisfied with democracy. However, the reasons for why this is the case vary.

The socialization literature argues that citizens indoctrinated about the benefits of an authoritarian regime in their formative or impressionable years are more likely to be more nostalgic for the past, and more critical of democracy (Neundorff et al. 2022). The exact timing of 'impressionable years' is open to debate, but most scholars estimate these as falling roughly between the ages of 4 and 24. Many authoritarian regimes sought to achieve high levels of public conviction about the **legitimacy** of the regime through a process of indoctrination.

By indoctrination, we refer to the inculcation of a doctrine, an ideology and political values beyond merely fostering a mentality of obedience (Brandenberger 2014). **Indoctrination** is a process whereby a subject irreversibly learns an attachment, learning information as if it were universally accepted and true whatever the evidence (Eibl-Eibesfeldt & Salter 1998). Thus, indoctrination closes down alternatives through the promotion of a single view that provides citizens with a narrative of why the incumbent should be seen as legitimate (Sears & Hughes 2006).

Authoritarian regimes successfully used the educational system, the media, and youth organizations and parties to shape the values of citizens from an early age. Ideological messages were instilled in schools and universities, and through the media and the arts. Educational systems were designed to discourage critical thinking and the questioning of authority (cf. **education**).

The educational systems in Cold War-era Latin American right-wing military regimes emphasized nationalism, Christianity, and discipline. Thus, the educational climate to which people aspired was one of respect, order and silence. Additionally, a military model of management was superimposed on the educational institution (Hanson 1996). Textbooks were destroyed and a new curriculum that supported military rule, purged of leftist ideologies, was introduced (Davis 1995).

In the case of Eastern Europe, the curriculum was modified to focus on nationalism and on Communist **ideology**. The goal was to inculcate the principle that communism was morally right and everything that opposed it morally wrong. In Turkey, textbooks focused on Turkish nationalism while simultaneously instilling a phobia of the enemy. No critical thinking was encouraged; instead, rote memorization of state ideology, along with deference to authority, was emphasized (Ince 2012).

The media was also used to disseminate propaganda in favor of the regime. For example, in the case of Argentina under the military regime (1976-1983), a mass media campaign stressed moral conduct and authoritative discipline. Argentines who watched more television were significantly more

likely to agree that people should obey authority, to approve of limits on freedom of speech, and to think a person's poverty to be his or her own fault (Morgan & Shanahan 1991). In Eastern Europe, television and radio programs were heavily loaded with indoctrinating items about the triumphs of the Communist Party (Taborsky 2015). In tandem with this approach, authoritarian regimes ensured that citizens had little access to alternative sources of information that could carry different values (Geddes & Zaller 1989). The result of this strategy was that citizens developed strong convictions about the benefits of the authoritarian systems in which they grew up.

Nostalgia about authoritarian pasts have been become a major obstacle for democratic consolidation. Citizens' formative experience in authoritarian regimes impacts their political preferences after the regimes' democratization. People who spent their formative years under authoritarian rule are more critical of and less satisfied with democracy, compared to people who grew up in democratic periods. Authoritarian regimes cast a long shadow on their citizens even after their downfall. These legacies have important implications for the development of a democratic political culture in transitioning societies. Many of the regimes in Eastern Europe and the post-Soviet sphere have struggled to democratize or have seen their democracies erode over time. A lingering authoritarian political culture has meant that citizens facing social dislocation have become nostalgic for the authoritarian era. The *Pew Research Center* survey data has revealed high levels of authoritarian nostalgia in Russia, Chile, Turkey and Brazil, and in many countries in Eastern Europe.

Communist regimes have proven to be adept at political socialization. Older respondents socialized for decades in paternalistic and authoritarian societies are more nostalgic for communism than younger cohorts and cohorts not indoctrinated in their impressionable years (Neundorff et al. 2017). Communist parties provided a more coherent **ideology** than right-wing dictatorships (with some exceptions), one that has had a lasting resonance within these societies. **Communism** has also had a greater 'indoctrinating effect' than a 'resistance effect' (see 'methodological issues' – below). A recent study demonstrates that the longer the exposure to communism, the higher the levels of opposition to democracy (Pop Eleches & Tucker 2014).

In contrast to the socialization arguments, some studies claim that nostalgia derives from the tremendous upheaval that accompanied the dismantling of the socialist economy and the loss of public goods provision (Berend 2007; Dragomir 2009; Louyest & Roberts 2015; Okulicz-Kozaryn 2014; Vassilev 2011). For these authors, the problem was more economic shock than political change to democratic governance. Nostalgia, in their view, arises in reaction to the ills of rapid liberalization such as inflation, unemployment, a decline in living standards coupled with high levels of corruption (Light & Young 2015). According to these authors, nostalgia is a normal reaction in times of shock or upheaval as people search for solace and security. Countries with a recent traumatic experience of democracy are more likely to support autocratic rule (Belmonte & Rochlitz 2020). These authors also claim that communist nostalgia is a response to distrust, disappointment with the democratic system, and the failures of the new regime (Ekman & Linde 2005). This could lead citizens of former autocracies to prefer a certain autocratic status to an uncertain democratic future (Alesina & Passarelli 2019). Those who grew up under socialist dictatorship prefer greater state intervention and redistribution (Alesina & Fuchs-Schundeln 2007). Other explanations of authoritarian nostalgia simply claim that people imagine their lives would be better. In other words, if democracies performed better there would be less nostalgia for the past.

CLASSIFICATIONS There are different types of nostalgia, which may help to better understand the phenomenon of authoritarian nostalgia: (a) personal, (b) collective and (c) national nostalgias. Personal nostalgia (a) is a longing for a personal experience in the past, or may refer to something that someone has experienced first-hand. This differs from collective nostalgia (b), in which longing is for shared experiences that are connected to a social identity or social group (Sedikides et al. 2015; Wildschut et al. 2010; Wildschut et al. 2014). Collective nostalgia entrenches a renewed sense of social identity and may arise in response to threats to self-continuity (Boym 2001; Davis 1979; Hewison 1987). For example, communist nostalgia may function as a mechanism that helps the losers in the market transition cope with economic hardships (Marandici 2022).

National nostalgia (c) is a specific form of collective nostalgia that is based on national group membership, and which regulates intragroup and intergroup attitudes and behaviors of national in-group members. National nostalgia is a sentimental longing for a positively remembered national in-group past (Smeekes et al. 2021). It may include a yearning for a national community or heartland, or an idealized version of the past that is retrospectively constructed (Taggart 2004). In a study based on cross-national surveys in 27 countries, national nostalgia was demonstrated to be a response to a collective fear about the country's future (Smeekes et al. 2018). When national, collective nostalgia is a yearning for an authoritarian past, this has negative implications for support for democracy in post-authoritarian regimes.

MEASUREMENT & EXAMPLES Mass surveys are used to measure authoritarian nostalgia. Such surveys can offer insights into how people feel about the past. Interviewees may be asked questions about how they feel about the past, and what in the past they miss. This is then followed up with questions about how they feel about certain authoritarian periods, and what, if anything, they missed about these periods.

Many of the regimes in Eastern Europe and the post-Soviet sphere have struggled to democratize or have seen their democracies erode over time. A lingering authoritarian political culture has meant that citizens who have faced social dislocation have become nostalgic about the authoritarian era. As

mentioned above, the *Pew Research Center* survey data has extensively mapped such nostalgia in its reports (Masci 2017; Wike et al. 2019).

Many formerly communist countries have experienced a longing for the past, sentimentalizing some of the certainties of the socialist era. As early as 1993, *Eurobarometer* surveys indicated that minorities in all post-socialist countries (ranging from 5% in the Czech Republic to more than 25% in Bulgaria) approved of a return to Communist Party rule, even in countries that experienced brutal repression. The emergence of this post-socialist nostalgia surprised many, given people's apparent elation when these socialist regimes were overthrown.

Romania under Nicolae Ceaușescu was one of the most repressive regimes in the Eastern Bloc, and after the regime fell in a revolution in December of 1989, the Romanian population appeared united in its hopes for a better future. By 1993, a *Eurobarometer* survey revealed that 13% longed for a return to communist rule. Ten years later, two-thirds of the population claimed to be nostalgic for communism. In spite of his noted brutality, many older people directly praise Ceaușescu, and voice their desire for a return to the order and certainty of the past (Light & Young 2015). Other *Eurobarometer* surveys of former communist countries in Europe demonstrate that their citizens would welcome a return to **communism**.

METHODOLOGICAL ISSUES The main methodological issues concerning the measure of nostalgia for the past arise when the citizens being surveyed are still living under authoritarian rule. There is not always a guarantee of gathering accurate responses as citizens may be anxious about answering the question in the wrong way. In some cases, there are of issues regarding memory. Citizens who endured repression and authoritarian rule may not be able to remember this period accurately, choosing to repress the negative memories of the past as a coping mechanism.

In relation to measuring the strength of attitudes, Pop-Eleches and Tucker (2019) control for 'exposure' and 'resistance' using the analogy of sunburn. Just as the risk of sunburn increases with more time spent in the sun, exposure to a regime's ideology grows with the amount of time lived under it. However, the effect of this exposure may vary in terms of intensity and resistance. In the context of communist regimes, the intensity of ideological exposure can vary at both country and individual levels. For example, regimes dominated by ideologues may deliver stronger propaganda than those led by technocrats. At the individual level, those who attended school during communist rule might receive a more potent dose of regime messaging. Conversely, factors like pre-existing literacy or religious affiliation can increase resistance to regime indoctrination. People from literate backgrounds or those in communities opposed to communist ideals, like Catholics, might be less influenced by regime propaganda. This model highlights that both exposure and resistance factors can interact to shape individuals' acceptance or rejection of regime-promoted attitudes, emphasizing the need to consider these variables when analyzing ideological influence under authoritarian regimes (Pop-Eleches & Tucker 2019: 11-13).

IMPACT ON POLICY The idea that citizens may be nostalgic for authoritarian rule puts the focus on the importance of democratic education, and civic education in particular.

Colonial Legacies

Until the lions have their own historians, the history of the hunt will always glorify the hunter.
– Chinua Achebe

The extent of colonialism's influence on postcolonial societies is a subject of academic debate. Its breadth can be illustrated with an example from Africa. On the one hand, Jeffrey Herbst (2014) has argued that colonial rule in Africa was ineffective because its administrations could not govern vast colonial territories, controlling only capitals or coastal towns and regions. On the other, Young (1997) claims that the African colonial state was deeply transformative and had an impact on economic, political, and social processes in Africa. According to Acemoglu et al. (2002: 1235), European colonialism caused 'institutional reversal' in Africa, which means that colonial administrations built institutions of private property in poor areas, and, in previously prosperous regions, they introduced extractive practices and institutions. This pattern of change overlapped with population density: poor areas with sparse populations became destinations for European settlement, whereas prosperous, densely-populated areas became sources of forced labor. On the basis of the work by Mazrui (1986), the effect of colonialism may be understood either from the perspective of (A) the 'epic school,' which claims that colonialism meant 'a revolution of epic propositions,' or (B) the 'episodic school,' which sees colonialism as a mere episode in African history (Ndlovu-Gatsheni 2015). Such debates can be extended to all world regions that experienced colonialism and echoes of these sentiments also appear in **imperial legacies**.

In the study of authoritarianism, the most important colonial legacies include the establishment of extractive and authoritarian institutions, the creation of arbitrary boundaries and centralized state structures, the fostering of ethnic divisions and inter-ethnic competition, and the imposition of economic systems that perpetuated inequality and dependency.

Whether the colonial state is a direct impact of colonialism is similarly disputed. The character of the colonial system (see **colonial states**) had a considerable effect on postcolonial local governance, ethnic politics, conflict, traditional institutions, and land rights (Müller-Crepon 2020: 736). According to Bolt and Gardner (2020), however, it is necessary to focus on the dynamic interaction between elites and the colonial state authorities, rather than just assess the degree of their mutual involvement. In many regions, as in Africa, on the eve of independence, traditional elites won power thanks to their connection to or collaboration with colonial powers, rather than from traditional rights (Ajayi 1982). The legacy of colonialism is still apparent in the political, economic, and social development of postcolonial societies.

The dynamics between colonial authorities and local elites have significantly impacted the emergence and persistence of authoritarian regimes in postcolonial contexts. Colonial powers established authoritarian structures through collaboration with or the subordination of local elites, leading to the empowerment of certain leaders and the under-

mining of societal checks-and-balances. After independence, this collaboration facilitated immediate control and institutionalized repressive governance. Centralization of power during colonial rule enabled postcolonial leaders to assert control over diverse populations, often at the expense of democracy. Ethnic divisions, entrenched by colonial rule, were exploited by postcolonial regimes to maintain authoritarianism. The economic exploitation and elite collaboration established under colonialism persist in postcolonial states, perpetuating authoritarian practices. The use of colonial-era laws to suppress dissent further consolidates authoritarian control (Cheeseman & Fisher 2019; see also Box 5.8 on regimes & repertoires). Additionally, the type of colonial rule has an influence on contemporary attitudes to democracy, which suggests that understanding colonial legacies is essential for the analysis of the challenges of **democratization** in former colonies (Lechler & McNamee 2018).

DEFINITION The political legacies of colonialism include political instability, violence, and ethnic exclusion (De Juan & Pierskalla 2017: 162). Colonial legacies are shaped by prior colonial and native policies (Steinmetz 2008) and influence postcolonial societies' economic, political, and social developments, e.g., the distribution of land, language policies, ethnic and racial exclusionary policies, etc. Colonial experiences create pathways that can develop into path dependencies for authoritarian institutions and for patterns of **repression**, so-called **authoritarian legacies**.

SEE ALSO It is necessary to distinguish colonial legacies from **imperial legacies**. Imperialism may be approached as a concept or ideology (but with practical effects); colonialism is rather a practice. In this volume, we consider the factors that influence the international position of postcolonial states and maintain contacts with former colonial powers as imperial legacies. On the contrary, the subject of this entry is the internal developments influenced by colonialism. For a treatment of the impact of colonial systems on statehood, identities, and institutions in particular colonial contexts, see the **colonial states** entry.

KEY SIGNIFICANCE Colonial legacies are used to explain the character of newly independent states. For instance, **neo-patrimonialism** and dysfunctional fragmented states (see **state fragility & failure**) arose after decolonization as a result of colonial systems. Olsson (2009) proposes a temporal approach to analyze the colonial determinants of democracy. According to his findings, a positive relationship between colonial duration and current levels of democracy is driven by former British colonies and colonies established after 1850. Roberti (2019) models the relationship between state capacities and the repression of civilians. He identifies and explains the heterogeneous long-term outcomes in non-democratic colonial regimes, having diverse institutional quality, that go beyond the distinction between settler and non-settler colonies. And, using comparative statistics, he forges and proves links between geographic factors, state capacity, and long-term development.

ORIGIN The impact of colonialism was a subject of discussion already in the nineteenth century, at a time when the conditions of colonized people were criticized, and European colonial powers needed to justify their expansion by stressing their 'civilizing mission' (Maseland 2018). For instance, Rudyard Kipling published his poem 'The White Man's Burden' (1899), which was then used to justify the US annexation of the Philippines (Harris 2007).

Current thinking about the legacies of colonialism can be traced to postcolonial theory. Works such as Frantz Fanon's (1961) *Les Damnés de la Terre (The Wretched of the Earth)*, Aimé Césaire's (1950) *Discourse on Colonialism*, and Albert Memmi's (1957) *Portrait du colonisé, précédé par Portrait du colonisateur (The Colonizer and the Colonized),* explored the psychological, cultural, and structural effects of colonialism on colonized people and raised awareness of the need to address colonial legacies.

LITERATURE The most influential studies on the impact of colonialism on the development of postcolonial states are Acemoglu et al. (2001) and Lange (2006a, 2004). However, as early as 1972, Walter Rodney published his seminal book *How Europe Underdeveloped Africa* (Rodney 1972), dealing with the extractive form of colonialism and employing a Marxist theoretical approach. Colonial legacies are the subject of ongoing academic debates. An important overview, which studies these legacies in the context and from the perspectives of political discourse and knowledge politics, local and global contestations, and postcolonial agencies and negotiations, is the special issue of *Third World Quarterly* edited by Swati Parashar and Michael Schulz (2021).

Generally speaking, the legacies of colonialism are the subject of current postcolonial thinking as represented by, e.g., Sabelo Ndlovu-Gatsheni (2015), Homi Bhabha (2004), Ngũgĩ wa Thiong'o (1986), Achille Mbembe (2001), Ania Loomba (2015), Ramón Grosfoguel (2003), and Walter Mignolo (2012, 2002). Coronil (2013) summarizes Latin American postcolonial studies, paying attention to their links to postcolonial studies in other parts of the world – Africa and India in particular.

Generally, colonialism is considered to have a significant impact on the economy (A), politics (B), and social structure (C) of postcolonial states and this is reflected in the literature.

Economic Impact (A) Studies of colonial economic legacies (Acemoglu et al. 2001; Bertocchi & Canova, 1997; Grier 1999; Mahoney 2003) generally deal with underdevelopment and economic stagnation as a result of colonialism. According to Acemoglu et al. (2001), the impact of colonialism on development is based on three premises: (i) different types of colonization policies created different sets of institutions; (ii) the colonization strategy was influenced by the feasibility of settlements, especially the disease environment; (iii) **colonial states** and their institutions persisted even after independence. In addition,

the slave trade and the export of enslaved people from Africa has had a severe impact on African economic development (Nunn 2008), and slavery in the New World (especially Spanish America) resulted in the creation of institutions that were not supportive of economic growth (Engerman & Sokoloff 2002).

The level of development is influenced by the characteristics of colonial systems: British indirect colonial system supported free trade and became important for economic development (Olsson 2009: 535). An analysis of Spanish colonies in America (Mahoney 2003) finds that the density of the Indigenous population and the power of liberal elites between 1700 and 1850 are critical factors that explain development differences between particular South American states. Comparison of regions of India directly administered by the British with those under indirect British control and governed by local princes (Iyer 2010) suggests that the effect of two kinds of rule is not straightforward. The level of postcolonial development depended on local contexts and policies aimed at ensuring equal access to public services, such as education and healthcare.

A comparison of British and Spanish economic models and their impact on the character of their colonies and the development of particular postcolonial states indicates that, since Spain colonized more populous regions, its brand of colonialism harmed development. As the British colonized less populous regions, their form of colonialism was less harmful than the Spanish system (Lange et al. 2006b).

Political Impact (B) The impact on institutions varies across regions. In the African context, authors such as Young (1997) and Jackson and Rosberg (2022) claim that colonial states had a considerable impact on the institutions of newly independent African states, and further that the character of colonial bureaucratic apparatuses, and the need to reform them after independence, may explain the rise of **personalist rule** in Africa. On the contrary, Mahoney (2003: 51) proposes an *"inverse relationship between colonial wealth and postcolonial development in Latin America,"* explaining that the poorer colonies in Latin America under colonialism performed better in the postcolonial era.

Olsson (2009) identifies a positive relationship between the duration of colonial rule and current democracy in postcolonial states. His findings are mainly supported by former British colonies and countries colonized after 1850. The impact of colonial systems on the duration of democracies was studied by Bernhard et al. (2004), who analyzed the *"relative contribution of economic development, social fragmentation, and the relationship between the state and civil society on the duration of post-colonial democracies."* According to their findings, the British colonial system had a positive effect on postcolonial democracies. On the contrary, research on French Africa suggests that the predatory (**kleptocracy**) and (neo-)patrimonial states there are the result of the French colonial administration (Bayart 2009) – see **neo-patrimonialism**. Young (2004) claims that patrimonial autocracies are the legacies of colonial states, and led to decline in the 1980s.

The variance between direct and indirect rule has an impact on the treatment of traditional authorities (see pre-modern **monarchies**) in postcolonial societies (Müller-Crepon 2020: 736). Since the British colonial power used both systems, analysis of the political development of these postcolonial states uses the following indicators: political stability, bureaucratic effectiveness, state regulatory burden, rule of law, lack of government **corruption**, and **democratization** (Lange 2004). Indirect rule left an ineffective *"system of decentralized despotism,"* with empowered local chiefs and ineffective local administrations (Lange 2004). On the other hand, direct rule left the conditions for state-led development (Kohli 1994; Wade 2018).

Similarly, different levels of colonialism led to different socio-political developments in the newly independent states (Lange et al. 2006b). The more extensive Spanish form of colonial administration led to the creation of predatory states; in contrast, British colonialism led to the introduction of the rule of law and effective administration. Different colonial legal systems also had an impact on the legal systems in colonies. Joireman (2001) addresses the British legal system introduced into colonies and its intersection with indigenous legal systems, and also the legacies of colonial legal systems and their respective legal education systems. He claims that, after decolonization, formerly Belgian and Portuguese colonies had almost no trained Indigenous legal professionals.

Japanese colonialism in East Asia, in contrast, strengthened East Asian states, as shown by the case of northern China (Mattingly 2017). However, there is disagreement about the role played by Japanese colonialism in the creation of states in East Asia. The claim that Japanese colonization created a well-trained and effective bureaucracy, crucial for further East Asian development, especially in Korea and Taiwan (Cumings 1984; Kohli 1994; Mattingly 2017), was criticized by e.g., Haggard (1997), who claims that Japan's influence on institution-building and post-war development in Korea was meager. In a similar vein, Doner et al. (2005) claim that the colonial effect was not crucial to Korea's state-building process. Analogously, Ha and Kang (2011) admit that, while Korea's industrialization was influenced by colonial rule, the colonial legacy did not play a crucial part in promoting effective bureaucracy and industrial development in the 1960s.

Different concepts of a 'nation' emerged from colonialism (Ekeh 1975: 106), benchmarked on the colonial powers. Colonial systems have an impact on the creation of identities in two broad senses: (a) the making of the serialized, modernist citizen; and (b) the fashioning of the ethnicized 'native' (Comaroff 1998: 329). Further, colonial administrations created social categories (defined by gender, occupation, ethnic group, religious group, etc.) (Lemarchand 1992).

With the imposition of 'nations' on multi-ethnic territories, violent nation-building transitions (which took centuries in Europe) were accelerated. Michalopoulos and Papaioannou (2016) claim that the partition of Africa in the late nineteenth century

led to an increase in violence in the postcolonial era and economic deprivation in certain regions. Many scholars claim that national borders in Africa are the product of colonialism, fail to respect pre-colonial political entities, and cut through ethnic groups (Asiwaju 1985; Herbst 2014; McCauley & Posner 2015; Müller-Crepon 2020: 723). The degree of the arbitrariness of African borders, and their possible consequences, was studied and identified by Englebert et al. (2002). In several states, partitioning according to ethnic groups led to irredentist conflicts, e.g., in Somalia (Adugna 2011), or as in the Illemi triangle (a disputed area between South Sudan, Ethiopia and Kenya), to delimitation conflicts (Mburu 2003). The arbitrary demarcation of borders in African postcolonial states led to civil wars, for example in Biafra (Simpson 2014).

Social Impact (C) This impact was particularly pronounced in education and knowledge production in and about colonies. Sociologists have identified the key role of Christian missionaries, in particular Protestant missionaries, in generating a democratic legacy in many former colonies, through the spread of literacy, mass printing, and voluntary organizations (De Juan & Pierskalla 2017: 162). Colonial education proclaimed that it brought the 'development idea' to Africa (Windel 2009), even as colonial administrations intentionally underdeveloped and undereducated local people, illustrated by the slogan *"no elites no problem"* (Roberti 2019: 248), which expresses colonial administrations' worries about educated leaders and their ability to start civil conflict. However, early colonial investments had great and persistent effects on current outcomes and spatial inequalities. Huillery (2009) uses colonial investments to explain inequalities in France's former West African colonies, and proves that public investments in colonies, especially in education, had long-term effects on development.

Missionaries' impact on colonial education has been the subject of several different case studies. Bolt and Bezemer (2009), e.g., present a comparison of British and French colonies and of Protestant and Catholic missions in Senegal and Uganda. They find that the British colonial system was more active in providing primary education than the French one. The role of missionaries in education in Cameroon has been studied by Lee (2012). Mattingly (2017) finds that the Japanese colonization of northern China led to increased school enrollment, improved public health, and sanitation, and to long-term increase in wealth. Relations between school enrollment and the character of the regime (either democratic or authoritarian) has been studied by Brown (2000). He sees colonial heritage as a predictor of primary school enrollment in low-income countries in Africa. Variation in school enrollment is caused by the distinct educational policies of British and French colonial states, and this gap has even widened over time. In French colonies, the education was in the French language, whereas the British colonial educational system taught students in their local languages.

The colonial legacy of ethno-racial discrimination (Lange et al. 2006b) can be identified in the South African Apartheid regime (Horáková 2018) – see also Box 4.7 – or in fabricated ethnic identities. For example, the concept of identity in Sudan was the result of historical processes stratifying races, cultures, and religions, and creating the dichotomy between 'South' and 'North' (Deng 1995). Indian identity was based on caste membership and religion (Robb 1997).

Certain institutions and policies, created and developed by colonial powers – such as property rights (Acemoglu et al. 2001), legal systems, tax collection, slavery (Nunn 2008) – had long-term consequences (Iyer 2010). The roots of social security can be traced to the colonial period (Schmitt 2015), as it has been analyzed in the cases of the Spanish, French, and British colonies.

The Nigerian author Chinua Achebe claimed that colonialism was *"the most extreme form of totalitarianism."* According to him, colonialism disrupted the habits and traditions of self-rule and resulted in weak states (Gilley 2016: 649). At the same time, however, Achebe admitted that colonialism had a positive impact on the creation of a consciousness of identity in some territories (e.g., the lower Niger basin). In one interview he said: *"These nations were created in the first place by the intervention of the British which, I hasten to add, is not saying that the peoples comprising these nations were invented by the British (…) this arbitrary creation called Nigeria holds out wonderful prospects. Yet the fact remains that Nigeria was created by the British – for their own ends. Let us give the devil his due: colonialism in Africa disrupted many things, but it did create big political units where there were small scattered ones before"* (cited in Gilley 2016).

Colonial systems have left their legacy in the urban design of colonial cities in Africa. The impact of Italian colonialism on urban architecture, and modes of living in Eritrea has been presented by Chelati Dirar (2007). French colonial urban design and its legacy in Africa has been analyzed by Njoh (2004), who finds that French urban development (in 1700s Goreé Island) preceded French territorial colonialism. Urban planning was considered a tool for modernization in the colonies. Colonial cities were designed to satisfy the needs of colonizers and colonial officers (with residential areas separate from the Indigenous population).

The slave trade and colonialism in Africa had an important impact on defining identities, such as gender and sexual identities and the position of women in African societies (Elnaiem 2021; Sudarkasa 1986; Tamale 2013). In addition, ethnic groups are social constructs created during the colonial era (Posner 2003) by missionaries or by explorers such as Henry Morton Stanley in Congo (Luyckfasseel & Meeuwis 2018: 88; Young 1976: 171). Posner (2003) illustrates how colonial administrations helped to consolidate certain language and ethnic groups in Zambia, which then played a significant role in postcolonial settings. The emancipation and consolidation of these languages were enabled by the activities of missionaries, colonial educational policies, and labor migration to mining regions. A similar case of missionaries impacting the development and consolidation of vernacular languages occurred in South

Africa (Gilmour 2007). Ranger (2012) criticizes the missionaries' role in inventing traditions in colonial Africa, meaning that they did not merely record, but rather created traditions. After decolonization, ethnic and nationalist movements used these traditions to justify their aims.

MEASUREMENT Colonial legacies are difficult to measure. There have been attempts using a temporal indicator, which means analyzing the impact of the duration of colonial administration on economic development (Bertocchi & Canova 1997; Grier 1999). There are also comparative studies claiming that the identity and character of the colonizing power have a significant impact on further development (Bertocchi & Canova 1997). Grier (1999) compares British, French, and Spanish colonial models, and discovers that former British colonies perform better than French ones. Statistical analyses find a positive and significant relationship between British colonialism and development indicators in postcolonial states (Lange 2004: 908). McPherson-Smith (2021) presents a qualitative study of the legacy of different colonial institutions in Africa (e.g., the administration of Somaliland as a British protectorate, whereas Somalia was an Italian colony). In contrast, Sokoloff and Engerman (2000) claim that the *"relationship between national heritage and economic performance is weaker than popularly thought,"* and there are broad disparities between different colonies of the same colonial power.

Bolt and Bezemer (2009) identify four benchmarks for the postcolonial growth of former colonies in Africa: (i) extractive institutions, like those under the Belgian colonization of Congo (Acemoglu et al. 2001); (ii) legal origins (Djankov et al. 2003); (iii) geography (Sachs & Warner 1997); and (iv) human capital (Djankov et al. 2003). Colonial education influenced further development in two ways, by affecting present education levels and by the effect it had on colonial institutions (Bolt & Bezemer 2009: 29).

METHODOLOGICAL ISSUES The majority of the studies on the impact of colonialism in the economic and political spheres mentioned in this entry are quantitative studies that compare a single colonial power's various colonies and their postcolonial development (e.g., Acemoglu et al. 2001). In addition, Nunn (2007) develops a path dependency model that links Africa's past, and colonialism in particular, with its current underdevelopment. William Darity (1992; 1990) and Ronald Findlay (1990) create models of the impact of the triangular trade between Europe, Africa, and America. Barbara Solow (1985) explores the validity of the hypothesis regarding the impact of slavery in the West Indies (Caribbean) on the economic development of Britain articulated by Eric Williams (1966). However, qualitative, in-depth analyses of specific social aspects of colonial legacies, such as knowledge production, and ethnic and national identity dynamics, are still required.

Colonial legacies have become the explanation for all postcolonial countries' problems by postcolonial national elites and also some authors in academia. Used to account for the woes of these countries, they thereby preclude the development of alternative theoretical models. Their impact is often confused with the impact of Cold War geopolitical dynamics and other international and internal political developments and influences (for a discussion of the persisting effect of colonialism on institutions and economic development see, e.g., Maseland 2018). Van den Bosch (2021), for instance, argues that Cold War geopolitics contributed much more to the longevity of **personalist rule** in Sub Saharan Africa than colonial legacies, and that such personalist legacies had a direct influence on violent transitions and civil war.

EXAMPLES Examples of colonial legacies appear in various case studies. Adelman (2012) deals with the colonial legacies in Latin America. Japanese colonial legacies in northern China are studied by Mattingly (2017). The study by Lee (2012) compares British (indirect) and French (direct) colonial systems in Cameroon, highlighting the French policy of assimilation and Western education against the British respect for native traditions. It also addresses the (earlier) German colonial legacy to assess the impact of these various colonial systems on post-independence Cameroon and the challenges stemming from its previous division into French and British colonies.

Also very interesting is the discussion on the Belgian reflection on colonial administration in Congo on the example of the Royal Museum of Central Africa at Tervuren, Brusssels (Ewans 2003). The paper also elaborates on Congo's unpreparedness for independence in 1960 and the problems it brought, such as the ascendancy of Mobutu's **kleptocracy** (see also Box 1.7) to supreme power in 1965 (Ewans 2003: 173).

IMPACT ON POLICY Colonial legacies have a very strong impact on the policy of newly independent postcolonial states. Policy-makers in newly independent states carried on the strategies of former colonial powers and their institutional imprints (Schmitt 2015). According to Christopher Clapham (2004), it was precisely the colonial period that initiated an era of robust political institutions and strong states in Africa, manifested, for example, in the establishment of borders between territories, and the creation of hierarchical government and citizenship rules. During the period of decolonization, states were created in territories into which state power had never reached. Thus, Clapham sees the main problem of collapsed states as lying in a situation in which the international community tries to 'graft' state institutions onto territories and populations that never experienced Western forms of statehood – see **state fragility & failure**.

OTHER LANGUAGES In Czech, Daněk (2000) analyzes the impact of colonialism on the uneven development of states, taking into account various economic, political, demographic, and social factors. In German, Lützeler (1997) provides a critical postcolonial view for Germany, which lost its colonies as a result of WWI.

NEW FRONTIERS New research trends are identified by De Juan and Pierskalla (2017) in their introduction to the *Politics & Society* special issue on *Comparative Politics of Colonialism and Its Legacies.* They urge increased attention to (a) the internal dynamics of colonial intervention; (b) non-institutional transmission mechanisms; (c) the role of context conditions at the time of colonial intervention; and (d) a finer-grained disaggregation of outcomes, explanatory factors, and units of analysis (De Juan & Pierskalla 2017: 159). There have also been discussions on the ongoing impact of colonialism on the institutions and economic development of independent states (Maseland 2018).

Coup d'État

Les coups d'État se terminent toujours par des tas de coups
(Coups always end in heaps of blows)
– Bernard Haller

Knocking off a bank or an armored truck, he said, is merely crude.
Knocking off an entire republic has, I feel, a certain style
– Frederick Forsyth, *The Dogs of War,* Bantam Books (1982: 120)

A *coup d'état* is the sudden (and violent) overthrow of an existing government by extra-legal means. Haller's statement underlines the ever-present element of violence; the quotation from Forsyth underscores how daring and dangerous such illegal operations are. Not all coups are violent. Sometimes the simple threat of violence during such **ousters** suffices, but it has to be credible for its intimidation to be effective. In contrast to **assassinations** (which may be opportunistic), coups always require an element of preparation and coordination. Coups are expected to have a plan for the takeover and for the ensuing government or regime transition.

DEFINITION Although coups may be hard to define (Powell & Thyne 2011), there is a general consensus in the literature about the basic defining features. The most important feature of a successful coup is that it results in the overthrow of the state. David Rapoport (1966: 59) underscores that a coup involves a state facing an attack against it. Eric Carlton (1997: ix) adds that a coup is *"a particular type of assault on the state."* This corresponds to the etymology of the French word *coup*, which translates as 'a stroke,' 'a blow,' 'a slash,' 'a shot,' or 'an attack' (Bankowicz 2011).

The Polish political scientist Marek Bankowicz (2011: 19) provides a comprehensive definition. A coup d'état is *"the illegal overthrow of the existing political power by a small group of conspirators, who use the strategy of a sudden seizure of neuralgic state institutions and facilities and is accompanied by violence or by the threat of its use. It is the work of conspirators, and thus it is not the political change enforced by mass social forces."* Thus, a key characteristic of coups is that they are discrete illegal events, with a clear beginning and end.

Another key characteristic of a coup is that it is a tool of the 'minority' (Barbé 1979: 295). It is not a social phenomenon with mass participation, which distinguishes it from a **revolution**. Those planning and executing a coup derive from state agencies, e.g., members of or those directing the security institutions (Bankowicz 2011; Carlton 1997; Hebditch & Connor 2005; Ferguson 1987; Luttwak 1979). Revolutions also differ from coups in that they often lead to the basic restructuring of a polity (Sartori 1987: 73). Although coups lead to a change in government, they do not necessarily lead to transformative socioeconomic changes (McGowan 2003).

Coups also occur relatively quickly and are often bloodless, with no casualties (Powell & Thyne 2011). In contrast, revolutions are long, drawn-out, violent affairs that can sometimes lead to civil war. The execution of coups is very different. The goal of a coup is not the direct conquest of an entire country, but to occupy and control critical points, such as the state's communication systems, transport hubs and key industrial enterprises (Malaparte 1931). Once this is achieved, the perpetrators turn their focus to centers of political power, and take over from the current powerholders.

Coups can overlap with **assassinations**, but only if the killing or incapacitation of the ruler is done by elite insiders and there is a comprehensive plan to take over power – see 'palace coups' under classifications. Coups differ from **mutinies**, which are open military rebellions, and usually directed against superior officers, not the supreme power-holders. The demands of military revolts are usually narrowly defined, and do not encompass replacing the **rulership**. Mutinies can play a crucial role in transitions, for instance when army units refuse to shoot or stop protesters during an insurrection. Sometimes the army's grievances, expressed in a mutiny, can spill over into a military takeover. In Latin America, this is called a 'barracks revolt' or *cuartelazo* (from the Spanish term *cuartel* – 'quarter' or 'barracks'), in which a mutiny by specific military garrisons sparks a larger military revolt against the government (Little-Siebold 1996).

Although it is easier for regime opponents to orchestrate coups, compared to other methods of seizing power, they are nonetheless risky. About half of all coups fail (Singh 2014). There are severe consequences for the plotters of a failed coup. Those who participate in a failed coup are most often killed, jailed, or exiled. Coup conspirators, therefore, must carefully assess the chances of success and should only attempt a coup when its expected rewards and probability of success are greater than the costs of failure.

SEE ALSO This entry covers the many aspects of coups d'état and their variants: *Putsches,* palace coups, self-coups (*autogolpes*), *pronunciamiento,* creeping coups, etc. Coups fit within the broader family of regime ousters and can be nested inside the literature on civil-military relations and **praetorianism** as well as that on **coup-proofing**. Coups are related to but distinct from **assassination** (regicide and tyrannicide), **mutiny** and **revolution.**

KEY SIGNIFICANCE The study of coups is deeply integral to understanding the rise and fall of authoritarian regimes. Coups have been the most common means whereby authoritarian leaders leave power,

occurring as often as one third of the time (Geddes et al. 2014). Theories about why coups take place help us understand many other processes, including revolution, protests, and conflict. Coups are also the most commonly used measure of political instability. Of special interest is their (negative) effect on democratization. Since the 2000s a new body of literature has arisen around **coup-proofing**, or the study of what measures regimes take to protect themselves from coups d'état, and the effects of such actions on military performance and long-term regime durability.

ORIGIN The term 'coup' first appeared in 1639 when Gabriel Naudé wrote his *Considérationis politiques sur le Coup d'État* (Bankowicz 2011: 20). However, modern coups became a subject of study much later. Edward Luttwak (1968; 1979) argues that a coup's feasibility derives from the development of the modern state with its professional bureaucracy and standing military, in a permanent location. This created a clear distinction between the political leadership (the regime) and the permanent state machinery. Additionally, since both the bureaucracy and the military were characterized by a structured hierarchy and chain of command, this made it possible to use parts of the state apparatus to take over the entire state.

One of the first early notable coups was Napoleon Bonaparte's of 1799, in which he crowned himself emperor in a bloodless coup. After his return from a failed military campaign in Egypt, Napoleon worked to overthrow the Directory that ruled France. He first tried to convince the legislature (the Council) to put him in power, but when this failed, he resorted to using the military to intimidate the Council (Hunt et al. 1979). Note: Foronda et al. (2005) trace the origins of coups to the medieval genesis of the modern state and posit that it was a widespread constitutive practice in Europe.

In addition to the literal translation *'golpe de estado,'* another Spanish term often used is *'junta'* ('council'), referring both to the takeover and to the military council of the new rulers once established. The term originally referred to the various consultative committees of the Spanish monarchy in the sixteenth century. Another term in (Swiss) German is *Putsch*, which literally translates as 'knock' or 'thrust.'

LITERATURE There is a vast literature on military coups, with classical works analyzing concrete cases. The best-known early examples are Curzio Malaparte (1931) and his book *Le technique du coup d'état*, in which he analyzed several coups, and Karl Marx, who analyzed the case of Louis Bonaparte in his well-known 1852 essay, *The Eighteenth Brumaire of Louis Bonaparte*.

Modern authors have addressed various aspects of the coup d'état, such as the history of coups, the theory of coups, the mechanism of coups, and the causes and consequences of coups, though, comparatively, there less research has been devoted to the history and theory of the coup d'état. Notable examples include French historian Maurice Agulhon (1977) and his book *Coup d'État et République*, which considers the history of coups, and M. Bankowicz (2011), who constructs a theory of coups in his book, *Coup d'État: A Critical Theoretical Synthesis*. Marsteintredet and Malamud (2020) depict the stretching of the concept over time. L. Martinák (2015) provides a similar dissection of coup definitions (in Czech).

Some works have focused on the logical challenges of planning and executing a coup. The most noted author on this topic is Edward Luttwak (1968, 1979 revised 2016). In his seminal book *Coup d'État: A Practical Handbook*, he details how coups are plotted and planned and the conditions under which coups may succeed. Other works include *The state against the state: the theory and practice of the coup d'etat* by Eric Carlton (1997); *Coup d'etat: A practical manual* by Gregor Ferguson (1987); and *How to stage a military coup: From planning to execution* by David Hebditch and Ken Connor (2005). In *Seizing power: The strategic logic of military coups*, N. Singh (2014) draws on 300 hours of interviews with coup participants to delve deeply into the intra-military dynamics of coup-plotting – see also 'methodological issues' below.

An interesting contrasting view, from the perspective of citizen resistance, is *The Anti-coup* (Sharp & Jenkins 2003), on how to counter coup attempts. This stands apart from the literature on **coup-proofing**, since it focuses foremost on the measures civil society can take to prevent coups.

As mentioned previously, most of the literature on coups aspires to identify the factors that drive coups, where they are likely to occur and what their impact may be. In terms of the drivers, many scholars have looked at the level of development of coup propensity (Londregan & Poole 1990; O'Kane 1981; Przeworski et al. 2000). Economic malaise is a condition that commonly precedes coups and impeachments. Londegran and Poole (1990) claim that poverty is a common denominator in almost all coups. Przeworski and Limongi (1997) demonstrate that reaching a minimal threshold of economic development is important to avoid instability. Hiroi and Omori (2013) argue that greater per capita income reduces the risk of a coup across regimes – this upper income limit is known as the 'coup ceiling,' and was popularized by S. Huntington (1995). Volatile economic and political conditions also make coups more likely (Casper & Tyson 2012; Welch & Smith 1974). In particular, an economic crisis makes a country more coup-prone (Johnson et al. 1983; Fossum 1967; Galetovic & Sanhueza 2000; Needler 1966; O'Kane 1981; Kim 2016). Other works focus on economic modernization outpacing the development of a country's political institutions (e.g., Huntington 1968).

Coups can also be explained by diffusion – they can spread over time and space (Li & Thompson 1975; Lutz 1989; Lunde 1991). Some works focus on the opportunities and motives for coups (Finer 1974). Coups occur when their cost is low, for instance when institutions are weak and vulnerable (Aidt & Albornoz 2011). The military may also stage a coup if the civilian government appears to be unstable and inefficient (Huntington 1968; O'Donnell 1973; Tusalem 2010). Personal factors, such as individual ambition or fear of demotion, can also trigger coups (Decalo 1990). A final explanation of their reemer-

gence is the 'coup trap' (see Box 5.2) – when a country has already experienced a history of coups. In such a case, institutions have been weakened, the political culture is accepting of coups, and the military has been emboldened to step in when they see fit (Collier & Hoeffler 2005).

Much of the scholarly work on the impact of coups has mostly highlighted their negative effect. Alesina et al. (1996) argued that coups, as a measurement of political instability, have a negative impact on growth rates. Fosu (2002) finds that, from the 1960s to 1986, abortive coups had the worst impact on economic growth, while coup-plots were also growth-inhibiting. Kim (2016) finds that a one-point decrease in per capita GDP growth, induced by weather shocks, increases the likelihood of a coup attempt by 1.3 to 1.5 percentage points. Blum and Gründler (2020) claim that coups are associated with a decrease in per capita GDP of 2-3 percentage points. Successful coups are also associated with increased levels of corruption, such as the sale of government property for private gain (Bennett et al. 2021).

Most of the literature has been critical of coups' impact on democracy. According to Geddes et al. (2014) at least half of all coups – 56% during the Cold War and 50% from 1990 to 2015 – initiate new authoritarian regimes. As concerns the usual outcomes, violent regime transitions are more likely than ones accomplished through reforms (Buchheim & Ulbricht 2020). For example, coups in Thailand and Mauritania have derailed their democratization processes. However, a handful of scholars offer contrary views. In an empirical study, Thyne and Powell (2016) argue that coups promote democratization, especially in states that are less likely to democratize otherwise. Marinov and Goemans (2014) argue that, after the Cold War, increasing international pressure to democratize has altered the trajectory of coups. Many countries dependent on Western aid have been forced to embrace competitive elections after a coup, leading to a different generation of coups, one less harmful to democracy than its predecessors. Derpanopoulos et al. (2016) counter that coups are not good for democracy. As they see it, the most common outcome is that the ousted autocratic government is replaced by another group of autocrats.

The study of the impact of coups in civil wars is equally mixed. Coups have been linked to civil wars, such as the 1975 coup in Bangladesh that led to 25 years of civil conflict (Powell 2011). Another study counters that coups that take place during a civil war can give a shock to an otherwise intractable bargaining situation, shortening the war's duration (Thyne 2017).

Over and above the long tradition of academic study of the phenomenon, we cannot forget the artistic treatment of the coup d'état. Probably the most classic examples are the novelist Frederick Forsyth's (1974) *The Dogs of War* and the movie *Power Play* by director and screenwriter Martin Burke (1978). In Forsyth's novel, and its later film adaptation, a coup is executed by **mercenaries**. The use of hired guns is rather rare, but such operations have happened in coups in the Seychelles (1977, 1981), the Maldives (1988), the Comoros (1995), and in Equatorial Guinea (2004). Despite their evident preference for small island nations, mercenaries seldom succeed. For more on this rare topic, consult Namboodiri 1982; Taulbee 1989; Taulbee & Head 1993; Musah et al. 2000.

CLASSIFICATIONS Differentiated according to actor, method, goal, level of violence, duration, etc., coups can be logically classified in various ways. Below we provide some of the best-known classifications in the literature and also frame some of the most relevant subtypes regarding the contemporary literature on political regimes. We distinguish between general coups d'état (I), military coups (II), palace coups (III), creeping coups (IV) and – although technically not a coup – self-coups or *Autogolpes* (V), and provide (relevant) subclassifications for them all.

This section adheres to the theoretical framework of L. Marsteintredet and A. Malamud (2020), which identifies three constitutive elements of a coup d'état (A, B, C – see also Table 5.2) and map our recent re-interpretations and variations along the core concept's ladder of abstraction. Any coup d'état involves the following specific, defining characteristics: (A) *Actor/Perpetrator* – Coups are carried out by state actors, such as the military, judiciary, congress, and the civil bureaucracy, excluding external agents as in invasions or revolutions. However, external actors can influence coup-makers. (B) *Victim/Target* – The victims are the government or head of state, coup-makers aiming to change or replace the government or regime. (C) *How/Tactics* – A coup involves illegal or unconstitutional means to remove a government, temporarily suspending the constitutional order. This distinguishes it from legal processes like impeachment or votes of no confidence. Determining legality can be complex, with questions regarding the authority to judge legality and reliance on sources such as local courts, international institutions, or researchers' interpretations, each having its challenges and biases (Marsteintredet & Malamud 2020: 10-11).

Coup d'état (I) & Military coups (II) Samuel Huntington (1957) provides several well-known classifications of coups, using the goal that the perpetrators set themselves as the criterion. Huntington initially distinguishes three types of coups: 1) governmental coup; 2) revolutionary coup; and 3) reform coup. The result of a governmental coup (1) is simply a change of ruler. Revolutionary coups (2) lead to larger political, social, and economic changes in the structures of the state. Reform coups (3) offer a plan for gradual reforms. A later typology by Huntington (1968) reframes these types as: (a) reform coup; (b) guardian coup; and (c) veto coup. In this updated version, reform coups (a) aim to bring a to power a previously excluded group with a plan for creating a new social order. The perpetrators are usually low-level officers. Guardian coups (b) are the opposite. In this case, 'high-level officers' stage a temporary intervention with the aspiration of restoring order, reducing corruption or purging the government. Veto coups (c) are also committed by higher-level officers

Table 5.2 – Key Characteristics of Coups & Related Ousters

Concept	***Key characteristics***			***(*) Remarks & Subclassifications***
	A	**B**	**C**	
(I) Coup d'état	Yes	Yes	Yes	*See:* Luttwak (1968: 1979)
(II) Military coup	Yes*	Yes	Yes	The perpetrator is narrowed down to the military. *See:* Huntington (1957; 1968); Thomson (1973); Albrecht & Eibl (2018)
(III) Palace coup	Yes	Yes*	Yes	Inner circle of the ruler is involved in the ouster. *See:* Chin et al. (2021)
(IV) Creeping coup	Yes	Yes	Yes*	The preparatory process is extended in time and the coup itself is often an expected outcome.
Assassination	Yes*	Yes	Yes	On condition there is a conspiracy to take power.
	No*	Yes	Yes	Opportunistic or there is no plan to take power after incapacitating the head of state.
(V) Self-coup (*Autogolpe*) *(i)* Presidential coup *(ii)* Royal coup α *(iii)* Judicial coup α *(iv)* Constitutional coup α *(v)* Electoral coup α	Yes	No*	Yes	The leadership uses *(i - ii)* executive powers to disable other branches of government (removing checks-and-balances); manipulates *(iii)* judicial interpretation (sometimes improvisation) or *(iv)* amends the constitution to prolong their hold on power; or *(v)* electoral fraud and post-electoral manipulation to renew their political mandate.
Revolution	No*	Yes	Yes	Perpetrators are external actors and not a small group.
Mutiny	Yes	No*	Yes	There is no plan to take power or remove the head of state.
Impeachment β	Yes	Yes	No*	Legal procedure is followed.

A – the perpetrator is a state agency (yes/no)
B – the target is the chief executive (yes/no)
C – the removal is illegal or unconstitutional (yes/no)
α All these listed variations of *autogolpe* are incumbent takeovers and thus, conceptually, not real coup d'états. If these actions serve to benefit other state agencies that target the chief executive, they may be categorized under 'palace coups' or 'military coups' – if opposition forces succeed in an electoral coup, this falls under 'revolution.'
β These should not be labeled parliamentary coups if they are fully within the bounds of the law.
Source: Authors' own work, based on: Marsteintredet & Malamud 2020; Powell & Thyne 2012; Santos & Guarneri 2016.

but intend to prevent or undo radical reforms that threaten either the middle or upper class or the military directly (e.g., military spending budget cuts) (Ezrow & Frantz 2011: 97-100). Huntington identifies the army exclusively as the main perpetrator when it comes to coups, thus overlooking several forms of palace coups initiated by non-military actors or the secret services.

Another typology comes from Luttwak (1968: 9-12; 1979), and is based on two criteria – a civil/military dimension and a left/right one. This results in three types of coups: (i) coup d'état, (ii) *pronunciamiento*, and (iii) *Putsch*. While the first is a civil action, the latter two are military actions. The latter are moreover associated with a right-wing orientation, whereas a coup (i) is politically neutral. A *pronunciamiento* ('announcement' – ii) differs from a *Putsch* in that, in the former, the whole army participates. Historically, in nineteenth-century Spain, Portugal and Latin America, this was a highly ritualized (public) process containing a consultation phase (an officer opinion poll), a compromise phase (rewards and role division), a call sign for action, and finally an appeal to the rank-and-file to rally behind their officers in the overthrow (Busquets 1982; Zoraida Vázquez 2006; Fowler 2011). A *Putsch* (iii) is also by the army (formally), but coordination is limited to its appointed leadership – there is no real attempt to win the support of the troops. Its conspirators count on the military chain of command and a shared dislike of the incumbent government (in crisis). Luttwak finds that they are a wartime or immediately post-war phenomenon.

William R. Thompson (1973) proposes a classification of coups based on realization of the perpetrator's goal as a criterion. Accordingly, there are (a) successful coups, (b) aborted coups, and (c) compromise coups. A successful coup ends with the attackers taking power, a failed coup ends in a fiasco, and a compromise coup either ends in power gradually shifting or in a stalemate and a provisional political arrangement.

Many scholars accept Thompson's (1973) definition of a successful coup, one where the 'post-coup ruling arrangement' remains in place for at least a week. Powell and Thyne (2011: 252) find the one-week threshold somewhat arbitrary and that a theoretically stronger approach would be to follow O'Kane (1987: 37-38), who considers a coup to be successful if it leads to the *"installation in power of a government of the conspirators' own choosing."* But, this criterion itself assumes that coup-leaders seek to remain in power (instead of simply attempting to displace the current powerholder.)

When it comes to military actors, Albrecht and Eibl (2018) distinguish between coups 'from above' and those 'from below.' This distinction has been noted in African politics – see 'regional variation' – categorizing coup leaders as either 'elite officers' (high-ranking officers entrenched in the political elite) or 'combat officers' (junior and mid-ranking officers at a distance from the regime). Elite officers often bring changes in leadership without significant shifts in authoritarian institutions, while combat officers tend to instigate more substantial political transitions within autocracies (Albrecht & Eibl 2018: 326). Elite officer-led coup attempts are markedly more successful than those initiated by lower or mid-level members of the military (Albrecht et al. 2021).

Palace coups (III) Palace coups include a readjustment of office-holding within an existing system, involving the removal of the incumbent supreme power-holder by another faction of the inner circle. Often, presidential guards or other trusted protective units are co-conspirators. Since coup-plotters in the inner sanctum have access to the dictator's offices or residence, are familiar with the leader's traveling schedule, and already control several levers of state power themselves, such coups can be executed by a small group, under the radar, relying on only a small part of the armed forces. They are frequently bloodless since they often merely require their military elements to subdue a dictator's bodyguards, and do not involve a raid on the capital. These coups can result in 'regime change' *(coups de regime)*, e.g., if a military faction takes power in a civilian regime; or they can result in 'leader reshuffling' *(coups de chef)*, if a dictator is ousted by his peers in the same organizational structure. There is a subtle overlap with some 'royal coups' (see below), and unapproved (hereditary or non-hereditary) **succession** by an appointed next-in-line can also count as a palace coup. Planned successions, even when followed by **purges**, should *not* count as palace ousters, because the heir apparent is still dependent on the predecessor's network when taking the reins.

Creeping coups (IV) Understudied, this rare subtype is characterized not by sudden action, but by actors using diversion, intimidation, assassination, etc., to prepare the necessary polarized environment and weaken the incumbent government in order to create the optimal structural preconditions for a future coup d'état. In Burundi, after being forced back to barracks in 1993, starting in the same year, Pierre Buyoya prepared a second coup with the assassination of the president, the vice-president, the speaker of the national assembly and even the deputy speaker, eliminating everyone in line for the presidential succession and creating a state of affairs in which no one could legally step up as head of state (Krueger & Krueger 2007: 38-39). This political crisis was manipulated to set up a puppet government, intimidating the ruling party into total obedience to its minority coalition partner, and to provoke civil war (between Hutu and Tutsi), eventuating in an overt coup 'to restore order' in 1996. In Chile, CIA activities against president Salvador Allende (1970-1973) – including sabotage, organizing strikes that led to food shortages in the capital, and the assassination of popular military figures – were aimed at provoking the Chilean military into a *'golpe de estado.'*

Self-coups (V) *Self-coups*, or *autogolpes* in Spanish, are not real 'coups;' they are nevertheless often (confusingly) used synonymously with some subclassifications like (i) 'presidential,' (ii) 'royal,' (iii) 'judicial,' (iv) 'constitutional' or (v) 'electoral' coups.' The self-coup, though often not covered in coup datasets, has received more attention with the rise of populist leaders like Donald Trump, who attack democratic institutions from within with the aim of retaining power. However, it does not meet all required conceptual criteria to be considered a real 'coup d'état,' since it is actually an incumbent takeover and thus falls under autocratization, as shown in Table 5.2 (Marsteintredet & Malamud 2020: 14). Baturo and Tolstrup (2023) classify incumbent takeovers as leader-driven power expansion, which they label as 'subversions by the ruling executive' in democracies and 'personalization' in autocracies.

A *presidential coup* (i) is the most common form of *autogolpe*. It occurs when the sitting president alters the government's structure or its functioning to consolidate power unlawfully. This typically involves the president using executive powers to bypass or dissolve other branches of government, such as the legislature or judiciary, effectively allowing the president to rule by decree or through emergency powers. This type of takeover is marked by the centralization of power in the executive branch, without the pretense of legal or constitutional justification, and overlaps with the concepts of **personalization** and **autocratization**.

A *royal coup* (ii) refers to a specific type of executive takeover involving members of a royal family, either acting against each other or against the current government, to seize control or consolidate power in the state. Royal figures may use their legitimacy, traditional authority, or direct command over certain state or military resources to orchestrate a change in leadership or government structure. It may (a) involve a sitting monarch taking drastic measures to centralize power, (b) a member of the royal family leading a faction against the current monarch, or (c) various factions within a royal family vying for power – in the latter two scenarios (b & c), there is overlap with 'palace coups' (see above); they result in leader reshuffling and a new ruling patronal pyramid (see **patronalism**).

A judicial 'coup' (iii) and a constitutional 'coup'

(iv) are distinct forms of non-violent incumbent takeovers that exploit legal frameworks to achieve political goals. While both processes employ legal mechanisms, they differ in their approach, the first operating through judicial reinterpretation and the second through direct constitutional changes or exploitation.

A *judicial coup* (iii) centers on the judiciary's role in reshaping or reinterpreting laws in ways unintended by the framers of the constitution. This manipulation can lead to significant shifts in the power dynamics within the government structure, even without explicit changes to the constitution itself. The key strategy in this case is to use legal reinterpretation or improvisation to achieve political outcomes, potentially diverging from established legal norms or constitutional principles.

In contrast, a *constitutional coup* (iv) focuses on direct changes to the constitution or the exploitation of existing constitutional provisions to consolidate power. This type of takeover often involves the ruling government or a dominant political faction using legislative processes to amend the constitution, manipulate clauses, or exploit ambiguities to strengthen its hold on power. The methods include altering **term limits**, modifying electoral laws, or influencing judicial appointments, all aimed at centralizing power and limiting opposition effectiveness.

An *electoral coup* (iv) is also not a coup, and is characterized by using existing legal and constitutional frameworks to carry out what is essentially an anti-democratic action. This might involve the incumbent government exploiting ambiguities in the constitution or existing laws to adjust the rules of the electoral game, thereby ensuring its continued hold on power. This could be accomplished through actions such as redrawing electoral boundaries in a biased manner (gerrymandering), changing the rules about who can vote or how votes are counted, or even more overt actions, like delaying elections indefinitely under the pretext of legal authority. Electoral coups maintain a *façade* of legality and constitutionalism, making it distinct from more overt and traditionally violent, real coups. This type of **autocratization** is particularly insidious because it can undermine democratic institutions from within while appearing to adhere to legal norms, thus making it difficult to counteract with straightforward legal or constitutional challenges.

Other coup adjectives The 'soft coup,' 'silent coup' and 'bloodless coup' generally refer to types of coups that are executed without the overt use of violence or physical force. Sometimes, soft coups imply the military is not involved at all, but none of these terms are applied consistently.

A 'parliamentary coup,' however, indicates that the actor is a state agency turned against the government. This should not be considered a 'coup' unless the parliament illegally removed the president (for instance, not having the necessary number of votes to depose the president). If the rule of law was obeyed, this is just 'impeachment' or a 'vote of no confidence' (Santos & Guarneri 2016; Marsteintredet & Malamud 2020: 15-16). The recent label of 'smart coup' (on the analogy with 'smart power') refers to a coup executed with strategic sophistication, employing planning that exercises caution and restraint by taking into account expected domestic and international reaction, and operating behind a guise of popular and institutional legitimacy. It is simply a label for a successfully executed coup.

MEASUREMENT The frequency of coups has ebbed and flowed over time. In the 1950s and early 1960s there were about five coups per year. During the 1960s and 1970s, coup activity rose, peaking in 1976 when there were 19 coups recorded. The post-2010 period has seen the biggest decline in the number of coups. Africa has been the region that has seen the greatest coup activity, followed by Latin America and then Asia. Coups are very rare in Europe, almost all taking place between the mid-1970s and the mid-1980s. Coups have also significantly decreased in Africa and Latin America, but the decline is less pronounced in Asia.

Originally, studies that focused on coups were either case studies or regional in scope. A host of regional studies looking at coups in Latin America and Africa was used to understand the nature of coups and their frequency. By the end of the Cold War, more research on coups emerged using a Large-N dataset to identify patterns. The works of O'Kane (1987) and Londregan & Poole (1990) were among the first to use global coup data. Subsequent cross-national research offers more rigorous comprehensive empirical testing (e.g., Alesina et al. 1996; Galetovic & Sanhueza 2000; Belkin & Schofer 2003).

Goemans and his colleagues (2009) came up with a coup dataset, called *Archigos,* based on a database of political leaders from 164 countries from 1875 to 2004. The identities of all leaders are coded, including information about how they assumed and left office. This dataset looks at the way power was transferred from one leader to another to identify events that may qualify as coups.

The first global and comprehensive dataset on coups was presented by Powell & Thyne. The dataset, known as PT11, looks at coups from 1950 to 2010, and expanded previous data collections by consolidating 14 prior datasets. The dataset coded information that researchers could use to understand coup propensity and impact, offering data on the targets, perpetrators, tactics, plots, successes and failures. This dataset helped identify coup incidents over time and space and enhanced the validity of global coup data. The dataset is now updated annually.

Bjørnskov and Rode (2020) created a dataset running from 1950 to 2018, looking at 537 coups or coup attempts that took place in 498 country-year observations, indicating whether a coup succeeded or failed. The dataset also includes the group which led the coup (e.g., civilian or military), the names of the coup leaders, and their military rank or civilian status. The dataset covers detailed information about second or third coup attempts in multiple countries.

Albrecht and colleagues (2021) built the *Coup Agency and Mechanisms* (CAM) dataset which covers all countries from the period from 1950 to 2017. The CAM builds on the PT11 and other datasets to

increase the data on coup episodes. The CAM codes coup occurrences and outcomes along with the agents behind specific coup-plots, and the plotters' relationship to the existing regime. It also codes the incumbent's trajectory after a successful coup, the level of violence, and the resources deployed in coup attempts.

The Cline Centre, at the University of Illinois Urbana-Champaign, produced the *Coup D'état Project* (CDP), which lists, documents, and categorizes coups for 165 countries from 1945 to 2019. The dataset encompasses 426 coups, 336 coup attempts and 181 plots (Peyton et al. 2024).

Chin and colleagues (2021) introduced the *Colpus dataset*, which provides data on coup types and characteristics from 1946 to 2019. The data identifies coup leaders and provides a typology of coups, coding if the coup leaders sought or achieved 'regime change' *(coups de regime)* or 'leader reshuffling' *(coups de chef)*, if they were democratic or anti-democratic, if it was a mutiny or not, or if it was an **assassination**.

Baturo and Tolstrup (2023) merge 11 datasets with original data collection to introduce a new, comprehensive dataset on 495 'self-coups' (incumbency takeovers) carried out by 279 political leaders in 132 countries in the period 1918-2019.

METHODOLOGICAL ISSUES The main challenge facing works undertaken to study coups is the lack of a common definition of coups that is widely accepted by scholars, and of a distinction that differentiates coups from other types of anti-regime activity (Powell & Thyne 2011). For example, some assessments measure coups by the involvement of military actors exclusively, while others include coups orchestrated by non-military actors. Many takeovers or ousters are labeled as coups, even if they do fit its basic defining criteria.

It is also difficult to identify the coup-plotters and to discern their motives. Ethnic perspectives are routinely omitted in the study of coups (Harkness 2016). Even the faction *within* the military organizing the coup often leads to a completely different dynamic, rationale or outcome (see Singh 2014). Albrecht and Eibl (2018) distinguish between *'elite officers'* (high-ranking officers, already members of the political elite) and *'combat officers'* (junior and mid-ranking officers, distant from the regime). The former tend to produce changes of leadership, but not substantial shifts in authoritarian institutions; the latter, in contrast, tend to trigger more substantial political transitions in the form and content of autocracies (Albrecht & Eibl 2018: 326).

Coup attempts led by *'elite officers'* are significantly more likely to succeed compared to those initiated by lower or mid-level ranks in the military. Additionally, top-led coups tend to reinforce authoritarian elite alliances and uphold autocratic governance, typically without paving the way for democratic reforms. On the other hand, successful coups initiated by lower ranks can destabilize authoritarian regimes and create opportunities for democratic transformations to occur (Albrecht et al. 2021).

At the constructivist level, L. Marsteintredet & A. Malamud (2020) portray the stretching of the concept – occurring in tandem with the global decline of the practice – resulting into the so-called 'coups with adjectives.' This is especially noticeable in the contemporary use of the Spanish synonym *'golpe'* in Latin America. With a long list of qualifiers – soft, parliamentary, constitutional, electoral, slow-motion, judicial, etc. – some of these innovations dilute the core concept and label legal ousters (e.g., impeachment or any mandate interruption) as a 'golpe' for politically motivated reasons.

Second, despite considerable efforts made to verify coups and coup attempts, reporting bias may have limited our ability to identify events. This is particularly true for coup attempts in states with a small Western media presence and for events that happened in the earliest time period under investigation. One way to analyze these potential biases is to examine instances where scholars identified coups within the original candidate datasets for which we can find no evidence. This bias is also present in coup datasets (see 'measurement' above) – see Ben Hammou et al. (2023).

Furthermore, there are concerns that the literature on coups lacks a robust model to determine military coups (Lachapelle 2020). This is because most works have been driven by Large-N data. By conceptualizing coups in terms of probabilities, risks, and likelihood, existing studies succeeded in demonstrating that countries plagued by economic difficulties, historical burdens, and waning political legitimacy are more susceptible to coups – see Box 5.2 on 'coup traps.' However, even though there is no shortage of works that focus on how to predict coup risk (see Belkin & Schofer 2003), many questions still remain about the exact causal nature of these known preconditions, making it difficult to accurately make predictions. In contrast, small-n comparative research often cannot leverage its findings beyond the scope of its case studies. (This has led to the exploration of mixed methods to pin down the causal pathways in different world regions, e.g., Arugay 2014).

Finally, despite the boom of new datasets that map coup instances, little attention has been paid to other forms of military involvement in politics (stopping short of deposing civilian leadership); for instance, in the case of a result of mission creep under the guise of counter-terrorism policies (Bove et al. 2020). Croissant et al. (2010: 954) have baptized this blind spot the 'fallacy of coupism' or the belief that, in the absence of coups, civilian control of the armed forces is secure, and civil-military relations are balanced.

EXAMPLES Few countries have experienced more coups than Thailand. The military has had little respect for civilian rule and its intrusion has been a constant, with almost 20 coups staged since the 1950s. Thailand has very dysfunctional civil-military relations. The military believes that it has the right to intervene in domestic politics whenever it wants or feels it needs to, and there is little that the civilian government can do about it. The military uses coups, usually framed as necessary to restore order, as a means to gain greater access to lucrative business

opportunities, such as controlling Thai Airways and the Thai Military Bank. After the 2006 coup the military added other key state enterprises in areas such as telecommunications and transport to its arsenal.

After a brief democratic interlude, in May of 2014, the military staged yet another coup to oust the democratically elected leader Yingluck Shinawatra, the sister of the former president Thaksin. Unlike its conduct in the past, the military made no attempt to pretend that it was going to leave power and ensure the return of multi-party elections. The political divisions between the Yellow Shirts, who supported the monarchy, and the Red Shirts, who supported Thaksin, was used as a pretext to step in. Protests to the coup followed, and a state of emergency was declared for an entire year. Democracy has yet to return to Thailand. A commission was hand-picked by the military to draft a new constitution that would guarantee its influence (Schaffar 2018).

IMPACT ON POLICY Political scientists have investigated which factors might reduce the chances of a military coup. In the field of civil-military relations, scholarship has demonstrated that, when institutions provide a path for military elites to achieve their objectives without overthrowing the chief executive, they prefer this path to the more costly undertaking of staging a coup (Aydogan 2019). Thus, the implementation of meaningful elections, in particular, may provide a deterrent to coups because they allow potential coup-plotters another option if they have issues with a particular administration. Other research has observed that coups are less likely in democracies because democratically elected leaders are perceived to be more legitimate than non-democratic leaders, and government legitimacy (or lack thereof) is an important driver of coups (Finer 1974; Jackson & Rosberg 1982; Lindberg & Clark 2008). Democracies are also less likely to coup-proof their militaries (Pilster & Böhmelt 2012), and the welfare of common soldiers may be better under democracies (Bueno de Mesquita et al. 2003). In a study that looks at Africa from 1990 to 2004, Lindberg and Clark (2008) argue that democracies run less risk of experiencing a coup attempt, but economic development is not controlled for in their study. In spite of some theoretical and empirical support for democratic elections as a coup deterrent, other works have cautioned that democracies face just as many coups as non-democracies, and, more problematically, that coup attempts in democracies are twice as likely to succeed (Bell 2016).

Other studies have looked at civil-military relations as the key to preventing coups, specifically at how the military is treated. Strategies to satisfy and placate the military include increased military spending, weapons acquisitions and greater autonomy for the military (Bove & Brauner 2016; McMahon & Slantchev 2015). Higher amounts of defense spending could prevent coups led by elite officers (Albrecht & Eibl 2018). Other work has shed light on the potential coup risk constituted by the degree to which the military believes that its position in the state is threatened (Hunter et al. 2020). In Latin America, civil-military pacts helped many former military regimes transition to democracy, without it intervening with frequent coups or coup attempts (see **transitions**).

Foreign governments can also play an important role in coups – either by offering support to the coup-plotters (Thyne 2010), or, conversely, deterring coups by threatening to withhold foreign aid or employ sanctions. Regional organizations like the African Union have been instrumental in deterring coups. Several studies have noted that far fewer coups have taken place in Africa since the Lomé Declaration (Powell et al. 2021; Souaré 2014). The Declaration banned coups and issued sanctions against regimes that experienced a coup – and claimed a zero-tolerance policy for military coups. Some studies have also looked at the role of the international community in shaming coup leaders, and in fostering international norms against coups (Tansey 2018).

Deteriorating economic conditions (such as price shocks and high unemployment) and economic crisis have also been cited in the literature as drivers of coups (Johnson et al. 1983; O'Kane 1993; Londregan & Poole 1990), influencing US policy regarding coup prevention strategy. US policy makers have noted that economic support, along with assistance and training for the military and security institutions, particularly in fragile contexts, is a critical policy in coup prevention (Sheehy et al. 2022).

REGIONAL VARIATION Alongside the evolving dynamics of **coup-proofing** and the resurgence of **autocratization**, this part examines how different world regions have contributed differently to our understanding of coups and their causes, as well as topics like military grievances, ethnic tensions, foreign backing, and the impact of postcolonial realities.

Latin America Latin America's long history of independence is riddled with *juntas* – a typical South American country experiencing seven coup events in 107 years (from 1900 to 2006). Most coups occurred between 1930 and 1980, Paraguay being an exception with eight coups between 1900 and 1930. With the third wave of democratization, improved coup-proofing and competitive politics, coup instances have dropped significantly (Lehoucq & Pérez-Liñán 2014; Valenzuela 2004; Rittinger & Cleary 2013), but the specter of military intervention remains present (Mainwaring & Pérez-Liñán 2015; Levitsky & Murillo 2019), especially in the Caribbean.

Early research (e.g., Needler 1966; Fossum 1967; Thompson 1975a/b) focused on the intertwined topics of military intervention and **modernization theory**, **bureaucracies** (e.g., **bureaucratic authoritarianism**), and cultural factors (cf. Box 1.10 on *Caudillismo*). Later works (King 1998; McSherry 2002; Olar 2019) look at **authoritarian learning** (in line with the 'immunization effect' – see Weyland 2020) and **authoritarian collaboration** to explain clusters of military rule, or the latter's emergence as a reaction to revolutionary insurrections (Kreiman 2024).

Dix (1994) finds that coup decline is significantly rooted in the enduring impact of military rule. This includes the latter's association with economic set-

backs, the alienation of business allies, international and regional anti-coup norm diffusion (e.g., Cassell et al. 2018), and, notably, internal divisions and declining professionalism in Latin America's military.

While ethnicity is not a recurrent theme in Latin American coups, contemporary scholars sometimes differentiate between power grabs from the 'Left' and 'Right,' each with its respective dynamics (Rittinger 2020; Sánchez 2021). A significant strand of coup-focused work has zoomed in on *autogolpes* and 'parliamentary coups' (e.g., Pérez-Liñán 2007; Santos & Guarnier 2016; Teixeira & Castilho 2018) – with others scrutinizing the legacy and covert contemporary influence of the military in politics (Pion-Berlin 2005; Diamint 2015; Pion-Berlin & Acácio 2020; Jenne & Martínez 2022).

MENA Middle Eastern coups and their causes were all the rage when this world region was swept up in the military takeovers of the 1960s and 1970s. As in Sub Saharan Africa, newly formed 'national' armies were coming to terms with postcolonial realities even as revolutionary ideas divided these militaries. Coup pendulums impelled by revolutionary and reactionary groups locked some countries into entrenched 'coup traps' (see Box 5.2). Between 1950 and 1970, Syria experienced nine and Iraq eight coup events (Powell & Thyne 2011).

Early works (Haddad 1965; Bill 1969; Thompson 1974) explored the military grievances behind this historical coup outpouring. By the 1980s, scholars aimed to explore why these coup traps halted (Be'eri 1982). Autocratic consolidation and foreign backing during the geopolitical crystallization of Cold War alliances brought a halt to the coup traps. For this reason, the Middle East was the first region to be studied from the perspective of **coup-proofing**, especially after the autocratic turn that followed the **Arab Spring** (Cronin 2013). Similarly, MENA experts continue to provide critical perspectives based on case studies from this region (Ben Hammou et al. 2023: Bradshaw & Curtis 2023).

Sub Saharan Africa The history of military coups in Sub Saharan Africa began in Togo in 1963, marking the region's first coup d'état, in which Sylvanus Olympio was assassinated as he sought refuge in the American embassy compound (Nugent 2012: 204). Ever since, Africa has become the most coup-prone region in the world. By the 1980s, the African continent had experienced 67 successful military coups (Kieh & Kalu 2001: 5). By the end of 2023, the number stands at 106 (Al Jazeera 2023).

The post-independence Africa of the 1960s and 1970s witnessed a discernible pattern in military coups, with the emergence of two distinct generations of coup leaders. The initial coups were executed by high-ranking officers trained under colonial regimes, who took pride in their professional military status. These officers were inclined to seize power when they perceived political interference in military affairs (especially when military budget allocations and privileges were threatened), or to address the chaos caused by corrupt politicians. The postcolonial militaries, which were slower to adapt to new societal structures than other state structures, also harbored grievances, particularly regarding the pace of reform, working conditions and salary expectations. Socialist-oriented governments (see Box 4.9 on Fifty Shades of Socialism) disturbed the civil-military balance when they sought to indoctrinate the military or establish civilian militias (threatening the status of the regular armed forces) (Nugent 2012: 207).

As the Africanization of the military progressed and postcolonial economies dwindled, ethnic tensions became more prominent in all spheres of politics. A new wave of coups was executed by lower-ranking officers (e.g., the 'Derg' in Ethiopia in 1974, Samuel Doe in Liberia in 1980), often driven by ethnic grievances rooted in colonial state structures, military rank distribution (missing promotions), or plain greed to profit from **rents** (e.g., Mboku 1994; N'Diaye 2001). Typically, the rank-and-file were recruited from specific ethnic groups and underdeveloped regions, while the officer corps came from more developed areas with better ties to the capital.

K. Harkness (2016: 593; citing Adekson 1979: 154) identifies the colonial origins of this practice: *"British martial race doctrine, developed first in India, stipulated that some ethnic groups were naturally more politically reliable and suited to combat and military discipline than others. Frederick Lugard, the high commissioner (1900-1906) and then the governor-general (1912-1919) of Nigeria, further developed this doctrine in Africa. He proscribed that one ethnic group should dominate the colonial army, provided that that group was both politically reliable and unable to dominate civilian political life (i.e., the local civil service). It was a policy of 'making the politically strong militarily weak and the politically weak militarily strong.'"*

These tensions became more complex as, in response to the initial wave of coups, rulers started to implement **coup-proofing** strategies, such as forming parallel security forces like bodyguards and presidential guards (recruited from their own regions of origins).

By the late 1960s, only one third of African armies was ethnically balanced, and, although ethnicity has been a core *explanans* in African civil war and party politics, only a few works have dealt with this dimension regarding coups, either in the region – Luckham 1971; Ejiogu 2007 (on Nigeria); Cox 1976 (on Sierra Leone); Hutchful 1985 (on Ghana); Lindemann 2011 (Uganda and Zambia – the latter as a coup-free negative case) – or in a comparative setting: Horowitz 1985; Jenkins & Kposowa 1990; Decalo 1990; Roessler 2011; Rabinowitz 2013; Harkness 2016; Houle & Bodea 2017.

After the Cold War, the tolerance for coups declined both in Africa and internationally, and coups became universally criminalized. Such norm diffusion was tied, in part, to African **regionalism** (Clark 2007; Mills 2022). Electoral regimes became the norm after 1990, although opportunistic rebelled coups with foreign backing (e.g., Chad in 1990, Sierra Leone in 1991, CAR in 2003) took place alongside regular military ousters.

Since 2010, there has been a clear autocratic resurgence and an uptick in military coups in West Africa and the Sahel (Ibrahim 2022; Taruvinga 2023; Fain et al. 2024). **Presidential guards** themselves are often the new praetorians derailing faltering democratic transitions, and this wave of military interventions has now made this region a 'coup belt' – see Box 5.2. These are often bloodless 'smart coups' carried out with restraint, and supported by neighboring Putschists vetoing sanctions (Atta-Asamoah 2023). Widespread popular support for such military rule among the countries' young populations (although not always) is also worrying: they are dissatisfied with inept electoral systems and too young to remember the previous wave of repressive military rulers.

Indo-Pacific While most countries had their fair share of coups in the first decades after independence – as in Africa or MENA – many underwent (socialist) revolutions that installed rigid political control over their armed forces (reducing coup risk), and, in others, civilian rule has not yet been challenged by the military (e.g., Malaysia, Brunei Darussalam). Militaries in the Indo-Pacific are very diverse due to their different origins and their various paths to independence (Van den Bosch 2023). (For an interesting take on A. Perlmutter's (1969) typology of militaries in developing countries, see Croisssant & Kuehn 2017.)

Still, this region is characterized by several stubborn outliers like Thailand (Pongsudhirak 2008; Connors 2008; Connors & Hewison 2008; Hewison 2008; Chachavalpongpun 2014; Baker 2016; Farrell 2013; Johansson & Engvall 2022) and Myanmar (Thein-Lemelson 2021; Kapur 2022, King 2022), which are greatly coveted by scholars for their post-coup dynamics.

Few comparative works exist. The special issue of the *Australian Journal of International Affairs* (2013, Volume 67, Issue 3) is noteworthy (Mietzner & Farrelly 2013); so is Croissant & Lorenz (2018), for their survey of Southeast Asia.

Eurasia Notwithstanding popular ousters, this region experienced very few 'real' coups – e.g., the *Putsch* against Zviad Gamsakhurdia in Georgia (1991-1992), with failed attempts in Tajikistan (1992) and Kazakhstan (2022). This has been attributed to the **revolutionary legacies** of the former Soviet Union and their Asian counterparts, and the reemergence of Russian hegemony after 2000, which dissuade opportunistic coup-plotting (Van den Bosch 2020: 12-13; Zaporozhchenko 2024).

NEW FRONTIERS With the emergence of new and improved datasets on coups, there are further opportunities to research coups. The recent work by Croissant et al. (2024) provides an excellent state-of-the-art of the contemporary literature.

In view of these developments, more research is needed to understand the rise and fall of anti-coups norms. The latter come from a time when coups were relatively rare, but coups have come back with a vengeance and take different forms. Thyne and Hitch (2020) consider the political trajectory of states after coups and argue that international reactions to coups play an important role in Putschists' move either toward authoritarianism or democratic governance.

Interesting cases also raise questions about our theoretical knowledge. For instance, Banini et al. (2020) find that the case of Ghana challenges the idea that armies engaged as peacekeepers are more likely to mutiny or attempt a military coup against their governments after returning home. Choulis et al. (2023) discover that higher levels of mechanization in militaries reduce the risk of coup, because the costs of coup execution and coordination increase in more mechanized military organizations.

Box 5.2 Coup Contagion: Coup Belts & Coup Traps

The best time to slap a king is when a fly lands on his cheek
– African proverb

A 'coup belt' (*ceinture de coups d'État* in French) in comparative politics is a (geo-)political region where structural socioeconomic and political factors, contested regime legitimacy, civil society weakness, and past coup frequency determine the likelihood of new military coups.

The term is derived from economic or industrial belts – or geographic regions that are characterized by a significant concentration of specific industrial activities or mining operations – such as the 'copper belt' (stretching from southern DR Congo to northern Zambia) and the 'corn belt' (located in the Midwestern US). Like with **coups**, the term has also been applied to regions that share specific cultural characteristics, e.g., the 'bible belt' (in the southern US) known for its high prevalence of evangelical Protestantism and conservative political beliefs.

The main area referred to as a 'coup belt' in Western media is the region stretching from West Africa, the Sahel, to Central Africa (Engels 2023). This coup belt is foremost a geopolitical construct invented around 2020 to denote the loss of neo-colonial French influence in this region and the foreign policy pivot of these military **juntas** to non-Western great powers (foremost Russia and China). (Bianchi & Sangaré 2023) One of the earliest uses of the term was around 2010, but it had not acquired this geopolitical dimension yet. Before, such diffusion was studied under the label of 'coup contagion.'

Latin America has been historically known as a region prone to coups – most coups occurred between 1930 and 1980, with 37.5% of government changes being via military **ouster** during that period (Valenzuela 2004; Lehoucq & Pérez-Liñán 2014). Southeast Asia is also highlighted as facing similar challenges. Often, coup-prone regions are perceived as 'coup belts' due to some extreme country case outliers. For instance, the Latin American coups in the 1980s were confined to only four countries (Bolivia, Paraguay, Guatemala and Haiti). In South and Southeast Asia, Thailand has taken the crown with 12 coups since 1932, followed by Bangladesh (six) and Myanmar (five) since their independence. (Powell & Thyne 2011; Croissant 2013, Valenzuela 2004)

The African coup belt, in contrast, is not misconstrued because these coup instances are evenly spread out across Sub Saharan Africa:

"Between 2000 and 2023, over eleven (11) military coups have occurred in Africa. In 2022 alone, there were four attempted and successful military coups in Mali, Burkina-Faso and Guinea-Bissau. (…) Mali alone has recorded three coups in just more than a decade. This means that nearly 20 percent of African countries have succumbed to coups since 2013." (Odigbo et al. 2023: 645, citing Siegle 2021)

Coups are rarely linked to **authoritarian diffusion** (Gurr 1970: 169, cited in Ambrosio 2010: 387; Huff & Lutz 1974; Li & Thompson 1975; Lutz 1989; Lunde 1991), but the existence of a 'coup contagion' has been questioned recently (Miller et al. 2018). Coup belts are not treated in this literature because the term is too recent and developed from geopolitics.

'Coup traps' follow the same logic but apply to one country specifically and do not imply a geopolitical dimension. So, in analogy with 'conflict traps' or 'poverty traps,' countries that find themselves in the grasp of a 'coup trap' are likely to experience a coup in the near future.

As a concept, 'traps' are older than 'belts.' J.B. Londregan and K.T. Poole (1990) were among the first to popularize the concept. The term suggests that once a country experiences a coup, it may become 'trapped' in a pattern where the **legitimacy** of government is undermined, and the military or other groups now see coups as a viable means to change the regime. This can lead to a destabilizing effect where the political order becomes vulnerable to repeated power grabs by the military or other factions.

The empirical evidence shows that of all the identified factors contributing to coup-proneness, a previous history of *coup d'état* is the most salient. Of course, it is the combination of an incumbent's lack of legitimacy, interventionist military attitudes, and the current socioeconomic state-of-affairs, etc., that blends and increases the likelihood of future coups. Horowitz (1985: 480-496) labeled such subsequent coups 'see-saw' and 'attritional' coups.

Empirically, 'coups breed coups,' creating a cycle that can be difficult to break. In other words, a history of coups fosters a 'path dependency' where structures (the political and socioeconomic climate) and actors' behavior (militaries or other armed forces) reinforce each other and are likely to repeat the outcome of a military takeover. The same goes for the political culture: By coming to power in a military takeover, the new regime destroys the basis for its legitimacy in the process. (Collier & Hoeffler 2005: 5)

Coup traps are thus a significant factor in the political instability of a country and are associated with a range of other issues, including the greed and grievance motivations for seizing power, the role of resource rents and aid, the importance of legitimacy and narrative for the new regime, and the impact of military conditions on the risk of coups.

The underlying causes of coup traps are systemic and self-reinforcing, making them a critical area of study for understanding political fragility and the challenges of democratization and stability in affected regions. Anti-coup norm diffusion (cf. **coups** – 'impact on policy'), coup-proofing, electoral turnover, and improved socioeconomic indicators can – in time – halt coup traps, but it is an arduous path. K. Harkness (2012; 2016) investigates this symptom (for Africa) during decolonization and democratization. She highlights how, initially after independence, early African leaders ruling over ethnically diverse militaries sought to build military loyalty based on ethnic ties (recruitment, promotion) and thus set many nations on a path of violence. Regarding

democratization, she examines how these previous choices interacted with the third Wave (cf. Box 6.3): Once co-ethnic armies had emerged (e.g., through consequent **purges** – cf. **coup-proofing**), these same institutions viewed electoral liberalization (in a multi-ethnic context) as anathema to their corporate interests and often disrupted or overturned democratization processes.

Democratic Consolidation

Democracy is a slow process of stumbling to the right decision instead of going straight forward to the wrong one.
– Anonymous

It is always easier to fight for one's principles than to live up to them.
– Alfred Adler (1870-1937)

Originally, the term 'democratic consolidation' referred to the challenge of preventing regression to authoritarianism and ensuring that new democracies survived. Over time, it has become a broad concept covering various tasks including the promotion of democratic values, neutralizing anti-system actors, reforming institutions, and reducing poverty. Andreas Schedler (1998: 2), however, finds its essence more narrowly in the classic concern of assessing the likelihood for democratic continuity, a process quite separate from the logic of **transitions**.

DEFINITION The literature presents a complex view of democratic consolidation, highlighting challenges in definition and measurement. Democratic consolidation is not based solely on social, cultural, or economic factors but requires political predictability on a stable political spectrum. This predictability ensures that political outcomes remain within an acceptable range, making democracy, a rules-based order, the only framework for political contestation. Consolidation occurs when political actors consistently adhere to democratic rules. It also depends on citizen support, with both the public and elites viewing democratic institutions as legitimate. In such democracies, people adhere to norms even in the

midst of conflicts, reducing uncertainty in political competition (Hanson 2006; Alexander 2002).

Robust institutions are vital for democratic consolidation as they establish rules and frameworks for legally resolving disputes. Key institutions include elections, constitutions, political parties, free media, independent judiciaries, and a meritocratic administration. External (regional) organizations and (good) neighborhoods play an important role too (Mansfield & Pevehouse 2006; Whitehead 2001).

Democratic consolidation is an ongoing process that involves entrenching practices and norms over time while adapting to changes within democratic systems. It requires careful consideration of political actor behavior, public attitudes to democracy, and institutional strength. More than authoritarian consolidation, this is a multifaceted, multi-actor and context-dependent process, making it difficult to establish universal indicators (Diamond et al. 1997).

Democratization and democratic consolidation are distinct yet interconnected processes in the evolution of **political regimes**. Consolidation goes beyond holding elections and ensuring basic freedoms. It involves deepening democracy by strengthening the rule of law, promoting accountability, protecting individual rights, and ensuring effective representation of citizen interests. In other words, it is the process whereby **democracy** becomes the **legitimate** system (see 'the only game in town' – Linz & Stepan 1996) in the eyes of its citizens (Schedler 1998; Diamond et al. 1997).

SEE ALSO Democratic consolidation or deepening refers to the completion of a democratic **transition** (**democratization**). As shown in Figure 3.1, when juxtaposed to **autocratization** and autocratic consolidation, it is a distinct phase in a broader democratization process, but a crucial one in going from minimalist forms of democracy to more a comprehensive alignment of values, actor behavior, institutions and rules.

KEY SIGNIFICANCE The study of democratic consolidation is crucial for understanding political change and ensuring the stability and success of democratic regimes (Schedler 2001). Of course, minimalist forms of democracy can persist for some years, even decades, without fully consolidating. There is nothing teleological about the process. Paradoxically, even long-standing democracies are not immune to democratic decline. The rise of **populism** in some of the world's oldest democracies has led scholars to study the causes of democratic rollback and deconsolidation (Gorokhovskaia 2017).

The study of democratic consolidation involves analyzing the conditions in which democratic regimes develop deep roots in society, reducing the likelihood of their reverting to authoritarianism. It aims to explain why some democracies succeed while others fail, and offers insights for preventing democratic backsliding (Schedler 1998).

Challenges to democratic consolidation include persistent authoritarian enclaves (**authoritarian legacies**), weak institutions, lack of civic engagement, and unresolved social and economic issues. Recognizing these challenges helps us to understand the complexities involved in strengthening and safeguarding democratic institutions (Milačić 2022).

IMPACT ON POLICY The understanding of consolidation informs efforts to support democracy globally, whether through **democracy promotion** or **democracy support & assistance**. By identifying the factors that contribute to democratic stability, policymakers can design effective strategies for assisting countries transitioning to democracy. This includes supporting robust political institutions, a vibrant civil society, and a culture of democratic values.

ORIGIN Scholars began studying democratic consolidation in earnest in the period following the 'third wave' of democratization (cf. Box 6.3), which started in the mid-1970s and extended into the 1990s. This wave saw over 60 countries transition from authoritarian regimes to some form of democratic governance (Schedler 1998: 1). The realization that simply establishing a democracy was not enough to ensure its long-term survival was the primary reason for studying democratic consolidation. Scholars recognized that sustaining democracy posed challenges as significant as those involved in its establishment. The need to understand how to sustain these new democracies led to an increased focus on democratic consolidation.

LITERATURE Consolidation is distinct from **democratization**, as each process is driven by different factors. While there is some debate about the link between economic growth and democratization, most scholars agree that economic growth supports consolidation. The role of **civil society** remains ambiguous in both processes (Gorokhovskaia 2017).

Democratic consolidation, or democratic deepening, involves ensuring that a democracy becomes stable, resilient, and unlikely to revert to authoritarianism. This process can be analyzed in three dimensions – participation (A), representation (B), and stateness (C) (see Heller 2019) – but encompasses many others (D-J).

Participation (A) This is essential for democratic consolidation, as it ensures active citizen involvement in the political process. Key factors include respecting electoral outcomes, with elites accepting results even when unfavorable; non-violent political engagement, without coercion or suppression; and protecting civil liberties so citizens can freely express opinions, assemble, and criticize the government without fear (Schedler 1998; Heller 2019; Milačić 2022).

Representation (B) This ensures that democratic institutions reflect the interests of the populace. Key aspects include inclusive electoral systems, which fairly represent diverse groups; mechanisms for dialogue between citizens and representatives to influence policymaking; and responsive political parties that are accountable to their constituents and capable of articulating their demands (Diamond et al. 1997; Schedler 1998; Heller 2019).

Stateness (C) State institutions must function under democratic control and the rule of law. Key components include the separation of powers to prevent concentration and guarantee checks-and-balances; a professional civil service accountable to elected officials and serving public interests; and a robust rule of law that guarantees equal access to justice for all citizens, regardless of political or social status (Heller 2019; Milačić 2022).

In addition to these three dimensions, several interconnected factors significantly influence the stability and resilience of democratic regimes:

Elite Commitment (D) the genuine embrace of democratic principles and norms by political elites is crucial for reducing the risk of democratic backsliding. Their commitment is reflected in behaviors such as respecting electoral outcomes, prioritizing the long-term stability of the democratic system over short-term political gains, and actively keeping anti-democratic actors from assuming positions of influence.

Economic Performance & Equity (E) A strong economy, which meets citizens' basic needs and fosters social mobility, can bolster support for democracy while diminishing the allure of authoritarian alternatives. When people perceive tangible improvements in their economic conditions, they are more likely to support democratic governance.

Effective & Adaptable Institutions (F) The presence of robust institutions, such as an independent **judiciary** and a professional, meritocratic **bureaucracy**, is vital to effectively manage conflicts and ensure accountability. These institutions help uphold the rule of law and maintain public trust in democratic processes.

Supportive International Environment (G) A favorable international context can significantly bolster efforts to consolidate democracy. This includes the diffusion of democratic norms through international dialogue and cooperation, as well as material and technical assistance from global partners aimed at strengthening democratic institutions.

Historical Legacies (H) Countries with prior experience of democracy may have a stronger foundation for rebuilding democratic systems, even after a period of authoritarianism. Learning from past mistakes and effectively addressing the lingering impacts of **authoritarian legacies** is essential for successful consolidation (Diamandouros in Diamond et al. 1997).

National Identity & Unity (I) Addressing deep societal divisions and fostering a shared sense of national identity are crucial for stability in diverse societies. Ensuring that all groups feel included in the political process can help mitigate tensions and promote social cohesion.

Political Leadership (J) Visionary and committed leaders who prioritize democratic values and foster consensus can significantly enhance the prospects for democratic consolidation. Effective leadership is key to navigating challenges and building a resilient democratic framework.

Milan Svolik (2008) challenges traditional views on democratic survival, offering a nuanced understanding of consolidation and breakdown dynamics. Svolik argues that many democracies are in fact consolidated, facing little risk of reverting to authoritarianism, with about 42% achieving this status between 1789 and 2001. He emphasizes that consolidation, rather than mere survival over time, is crucial for democracies to endure. Consolidation involves becoming 'immune' to typical reversal factors; some democracies may survive due to favorable conditions, but remain vulnerable were those conditions to change.

Svolik highlights that whereas the duration of a democracy aids consolidation, economic and institutional contexts significantly influence this process. Higher economic development at the time of transition increases the likelihood of consolidation, making wealthier democracies more resilient. However, economic recessions pose immediate threats to transitional democracies, increasing reversal risks in the first decade after transition. Institutional factors, like a history of military rule and a presidential system, negatively impact the odds of consolidation (Svolik 2008).

MEASUREMENT Consolidation is dynamic and ongoing, requiring constant nurturing and adaptation to maintain resilience. Relying on a single indicator is insufficient. In addition, measurement involves more than simply observing democratic institutions; it requires assessing their resilience, their acceptance by political actors, and their capacity to withstand challenges. In essence, measurement involves assessing subjective judgments about the future stability of regimes, and these are not directly observable (Schedler 2001). Some potential indicators and approaches for measuring this complex process are listed below.

A key indicator of consolidation is the behavior of political elites during crises or in political competition. This includes their commitment to democratic rules, such as respecting electoral outcomes and resolving disputes through established institutions, without resorting to extra-constitutional means or violence. Elites should also reject anti-democratic tactics and marginalize actors espousing such views while respecting opposition rights. Monitoring instances of disloyalty to the democratic system is crucial. This includes rejection of democratic **legitimacy**, attempts to subvert democratic processes through violence or fraud, and appeals to extra-constitutional actors like the military.

Strong and enduring public support is crucial for democratic consolidation. Public opinion surveys can gauge support for democracy by measuring belief in democratic principles, **trust** in institutions like the electoral system and judiciary, and tolerance for opposing views. Understanding the views of elites is also vital, including their commitment to democracy as the only legitimate form of government and their confidence in the system's long-term survival (Schedler 2001; Alexander 2002).

Consolidation requires robust institutions, like an independent judiciary that upholds the rule of law, a professional bureaucracy resistant to corruption, and a functional party system representing societal interests (Schedler 2001). While not determinative, economic development and social equality can influence democratic stability. Economic growth and equitable wealth distribution often correlate with greater stability (Beetham 1994).

Schneider and Schmitter (2004: 67-68) provide coding criteria for the phenomenon. The twelve items they use to measure democratic consolidation (CoD) focus exclusively on the observable behavior of political actors, not their attitudes. While these items have an 'electoralist' bias – assuming that competing parties engaged in fair and regular elections help channel conflicts and ensure accountability – the measure goes beyond purely electoral mechanisms; indeed, several items constitute additional forms of representation through which citizens can hold leaders accountable.

METHODOLOGICAL ISSUES The concept of democratic consolidation is disputed. Some scholars see it as a tautology: consolidated democracies are those that survive, and those that survive are considered consolidated. Time plays a key role in studies of regime endurance. However, even long-established democracies face the threat of declining democratic quality (Gorokhovskaia 2017).

Nevertheless, some scholars apply the concept as a way to refer to avoidance of democratic breakdown or backsliding (Hanson 2006). Others see it as the completion of democratic transition (especially for regimes that suffer from **authoritarian legacies** (Schedler 1998)). Still others view it more neutrally as the 'deepening' of democracy by improving its quality and responsiveness (Heller 2019; Milačić 2022).

Measuring democratic consolidation is challenging, even when there is an agreed-upon definition. Inherently subjective assessments often rely on interpreting the behavior and stated beliefs of political actors, and these may not accurately reflect their true intentions or predict future actions. Additionally, it is difficult to distinguish between 'consolidated' and 'unconsolidated' democracies because consolidation exists on a continuum, making precise thresholds look arbitrary or overly simplistic (Schedler 1998).

Researchers may slip into selection bias by focusing on cases that support their preferred theories or hypotheses while ignoring those that contradict them. Svolik (2008) criticizes traditional survival models for treating democracies homogeneously, instead employing a split-population survival model to obtain a more accurate analysis. His research underscores the importance of economic and institutional factors in democratic endurance, offering insights into why some democracies thrive while others falter.

Additionally, there is a risk of teleological bias, which assumes a natural or inevitable progression to democratic consolidation – a linchpin of transitology (Box 5.3). This perspective can lead one to overlook or underestimate the potential for backsliding, stagnation, or alternative political development trajectories.

Furthermore, some approaches may overemphasize structural factors, such as socioeconomic conditions or institutional design, while neglecting the critical role of political agency and the strategic choices made by actors.

An overemphasis on formal institutions can overshadow the importance of informal institutions, power dynamics, and political culture in shaping democratic consolidation. Milačić (2022) highlights the often-overlooked importance of 'stateness' in consolidation. Unresolved issues related to national identity, territorial integrity, and state institution functionality can challenge consolidation even when there are formal democratic structures.

Additionally, inadequate consideration of external factors can impact a country's trajectory toward consolidation. The international context, including regional organizations, global norms, and external actors' actions (e.g., **black knights**) plays a significant role (Whitehead 2001).

REGIONAL VARIATION Comprehensive case studies can be found in Hanson 2001; Zielonka 2001; Pravda & Zielonka 2001; Kaldor & Vejvoda 2002; Eriksen 2009 (on Central and Southern Europe); Hagopian & Mainwaring 2005 (on Latin America); for a comparison of the two latter regions, see Roniger 1989; Higley & Gunther 1992.

Regarding the Indo-Pacific, see Sridharan 2012 (coalition governments in India, Malaysia, Sri Lanka, and Japan); Osaghae 1999; Mengisteab 2020; Chari & Dzimiri 2023 (Africa); for a comparison of these two world regions, see Daly & Samararatne 2024. See Sadiki (2009) for failed consolidations in MENA before and after the **Arab Spring**. Volpi & Cavatorta (2013) provide a comparative overview of the wider Muslim world.

Democratization

Democracy is the art and science of running the circus from the monkey cage
– H.L. Mencken

Демократция – не картошка, не весде растёт
(Democracy is not a potato, it doesn't grow everywhere)
– Bakytbek Orozbayev

It has only been in the last two centuries, and especially since the early twentieth century, that there has been an increase in the number of democratic polities in the world. The biggest rise happened between the mid-1970s and the end of the twentieth century, when the number of democratic polities grew and authoritarian regimes declined. Southern Europe embraced democracy in the early and mid-1970s; many Latin America countries underwent democratic transitions by the 1970s and 1980s, while some parts of East Asia followed suit. Central and Eastern European countries, after the collapse of the Soviet Union and other socialist regimes, moved toward democratization in the 1990s, as did Sub Saharan Africa (Welzel et al. 2018: 1). The democratization processes and subsequent **democratic consolidation** in these countries have, however, been highly complex and frequently divergent in character. Still, in the 1990s, this third wave of democratization (see Box 6.3) fostered an optimistic view of the future of democratic **transitions** world-wide, with hopes for democracy to become 'the only game in town' (Linz & Stepan 1996). By 2010, the scholarly community was openly discussing the possibility and nature of an autocratic wave.

DEFINITION Notwithstanding the routine contestation of concepts in the field of political science, the concepts of democratization and democratic **transition** do not experience this conflict. Although different definitions exist, they share similar components: the change processes, with new possibilities and the reasserted right of citizens to engage in political activity and organize in competing parties to participate in elections, marking a stark departure from previous modes of governance that operated on illiberal principles (Linz & Stepan 1996; Stepan 1988; O'Donnell & Schmitter 1990; Huntington 1991).

Linz and Stepan (1996: 3) emphasize the necessity of distinguishing between democratization and liberalization. Liberalization can occur in non-democratic regimes, and can entail reforms like reduced media **censorship**, more rights for working-class organizations, toleration of opposition, greater rule of law, etc. But liberalization does not necessarily entail the core element of democracy and democratization, which is based on the right of the people, and their various representative parties, to express their political beliefs and compete in elections for

controlling the government (for a stipulated period of time). So, democratization implies liberalization, but there can be liberalization without democratization. *"Liberalization refers fundamentally to civil society. Democratization involves civil society, but it refers fundamentally to political society"* (Stepan 1988: 6).

Huntington (1991: 9) argues that *"if popular election of the top decision makers is the essence of democracy, then the critical point in the process of democratization is the replacement of a government that was not chosen this way by one that is selected in a free, open, and fair election. The overall process of democratization before and after that election, however, is usually complex and prolonged. It involves bringing about the end of the non-democratic regime, the inauguration of the democratic regime, and then the consolidation of the democratic system."*

Although there is less unanimity among scholars about the definition of democratization, there is minimal agreement that this transition has to reach a certain threshold. At a minimum, the process covers the period between the breakdown of an authoritarian regime and the establishment of democratic institutions, such as the first democratic (free and fair) national elections. (Figure 3.1 portrays these concepts in juxtaposition to **autocratization**.) Beyond that point definitions vary, and the process can be divided into two main phases: the transition phase, which involves the initial shift from authoritarianism to democracy, and the consolidation phase, which involves the institutionalization and stabilization of democratic practices (political culture). Despite the assumptions of the transitologists of the 1990s (see Box 5.3), this is not a unilinear process, and episodes of democratic backsliding (**autocratization**) may occur. Many studies and **classifications & typologies** have proposed defining cut-off points where democracy ends and authoritarianism starts (see also 'dichotomous classifications') in the context of such democratic erosion.

SEE ALSO In the view of this encyclopedia, **autocratization** or executive aggrandizement is classified under **regime behavior**. This entry falls under **transitions** (from autocratic rule). Democratization is a broad term, here used first of all todenote the domestic processes in polities, in contrast to **democracy promotion**, which falls under externally-influenced regime change or **regime promotion**. Democratization processes are closely associated with party politics, electoral contestation, and upholding the rule of law. Once such transformations stabilize, it is possible to speak of democratic deepening or **democratic consolidation**.

KEY SIGNIFICANCE Although the topic of democratization and the reasons why and how democracies emerge – hence the question of democratization – have been present in political science since Aristotle, it gained true prominence in the last four decades with the expanding number of democratic polities, and with the new challenges to democracies in the twenty-first century, currently considered on the defensive.

The rather clear definition of democratization and its distinction from liberalization make the concept operational. However, the multiplicity of theoretical approaches, combined with the various explanations of the causes and conditions required for democratization processes to take off (and consolidate), along with the relatively small pool of cases, too small for any true statistical analysis, lead to unclear or contrasting explanations of certain democratization processes and democratic backsliding.

ORIGIN The concept is old, its origins traced to Aristotle's *Politics* and its consideration of the necessary conditions for a democratic polity to emerge (even as an undesired outcome, since democracy was considered a deviant form of government – see **Plato & Aristotle**).

Alexis de Tocqueville (2000) supplied one of the early classic accounts of the preconditions for democratic transition. His seminal work, *Democracy in America* (*De la démocratie en Amérique*, 1835-1840) analyzes the conditions that led to a democratic revolution in the US and the reasons for its persistence. Yet the now classic and systematic research on democratization came to the fore with the institutionalization of political science in academia after WWII during the second wave of democracy (Box 6.3).

LITERATURE The study of democratization in political science encompasses various approaches (A-E) that offer distinct perspectives on the transition from authoritarianism to democracy. *Modernization theory* (A) posits that economic development fosters democratization by creating favorable social conditions, such as a more educated populace and a burgeoning middle class. This theory suggests that as societies industrialize and become wealthier, they are more likely to adopt democratic institutions. Modernization theory has been revisited, particularly in light of the third wave of democratization, which saw rapid de-industrialization in many regions after liberalization.

Structural approaches (B) emphasize the influence of social, economic, and political structures on democratization. They consider factors such as economic development, social inequality, and historical legacies as critical determinants of the likelihood and success of democratization. This approach provides detailed, context-specific explanations but can be complex due to the multitude of interacting factors. *Elite-choice approaches* (C) focus on the strategic decisions and actions of political elites during transitions. This perspective highlights the importance of negotiations and compromises between authoritarian leaders and opposition groups, emphasizing the role of key actors in shaping the democratization process. While theoretically concise and handy for generalizations, it may lack the depth and context-specific insights provided by structural approaches.

Transitology and *consolidology* (D) are focused on two complementary processes. Transitology (see Box 5.3) examines the strategic interactions among political actors during the transition phase (**elite pacts**), while 'consolidology' analyzes the conditions necessary for sustaining democracy once it is estab-

lished. These subfields highlight the importance of both the initial transition and the long-term stabilization of democratic norms and practices. *Neo-institutionalism* (E) is a related approach that emphasizes the critical role of institutions in shaping political outcomes. It focuses on how formal and informal institutional arrangements influence democratic transitions and consolidation, highlighting path dependence and historical legacies. Institutions are seen as the 'rules of the game' that structure political interactions, creating incentives for democratic behavior or autocratic resilience. This approach also examines the design and impact of different constitutional and electoral systems, emphasizing gradual institutional change and the interplay between structural conditions, actor choices, and cultural factors in shaping democratization processes. (Note: it is simplistic to pigeonhole scholars into one discipline exclusively, as their work and methods naturally evolve over time, and insights from other approaches diffuse and lead to mutual influences.)

Modernization Theory (A) S. Lipset (1959) was the first to establish a link between economic modernization – especially GDP per capita – and democracy. He posited that economic development leads to decreased tolerance of non-democratic and repressive political regimes. A rise in GDP per capita, **Lipset** argued, causes a transition to democracy. Large-N studies have tested this modernization thesis (Dahl 1971; Burkart & Lewis-Beck 1994). Boix and Stokes (2003) claim that the significance of GDP per capita for democratization after WWII has been negligible, although statistically it may appear important. Przeworski, Alvarez, Cheibub, and Limongi (2000; hereafter PACL) find that the elementary hypothesis of **modernization theory** – that political regimes more or less automatically transition to democracy as GDP per capita rises – does not hold true. Thus, a rise in GDP per capita is not a causal factor in democratization processes. That is, democratic transitions can occur in different settings and contexts, sometimes intentionally, sometimes randomly. But when a democratic transition has been undertaken, those countries with higher a GDP per capita tend to remain democratic.

Contrary to PACL, Epstein et al. (2006) find that the modernization thesis is accurate. Epstein et al. (2006) include a third category – partial democracy – which has some but not all democratic characteristics, whereas PACL accounted for only two categories: democracy vs. autocracy. Epstein et al. claimed that *"What we learn from these efforts is that higher per capita incomes increase the likelihood of a movement away from autocracy as well as decrease the likelihood of a movement away from democracy. That is, we find reason (contra PACL) to support the modernization hypothesis. In our view, democracy is a process, not an end state. And as is often the case, the journey is more important than the destination."* (Epstein et al. 2006: 552).

Structural (B) and elite-choice approaches (C) Almond and Verba analyze the influence of civic and political culture on democratization (1963); L. Diamond follows the argumentation line (1999). Dahl claims that democratization can occur when the costs of tolerating a political opposition decrease, meaning that the opposition can be given political rights and opportunities to challenge the existing order, or when the costs of suppressing the opposition grow too great (Dahl 1971: 15-16). Moreover, he argues that democratization occurs mostly when power is spread across society, when it has a pluralistic nature.

When the (ideological) 'end of history' was proclaimed at the beginning of the 1990s (see F. Fukuyama), proposing that liberal democracy and market economy were victorious, Samuel Huntington (1991) published his famous book *The Third Wave: Democratization in the Late Twentieth Century*. The main argument of his book concerned the explanation of why and how (from 1974 to 1990) more than thirty countries around the world had become democratic. Huntington went on to distinguish between three waves of democratization (see Box 6.3): (i) the first between 1828 and 1926; (ii) the second from 1943 until 1962; (iii) and the third starting in 1974. He also included two counter or reverse waves: (a) the first from 1922 until 1942; (b) and the second from 1958 until 1975. Huntington (1991) has identified 27 different factors that contribute to promoting democracy.

According to Huntington (1991: 106), the third wave of democratization was made possible by *"higher levels of economic well-being, which led to more widespread literacy, education and urbanization, a larger middle class, and the development of values and attitudes supportive of democracy."* Despite these favorable conditions, Huntington argues that the *"the emergence of social, economic and external conditions favorable to democracy is never enough to produce democracy. Whatever their motives, some political leaders have to want it to happen"* (Huntington 1991: 108).

According to Charles Tilly (2000), democratization can occur within an interdependent set of relations consisting of public politics, inequality and networks of trust. The crucial element of any process of democratization is the decline of political inequality between citizens, which leads them to acquire *"relatively equal claims on a government's agents, activities, and resources."* This also leads to a different approach to governmental vigilance and control: people begin relying on governmental control and involve public authorities in their private and economic relations and commitments (Tilly 2000: 8). Bates (1991) and Tilly (2004) stress a different aspect of democratization: 'No taxation without representation.' According to them, democratic transitions occurred – in the form of representative political institutions – because monarchical and authoritarian elites needed to raise taxes to form a stronger central state apparatus.

Therborn (1977) emphasizes the importance of the working classes and their struggle in the historical processes of democratization: *"The most important allies of the working class in the struggle for democracy were the following: victorious armies of foreign bourgeois states, the small and the self-employed petty bourgeoisie, and a section of the ruling class itself"* (Therborn 1977: 34). Moore (1966) claims that the rise of the middle

class, and the specific way it is politically incorporated, is crucial for democratization. His analyses look at the importance of introducing market relations into agriculture and on the important role of the bourgeoisie. He famously argued: *"No bourgeois, no democracy"* (Moore 1973: 418).

D. Rueschemeyer, E.H. Stephens, and J.D. Stephens (1992: 58) claim that the crucial impetus for democratization is the specific class nature of capitalism, capitalist economic development and the rise in the power of the organized working classes.

Transitology & Consolidology (D) O'Donnell and Schmitter (1986) explain that transitions to democracy can happen only when there are certain conflicts and splits among the authoritarian ruling elites, and that they grow more liberal only when they are pushed towards political liberalization. The authors claim that no kind of democratization would be possible without a split in the ruling bloc: *"We assert that there is no transition whose beginning is not the consequence – direct or indirect – of important divisions within the authoritarian regime itself, principally along the fluctuating cleavage between hard-liners and soft-liners"* (O'Donnell & Schmitter 1986: 19). Moreover, they also observe that *"it is possible to offer a few generalizations. (...) First, all previously known transitions to political democracy have observed one fundamental restriction (...) the property rights of the bourgeoisie are inviolable"* (1986: 68-69).

In the early 1990s a distinct approach began to emerge, one focused, mostly but not exclusively, on the democratic transition of post-socialist countries, coupling these processes with economic transition, i.e. the introduction of a capitalist market economy. Haggard and Kaufman (1995) claim that the primary mechanism that leads to democratization is economic crisis, which eventuates in popular discontent with non-democratic regimes. Scholars have been preoccupied with the role of economic crises and their impact on democratization, but also on the 'sequencing' of the dual transition and reforms (Haggard & Webb 1994; Haggard & Kaufman 1995; Encarnación 1996).

Linz and Stepan (1996) guided a research project on democratic collapse, which had a major impact on the literature on democratization. They did not focus on economic and social conditions, but rather on the specific political choices of various political actors. Linz and Stepan (1996) claim that the type of democratization processes very much depends on the nature of the preceding non-democratic regimes.

Neo-Institutionalism (E) Acemoglu and Robinson (2006) have developed an approach to democratization based in political economy. They differentiate between *de jure* and *de facto* power. In non-democratic regimes the *de jure* power is in the hands of small elites. However, in certain circumstances, especially when social and economic inequalities are very persistent and obvious, the people may start to pose a true revolutionary threat, which will gather them together and give them *de facto* political power. Elites will want to secure their ruling position and forestall any sort of revolution. As a result, they have to make promises of 'pro-majority policies.' To give these promises credibility, they will also have to change the political system in order to give citizens some tools to exercise influence and control over political authorities. In this sense, elites would also give political rights and political power to the majority. Thus, Acemoglu and Robinson's approach and understanding of democratization processes is based *"not only the role of crises but also the importance of social unrest, the threat of revolution, and generally the de facto power of those without de jure political power in inducing a transition to democracy"* (Acemoglu & Robinson 2006: 67).

In the study of democratization processes, a focus on internal and external factors became one of the most important themes. In the example of Central and Eastern Europe (CEE), the influence of the rise of civil society as a counter-power to authoritarian regimes was emphasized as one of the crucial internal elements, along with the split within the elites (Pridham & Vanhanen 1994). Niklasson (1994) explores the relationship between the Soviet Union's Gorbachev era and the democratization processes in the Soviet-influenced CEE. He argues that it was internal liberalization and decoupling from the USSR that impelled democratization processes, with the Gorbachev reforms in the USSR playing an important auxiliary role, although even without the latter the CEE was slowly been inching toward greater political liberalism. Hyde-Price (1994) argues for the importance of democratic-oriented regional organizations, like the *European Community* (EC, a predecessor of the EU), the CSCE (*Conference on Security and Co-operation in Europe*) and the *Council of Europe*. Later EU integration and EU **democracy promotion** have also been considered important factors in the democratization of the CEE (Whitehead 2001).

REGIONAL VARIATION Democratization and democratic backsliding have been happening across the world. However, it is crucial to emphasize, that not all world regions have experienced the same levels of democratization at the same time. The process in Latin America has been markedly different and determined by its postcolonial legacy, military **juntas** and the strong (isolationist) *Monroe doctrine* and outside interference. The literature on Latin America has produced numerous volumes and articles about democratic transitions (Linz & Stepan 1978; O'Donnell 1979; O'Donnell et al. 1986; Diamond et al. 1989; Karl 1990; Remmer 1992; Close 1995; Stepan & Linz 1996; Hagopian & Mainwaring 2005).

In parallel, other scholarship has focused on southern Europe (O'Donnell et al. 1986; Opello 1985; Gunther et al. 1986; Stepan and Linz 1996; Whitehead 2001a); where, by the 1990s, interest shifted to the democratization processes of post-socialist countries (Lijphart 1992; Pridham & Vanhanen 1994; Kaldor & Vejvoda 1997; Kolodko 2000; Whitehead 2001b; Schneider & Schmitter 2004; Aliyev 2015). Few initially focused on democratization in the Arab world and the Middle East (Brumberg 2003; Rahbaek 2005; Harrigan & El-Said 2011), but the region got much more attention after the **Arab Spring**. Democratization processes in Africa have waxed and waned

since the mid-1990s (Joseph 1997; Diamond & Plattner 1999; Osaghae 1999; Lynch & Crawford 2013).

MEASUREMENT & METHODOLOGICAL ISSUES Several methodological and measurement issues arise in the field of democratization studies. The first methodological problem concerns the problem of defining and delineating democracy. In this sense, classifying regimes on a democratic-authoritarian continuum (incrementalism) yields different results from typologies that assume a dichotomy between autocracies and democracies (Maerz et al. 2021).

Second, various theoretical positions have pointed to different causal elements and conditions that lead to democratic transitions; however, selection bias remains an issue. Where this is concerned, there are too many factors, and not enough Popperian falsification ('all swans are white until a counterexample is provided') in theory development. It can be highly counter-productive when scholars only use cases that confirm their theories and causal effects, and neglect other dyads of causal interrelations.

Third, the problem of too small a number of case studies to make any serious statistically informed argument is a constant challenge in political science. Any general conclusions based on statistical analysis will thus always be limited.

Fourth, there is a great problem about variance in history. This is due to different conditions and different democratization processes over the past 300 years. These processes took place in very different settings, and what people once considered to be a 'democratic turn' par excellence is today (in hindsight) usually regarded as the beginning of an authoritarian or even totalitarian regime (the October Revolution, for instance). On the other hand, the history of the slave-owning Western countries (US, UK), including their road to democratization, is often posited as the norm, despite the very undemocratic nature of their polities even according to (exclusively) liberal democratic standards until relatively recently (when slavery was abolished and suffrage was extended to all men and women).

Fifth, since democracy is considered a Western invention, a normative bias stubbornly dominates in the Western-liberal world, where native democracies are seen as the most democratic and as a norm. Many adherents of this view remain insensitive to different cultural, historical and economic conditions in different regions of the world, and neglect or even refuse to acknowledge different democratic practices around the world – see also 'origins' under **elections**. They also ignore democratic deficits. For example, in the 1950s and 1960s, the US judged and ranked the progress of countries toward democratization in other world regions, at a time when racial discrimination was still fully embedded in its own domestic political system and processes.

Sixth, democratization processes are complex and involve many moving parts. There is always an inherent instability and unpredictability in political actions, especially when significant structural factors interplay with such transitions, because they are performed by humans. As a result, thus far, no single theory of democratization can reliably predict a democratic transition.

For instance, modernization theory, which suggests that an increase in GDP per capita leads to democratization, has been both embraced and refuted by scholars. It has been empirically proven wrong in several cases. O'Donnell (1973) argues against modernization theory by highlighting the democratic collapses in Latin America, where income levels did not prevent political instability. In fact, numerous military coups occurred in some of the wealthiest countries on the continent, suggesting that economic factors alone do not determine democratic outcomes.

Considering the various challenges and issues surrounding democratization, two things are evident. (I) Democracies can emerge under a wide range of conditions and settings. This is supported by the work of scholars like Przeworski et al. (2000), Wantchekon (2004), and Gassebner et al. (2013), who demonstrate that there is no single set of conditions necessary for the emergence of democracy. (II) There is no single path to achieving democracy. Different countries have followed diverse routes to democratization, as highlighted by scholars like Rustow (1970), Collier (1999), and Tilly (2004). These studies emphasize that the process of democratization is influenced by a variety of historical and contextual factors, and that multiple pathways can lead to democratic governance at different moments in history.

NEW FRONTIERS Although it could appear that the large body of scholarship produced would soon lose its appeal and relevance, we can conclude that the theories engaged with democratization and transition processes are still highly relevant today. If the turn of the millennium was greatly optimistic about the trend of democratization, the second decade of the twenty-first century witnessed a growing scholarship dealing with new challenges to democracies and the rise of **hybrid regimes** (see Levitsky & Way 2010; Lindberg et al. 2018; Diamond 2002). Indeed, Lührmann & Lindberg (2019) – following Huntington's thesis about the three waves of democratization (Box 6.3) and two waves of autocratization – explain that a third wave of **autocratization** has been at work in the last few decades. Crucially, contemporary autocratization processes have adopted the guise of the legal framework of democratic politics, but with a different content: *"regime change is typically gradual and slowly leading to hybridization into electoral authoritarianism instead of sudden, dramatic transitions"* (Lührmann & Lindberg 2019: 1102). In this light, democratization processes – colonized by the specter of liberal democracy and liberal values, and with the already described pitfalls and limits – face new challenges in a time when the form of the polity and the content of policies are further and further apart. This opens up new opportunities to retest old and conceptualize new theories of democratization and autocratization, while also, possibly, developing less value-biased approaches and providing more case-specific explanations.

Box 5.3 Transitology – An Ongoing Debate

The arc of the moral universe is long, but it bends toward Justice.
– Martin Luther King

This concept refers to the teleological expectations that all regime transitions move toward a democratic end goal. This assumption has old roots in **modernization theory** and the ideological 'end of history' (see Fukuyama 1992, and others), where democracy is made out to be the best (available) governance system and the final stage in human development.

By the 1990s a generation of scholars had genuine reasons to be optimistic as the so-called third wave of democracy seemed to be unrolling indefinitely: First the disappearance of **fascism** and **corporatism** in southern Europe, followed by the **military regimes** in Latin America starting in the late 1970s, to the democratization of some of the East and South 'Asian Tigers' (cf. Box 7.3), to the implosion and disintegration of the **single-party regimes** of the Soviet Union by 1990, triggering 'the wind of change that shook the coconut trees' in Africa in the early 1990s, accumulating to widespread liberalization and more democratic governance in all continents.

It should be noted that the study of transitions can be traced back to Rustow (1970) and thus before the start of the 'third wave,' but other instrumental works that inadvertently led to the popularization of the paradigm myth are O'Donnell et al. (1986) and Karl & Schmitter (1991).

After a brief honeymoon period right after the Cold War, this paradigm, of course, by the early 2000s started to receive criticism. Democratic progress was stagnating or reversing in many countries and no longer matched the analytical frames of transition.

The essay by Thomas Carothers (2002) and the lively (and diverse) reactions that followed soon after in the *Journal of Democracy* (2002, Volume 13, Issue 3) revealed the sizzling debate (see O'Donnell 2002; Hyman 2002; Wollack 2002) – especially around the post-communist world (Müller & Pickel 2001; Gans-Morse 2004) – but the transitology frame still ran deep at the time of the **color revolutions** and the **Arab Spring** (Diamond et al. 2014).

The paradigm, as originally set out and qualified by Carothers (2002: 6-9), involved five core assumptions: (a) any country moving away from dictatorial rule can be considered a country in transition toward democracy; (b) democratization tends to unfold in a set sequence of stages (opening – breakthrough – consolidation) – this progress can be halted or stalled, but is assumed to follow this path; (c) elections are a key generator for further democratic reforms down the line; (d) culture, political history, socio-economic contexts and other structural factors matter less than elite commitment to democracy; and the last assumption is that (e) democratic transitions take place in functioning states with democracy-building and state-building being treated as mutually reinforcing endeavors or even as two sides of the same coin.

While the universality of Carothers' theses was nuanced in the existing literature, there is a consensus that were these assumptions applied as listed, they would generate dangerous methodological pitfalls. However, the importance of understanding transitions, both for dictatorship scholars and experts engaged in democracy support, remains undiminished; thus, coaxing the debate into several avenues: (a) What lessons from the third wave are still useful? (b) What alternative frames (if only regional and temporary) can be used instead? For instance, see Ambrosio's (2004) 'consolidation paradigm' for the post-Soviet states. (c) How can we fix the paradigm? (see Mohamedou & Sisk 2016).

The debate has shed a new light on several analytical practices in regime studies prevalent in the late 1990s: The pitfalls are related to **hybrid regimes** (or equating democracy with elections) and to placing democracy and non-democracy on a linear scale. Reappraisal has revealed the need to benchmark the core concept of democracy (at least) according to its minimum (free and fair elections) and maximum definition (including the protection of political, human, economical rights, etc.). There is a new appreciation of autocratic resilience, consolidation and survival and the beginning of the study of **authoritarian collaboration** and **authoritarian learning**, but also the juxtaposition of state-building and democratization processes (i.e. **state fragility & failure**) and what this means for **democracy promotion**.

In any case, one can expect a cyclical return to the debate, and its undeniable impact on the field has left scholars sensitive to nuance and able to debunk trendy paradigms more speedily, the most recent examples being 'democratic recession' (Levitsky & Way 2015; Lührmann & Lindberg 2019) and the 'backsliding paradigm' (Cianetti & Hanley 2021).

Elite Pacts & Pactology

If you want to make peace with your enemy,
you have to work with your enemy.
Then he becomes your partner.
– Nelson Mandela

An elite pact is an agreement between a select group of political elites. It seeks to redefine the rules governing the exercise of power while ensuring mutual guarantees for the vital interests of the parties involved. Such a pact is often made during transitions from authoritarian rule to democracy, but it can also be used to maintain stability in authoritarian regimes. (The role of elite pacts in peace treaties or ceasefires, in the context of conflict studies, lies beyond the scope of this entry – see De Juan 2008)

DEFINITION & CLASSIFICATIONS When surveying the literature and the application of elite pact frameworks, one can distinguish two main types of elite pacts. Transition pacts (A) are agreements between rival elite factions during a transition from an authoritarian regime to a democratic one. These pacts are designed to ensure a smooth and controlled **transition** by establishing rules and guarantees that protect the interests of the key actors from both the old regime and the opposition. They involve cooperation between elites in power and those in the opposition, and aim to redefine the rules governing the exercise of power post-transition with mutual guarantees for those entering into the pact. Transition pacts often include compromises regarding sensitive issues, such as securing property rights or ensuring non-prosecution for past actions. Although criticized for being 'unjust,' they are considered crucial for successfully establishing democracy, as they include significant political actors whose interests must be respected to gain their consent to the new political regime.

In contrast are regime pacts (B), or those pacts internal to the ruling elite of an authoritarian regime. They are designed to maintain the regime's grip on power by managing internal divisions and preventing challenges from within the inner ranks.

These pacts focus on preserving authoritarian rule by enshrining collegial rule, sharing power and resources among elites, aiming to prevent internal conflict, and suppressing potential challenges to the regime's authority. Security forces often play a key role in enforcing these pacts and maintaining stability within the regime. Elite pacts are crucial for preventing **coups d'état**, which are a common cause of extra-constitutional transitions in authoritarian regimes.

The term 'pactology,' then, refers to the study of political pacts, particularly those involved in transitions from authoritarianism to democracy (A). It involves analyzing how these agreements are formed, their impact on political transitions, and their role in establishing stable governance structures.

Elite pacts, also known as 'elite settlements' or 'political settlements,' are rooted in elite theory (see under 'origin' below). Such pacts involve negotiations among elites to manage uncertainties and share power.

There is no universally accepted typology of elite settlements. Scholars tend rather to focus on their complexity and variety, emphasizing dimensions such as scope (the number of actors involved), degree of elite unity, formalization (written or informal), and durability. Factors like elite autonomy from mass pressures, crises prompting compromise, and strategic calculations by key actors are crucial in understanding these settlements (Burton & Higley 1987; Gel'man 2003).

SEE ALSO Elite pacts are intrinsically linked to **transitions** (A) and regime **longevity, stability and resilience** (B), particularly **succession**. In transitions, crises combined with expected **exit options** push elites to the negotiating table in order to control transitions, with mixed results regarding **democratization** and **democratic consolidation**.

ORIGIN Elite theory, which seeks to explain the power dynamics in modern society by stipulating that a small minority holds the majority of power (and treats this as inevitable), has its roots in the Italian school of elitism developed by theorists such as Vilfredo Pareto (1848-1923), Gaetano Mosca (1858-1941), and Robert Michels (1878-1936) in the late nineteenth and early twentieth centuries. These scholars emphasized the concentration of power in a small group of elites, who influence key political, economic, and social decisions. Pareto (1916, 1935) introduced the concept of governing and non-governing elites. Mosca (1896; 1939) described society as divided between a ruling minority and a ruled majority, highlighting the organized nature of elites in contrast to the unorganized masses. Michels (1911, 1915) contributed his 'Iron Law of Oligarchy' (see Box 5.4), which suggested that all organizations inevitably become oligarchic as they grow, concentrating power in the hands of a few (Maloy 2023).

LITERATURE & KEY SIGNIFICANCE Pactology became particularly influential in the 1970s and 1980s, during the 'Third Wave' (see Box 6.3) when it was first applied to explain **transitions** in Latin America and southern Europe (O'Donnell et al. 1986; Karl 1990; Higly & Gunther 1992). During this time, political pacts were seen as crucial for facilitating transitions from authoritarian regimes to democratic governance. Scholars viewed these elite pacts as mechanisms to manage the uncertainties of transitioning to a democratic regime by allowing political actors from both the outgoing regime and the opposition to negotiate compromises and share power, thereby enhancing the probability of a successful transition to a viable democracy.

However, since the 1990s, the popularity of elite pact theory has declined. There have been criticisms regarding its effectiveness. Some scholars argue that pacts can 'freeze' democratic transitions by empowering already powerful actors, potentially undermining democratic principles and practices, stalling socioeconomic progress, fostering **clientelism** and **corruption**, limiting political competition, and obstructing the growth of a democratic **civil society**. The theory's focus on successful transitions also means that less attention was paid to instances when pacts failed to achieve democratization, resulting in a limited understanding of the conditions necessary for their success.

Additionally, there is a lack of empirical support for the assumption that pacts lead to frozen democracies (Encarnación 2005). Cases like post-Franco Spain demonstrate that pacts can indeed contribute to successful democratic transitions: *"while parting does produce birthmarks, parted democracies are not necessarily frozen, but rather can be transformed into more competitive democracies"* (Field 2002: viii).

O'Donnell et al. (1986) argue that pacts are more likely to occur in contexts where civil society, especially the working class, is politically weak and inactive, allowing elites to negotiate with minimal interference. Colombia and Venezuela in the 1950s exemplify such transitions, in which pacts helped establish limited democratic systems. However, during the Cold War, much of South America had an active working class and parties representing their interests, complicating elite-driven pacts. This highlights the crucial role of the nature of civil society in shaping transition dynamics.

Additionally, O'Donnell et al. (1986) suggest that robust party systems can facilitate pacts, as seen in Spain and Italy, where strong leftist parties negotiated transitions. In contrast, Latin American politics often featured populist parties with weaker working-class ties, making elites hesitant to engage in formal pact-making.

Gennadii Iakovlev (2021) identifies several preconditions as crucial for successful pacted transitions. (a) Both the authoritarian regime and the democratic opposition must have moderate factions willing to engage in negotiations. These moderates are essential as they can mediate between hardliners and radicals within their groups, facilitating a smoother transition process. (b) The regime must be sufficiently weakened, either by internal divisions or external pressures, to consider negotiation as a viable option for maintaining some level of influ-

Box 5.4 The Lingering Iron Law of Oligarchy

Who says organization, says oligarchy
– Robert Michels (1915)

The 'Iron Law of Oligarchy' is a sociological theory formulated by Robert Michels (1911: 1915) in the early twentieth century. It asserts that all organizations, regardless of their democratic intentions, will inevitably develop oligarchic structures. This theory suggests that true democracy within organizations is unattainable because the need for efficient leadership and decision-making leads to a concentration of power among a select few, forming an oligarchy.

Michels developed this theory based on his observations of European socialist parties, particularly the *German Social Democratic Party* (SPD). He argued that the technical and tactical necessities of organizational life require centralized leadership, which inherently leads to oligarchic structures. This centralization is necessary for maintaining efficiency and order as organizations grow larger and more complex. Michels also incorporated psychological elements into his thesis, suggesting that members of an organization tend to be passive and prefer being led by those perceived as more competent or charismatic.

However, Michels' 'Iron Law of Oligarchy' has faced significant criticism over time. Critics have pointed out exceptions to Michels' law, such as organizations that have maintained democratic practices over long periods. Additionally, some scholars argue that Michels' theory is not universally applicable or inevitable. They suggest that democratic organizations can implement structures to resist oligarchization through mechanisms like rotating leadership roles, participatory decision-making processes, and maintaining checks and balances. H. Drochon (2020) highlights that while Michels' law points towards oligarchic tendencies, it also allows for a dynamic conception of democracy where continuous challenges to elite rule can occur. This perspective suggests that democracy involves ongoing efforts to contest and limit the power of elites rather than a static state.

Furthermore, critics like T. Diefenbach (2019) argue that alternative organizational forms exist that can avoid oligarchization by promoting egalitarian structures and collective decision-making processes. These include worker cooperatives, participatory democracies, and other non-hierarchical models. Despite these criticisms, Michels' 'Iron Law' remains influential in discussions about organizational dynamics and power structures. It serves as a reminder of the challenges inherent in maintaining democratic practices within complex organizations and the constant vigilance required to prevent the concentration of power among a few individuals or groups.

ence or control. (c) The opposition must be strong and unified enough to pose a credible challenge to the authoritarian regime. Its unity is crucial for presenting a cohesive front during negotiations and ensuring that any agreements reached are respected by all of the opposition's factions. (d) There must be credible guarantees for both sides regarding their vital interests, such as personal safety, political participation, and economic interests. These guarantees help build trust and reduce fears of retribution after the transition. (e) Pacted transitions often occur in contexts in which there is an existing institutional framework that can be reformed rather than completely dismantled. This framework provides a basis for negotiation and helps ensure continuity and stability during the transition process.

Intra-regime pacts (B) contribute to the **longevity, stability & resilience** of ruling networks and their institutions. They are most necessary after power takeovers (**coup**, **revolution**) and the creation of a new regime, or at a later stage after a leader transfer (**succession**) within the regime. When regimes are rocked by large **protests & uprisings** the ruling coalition can be broadened by co-opting opposition figures. Real or perceived tendencies of **personalization** erode these pacts and increase the likelihood of regime infighting. **Purges** are usually symptoms, either the prelude to a supreme powerholder breaking (or renegotiating) the pact, or the punishment of a rebellious inner circle faction for breaking a truce. This type of pact has not been researched in a systematic fashion due to a lack of credible data and because of the difficulty of obtaining sources that are located in still authoritarian contexts.

METHODOLOGICAL ISSUES The theory's emphasis on elite agency has been criticized for downplaying the role of structural and historical constraints in shaping transitions, leading to an incomplete understanding of democratization processes. Alternative explanations have also emerged, focusing on other factors driving transitions, such as economic development, institutional design, and civil society. These shifts reflect a broader trend in political science toward more comprehensive frameworks, incorporating not only elite negotiations but the roles of non-elite groups and broader societal dynamics.

Despite its decline in popularity, elite pact theory remains relevant to understanding political transitions. Contemporary scholars recognize the need to analyze pacts in conjunction with other factors, such as the broader political and historical context, the institutional design of new regimes, and the role of (un)civil society. Elite pacts are not inherently good or bad for democracy; their impact depends on the specific context and how they are implemented.

REGIONAL VARIATION Elite pacts were less formalized during the Cold War, when externally-imposed transitions, often backed by external forces, were more common (e.g., West Germany and Japan). The end of the Cold War brought renewed attention to elite pacts, with two important shifts: a regional focus on Eastern Europe, and a greater emphasis on understanding **democratic consolidation**. For comparative works, see Burton & Higley 1987.

Latin America This region has consistently been a focal point for studying elite politics and transitions, both during and after the Cold War (Karl 1987; 1990; Higley & Gunther 1992; Higley 1992). Its history of authoritarianism, combined with waves of democratization, offers numerous cases to examine the role of elites and pacts. **Authoritarian legacies** in Latin America also play a role. Effective pacts require a shared understanding among political actors that violating agreements harms all involved. However, past authoritarian reversals, and instability, may undermine trust among elites, reducing their willingness to commit to binding agreements (O'Donnell et al. 1986).

Southern Europe Countries such as Spain (Encarnación 2003; Sanchez 2003), Portugal (Costa Pinto 2006; Costa Lobo et al. 2016; Castaño 2024) and Greece (Karakatsanis 1996; Gursoy 2017), which transitioned from authoritarian rule in the 1970s, have garnered significant comparative attention (Linz 2019). The Spanish transition, especially, is often cited as a model for successful pacted transitions (Field 2002). A less-studied case is Albania (Margariti 2021).

Eastern Europe Following the fall of the Soviet Union, Eastern Europe became a key area for analyzing elite politics and transitions (Higley & Pakulski 1999; Pakulski et al. 1996; Frič et al. 2014). Scholars have used pact frameworks to explore the diverse democratization paths of countries like Poland (in Polish, Szelényi et al. 1995; Pakulski & Wasilewski 2006), Hungary (Tökés 1996; Seleny 1999), Czechoslovakia (Baylis 1998; Szomolányi 2019), Russia (Lane 1996; Gel'man 2003; Petrov et al. 2022), and Ukraine (Flikke 2008).

Regarding the rest of Eurasia, Luong (2002) and Collins (2002) are notable works for Central Asia (see **clan politics**). In the case of African countries, the lens of ethnic politics (Opalo 2011; Bedasso 2015) is usually used to explain their lack of durable elite pacts, but pacts still feature in the context of post-civil war negotiations (Le Van 2011).

Exit Options & Leader Fates

Jak się nie ma, co się lubi, to się lubi, co się ma.
(If you don't have what you like, you've got to like what you have.)
– Polish proverb

Nadzieja matką głupich.
(Hope is the mother of morons.)
– Polish proverb

Everybody worries about the future; dictators particularly. The comparative study of possible exit scenarios – how certain types of leaders leave power – has made it possible to model political transitions and, sometimes, even to make informed predictions. In democracies, leadership turnover is institutionalized, expected and desired to make way for new generations of politicians and to keep polities accountable to their electorates. In dictatorships, losing power has unappealing consequences which, according to rational choice theories, shape the ruler's behavior. Still, there is a lot of variation among types of authoritarianism.

DEFINITION Exit options and the fate of rulers refer to the various ways in which political leaders, especially autocratic leaders, can leave power and the potential consequences they face after leaving, such as punishment, exile, or a peaceful retirement.

'Exit options' are a product of game theory frameworks. These scenarios compile the predetermined rational choices rulers can make when their regime is threatened and they are likely to lose power. The menu of available choices and the scope of rulers' agency are, in turn, considered dependent on the (organizational) structure of their respective **political regimes** and their available resources, in combination with the precise nature of the threat (**foreign invasion**, **coups**, **revolutions**, **rebellion**, **protests**, etc.), the international context, and mitigated by the 'repertoire' of contestation (see Box 5.8). Note: mass non-violent forms of protest can be more dangerous to rulers than violent contestation (Gleditsch et al. 2023).

'Leader fates' are the actual outcomes and consequences of **ousters** or (electoral) defeats. They are shaped by various factors, including the manner of leaders' exit, the nature of the successor regime, and the presence of domestic or international pressure to hold them accountable for past actions. Such patterns can be mapped and studied as separate variables in transition studies, especially with an eye on democratization trends (resulting in liberalization and democratic consolidation), on the one hand,

and the likelihood of civil war and failed democratic transitions, on the other.

SEE ALSO Exit options are integral for understanding regime change and **transitions**, either **democratization** and **democratic consolidation**, or 'failed' transitions resulting in renewed autocracy. They are related to time horizons (see Box 5.5) and, domestically, influence various aspects of regime behavior (**repression**, **coup-proofing**, hoarding), as well as their international **performance** (e.g., **conflict** behavior). Autocratic exit options are one of the main explanatory features of the typology by **Geddes, Wright & Frantz** and relate to regimes' ability to negotiate **elite pacts** and avoid lustration (Box 3.7), **purges**, or other forms of persecution.

KEY SIGNIFICANCE This research field, which focuses on leader exit options and fates, is crucial for understanding the dynamics of authoritarian regimes. By analyzing the decisions leaders make when faced with the prospect of losing power, and its consequences, researchers can gain insights into the **longevity, stability & resilience** of these regimes.

Given (relatively) attractive exit options, rulers might be more inclined to step down voluntarily, facilitating a smoother transition of power. Conversely, if leaders anticipate severe punishment (or death) upon losing office, they may cling to power, increasing the risk of violent conflicts or repression (Goemans 2008; Radtke 2020). This helps explain variations in leader behavior, as leaders consider their well-being (and that of their families and friends) after they have left power, and this influences their decision-making while in office.

This research has significant implications for policymakers aiming to promote democracy and stability, particularly in regions with (long) authoritarian legacies. By identifying conditions that favor peaceful and democratic transitions, such as safe exit options for outgoing dictators, policymakers can design effective interventions.

Additionally, understanding the destabilizing effects of exiled leaders can inform strategies to mitigate risks and promote lasting peace. Despite its importance, the study of leader exit options and fates, especially the long-term consequences of exile (and possible return), remains under-explored compared to other areas, like leader survival (Escribà-Folch & Krcmaric 2017; Krcmaric & Escribà-Folch 2022).

Overall, this research field offers valuable insights into the complex interplay between leaders, domestic politics, and international relations. It contributes to more accurate theories and – sometimes – provides the only predictive frames available during autocratic transitions, which are notoriously volatile and chaotic (Baturo 2016).

ORIGIN The origins of 'exit options' are unclear and diffuse, but by the late twentieth-century political scientists adapted rational choice frameworks to political systems. William H. Riker (1920-1993) and Anthony Downs (1930-2021) were among the first to do so. By the early 1990s, rational choice theory began to gain sustained attention in comparative politics. The typology of **Geddes, Wright & Frantz** was one of the first to apply the theory, differentiating it to various forms of authoritarianism.

Anthony Downs' (1957) political choice theory was a seminal contribution to political science, offering an economic perspective on democratic processes. By applying similar economic principles (like firms and investors tend to do), it explores how political actors, including voters and parties, behave in a democracy. Together with Riker (1962), Downs' work is recognized as one of the earliest to introduce the concept of rational choice theory into comparative politics, analyzing how individuals make decisions based on their preferences and the information available to them.

LITERATURE The literature consistently illustrates that dictators are profoundly concerned about their fate after leaving office, a concern that significantly influences their decision-making while in power. Rather than focusing solely on preserving their position, dictators strategize to maximize their well-being in case they are ousted.

Dictatorships, particularly **personalist regimes** where power is highly concentrated, often lack mechanisms for the safe and stable transfer of power. This absence of security leaves deposed leaders vulnerable to various negative outcomes, including exile, imprisonment, and even death. These risks are not merely theoretical. Goemans (2008: 772) finds that while only about 8% of leaders who lost office in a regular manner suffered exile, jail, or death, fully 80% of leaders who lost office in an irregular fashion suffered one of these punishments.

Exile emerges as a prominent theme, representing both a potential escape route and a source of continued uncertainty for dictators. On the one hand, the option of fleeing to a foreign country that is willing to offer protection provides a powerful incentive for a dictator to relinquish power, especially when facing domestic unrest or violent uprisings. Exile offers a way to escape the immediate threat of retribution and potentially retain some assets or influence. However, exile is not a guaranteed solution, and its attractiveness depends on several factors. Dictators must weigh the likelihood of finding a host country against the possibility of extradition, prosecution, or a less comfortable life in exile.

These calculations are complex and involve assessing factors such as the following. (a) Transnational ties (see **linkage & leverage theory**): Dictators are more likely to find refuge in countries with which they have strong pre-existing connections, such as a shared colonial history, formal alliances, or economic ties. (b) Geographic proximity: Distance matters; countries geographically closer to the dictator's home country are more accessible and may offer logistical advantages. (c) The political stability of potential hosts: Dictators seek out stable countries where the risk of policy reversals, such as a change in leadership that could lead to extradition, is lower. Dictators are more inclined to seek exile in neighboring states that have previously hosted other dictators, are militarily strong, and share colonial links,

formal alliances, or economic ties (Escribà-Folch & Krcmaric 2017).

The issuance of international arrest warrants, such as those by the *International Criminal Court* (ICC), can deter countries from offering refuge to dictators, due to the potential legal and diplomatic repercussions of harboring individuals wanted for serious crimes, like genocide or crimes against humanity (see the Mogadishu line in Box 3.12). On the other hand, it also affects ousted dictators' choice of exile destinations. If these are too limited, insecure or unattractive, this increases their overall willingness to cling to power by all means necessary, instead of taking their chances in negotiations (Goldsmith 2003). Before the rise of the international human rights regime in the past three decades, asylum was an effective tool to encourage autocrats to step down, often as part of negotiated transitions to democracy. International actors played a key role in this process by offering asylum to fleeing rulers, convincing leaders to leave, or brokering agreements with local authorities to facilitate the departure of authoritarian leaders when they lacked credible domestic protections (Escribà-Folch & Wright 2015: 63-64).

The experiences of their predecessors provide crucial information for dictators contemplating their own exit strategies (see **authoritarian learning**). Dictators observe the fates of those who came before them, learning from their successes and failures. A history of dictators from the same country or region facing severe consequences after leaving office can deter a current leader, fearing a similar fate, from stepping down. Conversely, if previous dictators managed to negotiate peaceful exits or secure comfortable retirements, this can encourage their successors to consider similar paths (Baturo 2016).

Dictators' assessment of their potential exit options and post-tenure fate permeates various aspects of their decision-making. Dictators who believe they have limited options for a safe exit may be more likely to engage in risky foreign policies, such as initiating conflicts, to maintain their grip on power. They might even escalate existing conflicts, hoping for a victory that could bolster their standing and deter challenges (Goemans et al. 2009).

When dictators perceive high stakes and few guarantees for their safety after leaving office, they are more likely to resort to repression and violence to suppress dissent and secure their hold on power. This can create a vicious cycle of instability and conflict, making peaceful transitions less likely (Escribà-Folch & Wright 2015). Goemans et al. (2009) reveal that transitions to democracy (in the third wave) were more likely to fail when autocratic rulers were punished after leaving office, suggesting that punitive measures against former autocrats might destabilize nascent democracies rather than strengthen them. (See also Albertus & Menaldo 2014; Albertus 2019.)

In an effort to retain power and potentially improve their post-tenure prospects, dictators may manipulate constitutional rules, for instance by extending **term limits** or consolidating power, to make it harder for them to be removed (Baturo 2011; Miller 2021). Even after a peaceful, negotiated transition, a breakdown of the **elite pact** and of immunity, an overstepping truth commission (Box 5.7) or the sudden announcement of 'lustration' policies (Box 3.7) can result in violent reactions from former regime networks.

Dictators are strategic actors who consider not just their time in office, but also their life after power. Their decisions are shaped by the perceived costs and benefits associated with different exit options and the potential consequences they might face, making the study of leader fate an essential aspect of understanding authoritarianism.

CLASSIFICATIONS The **Geddes, Wright & Frantz** classification identifies four types of autocratic regimes: (a) personalist rule, (b) single-party regimes, (c) military regimes, and (d) monarchies (Geddes et al. 2014). In this ruler-focused typology, game theory is applied to posit the internal power dynamics of a regime type, helping to predict the most likely exit strategies for rulers and, consequently, the most probable transition scenarios.

Military regimes have institutional mechanisms, like power-sharing agreements, that help manage leadership transitions. These regimes are more likely to transition to democracy after hostile military interventions by foreign countries or international organizations (Debs & Goemans 2010), which often aim to restore democratic rule. Military defeat can weaken domestic support for both military and party-based regimes, further facilitating democratic transitions. To maintain military unity, officers usually negotiate a return to barracks that protects their careers and benefits (**elite pacts**). When one faction of officers initiates a coup, others tend to support the change. A civil war, in which they have to fight their own troops, is the worst outcome for them. Pure military regimes are also unlikely to compete in transitional elections, reducing opposition harassment and fostering democratic transitions. Leadership rotation and power-sharing may prevent any one individual from concentrating power; compared to other types, such collegial military regimes are the most likely to transition to democracy. Shaming campaigns are often effective in pushing military regimes to retreat, especially in nations with a history of democracy. Military **juntas** are common targets for democratic interventions that aim to restore overthrown democratic governments. Such interventions, especially ones that physically remove the regime from power, significantly increase the likelihood of democratization. They are more inclined to transition to democracy, anticipating a lower risk of punishment – including death – under a new democratic order than by being replaced by another dictator. Their threat of mounting a coup can leverage exit guarantees from successor regimes (Debs 2016; Kendall-Taylor & Frantz 2014; Kim & Kroeger 2017; Escribà-Folch & Wright 2015).

Party-based regimes also rely on institutional arrangements to handle leadership transitions. Dominant-party regimes often have formal and regular succession mechanisms that reduce factional con-

flict and ensure continuity. Peaceful leadership rotation is common, as institutions guarantee that factions have future opportunities to gain power. This reduces the likelihood of violent takeovers. Party regimes can protect the interests of former elites by using party institutions to gather support and retain influence in a new democratic order, thereby avoiding punishment. With **patronage** networks and **propaganda** machines in place, these regimes often perform well in post-transition elections, offering leverage for former elites to minimize the costs of their departure (Escribà-Folch 2013; Escribà-Folch & Wright 2015; Kendall-Taylor & Frantz 2014; Davenport et al. 2021). Autocratic ruling parties often remain influential in democracies as a consequence of advantages retained from their authoritarian past, such as policy experience, ethnic bases, and organizational strength. These parties frequently succeed in democratic transitions by maintaining these advantages rather than undergoing radical changes. The extent of their success depends on the degree to which their autocratic legacies translate into democratic competition and on whether the new political rules disadvantage new parties. Therefore, former autocratic parties significantly shape young democracies and can negatively impact democratic survival and quality (Miller 2021).

Personalist regimes, which dismantle institutions that could constrain the leader or serve as power bases for rivals, are most vulnerable during protests. These regimes are brutish, but institutionally fragile, with leaders usually having a narrow base of support based on personal ties. They are the least likely to transition to democracy and the most resistant to peaceful exits. Since they cannot count on a safe future outside of power, personalist leaders – with few exceptions, see Box 3.6 – cling to their position, renege on promises of reforms, and make their transitions violent. This escalatory violence, in combination with hollowed-out institutions and (extreme) **systemic corruption**, makes a transition to democracy unlikely and democratic consolidation even rarer (Van den Bosch 2021). When these regimes collapse, or their last stronghold is about to be overrun, leaders either flee into exile or face punishment. The longer a personalist spell (Box 2.4), the more likely it is that a successor regime will also be(come) personalist or that the country descend into civil war (Escribà-Folch & Wright 2015; Radtke 2020; Van den Bosch 2021; Kim & Kroeger 2017; Kendall-Taylor & Frantz 2014).

The **monarchies** still present in today's world are a durable regime type with regulated modes of **succession**. In contexts where there is no compromise, **revolution** and violence are required to enforce regime change. Possessing traditional **legitimacy**, monarchs under pressure can either negotiate an exit, in which they abdicate in favor of a more acceptable successor, or bind themselves to constitutional constraints, thus becoming a figurehead (retaining their influence, wealth and prestige in exchange for real power).

MEASUREMENT *Archigos* (Goemans et al. 2009) is probably the most comprehensive and widely used dataset for measuring leader fates and regime exits. Multiple sources draw on this dataset when making claims about leadership characteristics, regime type, post-tenure fate, the way leaders assume and leave power, and the length of their stay in power. *Archigos* contains four categories regarding the post-tenure fates of ousted leaders: (i) okay; (ii) exiled; (iii) jailed; and (iv) killed. The dataset records the highest level of punishment a leader faces within one year of leaving office. This limitation, however, has been criticized. For instance, Kubota et al. (2022) developed the unique *Leaders in Exile* dataset, which tracks outcomes for exiled leaders in the long term. Their study systematically examines whether exile truly functions as a form of punishment. Specifically, it investigates whether exiled leaders were able to return to their home countries, how they were treated upon their return, and whether their experiences in exile were favorable.

METHODOLOGICAL ISSUES As a sub-focus of rational choice theory and the behaviorist tradition of comparative politics, this approach has faced criticism for its perceived reductionism and failure to account for cultural and historical contexts. Critics argue that the theory oversimplifies political behavior by focusing solely on self-interest and rational calculations, ignoring the complex (psychological) motivations (e.g., **leader personality**) and cultural settings that influence political decisions (Roskin 2024).

Examining only the immediate aftermath of a leader's departure from office might not fully capture the long-term consequences of their rule or exile. The influence of a former leader might persist for years or even decades, potentially shaping political events and instability long after leaving office.

Broad regime labels such as 'military' or 'party regimes' can mask important variations in their internal dynamics and leadership structures. For example, is a military regime run by the top brass, junior officers, a strongman or rebels? Such distinctions matter when it comes to how they perceive threats, how they interact with domestic and international actors, and how they estimate their chances in a new order.

NEW FRONTIERS Adam and Tsavou (2022) combine the *Archigos* dataset with a cross-country dataset on terrorism, from 1970 to 2015, to shed light on leader fates after terrorist strikes. After experiencing terrorist attacks, autocratic leaders are more vulnerable to overthrow than democracies due to the former's reliance on a narrow support base, one riddled by increased factionalism as a result of the **terrorism**. Electoral autocracies, which contain a platform for opposition forces to rally against the incumbent, are especially prone to leadership changes following terrorist attacks.

Box 5.5 Time Horizons – A Ticking Clock

Fugit irreparabile tempus
(Time flies, never to return)
– Virgil

Time horizons refer to how long a regime expects to be in power, an idea that has been used to explain a host of different outcomes in authoritarian regimes. The theoretical framing of time horizons originates from broader studies of inter-temporal decision-making in political science, economics, and psychology, such as Robert Axelrod's (1984) notion of the 'shadow of the future' in cooperation theory and subsequent research on how actors weigh short- versus long-term benefits. Autocracies with longer time horizons are more likely to invest in their publics compared to those with short time horizons. This is known as the 'stationary' versus the 'roving' bandit theory, originally articulated by Mancur Olson (1993).

An autocrat who does not know when they will be ousted from power will have a strong incentive to engage in predatory economic behavior, confiscating as much as possible. Rulers who are unable to make any prediction about the timing or nature of their **ouster**, nor possess any guarantees about their **exit options & leader fates** are influenced by this uncertainty, which leads them to steal as much as they can, while they have the power to do so.

In contrast, autocratic regimes that believe that they will be in power for the long run, usually have a secure way of rotating elites, are more likely to provide public goods and develop long-term strategies. Because the regime knows they are in it for the long haul, they have an incentive to invest in things like property rights enforcement, which in turn, will increase economic growth (Clague et al. 1996; Knutsen & Fjelde 2016; Wright 2008). Research has also shown that autocracies with longer time horizons are also more likely to invest in healthcare (Yan & Lin 2020). Further research from China has also demonstrated that shorter time horizons of local officials has also corresponded with less investment in environmental protection and fighting climate change (Eaton & Kostka 2014).

Personalist rule, which lacks institutionalized mechanisms of turnover in power (and thus cannot provide leaders any certainty over their tenure) are more likely to have short time horizons. Because of this, it is more often than not, that personalist regimes engage in predatory behavior (**kleptocracy**). In Zaire under Joseph Mobutu (Box 1.7), the president's share of the economy rose to 95% (Reno 1997). On the other hand, **single-party regimes** which have clear methods of rotating elites and enjoy low coup risk and have stable regimes will try to make investments in the country's future, such as was the case with Singapore in generating economic growth and improving human development (Tushnet 2014).

Box 5.6 Dictators' Bodies: Burial, Memory & Necropolitics

Alla fine del gioco, il re e il pedone finiscono nella stessa scatola.
(After the game, the king and the pawn go into the same box.)
– Italian proverb

Before I died, I told my wife
I didn't want a parade.
It's in my will.
Nothing fancy.
A twenty-one-gun salute will do
– R. Zamora Linmark (2018)

The second quote above is extracted from the poem "The Dictator en Route to His Burial at the National Heroes' Cemetery" by R. Zamora Linmark, published in *The Massachusetts Review* in 2018, and touches upon the enormous controversy of repatriating the body of the brutal Philippine dictator, Ferdinand Marcos (1917-1989) for burial in a cemetery reserved for national heroes, presidents, and military figures. The burial was seen by many as part of a broader trend of historical revisionism in the Philippines, particularly under (authoritarian) President Rodrigo Duterte (reign: 2016-2022), who supported the burial and had close ties with the Marcos family.

The fate of dictators' bodies after death is not merely a matter of burial logistics or familial decisions; it is deeply intertwined with the political, social, and symbolic struggles that persist long after their regimes have ended. Whether a dictator dies in office, in exile, or through violent ouster, their body becomes a contested site of power, memory, and necropolitics. The treatment of these bodies reflects broader societal efforts to reckon with their legacies and the impact of their rule.

When revolutionary dictators die in office, their bodies often become symbols of the state they led and transformed. These bodies are sometimes preserved and displayed as part of a broader effort to maintain the regime's **legitimacy** and perpetuate the leader's **personality cult**.

For example, Vladimir Lenin's embalmed body has been on display in Red Square since he died in 1924. Despite ongoing debates about whether it should be buried, his body has been so symbolic and so political that there have now been more attempts at desecrating his corps than assassination attempts during his life: In March 1934, Mitrofan Nikitin, an agricultural worker disillusioned by corruption and famine, attempted to shoot Lenin's body as an act of protest, though he missed and turned the gun on himself. A more successful assault occurred in July 1960 when a man named Minibayev shattered the sarcophagus glass (by climbing on and kicking it) and damaged Lenin's face and hands with shards. In 1973, a more deadly attack took place when a man detonated a bomb inside the mausoleum, killing two bystanders and injuring several others, though Lenin's body remained unharmed.

The continued presence of Lenin's body highlights the complexities of reckoning with the past and the enduring symbolism attached to such figures. Even Putin (who frowns upon revolutionaries) does not want to resolve the issue: *"As far as the body is concerned, in my opinion, it should not be touched."* (Daily Sabah, 2024) Similarly, other leaders like Ho Chi Minh, Mao Zedong, and Kim Il-Sung were embalmed and placed in mausoleums to project an image of immortality and ensure that their ideological legacy would endure beyond death.

However, not all dictators who die in office are treated

with such reverence. In some cases, regimes seek to distance themselves from a deceased dictator by removing their body from any place of honor and burying it in a less prominent location. This often signifies an effort to dismantle the dictator's cult of personality and diminish their legacy. A prime example is Joseph Stalin's removal from Lenin's Mausoleum in 1961 and his subsequent burial near the Kremlin Wall. This act was part of Nikita Khrushchev's de-Stalinization (Box 3.4) campaign aimed at erasing Stalin's influence from Soviet politics and society. (Kattago 2017)

The other way around is also possible: After Robert Mugabe's death in 2019, a dispute arose between his family and the Zimbabwean government over his burial. While the new regime wanted to honor him at the *National Heroes Acre*, emphasizing his role in the liberation struggle, Mugabe's family insisted on a private burial in his hometown, reflecting distrust and a desire to control his legacy by those who ousted him in a palace coup (Burke & Chingono 2019; BBC, 2022).

When dictators die in exile, their bodies can become contentious symbols for both supporters and detractors within their home country. The decision to repatriate or bury them can ignite political debates about the legacy of their rule. In some cases, dictators who die in exile are denied burial in their home countries due to the negative sentiments surrounding their regimes. For instance, Idi Amin, the former leader of Uganda, died in exile in Saudi Arabia in 2003 and was buried there because his repatriation was deemed unacceptable by the Ugandan government. His burial in Saudi Arabia reflects both his ignominious fall from power and Uganda's desire to distance itself from his brutal regime.

In other cases, repatriation becomes a protracted and controversial process due to ongoing political divisions over the dictator's legacy. Ferdinand Marcos (mentioned above) provides a striking example: after dying in exile in Hawaii in 1989, his body was preserved by his family while they lobbied for his burial at *Libingan ng mga Bayani* (Heroes' Cemetery) in the Philippines. His body remained on display for decades until President Rodrigo Duterte allowed his burial there in 2016 – a decision that sparked widespread protests from those who viewed Marcos as a corrupt and brutal dictator responsible for **human rights** abuses on a mass scale during his imposed martial law. (Martin 2019)

Francisco Franco, the Spanish dictator, was originally buried in the *Valley of the Fallen*, a controversial mausoleum near Madrid that became a symbol of fascist glorification. (Biddiss 1994) His burial there sparked long-standing disputes, as the site also holds the remains of thousands from both sides of the Spanish Civil War. In 2019, after years of legal and political debate, Franco's remains were exhumed and moved to *Mingorrubio Cemetery* following a ruling by Spain's Supreme Court. The exhumation, part of broader efforts to address Franco's legacy, aimed to transform the Valley of the Fallen into a site of reconciliation rather than one honoring the dictator. (Anderlini 2021)

Dictators who are violently ousted often face a very different fate than those who die peacefully or in exile. Their bodies may be subjected to public humiliation or disposed of unceremoniously as part of an effort to erase their memory or prevent their graves from becoming sites of veneration for loyalists. This treatment reflects both symbolic revenge against their oppressive rule and an attempt by new regimes to assert power over their predecessors.

One infamous example is Benito Mussolini's execution by Italian partisans in 1945. After being shot alongside his mistress Clara Petacci, Mussolini's body was dragged through the streets before being hung upside down from a metal girder in Milan's Piazzale Loreto – a deliberate choice meant to evoke earlier fascist executions at that site. Mussolini's public humiliation served as both catharsis for Italians who had suffered under **Fascism** and a stark demonstration that his power had been decisively broken. (Matus 2005)

After Adolf Hitler's suicide on 30 April 1945, in his Berlin bunker, his body and that of Eva Braun were burned by his aides to prevent capture. Still, Soviet forces later discovered their charred remains, including fragments of Hitler's jawbone and teeth, which were identified through dental records. The Soviets kept the remains secret, moving them several times. In 1970, under KGB orders, the remaining fragments were exhumed, cremated, and the ashes were scattered in a river to prevent any Nazi shrine from forming. Only a few dental fragments remain in Russian archives.

Similarly, Muammar Qaddafi's capture and execution by Libyan rebels in 2011 followed a pattern of public display meant to humiliate him posthumously. After being found hiding near drainage pipes outside Sirte, Qaddafi was beaten and killed by rebel forces; his body was then displayed publicly before being buried in an unmarked grave to prevent it from becoming a rallying point for loyalists. The treatment of Qaddafi's body reflects both revenge against his brutal regime and an attempt by Libya's new leadership to erase his lingering influence.

In some cases where dictators are killed or ousted violently but not publicly humiliated like Mussolini or Qaddafi – such as Cambodia's Pol Pot – their remains may be disposed of quickly without ceremony as part of efforts by new regimes either out of fear they might become martyrs or symbols of resistance for opposition movements. (Guillou 2018) These discussions also pertain to Saddam Hussein's body. Eventually, after his execution on 30 December 2006 at Camp Justice in Kazimiyah, his body was transported by a US military helicopter to his birthplace of Al-Awja, near Tikrit, Iraq, to be buried in the family plot. (Santora 2006)

Box 5.7 Truth Commissions

And ye shall know the truth, and the truth shall make you free
– Holy Bible, Gospel of John 8: 32.

Truth Commissions (TCs) are temporary bodies established to investigate patterns of past human rights violations. They aim to promote democracy by fostering transparency, accountability, and reconciliation. By uncovering the truth about past abuses, TCs can delegitimize authoritarian networks and contribute to a culture of democratic behavior. However, their impact on **human rights** and societal transformation remains a subject of debate.

Eric Brahm (2009) highlights the challenges in TC research, including definitional ambiguities and methodological inconsistencies, which have led to divergent findings about their efficacy. While TCs are often praised for their potential to advance accountability and reconciliation, their effectiveness varies significantly depending on their design, implementation, and context. Olsen et al. (2010) argue that TCs alone often fail to improve human rights protections and may even have a negative impact. This is because they lack enforcement mechanisms to deter future violations or ensure justice. However, when combined with trials and amnesties in what the authors call a 'justice balance,' TCs can positively contribute to accountability and stability.

Despite these limitations, TCs influence societies through multiple mechanisms. Politically, they can encourage institutional reforms and human rights policies through their recommendations. They also mobilize civil society, amplify victims' voices, and foster public dialogue on past abuses. Judicially, TCs may provide evidence for prosecutions or shape judicial processes, advancing accountability for human rights violations. However, they risk promoting impunity if amnesty provisions are included or if their recommendations are not implemented.

Overall, the effectiveness of TCs depends on external factors such as political will and pressure from human rights organizations and victims' groups. When integrated into broader transitional justice strategies, TCs can play a meaningful role in addressing past injustices and fostering democratic governance.

However, Nalepa (2022) finds that their impact on democratic stability can vary, as they may not always lead to significant improvements in democratic governance. Despite this, truth commissions can play a crucial role in rendering authoritarian networks obsolete and promoting democratic values. In relation to other measures (like lustration (Box 3.7), she finds: *"Whether the transparency regime takes the form of lustration or truth commissions depends on our time horizon. In the short-term, truth commissions are effective. By applying to everyone and not only persons running for office they reveal the skeletons in the closet and prevent blackmail as well as undermine authoritarian networks."* (Nalepa 2022: 256)

Imperial Legacies

Every empire, however, tells itself and the world that it is unlike all other empires, that its mission is not to plunder and control but to educate and liberate.
– Edward Said

Empires and imperialism have affected the economic, political, and social development of colonized territories and metropoles. Imperial legacies explain the uneven development in former colonies, the nature of political regimes, and the various social developments in former colonies. Imperialism also affected identity creation in both the colonies and the metropoles.

DEFINITION Imperial legacies include the memories and sentiments apparent across the territories of former empires (Walton 2019), as well as practices such as the persistence of bureaucratic systems inherited from British, French, and other imperial traditions. According to Mulich (2018: 696), the legacies of imperialism are a *"complex web of hierarchical relations and diverse practices."* Imperial legacies are the result of the expansionist policies of empires and the ideology and practice of imperialism.

Empire is, according to Jordheim and Neumann (2011: 154), *"a key concept for thinking about hierarchy between polities."* They explain the conceptual history of the term 'empire,' presenting it in wider regional contexts and tracing its nuances. The conceptual history of an empire contains themes and problems such as forms of rule, race, culture, civilization, political orientation, and so on. It is rather a 'cluster of concepts' or a 'semantic field' than simply a single concept. Jordheim and Neumann (2011: 155) *"hold empires to be polities where middlemen with a territorial base play a central role in key practices, and where the power bargains between the center and the middlemen are not uniform, neither ideally nor in practice."*

Different approaches to the characteristics of empires are possible (Mulich 2018): (i) empires can be seen as expansive units not different from other types of states (see, e.g., Butcher & Griffiths 2017); (ii) or empires can be viewed as qualitatively different from nation-states. For instance, Nexon and Wright (2007) define ideal-typical empires as different from other types of hegemonic and unipolar orders, find that the former combine two characteristics: rule through intermediaries and heterogeneous contracting between imperial cores and constituent political communities. Empires are systems in which cores are connected with peripheries, but peripheries themselves are disconnected (Nexon & Wright 2007: 253). According to Centeno and Enriquez (2010: 345), the main characteristic of empires is multi-ethnic composition accompanied by power asymmetries.

A similar definition is provided by Howe (2002: 30), who claims that *"an empire is a large, composite, multi-ethnic or multinational political unit, usually created by conquest and divided between a dominant center and subordinate, sometimes far distant, peripheries."* According to Reynolds (2006), empires are entities *"consisting of a ruling polity (sometimes called the metropolis) and subordinate polities (peripheries or colonies). They came together, moreover, not by a voluntary (or supposedly voluntary) federation but on the initiative of what thus became the metropolitan polity, often by some kind of armed conquest."*

Mulich (2018: 696) suggests approaching empires as *"particular configurations of networks, often hierarchical, consisting of specific power relations and repertoires of practice."* According to him, building on previous historical and sociological scholarship, empires have three main characteristics: *"1) the differentiation of and inequality among subject groups, 2) a hierarchical relationship between different components of the empire, and 3) an expansionist impulse towards territory and/or subjects"* (Mulich 2018: 696). Defined as networks of relations, empires are composed of social ties and specific practices or a repertoire of practices. These practices are embedded in a historical and social context and bundled together in repertoires (Tilly 1978, see Box 5.8).

Imperialism can be understood as a concept or **ideology**, and colonialism as a practice. According to Said (1994), colonialism is a consequence of imperialism; it is a manifestation of imperial power. Modell (1974) defines imperialism as a *"policy of extending a country's power beyond its borders for the purpose of exploiting other lands and other peoples by establishing economic, social or political control over them."* Edward Said builds on this definition, even extending it by claiming that *every practice intended to rule distant lands and people is called imperialism* (Said 1994).

"Imperialism … operated from the centre as a policy of the state, driven by the grandiose projects of power" (Young 2001, cited in Blunt 2005: 176). It is "*control of the weak by the rich and powerful, not necessarily using the exercise of direct authority*" (Stone 1988: 57), forming the basis for establishing Europe-Africa relations, for instance. Howe (2002: 30) presents a similar definition, claiming that "*imperialism is used to mean the actions and attitudes which create or uphold such big political units – but also less obvious and direct kinds of control or domination by one people or country over others*."

If scholars view imperialism in similar ways to Lenin (1917), as the highest stage of capitalism, then it can only be applied to the era after the 1880s, according to Gallagher and Robinson (1953). The rise of imperialism in the nineteenth century has to be seen in relation to the dynamics of free trade. They define imperialism as a *"sufficient political function of this process of integrating new regions into the expanding economy."* It is important to make two important notes on the relations between economic development and imperialism: *"First, imperialism may be only indirectly connected with economic integration in that it sometimes extends beyond areas of economic development, but acts for their strategic protection. Secondly, although imperialism is a function of economic*

expansion, it is not a necessary function" (Gallagher & Robinson 1953: 5-6).

Imperialism is a policy pursued by imperial powers that "*may set out with a deliberate plan of exploitation, in which local inhabitants and territories are subordinated to imperial aims of aggression, expansion and enrichment"* (Jackson 1957: 412). Four fundamental topics have been discussed regarding the British Empire by proponents of imperialism: (a) the emigration of British labor overseas; (b) the profitability of investing money to support capital formation in the empire; (c) the potential profit from trade and commerce between Britain and its colonies; and (d) the kingdom's security (O'Brien 1988). British imperial policy was a *"by-product of exploration, settlement, and trade"* (Jackson 1957: 412-413).

SEE ALSO Colonial legacies refer to colonial-system treaties and their impact on postcolonial states' economic, political, and social development. On the distinction between postcolonialism and post-imperialism, see, e.g., Göttsche (2017), who illuminates this nuance through the case of the German empire and the loss of its colonies after WWI. In this entry, we present the impact of imperialist **ideologies** on the development of both colonial territories and metropoles. Alongside **colonial legacies** and **colonial states**, this entry presents insights into and the literature related to imperialism. The Japanese Imperial Shōwa regime (Box 4.2) is an interesting case, both a colonizer and an imperial non-Western actor.

The influence of imperial legacies on contemporary **political regimes** remains insufficiently explored, despite scholarly efforts to understand imperialism's impact on modern governance. While these legacies are often associated with colonial systems and their aftermath, not all are inherently negative. For instance, many contemporary West European parliamentary systems have been shaped by their monarchical predecessors. Imperial legacies can be observed, not only in former colonies, but also in the metropolitan centers themselves. Mukherjee (2010) highlights this by arguing that *"economic development in Europe both in terms of the rise in living standards in human development and in the sense of the structural breakthrough with the rise of capitalism was closely linked with Europe's relationship with the rest of the world from about the 15th century."* He examines the British Empire's relationship with India as an illustration of how this imperial connection influenced industrialization in Europe.

Examination of the legacies of empires offers a valuable framework for understanding systemic changes, given their historical dominance and their challenge to unit-centric theories of world politics. Colonial expansion played a significant role in 'political experimentation in local configurations,' blending elements of colonial power dynamics with local contexts and driving transformations at a systemic level (Mulich 2018). Within this framework, the 'imperial' nineteenth century is viewed as a pivotal period of transformation (for further discussion on the significance of this particular century, see Phillips 2016; Bayly 1998).

ORIGIN The study of imperialism and its legacies figures in Marxist theory. Among the first treatises on British imperialism in India were two newspaper articles, *The British Rule in India* and *The Future Results of the British Rule in India*, published in *The New York Daily Tribune*, on 25 June and 8 August 1853 by Karl Marx (Marx 1853a/b; Kumar 1992). Adam Smith also criticized imperialism from an economic point of view in his famous *The Wealth of Nations,* arguing that *"colonies imposed heavy and unfair burdens on British taxpayers, distorted the allocation of investible funds, and increased threats of war and the probability of political corruption at home"* (Smith, cited in O'Brien 1988: 164).

There are various approaches, particularly postcolonial ones, to the analysis and discussion of the legacies of imperialism in terms of power dynamics, manifested in politics, the economy, and social relations. For instance, Osuri (2017) examines imperialism and colonialism in the postcolonial geopolitical context to make visible the coloniality of the (post) colonial nation-state (Osuri 2017: 2428). The transformation of imperialism into neo-imperialism, and its impact on former colonies, was first explored in the 1960s by figures such as Kwame Nkrumah (1965), who detailed this transition in his work *Neocolonialism: The Last Stage of Imperialism*. According to Nkrumah, neo-colonialism involves maintaining economic, political, and military influence over former colonies.

LITERATURE The academic study of imperial history and legacies occupies a prominent place in history and political science, with numerous books and papers assessing the politics and ideological foundations of empires. Niall Ferguson's (2004) *Empire: The Rise and Demise of the British World Order and the Lessons for Global Power* portrays British imperialism as a civilizing force, a view critiqued by Price for neglecting the perspective of the colonized (Price 2006: 606). Price suggests alternative narratives, viewing empire as a 'process of contact, encounter, and interaction,' as discussed in Bill Nasson's *Britannia's Empire: Making a British World* (Price 2006: 606-607).

The 'New Imperial History' examines imperial politics from the viewpoint of the colonized, focusing less on political economies and more on cultural power dynamics (Price 2006: 607). Kathleen Wilson's *A New Imperial History* explores how empire shaped British society and identity, emphasizing the interplay between empire and domestic culture (Wilson 2004). Sir John Robert Seeley (1883) earlier proposed that *"the history of England is not in England, but in America and Asia,"* highlighting the interconnectedness between British history and its empire. David Cannadine introduces the notion of 'ornamentalism' to describe the way that British culture intertwined with empire through class perspectives rather than racial differences (Price 2006: 620).

CLASSIFICATIONS & REGIONAL VARIATION The legacies of imperialism may be traced through the economic (A), political (B), and social aspects (C) of postcolonial societies:

Economic Legacies (A) Marxist economic interpretations argue that imperialism and colonialism impoverished the Third World. Roy (2015) explores British imperialism in India, examining various approaches and interpretations of colonialism's economic impact, while also proposing new strategies to address imperialism in India. Mudimbe (1988) discusses how European imperialism underdeveloped the non-Western world, particularly Africa, which is also the subject of Rodney's seminal book *How Europe Underdeveloped Africa* (Rodney et al. 2018). Demissie (2007) analyzes the social consequences of economic relations, focusing on the legacy of raw material extraction and its link to urbanization and worker migration.

Kenneth Pomeranz' *The Great Divergence* (2021) compares the development of Europe with China and Japan, attributing the Industrial Revolution's Western origins to coal deposit locations and New World trade. Haberly and Wójcik (2015) examine how historical developments, especially British colonialism – Hong Kong, Singapore, the United Arab Emirates (UAE)/Dubai, and Mauritius acting as key regional offshore nodes – influenced current offshore FDI networks. Bhattacharya and Zachariah (1999) analyze development as a form of imperialism in colonial India post-WWII.

Japanese imperialism's economic legacies in Korea, Taiwan, and Northeast China are linked to industrialization. Japan uniquely transferred heavy industry to its colonies, laying the groundwork for further industrial development (Cumings 1984). Japanese investments in infrastructure, education, and economic enterprises (tobacco, salt, opium, railways) played a significant role in capital accumulation and economic involvement (Kohli 1994).

Imperialism also impacted the metropolis. For instance, Britain's emergence as an industrial nation was facilitated by exchanging manufactured goods for colonial primary produce (O'Brien 1988). Cain (2012) reviews British imperialism's economic consequences, highlighting topics like imperial expansion economics, the creation of its 'sense of Britishness' and British cultural superiority. He references John Darwin's *The Empire Project* (Darwin 2013), which details the history of the British Empire from 1830 to 1970.

Political Legacies (B) Imperial rule had an important impact on the formation of nationalist ideas and political and legal regimes. Centeno and Enriquez discuss the impact of the characteristics of empires on state formation and trace the links between imperial phenomena and national state outcomes. They argue that *"variations in national state development from imperial metropole origins can be explained, at least in part, by variations in the imperial administration, finance, development, identity, and inequality"* (Centeno & Enriquez 2010: 343). Bunce (2005) studies the imperial impact on the creation of nationalist ideas and political regimes in Central Europe. She argues that "*the political empowerment of the national idea continued when imperial dynamics returned to the region with the rise of communism"* (Bunce 2005: 406). She distinguishes the legacies of the Ottoman, Habsburg, and Russian empires from the territories ruled by Britain, France, and Spain in terms of nation-building. Bunce perceives communism as an imperial system and the anti-communist movements in the Eastern Bloc states as *"anticolonial struggles waged against the empire in the name of sovereignty, equality, and freedom for the nation"* (Bunce 2005: 429).

Imperialism also had very important consequences for legal systems. According to Joireman (2001), for instance, the British believed that the imposition of their 'civilizing' judicial institutions was one of the greatest legacies of colonialism. For the imposition of imperial legal systems in Spanish, Portuguese, British, and French colonies and the consequent elimination of Indigenous legal systems (in the case of Spanish and Portuguese colonies) or their accommodation into new legal systems (in the case of British colonies), see Schmidhauser (1997). There are also evident legacies in terms of law. For example, Han and O'Mahoney (2014: 268) investigate whether *"British colonialism is largely responsible for the criminalization of homosexuality around the world."* Wilets (1994) claims that the legacy of British colonialism makes the decriminalization of homosexual conduct less likely.

Anna Bocking-Welch (2012) examines the transformation of British moral geography during the decline of the British Empire, focusing on international campaigns against hunger in the Commonwealth. She argues that Britain played a pivotal role in conceptualizing hunger as a global issue, marking it as a legacy of its colonial empire. Bocking-Welch (2012: 892) suggests that decolonization did not signify the end of empire, as *"imperial interest and global reach continue to the present."*

Charbonneau (2014) explores the imperial legacy in international peacebuilding, analyzing the ways that historical imperial capabilities have been adapted in modern contexts. He finds that, in West Africa, French imperialism involved a history of inclusion and exclusion, tied to its civilizing mission. Post-decolonization, France maintained close ties with former colonies through 'military cooperation,' which allowed African political elites to exploit resources of these relations, thus securing their autonomy (Charbonneau 2014; Bayart 2009).

Imperial legacies are also expressed in ideas of regionalism. The idea of *Mitteleuropa* associated with federalist claims was rediscovered in Italy in the 1970s. Discussions of *Mitteleuropa* in Germany of the 1980s raised ideas of reunification. In Central Europe, it meant weakening the ties with Eastern Europe and establishing relations with the West (Ballinger 2003: 95). For the relations between imperialism and cartography, see, e.g., Stone (1988), who claims that maps legitimized the imperial ambitions of great powers and were simultaneously symptoms of *"change from imperial to colonial control"* (Stone 1988: 61). The imperial ambitions clearly expressed during the Berlin conference (1875) had an important impact on the cartography of and map making in Africa.

Aware that imperialism had an impact on metropoles as well, Reynolds (2006: 162) discusses

"how much and in which empires repression abroad has affected ideas about the rights of subjects or citizens at home."

Social Legacies (C) The social legacies of imperialism are evident in both formerly colonized societies and metropolitan centers, manifest in various aspects such as demography, architecture, language, and societal structures. The consequences of slavery have been the subject of several academic works (e.g., Nunn 2008; Law et al. 2016; Arowolo 2010). A critical approach to the study of the impact of colonial violence on penalty, from a postcolonial perspective, can be found in a special issue of the Journal *Punishment and Society,* edited by Black and his colleagues (for the introduction to this issue, see Black et al. 2021).

Imperial legacies in terms of demography, both in metropoles and in former colonies, are considerable. For example, Cohen (1980) studies the case of Algeria and the exodus of French settlers from Algeria to the Metropolis – the *Pieds Noirs* (lit. 'Black Feet'), the *Harkis,* i.e. Algerian Muslims who collaborated with the French authorities, accompanied by Algerian migrant workers. Decolonization generally led to massive population transfers. From British colonies (as Britain administered its colonies using an indirect form of rule) it was only around 10-15 thousand people. From French colonies, it was around 1.5 million people: French settlers from Algeria, Morocco, Tunisia, Indochina, and Sub Saharan Africa (Cohen 1980). Migration from the British West to the East Indies between the 1770s and 1830s, consequent on the loss of the American colonies and acquisition of territories in Asia, caused a demographic change in these territories and the creation of the Second British Empire. These processes were influenced by the abolition of slavery in the British Empire in 1833 and had an impact on the establishment of a settler colony in Australia, where some former Caribbean slaveowners moved (Lester & Vanderbyl 2020: 165). Kuzio (2002), for example, has discussed the case of the Soviet Union, the Russian in-migration to non-Russian territories, thanks to which large numbers of settler-colonists were sent to Latvia, Estonia, Ukraine, Belarus, Moldova, and Kazakhstan.

Imperial architecture persists as a visible legacy in postcolonial cities. There has been a debate about African postcolonial cities (see Demissie 2007), where urban planning was intended to establish political domination and control over resources. Colonialism was not just an economic, political, or military project, but also a spatial one. The colonial buildings constructed at different times, and characterized by the different architectural and urban planning traditions of the various European colonizing powers (Portugal, Netherlands, France, Spain, Italy, Belgium, Germany, and England), are a reminder of this (Demissie 2007: 157).

Colonial cities were built on the coasts to help export raw materials extracted from the colonies' interiors. All major colonial cities in formerly French Africa were constructed in line with French colonial urban planning, and the process was controlled by territorial governments. At the same time, urban planning in Africa was used as a tool for modernization by the French authorities, the result being racially segregation, as French colonial cities were planned mainly to benefit Europeans (Njoh 2004). Mawani (2003) discusses imperial legacies in the case of Stanley Park in Vancouver. She covers the effacement of Indigenous landscape identity, creating a new one based on the colonial project of constructing Vancouver as a settler colonial city, eradicating Indigenous people. The latter are commemorated in the park's commodified representations of totem poles and Northwest Coast Native art. This process was connected to the renaming of coastal places and eliminating the original Indigenous toponymy. The inauguration of Stanley Park was perceived as the birth of a 'civilized imperial city' and the park itself seen as a 'little piece of empire,' constructed as a contrast to the *"racialized primitiveness of Aboriginal peoples"* (Mawani 2003: 110).

Imperial legacies are apparent in the language used. This forms part of a wider idea, as in the case of *francophonie* in the French former colonies. The spread of the French language, supported by France itself, was part of extending France's influence in former colonies. Xavier Deniau, ex-colonial administrator and cabinet minister in charge of overseas territories, claimed that *"language is one of the elements defining national identity (...) language needs to be treated as a crucial element of foreign policy."* For discussions of imperial legacies in the context of language and geopolitics, see, e.g., Cohen (1980: 118).

MEASUREMENT Imperial legacies are very difficult to measure. However, we can study the impact of imperialism by tracing the postcolonial 'imperial transition,' which consists of four aspects: nation-building, state and institution building, and, in some cases, democratization and marketization (Kuzio 2002: 250). An issue affecting the assessment of the impact of imperial legacies on economies is the lack of reliable comprehensive data. Available data only record the part of the flow of British savings channeled through London to the empire (O'Brien 1988: 171). Edelstein (1976; 1982) conducted an analysis of home and overseas returns from paper assets traded on the stock exchange between 1870 and 1913 in Britain.

Vogler (2023) develops a theory of *imperial pervasiveness* and proposes a set of quantitative tests to measure the impact of imperialism on the different levels of **bureaucracy**, combining them with a qualitative analysis of people's perception of bureaucratic effectiveness. He presumes that resistance to foreign rule makes the application of colonial bureaucratic systems more problematic and less effective.

METHODOLOGICAL ISSUES There are methodological issues stemming from the very conceptualization of the term 'empire' and the periodization of imperialism (see 'definition' above). For example, Reynolds (2006) discusses the conceptualization of empires as European state polities and the reservation of the title 'emperor' for European rulers. According to her, these conceptualizations throw up obstacles for the comparative studies of empires, especially when it

comes to non-European empire-like entities. She suggests that *"looking directly at the variety, not to say confusion, of words and concepts that we have inherited may make it easier to lay both words and concepts aside for the moment and concentrate on deciding what seem to be the most important characteristics of the phenomena with which I think that historians of empires, particularly more modern empires, are concerned."* She proposes a proper operationalization of the concept of empires to enable comparative historical analyses.

As for the specific methodologies used to study the impact of imperialism, Walton, for instance, suggests the study of imperial legacies using the method of textured historicity, emphasizing *"the distinctive, embodied encounter between the subject in the present and the objects that convey the past in the present"* (Walton 2019: 357).

EXAMPLES Imperial legacies explain variants in public administration in former colonies. Vogler (2019) studies the relations between imperialism and public administration in the case of Poland, which was split between three empires – Russia, Prussia, and Austria. He finds that there are still noticeable differences in public administration as a result of this diverse imperial past, even finding evidence that *"bureaucracy in the former Austrian partition, which evolved from a decentralized model, is more efficient than bureaucracies in both the former Russian and Prussian partitions, lending additional limited support to the view that decentralized rule has positive developmental effects in the long run"* (Vogler 2019: 809).

Imperialism influenced identity creation in both former colonies and metropoles. The legacy of Russian domination over the Kazakh lands has been studied by, e.g., Zardykhan (2004), who addresses the position of the Russian minority in today's Kazakhstan, as well as Kazakhstani identity-building after independence from the USSR – the policy of 'Kazakhization.'

Assimilation and 'Russification' policies in Ukraine, Moldova, and Belarus are thoroughly examined by Kuzio (2002). These policies aimed to integrate these regions more closely with Russia by promoting Russian language and culture, often at the expense of local identities and languages. Katz (1994) discusses the dissolution of the USSR, which he describes as the last European colonial empire, and its impact on nationalism and democratization in newly independent states. He argues that authoritarian regimes in some post-Soviet states manipulated ethnic identities and national sentiment to maintain power. Meanwhile, Russia continued to exert influence in these newly independent states, often intervening to support Russian-speaking populations abroad.

Göttsche (2017) explores the anti-imperial rejection of colonialism in Germany, comparing historical discourse from WWI and the 1990s. This work highlights how historical memories of colonialism influence contemporary attitudes to imperialism. Stone (1988: 58) characterizes European colonialism and imperialism in Africa as 'collaborative internationalism' with historical continuity. In contrast, colonialism is seen as a brief period marked by competitive European nationalism.

Academic works have compared the legacies of European and Asian empires, highlighting their distinct characteristics. Cumings (1984: 8) presents Japanese imperialism as differing from Western models, emphasizing: *"It involved the colonization of contiguous territory; it involved the location of industry and an infrastructure of communications and transportation in the colonies, bringing industry to the labor and raw materials rather than vice versa; and it was accomplished by a country that always saw itself as disadvantaged and threatened by more advanced countries. Japan was 'weak and puny.'"* Adas (1998) discusses parallels and differences between European and Qing imperialism.

Several papers and books focus on British imperialism in India and its consequences. India's imperial relationship with Kashmir can be understood as a legacy of British imperialism in India, treating Kashmir as a part of India (Osuri 2017). The impact of British colonial rule on India and its post-independence development is discussed, e.g., by Rajan 1969; Tharoor 2018.

IMPACT ON POLICY Imperialism ideas became part of the expansionist policies of the great historical empires. For example, the myths of French imperialism in Algiers, as crucial for the development of the state, have become part of French foreign policy (Cohen 1980: 97-98). Since 1960 the French government has attempted to establish a kind of Commonwealth of French-speaking states. President Giscard d'Estaing revived the idea of Eur-Africa, including the Arab world, and called for a 'trialogue' between Europe, Africa, and the Arab world because of their common historical past (Cohen 1980).

Imperialism had an impact on problematic nation-building processes in various parts of the world. According to Crawford and Lijphart (1995), *"the legacy of incomplete nation-building is perhaps the most important threat to the project of economic and political liberalism in Eastern Europe."* The imperial and colonial past of the Russian and Soviet empires greatly impacted nation-building in post-Soviet states. Ethnocultural definitions of nationhood in post-Soviet states were the legacy of Soviet nationality and imperial policy. This necessitated searching pre-Soviet history for legitimization of their independent existence.

In Belarus, for example, the idea of Russia as a 'brother nation' prevailed, with Soviet historiography as part of the new nation-building process. In Ukraine, on the other hand, the nation was built as contrary to previous historical memory, and Ukraine could no longer use Soviet historiography (Kuzio 2002: 247). Kuzio (2002) discusses current historical narratives in Ukraine, Belarus, Moldova, and Kazakhstan (especially regarding Russia). Bhabha (2004) deals with identity creation in colonies from a critical, postcolonial perspective: *"The objective of colonial discourse is to construe the colonized as a population of degenerate types based on racial origin, to justify conquest and to establish systems of administration and instruction."* Colonial historiography or manipulation of historiography of the colonized serves these

purposes.

Imperial nostalgia is, according to Rodriguez (2020), a constitutive part of identity security, one which has a considerable impact on individual states' policies regarding migration and security, for instance. He studies the development of anglophone empires, Great Britain in particular, and British imperial legacies in the US, Australia, and Canada. According to him, the imperial idea first animated the expansive colonial foreign policy of Great Britain, especially in the nineteenth century. It was adopted by its rivals – Germany, Japan, and Italy. The United States, inspired by Great Britain, developed its own expansionist policies. The concept of the 'Anglosphere,' as a legacy of British imperial policy, consists of ideas of British exceptionalism, and elements such as a free market economy, Protestantism, respect for the law, and parliamentary democracy. Rodriguez discusses the connection between British imperial nostalgia and the vote for Brexit, and Britain's special relationship with the US, especially in the 'war on terror.' Similarly, Graham (2013) links *"security and military doctrine in the cities of the West with those on colonial peripheries,"* and explains them in the context of legacies of colonialism and imperialism.

More critically, and focusing on discourse, Rosaldo (1989) covers imperial nostalgia and analyzes movies about and anthropological writings on the colonial period in the Philippines, Africa, and Mexico, among others, discussing the portrayal of 'white' European colonizers and colonized subjects. He finds that the portrayal of colonial times contains a huge amount of nostalgia, considered a 'civilizing mission;' at the same time, Indigenous peoples are treated as 'vanishing savages.'

The 'imperial turn,' as discussed by Richard Price (2006), can be linked to imperial nostalgia and signifies the creation of the very idea of Britain as a legacy of the English imperialism that defeated Scottish imperialism. Price argues that British history is the result of a mutually constituted history between Britain and its empire. Price refers to the book *Africa and the Victorians* by Robinson et al. (1995), first published in 1961, which presents the 'peripheral' view of empire through the 'official mind' of the metropole, meaning that *"empire in Africa grew out of the way that events on the outskirts of the empire were processed through the official mind in London"* (Price 2006: 604).

NEW FRONTIERS Current research on imperial legacies may broadly build on the 'turn toward memory' in anthropology, history, and the social sciences; and focus on historical empires' shared memories and nostalgia (Walton 2019). 'Imperial nostalgia' for the Habsburg monarchy, in the case of Trieste, has been analyzed by Ballinger (2003). Current discussions on imperial (and also colonial) legacies are informed by postcolonial theory in particular, analyzing postcolonial cultural discourses and power dynamics from a critical perspective (see, e.g., Göttsche 2017; Bhabha 2004). New studies address the mutual creation of identities, building on Said's *Orientalism* (Said 1979) and the conceptual 'other' – the colonizer in contrast to the colonized. Lester (1998) offers an example, focusing on the identities created during the Second British Empire (from 1770 to 1840) in the peripheries of the British Empire – the Eastern Cape colony – and reveals how *"the frontier between Europeans and Africans was imagined in various ways from different colonial positions."* Kuzio (2002: 244) covers the creation of 'otherness' in Ukraine during the Russian/Soviet empires, with Ukrainians denoted as 'peasants' and 'unfit for the modern world' in order to justify their conquest.

Building on the works by Foucault, several authors deal with the imperial boomerang effect, that is, the effect of imperialism on the metropolis (Graham 2013). According to Foucault, colonization *"had a considerable boomerang effect on the mechanisms of power in the West and the apparatuses, institutions, and techniques of power. A whole series of colonial models was brought back to the West, and the result was that the West could practice something resembling colonization, or an internal colonialism, on itself"* (Foucault, cited in Graham 2003). The imperial boomerang then served as a means of 'white' European self-conceptualization (Woodman 2020). Employing Foucault's concepts of biopower and biopolitics, a similar analysis has been conducted in the context of creating 'white' sexuality, in opposition to colonized women who were objectivized and sexualized (Stoler 1995).

Longevity, Stability & Resilience

Maybe then you will offer me an elixir of youth and energy (...) Just find me an elixir.
– Nursultan Nazarbayev, founding president of Kazakhstan (2010)

Every autocratic ruler departs his or her post one day – either being forcibly deposed, resigning voluntarily, or succumbing to the natural law that binds every living being. However, some leaders manage to stay in power for truly impressive periods, even decades, and some political regimes last longer than others. How is such longevity possible? Are these rulers unchallenged, or do they possess unique personal skills or charisma, allowing them to face every challenge? Are some autocratic regimes by definition more durable than others? And if so, which factors are at play?

KEY SIGNIFICANCE History shows that autocrats and autocratic regimes are almost never enlightened, benevolent, or just. Neither are democratic politicians. However, the latter can be regularly challenged and changed through elections. The long rule of a wise autocrat or group may benefit a country significantly, but more often, a power-greedy autocrat plunges his country into misery. The longer that rule lasts, the longer its consequences usually endure; and these consequences matter not only to the domestic population but also to its neighbors and other states through the many channels of a globalized world.

ORIGIN During the era of monarchies, long rule was usually expected from kings, emperors, or shahs, as their power had a divine origin and could not be questioned, let alone actively contested. However, as democratic election practices spread worldwide, and autocratic leaders started to use them as a facade to gain legitimization and as a tool to co-opt political opponents, this discrepancy became more and more apparent. Even if these leaders cast aside formal procedures and remained in power by other means, their governance was often marred by human rights abuses, corruption, or violence, attracting attention and criticism either way.

SEE ALSO Many factors are associated with regime longevity. Autocrats' abilities (**authoritarian learning**), effective **coup-proofing**, building up **legitimacy**, adherence to **political ideology**, the formative experience of the regime (e.g., **revolutionary legacy),** resources and assets (e.g., **resource curse),** and the neighborhood in which they function at the international level (**authoritarian collaboration**).

DEFINITION Longevity, stability, and resilience all have particular, but overlapping meanings in the study of dictatorships, and are thus treated together in this entry. Longevity is the outcome or effect of upholding regime stability. Resilience is a regime's ability to adapt to a changing world and successfully deal with (domestic) challenges.

Longevity, the long duration of a ruler's life, is primarily a concern in **personalist rule**, where the individual's longevity is closely intertwined with the lifespan of the regime as a whole. Based on the criteria discussed below, some autocracies manage to survive their long-lived rulers; but some do not, and effectively collapse with their rulers' demise. When applied to regimes, longevity represents the perseverance of the founding power structures and practices through time, without significant and fatal episodes of discontinuity.

Stability can be examined from two perspectives. The term 'stability' implies a *status quo*, an unchanged situation. In this regard, attention should also be paid to 'stabilization,' processes, actions, and trends leading to higher stability. While relative instability and the regular change of power is typical of democracies, autocracies usually require stability to survive. However, stability in this context is understood as the removal of uncertainties, especially during the crucial phases of an autocracy's lifetime, such as successions, or when they are susceptible to external pressure. Democracies reduce uncertainty through formal laws and procedures; autocracies need to find

other ways.

Resilience refers to the regime's capacity to return to a previous state (or a state as close as possible to a previous condition) after suffering a significant difficulty. Resilience is essential when the regime's active defenses fail to provide protection. Emphasizing proactive and dynamic aspects, resilience is a function of continuous adaptive institutional change, rather than an attempt to maintain the *status quo* at all costs (Dimitrov 2013).

LITERATURE The academic debate over autocratic durability *vis-à-vis* powerful autocracies in the 1930s and 1960s used the totalitarian prism, with specific attention to and emphasis on dimensions of **repression** and political **ideology**. The so-called second wave, up to the 1980s, looked more closely at the functional aspects of autocracies, especially economic motivations, the power of **bureaucracy**, and incorporation of local specifics, such as **neo-patrimonialism**.

The 1990s introduced the concept of institutions and other stabilizing mechanisms into the academic debate. Seminal works by Barbara Geddes (Geddes 1999; 2018) and Jennifer Gandhi & Przeworski (2006; 2007) and their followers elaborated on the toolbox of how authoritarian regimes utilize various state (and regime) institutions, even those mimicking democratic procedures, such as parliaments and political parties or demonstrative elections. The actors involved and the prism of their political survival constitute an alternative analytical point (see **selectorate theory** by Bueno de Mesquita et al. 2003: 273-288), along with the prosperity related to the question of elite cohesion and the loyalty of units vital to the regime's functioning. In this context, repression emerged as an option rather than as a defining factor, although the stability and reliability of the security apparatus remain an essential component.

Furthermore, researchers in the twentieth and early twenty-first centuries have had the opportunity to follow autocratic states, and all the diverse challenges they encountered, during their entire life-cycle. Challenges may come from outside the regime (public protests, political **opposition**, or an attack by a foreign actor) or from the inside (**coups**, intra-regime destabilization).

In his seminal paper, Johannes Gerschewski (2013: 13-28) theorizes the defensive strategy of autocracies as built on three pillars. He argues that legitimation, **repression** and **co-optation**, if used efficiently, can be combined to withstand public uprisings, organized oppositions and intra-elite splits. In other words, academic debate has focused on functional mechanisms within autocratic regimes, as well as their consolidation, survival mechanisms and strategies to prevent challenges.

The literature on the internal cohesion of autocracies suggests that consolidated **personalist rule** and **single-party regimes** contain internal loyalty-based mechanisms and incentives that reduce the risk of splits. This argument is based on the assumption that elite arrangement in non-democracies, lacking security protection for ousted rulers, enables a never-ending struggle for survival (Izquierdo-Brichs & Serra-Massansalvador 2021: 1-39). As there is no opportunity for political prosperity outside the ruling structures, the risks and dire consequences of defeat, and the perspective of benefiting from the regime in the long run, dominate elite relations.

The survival prism offers empirical material for cases in which splits have actually emerged in consequence of the failure of intra-elite bargaining, linked to legitimacy collapse (Ulfelder 2005: 312). However, since both one-party and personalist regimes, by design, prevent and de-incentivize the formation of alternative power (and legitimacy) centers, the system may run on elite cohesion and a *status quo* preference virtually indefinitely, or at least until a fundamental threat emerges.

Military regimes are relatively fragile in this respect, as the private and career interests of officers may surpass their interest in regime cohesion. Large-scale public opposition to their rule is risky, however, especially when it rises to the level of violent protests and riots, since the main legitimization of military rule is often the declared mission to preserve public order and safety. Military officers may react either by retreating or, on the contrary, by tightening their rule, using even more force. They both often signal the end of the regime.

The processes of the establishment of revolutionary regimes define the stability and durability (see also **revolutionary legacies**). As Levitsky and Way observe (2010: 181-235), in an early phase, such regimes usually destroy prior or other independent power centers, establish cohesive ruling parties with political control over the security forces, and generally rely on powerful coercive apparatuses. They are relatively coup-proof, as the previous (and possibly oppositional) military structures have been dismantled early on in their formative phase, that is, during the **revolution**. Revolutionary regimes can verbally sustain their 'revolutionary' phase for quite a long time, contributing to their internal cohesion (Lachapelle et al. 2020: 557-600).

Nevertheless, the durability of revolutionary regimes lies in the ability of their internal loyalty mechanisms to continuously evolve for both elites and the masses, and to adapt to international conditions. Martin Dimitrov (2013: 183-234) demonstrates this kind of success in communist one-party regimes, which have been the most durable, outlasting both non-communist single-party regimes and other nondemocratic monarchies. Dimitrov argues that its natural life-cycle reflects economic conditions (from a siege mentality in the early years to technical-bureaucratized stabilization later) as well as the varying intensity and extent of repressions imposed. Naturally, even in an institutionalized system such as the Soviet Union, the personality of the leader is important and his decisions can push it to either prosperity or collapse, as in the case of Mikhail Gorbachev. Nevertheless, if the revolutionary regime manages to avoid early burnout and is stabilized, it may survive both incompetent leaders and policy disasters. Other authors have also developed this idea from other perspectives, especially

ideology (Kailitz & Stockemer 2017: 332-348) and mass organization (Reuter 2022: 1014-1034).

Besides the durability of political systems and regimes, researchers focus on the durability of specific regime institutions or functions (Magaloni 2008). The former Soviet states provide especially rich material, since the institutionalized links were stronger than in the case of the British or French empires. For example, Erica Marat points to the durability of the structures of security services (Marat 2016: 531-548). On the international level, Maja Bovcon demonstrates the persistence of political structures of the international regime, with France contributing to the stabilization and survival of newly independent political leaders in Africa (Bovcon 2013: 5-26). With the deepening of global economic and infrastructural connectivity, the appropriation of rents for the survival of ruling groups, especially those based on natural resources (Wright et al. 2015: 287-306), became a vital topic for the critical regions of MENA and Latin America (see **resource curse**). Under this general heading belongs the rich and expanding research on various forms of cooperation among autocracies (see **authoritarian collaboration**), ensuring the durability and stability of regimes, although not necessarily the survival of specific individuals within a regime, and spheres of **authoritarian learning**, emphasizing the diffusion of 'best practices' (Tansey et al. 2017: 1222-1223) in stabilizing regimes, taming the opposition and ensuring smooth power transfers from one leader to another (Cottiero & Haggard 2023: 1-15).

The subject of **repression** and the coercive capacities of autocratic states has remained on the table since the totalitarian phase of dictatorship studies (Gandhi & Przeworski 2006: 1-26; Dukalskis et al. 2022: 1-17). Depending on the context, authors have defined and categorized repression based on means, intensity (high and low), or targets (mass, selected). However, one of the advanced practices in modern autocracies is to prevent engagement in costly repression, if the situation permits (Keremoglu et al. 2022: 136-152). Erica Frantz and Andrea Kendall-Taylor (Frantz & Kendall-Taylor 2014: 332-346) describe **co-optation** as one of the alternative mechanisms available, either formal (into the ruling party) or informal (through **neo-patrimonialism**), but both *ad hoc* and strategic. Autocracies are, in general, reluctant to make alliances and frequently use enemies (both real and imagined) to rally support to their flag. Nevertheless, co-optation of groups and individuals, as well as reversed strategic appointments to office, may serve as a useful **coup-proofing** mechanism. Prevention of palace putsches and military **coups** has been an important topic, especially for scholars focused on Latin America, MENA, and Southeast Asia (Quinlivan 1999: 131-165; Sudduth 2017: 3-15), as military ousters in the former Soviet space have been rare.

Regimes with strong personalist features constitutes a specific case in the literature. In such a case, obviously, the leading individual (whether president or king) needs to ensure his or her own longevity first. However, no regime exists in a vacuum and every leader, or leading group, needs institutions to facilitate and protect their rule and prevent the ruled from taking over. At the same time, modern autocracies have realized that it is virtually impossible to sustain dominance based on repressive force exclusively, at least in the long run, and to prevent exhaustion from the constant struggle for survival. For this reason, every political regime needs to establish some form of **legitimacy**.

The dissolution of the former British and French empires in the twentieth century and the Soviet Union in the 1990s introduced a special representative group of personalist autocratic leaders, founding fathers of newly independent countries. In some, the new political arrangement resulted not merely from a declaration of independence, without popular demand for regime change, as in the case of post-Soviet Central Asia, but from a revolution. Research on those 'founding generations' provides rich empirical material for studies of longevity and its factors. According to Levitsky and Way (2013: 14), these state- or nation-building actors were able to use their historical role to legitimize their regime, despite its possible dire economic and social performance. This has also proved relevant for specific actors inside the state, as Erica Marat notes in the example of Central Asian security services: dominant nation-building discourses go hand in hand with designing the basic features of the state according to their specific needs and preferences (Marat 2018: 1-44).

Since some leaders manage to remain in power for truly impressive periods of time – Teodoro Obiang Nguema Mbasogo has been at the helm of Equatorial Guinea since 1979; Fidel Castro spent almost five decades in office – the question has arisen of whether the mere fact of such a long tenure in office plays a role in sustaining the *status quo*. The answer seems to be, as in most cases, context-dependent. Jason Brownlee claims that rulers' longevity in office before a power transfer may play a vital role in the success of the entire process: *"dictators who sufficiently entrenched themselves to survive in power past age sixty cleared the biggest hurdles to orchestrated leadership transitions, including hereditary handovers"* (Brownlee 2007: 602). On the other hand, Betts and Huntington (1985: 121) claim that if there is no designated successor or established succession process, the low institutionalization of the regime makes it prone to conflict and collapse. In this case, the shorter the ruler remains in office, the less the instability that follows their demise (Anceschi 2021: 660-680).

MEASUREMENT The ultimate measure of a regime's longevity is the long-term survival of its core ruling group and the basic architecture of power distribution. Assuming that every ruling group in an autocracy wants to stay in power at (almost) any cost, failure to do so should be considered a failure of resilience and of the stabilization mechanisms outlined above. Hence, the first task of any research should be to determine these essential regime features, and its actors, and follow their shape and development over time.

To date, authors have measured both entire regimes and their specific features. Among the semi-

nal datasets of state-level regime survivals is the one gathered by the collective around Barbara Geddes (Geddes et al. 2018), which uses Large-N datasets to examine the durability-ensuring role of social revolutions. Others, such as those composed by Michael Miller (2020), elaborate on the origins of autocratic ruling parties and how they impact longevity.

While a leader's survival is frequently a question of a mere dichotomy, measuring the abstract components of autocracies is more difficult. Joseph Wright and Daehee Bak (2016: 1-7) delve into measuring legitimation based on expectation and delivery (performance) or ideology. These measures need to be context-specific and to account for the regime type, the level of repression, and any potential external patronage favoring the ruling group or individual (Ramzan Kadyrov in Chechnya or Bashar al-Assad in Syria may serve as examples).

METHODOLOGICAL ISSUES Identifying the primary sources of stability for a regime or a personalist autocrat might constitute the first methodological obstacle. In many cases, they seem to be obvious: ruthless repressive governance, omnipresent ideology, or abundant financial resources allowing the elite to buy off any potential opponents or critical sentiments. However, their combination with other, less visible but not less relevant, factors should always be presumed and tested.

External factors especially should not be omitted. During the Cold War, the Soviet Union supported 'its' autocratic clients with significantly greater enthusiasm than its Western counterparts for, among other reasons, ideology and their shared indifference to human rights violations. From another perspective, a broader regional consensus among states might appear about whether to support or condemn specific autocratic leaders, because their ouster is considered riskier or more costly than their current actions (the stability-democratization trade-off – see also Box 1.7 on Mobutu). Last but not least, a ruler may remain in power simply because there is no one in the international arena interested in mounting a challenge.

The problem with this analysis is the scarcity of available information. This usually concerns the security dimension of the regime, as any information about it is not readily available or accessible. To mention the most obvious case, the sudden demise of the Soviet Union caught many unprepared and by surprise, even those with abundant resources and access to classified information.

In all probability, even in the future, a coup, an intra-regime power struggle, or unofficial transnational power operations will not be predicted in advance but revealed only as they are already taking place. Furthermore, any information about it will be written by the winners, resulting in the blurring of even the scarce amount of data available. For this reason, all sober research will rely on degrees of probability and possible scenarios rather than any definitive statement.

EXAMPLES *Former Soviet Central Asia*. While the Baltic part of the USSR departed the Soviet orbit as quickly as it could at all levels, structures in Central Asia proved to be interestingly stubborn (Hale 2019). In all cases except Kyrgyzstan, the elementary elite power architecture remained largely the same, with former Communist apparatuses transforming into new national parties. However, even Kyrgyzstan, initially casting out the previous power structures through democratic reforms, gradually converged with the rest of the region.

Postcolonial Africa. For decades, following the collapse of French dominance in Africa, Paris has sustained the so-called *'Françafrique'* policy, which offers semi-formal support for the rulers of newly independent states in exchange for the protection of French business and power interests (Bovcon 2013: 5-26). In other words, although the formal institutional arrangements between France and the African states changed profoundly, an informal network of power and practices proved significantly resilient.

The Islamic Republic of Iran. After the 1979 Islamic revolution, the governing system in Tehran demonstrated another way of ensuring regime longevity. A combination of ideological (religious) backing and separation of the supreme body from everyday politics proved to be a useful mechanism (although not the only only) to ensure regime durability despite enormous, long-term economic pressures from external actors.

NEW FRONTIERS The current globalized world provides autocrats and autocratic regimes with new opportunities to secure their wealth and related positions. For example, the global Western-originated financial system allows them to extract abundant financial resources from the state budget and use them for their personal benefit, including power stabilization (Cooley et al. 2018). Or they can use global institutions and legal systems for the transnational repression of their opponents (Cooley & Heathershaw: 2017). In both cases, they are effectively removing threats and strengthening their positions in ways that have recently gained broader academic attention (Sanghera & Satybaldieva 2021: 257-278).

Another under-explored frontier is the effect of durable regimes on their subjects and opponents, and the possibly looming withdrawal of significant global advocates for democratization, the rule of law, and human rights (see **authoritarian legacies**). This effect goes hand-in-hand with the much-debated rise of alternative world orders and normative approaches to Liberalism, such as the diffusion of the so-called 'democracy with Chinese characteristics' in the 'Third World.' Such authoritarian diffusion, driven by powerful, long-lasting autocracies, enables and emboldens similar regimes and autocratic rulers in some world regions. Beside the routinization and normalization of autocracy, these clusters could also lead to more obstacles to gaining objective information, with reduced access and disinformation serving to confuse researchers and the wider public.

New methodological and theoretical approaches are likely to appear in areas where autocratic research meets decolonialization. Above all, specific actors, their agendas and positionality are enjoying

significant renewed attention (Brandsen 2001: 2-14; Kailitz 2013: 39-60). They offer valuable opportunities for cooperation beyond and in addition to the traditional theoretical prisms of Western academia.

Ousters, Depositions & Abdications

The tree of liberty must be refreshed from time to time with the blood of patriots and tyrants.
– Thomas Jefferson (1787)

In political science and comparative authoritarianism, an 'ouster' refers to the process of removing someone from a position of power or authority. This can occur in various contexts, as when a politician is pressured to leave office or a leader is forcibly removed from their position. An ouster implies a forceful or coerced removal, often involving political maneuvering or external pressure.

The literature does distinguish between violent and non-violent ousters. (**Assassination** is the most violent and irrevocable mode on this spectrum.) With most **coups** and all **foreign invasions** and **revolutions** pigeonholed into the former camp, and impeachment, (unexpected) electoral defeat and some 'palace coups' and 'royal coups' into the latter. **Protests & uprisings** often act as catalyst factors and can be pivotal during **transitions**, but other forms, like rebellions, can of course also oust regimes.

When ousters affect **monarchies**, they are often called 'depositions,' especially if they involve legal or parliamentary methods. In contrast to the voluntary relinquishing of royal power, an 'abdication' that usually involves an actual ceremony or proclamation of giving up power or renouncing further claims to **legitimacy**, a 'forced abdication' is nothing more than a royal ouster or deposition that employs this public ritual.

Note that 'ousters,' 'depositions' nor 'abdications' (as terms) imply regime change *per se*. They often solely concern the supreme powerholder and open the path to **succession** through a leader transfer.

The study of ousters is intrinsically linked to the literature on regime breakdown, **transitions**, **exit options & leader fates**, and **protests & uprisings**, depending on the push-and-pull factors involved in their exact dynamics.

Protests & Uprisings

RIOT, n. A popular entertainment given to the military by innocent bystanders.
– Ambrose Bierce, *The Devil's Dictionary* (1911)

Some of the largest protests in world history have taken place in the last decade – and on a wide range of topics, from the worldwide campaign against systemic **racism** (sparked by the George Floyd murder), to the protests that broke out for **gender equality** (sparked by the '#MeToo' movement), to the climate strikes demanding action on climate change, to the 2024 protests on university campuses calling for an end to the war in Gaza. But a significant number of protests have broken out in resistance to **autocratization** and **authoritarianism**. In some cases, protests asked for small democratic reforms (**democratization**, **human rights**); in others, protesters aimed for the removal of an autocratic leader (**ouster**); in still other instances, the citizenry was fed up and hoped for complete regime change and a **transition** to democracy.

Protests generally arise due to some kind of grievance, on the one hand, and the presence of an opportunity or opening, on the other. Common grievances include political injustices, deteriorating political conditions, economic crises, corruption and fraud (Brancati 2016; Brancati & Lucardi 2019; Hale 2019). Other authors claim that political protests are driven by openings or opportunities, particularly in non-democratic societies (McAdam et al. 1996). These openings in authoritarian regimes may occur during changes in the institutional structure or informal power relations, offering an opportunity for meaningful change. A growth in resources available – such as additional financial resources, connective structures and networks – can also help movements organize and mobilize.

For this reason, some scholars argue that the rise of social media would help protest movements in authoritarian regimes by helping to facilitate coordination and communication (Breuer 2016; Jost et al. 2018). Social media can connect leaders and activists to ordinary citizens, and expand the network of individuals willing to take action. Dense connections help ideas spread more rapidly and social media has been used by citizens living in autocracies to exercise freedom of speech.

The 2019 Hong Kong protests, which erupted over a proposed bill that would allow individuals to be extradited to China to stand trial, were one of the most widely covered protest movements. These protests evolved into a broader movement against the increasingly repressive environment in Hong Kong, and the fact that its leadership has come completely under the control of Beijing. At one protest, in June of 2019, at least 2 million people, out of Hong Kong's 7 million, came on to the streets (BBC News, 2019). Although young people have been at the forefront of these protests, a broad range of groups joined the protest as well, including many working professionals. These protests have largely been leaderless, but activists have coordinated using secure apps, such as Telegram, to avoid being identified. Social media was also a factor in motivating people to participate in the protests because it served as an echo chamber, giving the impression of a homogeneous climate of opinion, one opposed to the regime (Shen et al. 2020).

Pro-democracy protests also notably broke out in Iran in 2022, in Myanmar in 2021, and in Belarus in 2020, all calling for the implementation of reforms. While they were significant in terms of the risks taken by protesters to voice their displeasure with their leaders, none of these protests led to any significant changes. In fact, most protests fail to achieve their aims. In a study of protests from 1989 to 2011, almost two-thirds attracted fewer than 10,000 participants in their single largest rally; most ended in three days or less; and less than 10% led to the government being ousted, with less than 25% extracting any concessions from the government (Brancati 2016). Instead, most protests are shut down with brutal force and crackdowns (see **repression**). When they are not considered a threat, authoritarian regimes may allow small-scale protests as an information-gathering tool to identify discontented social groups and monitor local governance issues, as seen

in the Chinese context (Lorentzen 2013).

In Belarus, security forces arbitrarily detained thousands of people with hundreds subjected to torture (Human Rights Watch, 2021). In Myanmar, more than 15,000 people were arrested and several protesters were killed (Ratcliffe 2022). In Iran more than 500 people, including 69 children, were killed during the protests (Human Rights Watch, 2023).

Given this gloomy picture, what makes a protest successful? Protests are more likely to be successful when they are non-violent (Brancati 2016; Carey 2010; Chenoweth & Stephan 2011); when they involve women (Chenoweth & Marks 2022); when they involve labor (McCallum 2013); when they are part of a global protest cycle (Della Porta 2017); and when they are large and intense (Chenoweth 2021). Protests that have mobilized large numbers of people can persuade holdouts to join the winning team, and generate a sense of inevitability. For protests to be successful, according to one study, 3.5% of the population would need to protest during the peak of a protest movement (Chenoweth 2021).

Mass protests – consisting of hundreds or thousands of people taking to the streets to demonstrate against a particular grievance – are the most common form of collective resistance. There are many forms, and opposition movements alternate, blend and adapt them to circumvent or address regime responses to such contention – see regimes & repertoires (Box 5.8).

Marches (a) involve large groups walking along a set route to demonstrate their stance on an issue, often culminating in rallies. These events are effective in drawing public attention and media coverage, which can influence public opinion and policy decisions. Marches also serve as a platform for solidarity among participants and can increase political engagement.

Similarly, *rallies* (b) gather people to express their views through speeches and performances. They are effective in energizing participants and drawing public attention to specific issues. Rallies can amplify the message of a movement and increase its visibility, potentially influencing public opinion and policymakers.

Picketing (c) involves demonstrators standing at or walking in front of a specific location, like a politician's residence, a government building, a place of business, often in an attempt to dissuade others from engaging in some behavior or activity. Pickets can also be used to draw attention to broader social causes or political movements. (It is commonly used during labor strikes, and is effective in applying direct pressure on employers by disrupting business operations and drawing public attention to labor disputes.)

Sit-ins or *occupations* (d) involve occupying a (public and) symbolic space and refusing to leave until demands are met. They are effective in highlighting perceived injustices and forcing negotiations by creating a physical disruption (Zick 2021). Sit-ins can draw significant media attention and public sympathy, increasing the pressure on authorities to address protesters' demands. The **Arab Spring** protests were famous for occupying central squares in capitals.

General strikes are a form of protest levied against governments as policy-setters. Unions usually call them to protest policies that retrench the welfare state and deregulate labor markets, but they can support other political goals. For example, the general strike in Russia during the revolution of 1905 forced the tsar to promise constitutional reforms.

Successful general strikes mobilize a broad group of citizens, attract media attention, cause economic disruption, and signal widespread opposition to government policies. Strikes have historically been a critical tool used by labor movements, especially during the Industrial Revolution when they became more common due to the rise of mass labor in factories and mines. While purely political strikes (meant to force a government to resign) are illegal and fall outside the internationally recognized 'right to strike,' strike action can still pressure governments to alter policies when workers' social or economic interests are threatened (Creighton et al. 2020: 5).

Most democracies afford protection for strike activity. Under authoritarianism, strikes can be particularly challenging due to potential **repression** and legal restrictions. Contrary to the existing literature, which attributes strikes to union membership or characteristics of the information environment, Robertson (2007) argues that labor protests emerge when they align with the interests of powerful elite factions or when economic conditions become truly desperate.

However, strikes can still be effective under certain conditions. Those that mobilize broad public support and attract international attention can exert significant pressure on authoritarian governments by highlighting grievances and undermining the regime's legitimacy. The famous *villes mortes* (dead cities) campaign in Cameroon, during the early 1990s, was a significant civil disobedience movement involving general strikes, work boycotts, and tax evasion as methods of undermining the government's fiscal base by shutting down economic activity in major urban centers.

But protests are just one form of political behavior. Though not widely studied by political scientists, riots and mutinies constitute forms of public collective (meaning the involvement of more than one person) behavior arising from some form of grievance.

Riots, in particular, are a pejorative term for activity that protests social, political, judicial and/or economic conditions. Many researchers see riots as a manifestation of legitimate grievances and alienation (Lapeyronnie 2008; Kokoreff 2018; Schwartz 2017; Slooter 2015; 2019); however, the media portrays riots as largely (though not always) uncoordinated destructive behavior that involves vandalism, looting, arson or other attacks on property (Yarrish 2019). Riots are therefore usually depicted as unpatriotic forms of rebellion, often involving young people from marginalized groups (Gadinger et al. 2021; Umamaheswar 2020; Brown & Harley 2019).

Mutinies constitute another form of rebellion, usually involving members of the army or navy – or some form of organized group of workers (or pris-

oners) who challenge authority. Their aim is often very specific – to overthrow the group's superiors, or change the chain of command. Mutinies can involve bold and risky action, such as seizing control of facilities or refusing to follow orders. As with riots, mutinies are always grounded in grievances about conditions, leadership, or other injustices. Unlike riots, which are typically unplanned and spontaneous, mutinies usually involve some planning and organization (Carey 2010). All of these actions are considered serious offenses, and can involve severe repercussions.

Defections, in the context of military mutinies, are distinct forms of resistance. They can manifest in two primary forms: a softer form, known as a loyalty shift; and a harder form, which is the execution of a **coup**, and falls under **ousters**. (Note: defections refer to abandoning one's own military and joining the other side; 'desertions' simply involve leaving the military.)

A loyalty shift occurs when the military refuses to use large-scale force, despite orders from the dictator. This can involve the military remaining inactive, as seen in the cases of the South Korean army in 1960 and the forces of communist Czechoslovakia and East Germany in 1989 (Croissant et al. 2018a: 143-144). A more active form of loyalty shift involves the military signaling its support for regime opponents without launching a coup. Examples include the Philippine military's backing of anti-Marcos protests in 1986, the Romanian army's initial support for anti-Ceaușescu forces in 1989, and Tunisian troops fraternizing with demonstrators against President Ben Ali in 2011. Both passive and active loyalty shifts indicate that a dictator can no longer rely on military support, significantly undermining their hold on power (Croissant et al. 2018a: 144).

Recent research has captured mutinies and defections, thus enabling researchers to use a database to gain a better understanding of civil-military relations (Johnson 2021). Studying defections is particularly important because the number of defections can heavily influence the outcomes of nonviolent protests against authoritarian regimes (Nepstad 2013). This was especially salient during the **Arab Spring** in the case of Tunisia, which saw its security institutions quickly defect in favor of the citizens (Haas & Lesch 2013), the police as well as the military (Holmes & Koehler 2020). Militaries are likely to defend a dictator against popular uprisings if their leaders' physical and economic well-being depend on the dictator's continued rule (cf. **exit options**). Conversely, military leaders will only abandon the incumbent regime if they anticipate that supporting the opposition or orchestrating a coup d'état will serve their interests better than remaining loyal (Croissant et al. 2018b). Personalist rule is conducive to military defections when such regimes are pressured by protests (Lee 2014).

Box 5.8 Regimes & Repertoires of Contention (Charles Tilly)

Composing is improvisation slowed down.
– Wayne Shorter, Jazz saxophonist

Charles Tilly (1929-2008) was a prominent theorist of social movements and protest, and was a central figure in the debates around this literature. The contribution of Tilly to social movements theory largely involved his understanding of social movements in terms of performance.

According to Tilly, 'repertoires of contention' refer to the established set of methods and strategies of claim-making in a society as well as the collective set of available methods and performances by which groups make claims (including, but not limited to, street protests, strikes, petitions, international appeals, terrorism) (Tilly 1978; 2006). Repertoires are specific to a societal, cultural, and regime context, and vary according to factors such as language, culture, as well as regime type and historical context.

Repertoires of contention are culturally distinct, meaning that a society's collective memory impacts upon the forms that collective action takes within it. Repertoires continually evolve as a result of innovation and lesson-drawing from previous examples of contention. When considering the quote by musician Wayne Shorter (above), actors of contention can either strategize and plan out their actions, or act spontaneously, but in both cases their actions will be in line with what they know, and fall back on familiar repertoires. The link between repertoires and improvisation is not accidental. Tilly finds that genuinely unfamiliar performances almost always misfire, but exact repetition of one performance in the next breeds boredom and indifference on the parts of claimants and their objects alike (Tilly 2006: 41). This is thus a paradox that underscores the

Table 5.3 – Tilly's Four Regime Ideal Types & Contestation Performances

Governmental Capacity (A)	**Openness (B)**	
	High capacity + Nondemocratic = many prescribed, narrow range tolerated, almost always forbidden, high involvement, medium violence	High capacity + Democratic = few prescribed, medium range tolerated (with a lot of overlap), low forbidden, high involvement (often as third parties), low violence
	Low capacity + Nondemocratic = few prescribed, medium tolerated, much forbidden, low involvement, high violence	Low capacity + Democratic = few prescribed, broad range tolerated (with a lot of overlap), low forbidden, medium involvement, medium violence

inherent dynamism of social relations.

Tilly makes special reference to the example of the barricade, which is 'inscribed in the history' of French contention, and thus emerges time and again as a familiar symbol utilized by activists to draw on the national collective memory (Tilly 2006: 30). However, repertoires are not always bounded by nation-state borders. In the twenty-first century, other authors find that repertoires take an increasingly transnational character, and can be bundled into 'modular repertoires' easily transferred between contexts, claimants, and claims, as shown by the wave of **color revolutions** in post-communist Eastern Europe (Beissinger 2007) or the **Arab Spring**.

Regimes themselves are also defined in terms of performance for Tilly; he defines a regime as the set of repeated, regularized interactions between major political actors. Depending on the regime in question, the major political actors may include institutions, political parties, businesses, activists, media organizations, etc.

Tilly's work relies on a categorization of regimes according to two dimensions: governmental/state capacity (A) and regime openness (B). This (crude) two-dimensional categorization of ideal types helps to explain the divergence between different authoritarian regimes' responses to similar forms of contention. Note that on this spectrum, regimes cannot exist at either of the extremes: e.g., a minimal amount of state capacity is required to keep regimes in power.

Governmental capacity (hereafter state capacity – A) is defined as the *"degree to which governmental actions affect distributions of populations, activities, and resources within the government's jurisdiction, relative to some standard of quality and efficiency"* (Tilly 2006: 21). Openness (B – called 'democracy' by Tilly) is defined as the *"extent to which persons subject to the government's authority have broad, equal rights to influence governmental affairs and to receive protection from arbitrary governmental action"* (Tilly 2006: 21). At one end of this dimension there are closed (non-electoral) dictatorships; at the other one finds democracy.

Tilly's *Regimes and Repertoires* has relevance to the study of **repression** and **co-optation**, because it theorizes when and why regimes respond to political performances.

Tilly distinguishes three types of response to an act of contention – coercion, capital, and commitment. A country, according to its regime type, can be expected to use these three tools in different ways to produce outcomes reinforcing either the prescribed, tolerated, or forbidden nature of a contentious act (Tilly 2006: 74). Common to all regimes is the use of these three tools to respond to threats to the regime perceived as existential, whether violent insurgence in Uganda or Nazi resurgence in Germany. The difference lies in what is considered an existential threat, and what is considered necessary to ensure the regime's survival (see: **longevity, stability & resilience**).

By reviving (contested) theories of political opportunity structures, Tilly's work offers a categorization of regime responses to political performances along the two dimensions of state capacity (A) and openness (B), as depicted in Table 5.3. In this typology, repertoires of political performance are categorized as either prescribed, tolerated, or forbidden. These dyads include the involvement of government agents in contestation (often as principals) and yield different levels of violence.

Table 5.3 – Tilly's Four Regime Ideal Types & Contestation Performances

In high-capacity, non-democratic regimes (e.g., **totalitarianism**), there is a high level of control over the citizen's public life, meaning that the amount of prescribed and forbidden performances is high, whereas the number of tolerated types of political participation is low. One example is China, which as a **single-party regime** mandates regular performances of loyalty to the party and forbids dissent as well as insults to the party and its leadership. Nonetheless, some localized protests and complaints about lower levels of the party administration are tolerated (Chen 2012).

In high-capacity democratic regimes (typically highly-developed democracies), there is a higher amount of tolerated and legitimized political performances. In some cases, political performances that are essential to the continuation of the regime, such as voting, are prescribed in these regimes. Some political performances, especially those considered to endanger the regime, are forbidden. One example might be Germany, which tolerates many forms of performance, even those which are highly contentious such as insulting politicians or religious figures, but prescribes some repertoires and forbids others, notably Nazi-related symbols and speech.

In low-capacity non-democratic regimes (see **fragile & failed states**), there also is a high level of tolerance, as the state does not have the ability to control the citizen's public life as closely. Very few types of political performance are prescribed, and those types which are forbidden are punished at random, as the state does not have the capacity to punish consistently. Tilly points to Uganda in the 2000s as a country scoring low on both state capacity and democracy, which passed laws forbidding political violence and terrorism and banned all parties other than the president's, but was not able to fully enforce these laws in rural territories where insurgents were active (Tilly 2006: 82).

Low-capacity democratic regimes are typically middle- or lower-income democracies, where the state rarely prescribes or forbids political performances, and where most repertoires are in the category of tolerance. As a result of poor control over the polity, the regime has less capacity to punish contentious acts. The example of Jamaica shows that, although it is a democratic country with regular multi-party elections, it differs from high-capacity democracies in that vigilantism and police killings are commonplace political acts, which would not be tolerated in a high-capacity state.

Revolution

Poverty is the parent of revolution and crime.
– Aristotle, *Politics*

Those who make peaceful revolution impossible will make violent revolution inevitable.
– John F. Kennedy, 1962

Revolutions have many different meanings. The modern concept of revolution comes out of the experience of the American and, especially, the French and Russian revolutions. In particular, the French revolution became *the* revolution, synonymous with all other revolutions, because it had a structure, clear causes, a clear break with the previous regime and system, and it was easy to explain and understand.

EXAMPLES & REGIONAL VARIATION Revolutions are very diverse and time-bound and many caused a significant ripple effect in their respective regional international systems. They often occur in transnational waves. Firstly, socioeconomic processes operate on a regional or (now more often) global scale, weakening states and encouraging popular uprisings. Secondly, interstate wars weaken states and generate grievances, affecting multiple countries simultaneously. Thirdly, revolutions possess a 'demonstration effect' for other countries (see also **authoritarian learning**), inspiring imitation of ideologies, strategies, and tactics. Lastly, successful revolutionary movements may provide both material and military assistance to others. However, not all movements within a wave have succeeded, and attempts to export revolution have often failed.

The French revolution (1789-1797) meant the end of the feudal system, the *ancien régime*. It introduced the power of capitalism at the political level. The English revolution of 1688 was the first of this kind but was not successful, as both the monarchy and feudal structure survived.

The American revolution of 1776 was *de facto* a secession event, and one of the first successful anticolonial rebellions; it did not attack the core of the feudal system. It was simply a breakaway from the English colonial feudal system, adopting a new dominant means of production, partly based on the slave-owning system. According to Nelson (2014), Americans did not propose a new political concept to George III in 1774-1775; their vision of the British (or English) nation as a set of self-governing communities, linked by loyalty to the same monarch, was essentially the vision they had held since the seventeenth-century establishment of the colonies. Thus, the Americans did not attack the existing feudal principles of the time and were not as 'revolutionary' as the French revolutionaries when it came to installing a new (ideological) order; or when compared to the Haitian revolution (1791-1804), a successful, anticolonial slave insurrection.

The French revolution was only partially successful, and was forced to extend into the following century as the forces of change intensified. The most important and decisive of these were the March revolutions of 1848 – the 'Spring of Nations' (cf. Box 6.4) – which destroyed some elements of the feudal system. However, monarchies and the special privileges of the Roman Catholic Church and Muslim communities, including the special position and power of the **aristocracy**, were safeguarded in Europe and 44 states around the world.

Where the French revolution was bourgeois, the Russian one was proletarian. With the 1917 October revolution in Russia, a new type of revolution emerged, catapulting new political actors to the forefront: proletarians, peasants, and soldiers, who tried to realize their perception of an anti-capitalist and anti-feudal system, one which called for socialism under the leadership of the Communist party. The Russian (1917-1921) and Yugoslav (1943-1948) revolutions eliminated monarchies, the monopoly of churches in political life, and reformed the semi-feudal system by introducing agrarian reforms. At the same time, they introduced and d the process of industrialization and commodification in the form of state capitalism. The Yugoslav idea of self-management and societal ownership lasted only twenty years and, in fact, increased the accumulation of capital on both the local level and that of the republics. None of the socialist revolutions were able to develop

new postcapitalist forms of production of life capable of surviving. That is why they all ended up as capitalist systems, including the Russians, Yugoslavians, Chinese and Cubans. (The only self-proclaimed socialist state remains North Korea.)

The growing clash of ideological beliefs that fueled the decolonial struggles resulted in political, economic and social transformations after WWII, but with a great deal of variation in the timeframes and modes of contestation (see **colonial legacies** and **imperial legacies**), resulting in several outcomes too nuanced for the scope of this entry. For instance, in Latin America, the Cuban (1953, 1959) and Nicaraguan (1979) revolutions were the start and end point of a series of mostly failed attempts at Che Guevara-designed *'Foquismo'* (see Box 5.9) – a period characterized more by the reactionary military counter-revolutions that dominated politics from the 1960s to the 1980s than for the social change that triggered these interventions.

Many observers argue that decolonization processes are still ongoing, ranging from the *Black Lives Matter* movement targeting systemic **racism** to the recent coups d'état in Africa, exposing dissatisfaction with the neocolonial position of African states *vis-à-vis* the great powers, which find it increasingly difficult to assert their dominance on the global stage.

The **color revolutions** and **Arab Spring** were the latest waves, characterized by (initially) non-violent mass protests driven by political aspirations and socio-economic grievances.

DEFINITION A revolution is defined as a swift and deep (structural) change of society and of the political system. In some definitions, violence is added as a necessary instrument for change, though some authors see violence as primarily generated by counter-revolutionary forces. Some definitions concentrate on violence, describing a revolution as a violent attempt to change a government, regime, or system. The geographical unit of a revolution can be a particular state (or polity) but also the total system of production in the world.

In common usage, the concept of revolution is employed to describe any kind of (often not very fundamental) changes in society. In the modern world, revolution is almost synonymous with notable change or innovation in every possible field of human practice. Contrasted to evolutions, revolutions often mean a quick, sudden change; evolution, on the other hand, describes gradual long-term changes, which can be more or less formal but not as far-reaching. In this broader sense, the unit of revolution is a particular practice, a pattern of thinking, feeling or other micro-level of human living.

SEE ALSO Revolutions are considered both a cause of **transition** (regime **ouster** through mass mobilization) and a mode of transition (when the old regime is successfully replaced by a new order). A revolutionary process can be undone by a counter-revolution or by a **coup**. Note that coups may become 'revolutions from above' if the usurpers implement radical political or socioeconomic changes. Revolutions affect both autocracies and democracies and can thus result in either **democratization** or **autocratization**. Regimes created from (violent) revolutions have some special characteristics as described in **revolutionary legacies** – for a comprehensive overview, see Levitsky & Way (2022).

ORIGINS Revolution initially meant the return to a point of origin, *revolutio* (in Latin). It has been used in mechanics and astronomy for describing the action performed by a physical body as it rotates on its axis. Before the seventeenth century, it was usually used to characterize a dynastic restoration (e.g., restoring a legitimate monarchy after ousting a tyrannical usurper). Thereafter, it was used to describe some significant improvement or deterioration in the political sphere.

The concept of revolution should also be considered in contrast to the concept of counter-revolution. The latter aims to bring revolutionary results back to a previous stage, no matter what the cost. There is a great dispute about which is more violent, revolutions or counterrevolutions.

LITERATURE This part provides a short overview of the most influential authors in the mainstream literature before moving on to works that study the drivers and outcomes of revolutions.

The works of Theda Skocpol (1979; 1994) explore the correlations between revolutions and the social circumstances that preceded them, emphasizing the role of the proletariat and the importance of branched networking within classes. Skocpol's ideas extend the first- and second-generation concepts of the theory of revolution, focusing on the social system failures, reasons, and consequences of revolutions in the context of revolutionary modernization.

Jack A. Goldstone (1980; 1982; 2001; 2009) writes about revolutions and their roots in societies. He challenges the dominant model of 'Western exceptionalism' and argues that early modern and modern European and Asian societies have more in common than previously recognized. He proposes a four-stage process of revolution that includes fiscal crisis, inter-elite conflict, mass mobilization potential, and the breakdown and remaking of culture and ideology. Goldstone's work has influenced the creation of multiple theoretical models and has been central to early twenty-first-century sociology. He also examines revolutions in history, from ancient Greece and Rome to the **Arab Spring**. Goldstone emphasizes the pursuit of social justice as a driving force in revolutions and the creation of new political institutions

The edited work by J. Foran (1997) focuses on the 'Third World,' integrating insights from diverse fields (civil resistance studies, international relations, social movements, terrorism, etc.) to offer new ways of thinking about the study of revolution, beyond the dichotomous, considering structure and agency as mutually reinforcing processes. Contention is not simply violent or nonviolent – it is a messy process that usually involves both strategies. Revolutions do not just succeed or fail – they achieve and simultaneously fall short. And causal conditions are not just domestic or international – they are depend-

ent on the interplay of the two.

Jeff Goodwin (2001) offers a comprehensive analysis of the rise of revolutionary movements and revolutions during the Cold War period. Using examples drawn from Southeast Asia, Central America, and Eastern Europe, the book explores how authoritarian regimes inadvertently fuel popular resistance, leading to radical and often violent outcomes. Drawing on T. Skocpol's state-centered approach (see Goodwin & Skocpol 1989), and echoing Trotsky's assertion, he illustrates how revolution became the sole recourse for opposition to entrenched regimes. Through comparing over a dozen countries, Goodwin demonstrates that revolutionaries sometimes orchestrated opportunities to seize state power rather than merely exploit existing conditions.

Charles Tilly (1978; 1993) writes extensively about revolutions. He explores the core themes of revolutionary classes, revolutionary violence, and the outcomes of revolution, building upon the work of his teacher Barrington Moore (1966). Tilly's work on revolutions and state-building demonstrates the way in which state building and contentious mechanisms combine to produce both terror and the foundation for mass politics. A central aspect of his writings is the concept of collective action, developing a structuralist perspective into a more relational and interactive model.

A revolution always has roots or causes. For 'shallow science,' the causes are observed in the abysmal living circumstances of the lower classes: monarchs were often uncompromising and brutal in their treatment of their own populations. The most common way of explaining the drivers of a revolution is to try to discover individual decisions, or some very well-organized group of individuals, or a group of ideas, as the cause of the revolution. However, this type of explanation overlooks the composition of the polity as a whole, which, through the development of its own contradictions, has become ripe for change.

Drivers of revolutions Goldstone et al. (2004) assert that three major approaches have dominated the discussion: (i) *Economic theories*, such as the 'J-curve' theory and relative deprivation theories, suggest that economic downturns or frustration with poor economic conditions relative to expectations can trigger revolutionary discontent. (The J-curve theory – developed by J.C. Davies in 1962 posits that revolutions and social unrest are more likely to occur when a period of improving economic and social conditions is followed by a sudden downturn, leading to a gap between heightened expectations and reality.) ***Modernization theory*** (ii) posits that as countries become wealthier, tensions arise between the political aspirations of the middle and professional classes and the exclusionary institutions of autocratic states, making autocracies in modernizing nations prone to revolutionary conflicts. The *institutionalist approach* (iii) emphasizes the importance of the specific form and function of state institutions. It suggests that states are most prone to revolution when their political institutions are under stress and undergoing reform. The stability of a regime is not simply a function of the degree of its democracy or autocracy but depends on detailed institutions and the nature of political participation.

Goldstone et al. (2004) employ global data from 1955 to 2001, and show that regime type is the dominant factor behind revolutions, ethnic wars, and the overthrow of democratic regimes. Their **trichotomous classification** of regimes finds that most unstable regimes are 'hybrid regimes,' which combine elements of democracy with significant aspects of authoritarian rule. Full democracies and full (or closed) autocracies can both create stable states, but such stability varies in relation to the specific characteristics of their political institutions. Regime type seems to matter as it often correlates with variations in state power. Slinko et al. (2017) find a similar U-shaped relationship between regime 'types' (but they measure the scale of all political regimes using a **continuous measure**); established autocracies and consolidated democracies are less susceptible to revolution.

There are other important observations. For example, economic factors like infant mortality and trade openness affect stability, but less than institutional factors. Colonial heritage and ethnic composition have almost no effect on political stability once economic development and political institutions are accounted for – see **colonial legacies**. In Sub Saharan Africa, the effects of regime type on stability are even stronger, but ethnic composition has no direct impact on stability unless combined with active political discrimination against particular groups (Goldstone et al. 2004).

Revolutions develop from popular uprisings, fueled by perceived injustices within an existing political regime, and are often catalyzed by economic and social upheaval. Some, termed 'social revolutions' or 'great revolutions,' usher in profound economic and social changes. The success of a revolution often hinges on the weakening or collapse of the old regime's infrastructural power, its ability to impose its will on society (Goodwin & Green 2008). Several salient aspects of the incumbent's infrastructural power remain under-researched, like their international leverage to solicit support from allies during times of crisis (see **black knights**, **linkage & leverage**).

Outcomes The fate of revolutions is thus influenced by various factors, including resource endowments, prior economic development levels, and socioeconomic structures. International constraints like external dependencies and involvement in conflicts against foreign adversaries can also shape their outcomes. Furthermore, historical variables, such as population pressures and fluctuations in inflation or deflation cycles, are additional factors that can impact the course and results of revolutions (Zimmermann 1990).

Hellmeier and Bernhard (2023) point out that mass mobilization plays a dual role in shaping **transitions**, as it can either bolster democratic institutions or fortify authoritarian regimes. Pro-democratic mobilization contributes to an enhancement in democratic quality and raises the likelihood of successful **democratization**; on the other hand, mobilization in support of autocracy tends to erode democratic

principles. General disillusionment with the lack of (promised socio-economic) progress is another major factor that can halt or derail democratization processes.

While global data show that pro-autocratic mobilization has waned following the dissolution of the USSR (Hellmeier & Bernhard 2023: 25), scholars should not take democratic claims by revolutionary movements at face value, nor should they underestimate the risk of counter-revolutions or creeping coups by military elements when a new order is being negotiated – see **coups**. A good example is the coup by General Abdel Fattah el-Sisi in Egypt, which sidelined the democratically elected president Mohamed Morsi after the successful ouster of Hosni Mubarak (1981-2011) by mass protests in Egypt's '**Arab Spring**.'

Systemic change Revolutionary governments may encounter difficulties instilling mass behavioral shifts aligned with their ideals, potentially influencing the revolution's success and outcomes. The exact conditions required to ensure that revolutionary change lasts are under-explored, and dependent on fostering psychological change in the collective behavior of polities. Possible ways of achieving this are by building alliances with like-minded groups, **indoctrination** (educational programs and campaigns) and co-opting citizens into the system (Moghaddam 2023). Marxist thinkers, especially, underline these non-materialistic aspects of systemic change.

In the third of the *Theses on Feuerbach* Karl Marx defines a revolution as follows: *"The coincidence of the transforming of circumstances and of human activity or self-transformation [Selbstveränderung] can be grasped and rationally understood only as revolutionary practice"* (Marx 2022). According to this definition, revolution has always been not only the transformation of material circumstances, but also self-change, a change in the subject of revolution, a change of individuals' consciousness. Marx believed that a revolution must remake the core of capitalism as a world system. According to Marx, we also have a perception of revolution in a sense that is inherent to the capitalist system and the logic of capital. In *Grundrisse*, his unfinished manuscript, he writes: *"In accord with this tendency, capital drives beyond national barriers and prejudices as much as beyond nature worship, as well as all traditional, confined, complacent, encrusted satisfactions of present needs, and reproductions of old ways of life. It is destructive towards all of this, and constantly revolutionizes it, tearing down all the barriers which hem in the development of the forces of production, the expansion of needs, the all-sided development of production, and the exploitation and exchange of natural and mental forces"* (Marx 1973).

Analyzing the Italian polity, Antonio Gramsci (1891-1937) introduced the distinction between a passive revolution, or war of position, and a rapid revolution or a sudden surge. According to Gramsci, in Western societies, a Russian-type revolution is not possible as such revolutionary change requires a gradual, long-term transformation of civil society, but civil society in Western societies is highly developed. In Russia, where there was no civil society, it was possible to attack the state directly and that is why Russian revolutionaries had to work hard after the revolution to build a suitable civil society that would express the change to a new order.

As shown in Box 4.9, Lenin believed that a socialist revolution would be possible as a world revolution, starting in the country that was the weakest link in the capitalist chain. When that did not happen, he believed that Soviet socialism should catch up and overtake capitalism. Stalin then stepped away from the whole 'world change'-oriented idea and stressed the idea of socialism in one country. Step-by-step, country-by-country, socialist revolutions would change capitalism according to the doctrine of the new *Comintern* (Communist International with its center in Moscow, led by the Communist Party of the USSR).

Some believe that revolutions are possible only if an old regime is first destroyed completely. This is called catastrophism: first, a catastrophe must happen, and then a new society or state can be built. That is also the position of Lenin in his pamphlet *State and Revolution* (1918).

In bringing the 'social question' to the forefront of international legal debates, the Mexican and Russian revolutions offered new ways of thinking about foundational concepts of property, statehood and non-intervention – and indeed about the very nature of law itself (Greenman et al. 2021).

METHODOLOGICAL ISSUES Several issues should be taken into account when studying and comparing revolutions.

The French bias When studying revolutions, one should be aware of divergences from the French revolution taken as a typical model. Over the years, revolutions – the Mexican revolution, the Iranian revolution, the post-communist revolutions, and the Arab Spring – have demonstrated that the French case is not representative. These examples suggest that revolutionary outcomes often fail to fulfill the promise of progressive social change, instead resulting in more centralized or authoritarian regimes. One critical consideration is the misreading of revolutions through a normatively optimistic lens, often based on the French model. (In 2011, the 'Arab Spring' ushered in an era of misplaced hope.) The essential difference between the French and other revolutions is that the French one destroyed feudalism, while all the others wanted to overthrow capitalism. This turned out to be impossible, so they were unable to fulfill their set goals and promises.

Delineation Scholars do not agree on the constitution of a revolutionary process, and bicker about how to demarcate between revolutions, uprisings, rebellions, **coups**, and civil wars. Some focus on revolutionary movements attempting to change society or political regimes, while others concentrate on revolutionary situations involving violent contests for state power. Additionally, there are differing perspectives on whether a revolution is defined solely by

its ultimate outcomes, such as a discernible transfer of power and large-scale social change.

Time-bound phenomenon If revolutions reshape states and, sometimes, the societies they govern, it follows that revolutions could only occur on a significant scale after the emergence of consolidated national states, and these began roughly in the past two centuries. Prior to the modern era, there was no institution, apart from perhaps the Catholic Church, with the capacity to consistently exert control over substantial populations occupying contiguous territories. Once political authorities acquired this kind of infrastructural power, revolution became feasible and, for many, appealing. Thus, although political strife has existed for all of human history, the ability to profoundly alter a 'society,' 'nation,' or 'people' – the economic, political, and/or cultural structures of a large population under state governance – is intertwined with the advent of the modern state system, originating in Europe and subsequently propagated globally. Unlike certain types of political conflict, revolution is thus a distinctly modern phenomenon (Goodwin & Green 2008: 1871).

The need for violence Violence is often seen as a common element in revolutions, but its role is complex. Definitions of violence vary, and there are questions about when violence is pivotal in a revolution. Furthermore, the presence or absence of violence does not definitively determine the qualification of a situation as a revolution. Structural contingencies and the actions of organized social movements also play significant roles in revolutionary processes.

CLASSIFICATIONS The old-new dimension can assist with divisions: changes from the old to the new regime are *revolutions,* and changes from the new to the old regime are *counter-revolutions*. Nietzsche originated the term *conservative revolution*, which experienced a strong development in Germany in the 1920s and 1930s, and has often been described as part of the counter-movement to the French Revolution. According to this definition, it extends before the twentieth century as a tradition of militaristic, authoritarian nationalism, which rejected liberalism, socialism, democracy and internationalism.\ (Woods 1996). The conservative revolution is a slow, long-term counter-revolution.

Revolutions can also be divided in terms of the depth of change: a *political* revolution only changes the group in power; a *social* revolution aims to change social relations, which means first of all an intervention in property (agrarian reform, collectivization, nationalization, privatization) and then the social structure; a *cultural* revolution aims to change people's behavior patterns, and values. Note: social revolutions are also referred to as 'great revolutions' (Goodwin & Green 2008).

Kamrava (1999) identifies three ideal types of revolutions: spontaneous, planned, and negotiated. The balance between structural factors and human agency varies depending on the nature of the revolution: (a) *spontaneous revolutions* are deeply influenced by existing structural conditions, particularly those that weaken state institutions and foster the mobilization of social groups. Conversely, in *planned revolutions* (b), self-proclaimed revolutionaries take charge of mobilizing supporters and undermining state authority, often with a detailed ideological, tactical, and strategic plan for seizing and consolidating power. *Negotiated revolutions* (c) represent a fusion of structural forces and human intervention. While the groundwork for revolution is laid out, structural conditions alone are not sufficient for success. Representatives from the state and society must engage in negotiations for the revolution to potentially thrive and be firmly established.

Revolutions can be divided into *violent* and *non-violent*. When we consider the depth of change brought about by revolution, it is also possible to distinguish between *rapid* revolutions, which are shallow and operate in the short term (e.g., the October revolution), and *gradual*, or as Gramsci called them, *passive* revolutions, which introduce deep changes in the long term (e.g., the *risorgimento* or unification of Italy). Revolutions can also be distinguished by the doctrine they impose: *liberal, socialist, fascist, national, conservative*.

Revolutions can also be divided according to the field where they operate. Of this kind of revolution, the *sexual* revolution of the 1960s was the most radical, because it profoundly reduced social distance, liberated sex, de-patriarchalized the family, allowed people to behave more naturally, and changed lives and the mode of production of life. A special case is constituted by *technological* revolutions, through which society prepares the ground and produces the need for new technologies, which then accelerate transformations in directions set for the development of societies – see also **digital authoritarianism**.

NEW FRONTIERS Revolution constitutes a great and profound change in society, in the mode of production of life and the reproduction of social relationships. In this sense, there has been only one great revolution – the French revolution, which introduced capitalist relations and the capitalist mode of production of life into one particular nation-state and thereafter into the whole world. All so-called socialist revolutions have hitherto only had the function of introducing the capitalistic mode of production through the form of state capitalism. The introduction of the capitalist mode of production has not yet finished. Commodification processes are still going on and the potential to revolutionize new spheres of social life still exists.

Box 5.9 Foquismo: A Deceiving Manual for Insurrection

La revolución no es una manzana que cae cuando está madura. Tienes que hacerla caer.
(The revolution is not an apple that falls when it is ripe. You have to make it happen.)
– Ernesto 'Che' Guevara

Even while his violent death prevented Ernesto 'Che' Guevara de la Sarna from competing with Fidel Castro's long list of publications, the fellow Cuban revolutionary did have a notorious bestseller: *La Guerra de Guerrillas* (*Guerrilla Warfare,* 1961). While Mao Zedong covered the same topic in 1937 (to convince fellow decision-makers on strategy during the war with Japan), Che Guevara aimed for a different audience: future insurrectionists. His is a manual about the preparation, organization and feasibility of a guerrilla *foco* (a guerrilla unit, 25-30 fighters). His three fundamental lessons are that (a) popular forces can win against a regular army, (b) one should create the conditions for **revolution**, not wait for them, and (c) that the underdeveloped Latin American countryside is the most suitable basis for insurrection.

Alas, Che Guevara's *foco* theory (*foquismo*) was solely deduced from his hands-on experience in the successful Cuban revolution, ousting the personalist US puppet, Fulgencio Batista. Che's original document acknowledged this subjective vision, but as Childs (1995) has shown, the final manuscript experienced quite some interplay with (internal) Cuban politics and **propaganda**, overstating the importance of the rural component, stressing practice over (Marxist) theory, and exaggerating the universal applicability. The final doctrine proved terribly ill-suited to the political, social, and cultural context of most countries, as violent guerrillas flared up and were easily defeated. The first lesson (a) remained an unproven statement. The second (b) was pure heresy in established Marxist thought. But the third (c) was a final nail in the coffin of his Latin American insurrectionist followers. Not only did it sideline urban insurrection, *foco* warfare treated the (Latin American) peasants as a unified class, with a coherent set of demands – a crucial mistake as in many cases villagers seldom supported the guerrillas, even aided in tracking them down, swayed by government promises (of land reforms).

As a Marxist heresy, *Foquismo* contributed to the rift in the Leftist Latin American front and resulted in much unnecessary bloodshed. H. Brands finds that: *"In fact, the foco was better suited to radicalizing the Right than radicalizing the masses. In no case during the 1960s did a Latin American guerrilla movement achieve sufficient strength to seize power, but foquista violence and Cuban support provided militaries, security services, and conservative elites with both a reason and a pretext for internal repression"* (Brands 2012: 52).

Revolutionary Legacies

Так закалялась сталь!
(That's how the steel is tempered!)
– Russian idiom referring to the title of Nikolai Ostrovsky's social-realist novel

Revolutionary legacies differ significantly from regular authoritarian legacies, particularly in terms of regime durability, state-building, and the relationship between the state and society. These differences are manifest in several key areas as shown by Levitsky & Way 2016a/b; 2022.

Revolutionary regimes tend to exhibit a higher degree of durability when compared to their non-revolutionary authoritarian counterparts. This enhanced durability largely derives from the formative process during which revolutionary regimes arise. Typically, these regimes emerge from the violent overthrow of existing power structures, necessitating the consolidation of power in the midst of intense domestic and international resistance. Scholars refer to this process as a 'reactive sequence,' which compels revolutionary regimes to develop robust state institutions in the face of existential military threats emanating from counterrevolutionary movements or external conflicts (Lachapelle et al. 2020, citing Mahoney 2001). Revolutions (or the threat thereof) can also enable authoritarian 'protection pacts' in counterrevolutionary movements (Box 1.2) (see Slater 2018).

One of the formative features of revolutionary regimes is the presence of cohesive ruling elites (i). The shared experience of revolution and the continuous threat from counterrevolutionary forces foster a strong sense of unity (**trust**) among these elites, simultaneously ingraining widespread practices of surveillance, control, and the suppression of dissent in society as a whole (Mello 2018). For elites, this cohesion significantly reduces the likelihood of elite defection, a common cause of breakdown in authoritarian regimes (Smith 2005; Levitsky & Way 2010; Slater 2018).

Moreover, revolutionary regimes often possess a powerful and loyal coercive apparatus (ii). The imperative to suppress counterrevolutionary movements and defend against external threats leads these regimes to establish large and effective security forces that are deeply loyal to them. This loyalty is reinforced by the fact that revolutionary armies are typically newly created, staffed by veterans of the revolution, and closely tied to the ruling party (Levitsky & Way 2020).

When dealing with army recruitment, revolutionary regimes often balance necessity, ideology, and pragmatism. Conscription becomes crucial in prolonged conflicts, as seen with the Continental Army during the American Revolution, which expanded its recruitment criteria to include diverse groups (Kestnbaum 2000). Beyond mandatory enlistment, regimes also utilize ideological persuasion and material incentives. The Chinese Communist Party's recruitment during the Civil War exemplified this blend of ideological fervor and tangible benefits to motivate individuals to join (Zhou 2023).

Additionally, revolutionary movements' activities often result in the destruction of rival organizations and power centers (c). By sweeping away existing social structures and institutions, revolutions eliminate potential sources of opposition. This allows revolutionary regimes to establish a more dominant presence in society, making it considerably harder for opposition movements to take root and challenge their authority. (This also facilitates **totalitarianism**.)

In contrast, authoritarian regimes often lack these sources of strength. They may come into power through less violent means, inherit existing power structures, and face less intense opposition. As a result, they are more vulnerable to internal divisions, **coups**, and popular uprisings. This inherent vulnerability makes regular authoritarian regimes generally less stable than their revolutionary counterparts.

In terms of **personalization**, revolutionary legacies have mixed outcomes due to the nature of revolutionary parties and their formation. Van den Bosch (2021) identifies five factors that can either hinder (a), facilitate (b, c) or have truly mixed effects (d, e) on the eventual personalization of power within revolutionary regimes.

Revolutionary parties often have pre-established

decision-making procedures (a) that can act as obstacles to personalization. These procedures are designed to maintain unity and prevent any single individual from consolidating excessive power. For example, Lenin's Bolshevik party established collective decision-making processes that were later reinstated after Stalin's personalist escapade.

The civil-military relations specific to revolutionary regimes make military coups unlikely (b), and this can support the personalist ambitions of incumbent rulers. A cohesive ruling party and a tightly controlled coercive apparatus reduces the likelihood of military insubordination.

During the formative phase of a revolutionary regime, leaders who emerge victorious from violent struggles often possess significant **charisma** (c), which can aid in personalizing power. Leaders like Fidel Castro and Mao Zedong used their revolutionary credentials to centralize authority and shape institutions to their liking.

A strong revolutionary **ideology** (d) can deepen military obedience and provide legitimacy for individual leaders acting as ideologues, which may facilitate personalization. However, ideologies can just as easily prescribe collective governance structures that resist personalization.

As already stated, revolutionary regimes often face external threats or counterrevolutionary challenges, which reinforce elite cohesion and the coercive apparatus. This environment (e) can either support a leader's personalist ambitions, by eliminating rival centers of power, or solidify collective governance, by uniting leaders against common threats.

While some revolutionary regimes successfully personalize power, others do not. For instance, North Korea managed to personalize under Kim Il-Sung despite his not founding the ruling party; on the other hand, regimes like Angola (MPLA), Laos (LPRP), Mozambique (FRELIMO), Nicaragua (FSLN), Vietnam (PRP), Zimbabwe (ZAPU-PF) upheld collective governance structures without personalization.

Revolutionary regimes often enjoy long lifespans thanks to their strong institutional bases and ideological foundations. **Personalization** is more likely to occur in the early stages of a regime, but over time, successors often return to collective governance models, as seen in the USSR post-Stalin and China post-Mao (Van den Bosch 2021: 254-256).

Revolutions significantly influence the **transition** and establishment of revolutionary regimes using several key mechanisms.

Firstly, the emergence of revolutionary movements is often preceded by periods of intense social and political unrest (A). These movements mobilize against perceived injustices, aiming to overthrow the existing order. The dissatisfaction with the *status quo* fuels the momentum needed for revolutionary change.

Secondly, revolutions are marked by the breakdown of the existing state apparatus (B). This collapse or weakening of previous structures creates a power vacuum, which revolutionary movements can exploit to seize control; and, in doing so, they begin constructing new institutions and power structures that align with their revolutionary ideals.

The role of ideology (C) is another critical factor in revolutions. **Ideology** shapes the goals and strategies of revolutionary movements and significantly impacts the durability of the resulting regimes. Revolutionary elites driven by ideology often pursue radical policies that challenge established interests. These actions can provoke counterrevolutionary reactions, which in turn may harden the control of the revolutionary leaders as they respond to these challenges. However, a regime's immediate pragmatic needs (aimed at survival) may overshadow the pursuit of more egalitarian ideological goals (Arendt 1951).

Regarding stabilization, it matters who rules (D). Goldstone (2023) finds that radical and moderate revolutionary leaders contribute to different revolutionary outcomes and resulting regime types. Radical leaders, aiming for sweeping societal changes, often face resistance, and this leads to the establishment of coercive apparatuses and durable authoritarianism. This can result in cycles of radicalization, as seen in Stalin's Soviet Union and Mao's China. Conversely, moderate leaders may guide revolutions toward **constitutionalism**, but face challenges like factionalism and military influence, which can threaten more rule-based systems.

Finally, violence and coercion are aspects inherent to **revolutions**. The process often involves armed struggle (**conflict**), **repression**, and the use of force to achieve political objectives. This violence is not only a means to an end but also a formative characteristic of how revolutionary regimes establish and maintain their authority in the face of opposition. (Note that Arendt (1951) considers violence as a sign of weakness. She argues that true political **power** stems from the collective action of citizens, while violence is a sign of its absence.)

The evolution of revolutionary regimes typically follows a general pattern, although the specific stages and their characteristics vary in different cases. This evolution can be broadly divided into three phases: (i) the formative phase; (ii) the stabilization phase; and (iii) the post-revolutionary phase. It is important to note that not all revolutions follow a linear path of development; many regimes do not survive their 'reactive sequence' and some revolutionary regimes collapse before reaching the post-revolutionary phase. Furthermore, even within these broad phases, revolutionary regimes exhibit considerable diversity in their trajectories and outcomes.

In the formative phase (i), revolutionary regimes have the experience of the initial seizure of power and the establishment of a new government. This period is often marked by intense instability and violence (i.e. the 'reactive sequence') as the regime attempts to consolidate control. During this phase, a charismatic revolutionary leader often emerges, playing a central role in shaping the regime's ideology and direction.

If a revolutionary regime survives this tumultuous beginning, it enters the stabilization phase (ii). Here, the focus shifts to building new institutions, con-

solidating power, and suppressing any remaining opposition. During this time, the regime may undertake extensive social engineering (even totalitarian) projects aimed at reshaping society according to its revolutionary ideology.

Such institution-building is still very dependent on unique historical contexts as evidenced, for instance, by comparing the Chinese (CCP) and Soviet commissar systems. The USSR maintained a clear separation between political and military roles, supported by access to resources and professional military structures. Commissars focused on political **indoctrination** and military experts handled technical matters. In contrast, the CCP's system blurred these distinctions due to resource scarcity, its reliance on guerrilla warfare, and (historical) fears of **warlordism**. As a result, commissars took on multifaceted roles, integrating political and military functions. The CCP emphasized political work and adaptability, often critiquing Soviet **bureaucracy** for being detached from the masses (Zhou 2023).

As revolutionary regimes age, they enter the post-revolutionary phase (iii). In this stage, there are often significant transformations as the initial revolutionary fervor fades and the founding generation of leaders passes from the scene. The regime may face new challenges to its legitimacy and authority, and embark on new self-legitimization strategies (Loff 2014). Although revolutionary legacies – such as strong state institutions and a weakened civil society – can endure for decades, they are not permanent. Over time, these regimes may become more vulnerable to internal divisions, corruption, and popular unrest.

Nevertheless, even as the revolutionary ideology wanes (see post-**totalitarianism**), and the first generation is replaced (**succession**), the persistence of authoritarian structures and practices (**authoritarian legacies**) as well as memories (**authoritarian nostalgia**) remain significant. The 'powerful coercive apparatuses,' forged in the crucible of revolution and counterrevolution, often remain intact, ensuring the regime's capacity for repression even as its ideological underpinnings shift or erode. For this reason, revolutionary regimes are considered a form of 'durable authoritarianism.'

Succession

For princes like crabs have a notorious tendency of eating up their begetter.
– Kautilya, *Arthashastra*, Chapter XVII, Book I.

The state is left without a ruler or regular government, and is in imminent danger of destruction, just as a ship without a master is liable to be wrecked by the first wind that blows.
– Jean Bodin, *Six Books of the Commonwealth* (1575)

It is worth opening with the words of Dankwart A. Rustow, who aptly exposes the temporal link between the polity and its rulers: *"The problem of political succession is implicit in the human condition:*

it is posed by man's mortality and frailty. The founders of a commonwealth intend their work to endure through the centuries, and loyal citizens rarely put its permanence into question. But the impermanence of rulers is abundantly clear even in the most solidly founded state and even to the most loyal citizen. It is guaranteed by the hazards of health, the risks of fortune and the certainty of death" (Rustow 1964: 104).

In political regimes, leader succession constitutes a vulnerable moment and a dangerous process for dictatorships. Autocratic regimes, unlike democracies, do not all have established rules for this. And even if they do, the transfer of supreme power from one individual to another is a process where old (informal) rules can be renegotiated or a new order can be imposed.

For this reason, incumbents and the regime as a whole both face a major dilemma. If an incumbent ruler prepares a successor to take over, will the latter wait until the former steps aside, or speed up the process? Secondly, do other elites in the inner circle accept the successor? Do they consider this prospective ruler as competent and the right choice to safeguard their interests? Will they respect such a takeover once the incumbent relinquishes power, is incapacitated or dead?

DEFINITION Any high office intra-regime succession constitutes a leadership change of the supreme power position within the same ruling network. If the leadership is replaced by another network, this is a **transition** and a regime change.

According to Sir John (Jack) Goody (1966), the first issue to be considered is whether the polity itself can be divided among eligible successors, even if fair divisions do not preclude ambition and future strife intending to reunite the polity. Secondly, the exact timing of the successor's accession determines many dynamics of succession politics. A new ruler may either ascend immediately upon the death of the incumbent, after a reasonable interval of time, or while the latter is still in power (Goody 1966: 7-9).

To systematize these key moments: political succession consists of two sub-processes (A & B) stipulated in time. The 'selection process' (A), which identifies successors, and the actual 'transfer of office' (B), where the key moments of 'exit of the incumbent' (a) and 'entry of the successor' (b) are also of paramount importance.

If A takes place before B, we are in the realm of grooming (with 'a' before 'b') or co-rulership (with 'b' before 'a'). Note that when there is a split between religious and political authority (e.g., pope and emperor), this is also a form of co-rulership, where smooth succession in either branch can be supported (or sabotaged) by the other as a parallel authority.

If a successor is yet to be identified after the demise of the ruler ('a' before A) the polity has to deal with an 'interregnum' before A allows for 'b' and the conclusion of B.

'Interregnums' are very vulnerable moments for regimes, as elites can negotiate new ruling pacts without a *primus inter pares* to settle escalating conflicts. For this reason, agreed-upon 'stand-ins' (regents, deputies) are recognized to take the wheel while elite consultations, selections or elections are carried out. 'Stand-ins' usually do not have the **legitimacy** or **power** to highjack high office outright themselves, but many have been known to unduly influence underage, inept or inexperienced successors, becoming *de facto* rulers over time.

The section on 'literature & classifications' below provides some partial frameworks to understand the nature of the incumbent's exit (see 'B') and its impact on succession, as well as various modes of identifying successors (see process A) and their trade-offs for the stability of polities.

Succession processes are challenging for autocracies because they lack independent institutions to ensure an orderly transfer of power, unlike democracies, and violence remains the ultimate arbiter (see Svolik 2012) within autocracies. Democracies, on the other hand, excel at managing succession through free and fair **elections** (their central defining feature), rendering them inherently durable if their rule-based order is upheld by all political actors involved and sufficiently adaptable to mitigate structural change and sudden shocks.

In dictatorships, when many contenders vie for leadership, elites are unsure where to place their loyalties, often preferring to avoid a brutal struggle by agreeing on a good-enough successor. However, coordinating to identify a successor is difficult. Designating an heir supported by law and tradition can provide a focal point for elites, reducing the risk of rebellion against a weary ruler. Kings are also known to protect property rights better (Knutsen & Fjelde 2016).

Yet this 'crown prince' can become an incumbent's most dangerous enemy, as their own path to power necessarily involves the ruler's demise. With a designated successor, the loyalties of elites begin to coalesce against the **incumbent**, rendering the ruler a 'lame duck' (Box 3.14). This issue is particularly acute if the successor is from the same generation as the ruler and cannot be certain of eventual inheritance (Kokkonen et al. 2022: 206).

To maintain (authoritarian) stability, over time regimes have experimented with various arrangements to address succession challenges. But no matter how elaborate or regulated these schemes are: *"No system of succession is completely automatic, (...) high office generally demands some particular qualities of its incumbents, even if only 'mens sana in corpore sano.' The health of the king often has a direct link with the health of the kingdom; and in a next-in-line system not all the automatic successors can meet the minimum demands of royal fitness. Hence some flexibility must exist or the dynasty will find itself out of power through inadequacy or incompetence"* (Goody 1966: 13).

SEE ALSO A successful succession is a cornerstone for authoritarian **longevity, stability & resilience**. The tense relation between incumbent and heir-apparent (the so called 'crown prince dilemma') is one key source of conflict; another is the process of designating a new ruler *after* the demise of the previous supreme powerholder and upholding that **elite pact**. Successions are vulnerable moments for most **political regimes**, less so for **democracies** that have institu-

tionalized the practice as a key feature, and thus face different **exit option & leader fates** after the ruling group loses office.

LITERATURE & CLASSIFICATIONS Different types of **political regime**s developed various organizational predispositions to manage succession. As regards the 'eligibility' of candidates, **selectorate theory** covers the range of endowments members of the inner circle need to possess (their background) to operate at the highest echelons of the regime, alongside the ruler, but such theoretical frameworks do not describe the precise nature of the power relations between a ruler and his ruling coalition (they focus foremost on the size of the latter).

In essence, the size of the **ruling coalition**, its **background** (competences and political culture), the type of leadership structure and the level of fragmentation are all key elements that influence successions (or **transitions**). But these (theorized) factors then meet reality, where successions are conditioned by time, place and context, and the whole process can thus be high-risk, unpredictable, and have grave consequences for all involved.

For this reason, it is quite impossible to 'model' successions (or transitions for that matter). Below are listed the relevant insights from the literature about mitigating factors, like the organizational basis of regimes (A), the nature of the incumbent's exit (B), the mode of the envisioned succession process (C), the successor's background (D), and the influence of spoilers or fate. All these dimensions may be salient in a succession, and because they all interrelate and affect one another they make intra-regime leader transfers very complex and unpredictable.

(A) Regime Organization Various regime **classifications & typologies** can be applied to distinguish organizational structures, but none were specifically designed to study political succession; so, below, I have mixed several classifications and borrowed categories to highlight how regime structures can affect succession.

Succession in **monarchies** (I) is too often conflated with the practice of primogeniture (see Box 5.10), but traditionally this regime type espoused various methods of succession, including 'open succession,' designation, election, and procedural systems. The more these systems favor legitimate birth and hereditary rule, the more fellow elites can rely on royal **dynasties** to ensure longevity. With a strong royal **bureaucracy** and a large pool of potential successors, the risks during leader transfers can be mitigated. Sometimes this worked to such a degree that the occasional regicide (**assassination**) to dispose of a disliked or incompetent monarch (royal **coup**) did not actually hamper a smooth transition (Bagge 2019: 172). Of course, not all monarchs were equally powerful and their *potestas* could range from impotent ceremonial figurehead (where reigning was separate from ruling) to virtually unconstrained **absolutism**.

The takeaway is that monarchies, in contrast to popular representation, have experimented with various succession methods throughout history. Elites' agency to disavow, select, elect, endorse or merely tolerate a new ruler is as varied as the manifestations of such rulership in past millennia. Nonetheless, blood and name (and often sex) mattered when it came to circumscribing the potential pool of eligible and legitimate candidates for the throne according to custom or law (**traditional rule**), and claiming **legitimacy** by descent from a founding figure (**charismatic rule**).

With high infant mortality, pre-modern healthcare and a hazardous political climate for competing royal progeny (often spearheaded by their mothers and in-laws), elites often clustered their alliances among the surviving offspring by the time the incumbent was incapacitated. Note that many royal courts were additionally separated into outer and inner parts (like harems – see Box 5.11), and the border between them might have been impassable for many elites, thus depriving them of crucial information regarding succession plans. For instance, outsider elites were forbidden to enter the inner sanctum; some royal family members were forbidden to leave; while eunuchs and select servants (maidens, pages) traveled both realms and acted as gatekeepers and messengers.

Describing or sub-classifying all monarchical succession practices as part of a single entry is, of course, absurd since these encompass millennia of forms of human rulership from all over the world. So, the focus is on just three main features (a, b, c) that differentiate monarchies from their regime type counterparts. For a deeper study of succession practices in pre-modern kingdoms and empires, see Duindam (2015) (global comparison); Goody 1966 (for (pre-)colonial Africa); Ertman 1997; Kokkonen et al. 2022 (Europe); Woodacre et al. 2019 (selected cases); Duindam 2021 (gender). For reference works on modern succession, see 'regional variation' below.

The first feature (a) is that monarchies, once established and consolidated, can typically rely on the **legitimacy** of **traditional rule,** filling a psychological-biological human need, in any social unit, to have a leader (Ludwig 2002: 8). Today, this is an asset that modern authoritarian regimes struggle to obtain or create since legitimacy is often grounded in legal-rational **rulership**. Monarchs, mirroring their predecessors, offer a familiar, historically-proven stability to other elites if they set up clear succession rules or appoint an heir-apparent early enough. This does not remove the 'crown-prince dilemma.'

Secondly, **dynasties** (b) are the real cornerstones of monarchies. Such aristocratic or oligarchic networks coalescing around rulers (sometimes even conglomerates of ruling families, e.g., in the case of alternating dynasties) actually largely correspond to the regime network itself in the modern definition of **political regimes** (if 'dynasties' are not too narrowly defined). Still, the historical divide between pre-modern kingdoms and empires with their static, long-lived dynasties, on the one hand, and modern monarchic autocracies with their dynamic regime networks, on the other, persists. Scholarship would benefit from designing theoretical frameworks that would link both sets of cases, highlighting that dynasties (then and now), were often short-

lived patronal networks (see **patronalism**), which attempted to uphold continuity through impromptu measures and to safeguard their legitimacy through self-legitimizing acts stressing permanence and tradition (Duindam 2015: 74).

Third (c), in contrast to other contemporary regime types, women, though still too often overlooked, have always played key roles in monarchies, either as (indirect) rulers (**female rulers**) or as wives, mothers, and concubines, leveraging their proximity to male rulers to advocate for their own interests, promote the aspirations of their sons, and shape political decisions (see harems in Box 5.11). Women are crucial actors in monarchic successions and in upholding dynasties, beyond their logical biological role (producing heirs), or their position as daughters, sisters, and aunts in strategic marriages and alliance-building.

Succession in **party-based regimes** (II) involves risks like factionalism and intra-party conflicts, weak institutionalization, and potential challenges from the military wing. These risks arise when a long-ruling leader departs, leading to power struggles and instability. Succession practices often involve formal rules and procedures, such as party congresses and central committee elections, but also rely heavily on informal power dynamics. The outcomes can range from orderly transitions, which maintain continuity, to instability and potential regime change if succession fails (Zhu & Mukhin 2021; Battera 2023).

Military regimes (III) face succession risks primarily from coup attempts and military interventions due to the lack of strong civilian institutions. If **personalization** often concentrates power in a single leader, this makes succession unpredictable. Practices typically involve **juntas** or military councils where senior officers play a crucial role in the selection of new leaders. In the absence of succession rules, reshuffling **coups** *(coups de chef)* are one way to alternate between ruling factions, often contributing to 'coup traps' (Box 5.2). Outcomes can either continue military rule or transition to civilian rule, depending on internal pressures and negotiations, affecting **exit options**.

Personalist rule (IV) is highly vulnerable to succession crises due to the hyper-centralization of power in one individual. The absence of institutionalized mechanisms for succession often leads to uncertainty despite a tendency to set up dynastic succession. Succession practices may either involve designating an heir or relying on informal networks. Outcomes frequently result in regime collapse or the emergence of a new strongman – notwithstanding temporary depersonalization under the successor (Van den Bosch 2024); however, succession crises can also open paths for demands for political liberalization (Brossier 2024).

In a **democracy** (V), succession refers to the orderly transfer of power from one leader or government to another, ensuring continuity within the political system. In parliamentary systems, changes in leadership, such as appointing a new prime minister, often coincide with shifts in the party composition of the government. However, in some established parliamentary regimes, between elections, new prime ministers may inherit their position from predecessors in their own party, reflecting a succession without a complete governmental transition. In coalition governments, a change in party composition does not always entail a change in leadership; the dominant party may continue to lead with new coalition partners. In presidential systems, distinguishing between 'succession' and 'transition' can be challenging. If a newly elected president takes office without altering the party makeup, this is considered succession; however, significant changes, often made by new presidents, can make these successions resemble transitions. The extent to which there is a transition also depends on executive-legislative relations. For example, in the US, if the president's party controls one or both legislative chambers, this can significantly affect governance and policy implementation (Helms 2020: 331).

(B) Incumbent Exit The nature, mode and context of an incumbent's exit matters a lot for succession. Even perceived **exit options & leader fates** influence regime behavior.

Sudden vs. Expected Sudden exits, often the result of unexpected death or incapacitation (e.g., an accident, rapid decline in health, or **assassination**), create a power vacuum that can lead to instability and violent power struggles, particularly in personalist regimes where power is highly centralized. These abrupt departures heighten uncertainty as there is little time for the regime to prepare for a transition, often leaving no clear successor. This lack of a designated heir can intensify competition among elites, leading to fragmentation and potential violence as various factions vie for control (Kokkonen et al. 2024).

In contrast, expected exits, such as those due to natural causes, **term limits**, or voluntary retirement, allow for more managed transitions. These scenarios reduce uncertainty because the ruling elite has had time to prepare for the leadership change. The presence of a designated successor can serve as a focal point for elite consensus, minimizing the risk of destabilizing power struggles. Established succession rules and procedures further contribute to smoother transitions by setting clear expectations and reducing ambiguity (Zhu & Mukhin 2021; Kokkonen & Sundell, 2020; Zeng 2020).

Violent Ousters Violence can significantly influence succession outcomes regardless of whether an exit is sudden or expected. In many cases, violence – through **coups**, **assassinations**, or post-succession **purges** – has been a tool for determining leadership transitions in regimes lacking institutionalized mechanisms for peaceful power transfers. Even when an exit is non-violent, the threat of violence often looms large, influencing elite behavior and shaping the transition process. Thus, while sudden exits tend to breed instability and increase the likelihood of violent struggles, expected exits offer opportunities for more stable transitions only if

accompanied by clear succession mechanisms and consensus-building among elites (Kokkonen & Sundell, 2020, Kokkonen et al. 2022; 2024).

Incumbent Age The age of an incumbent leader significantly influences succession dynamics by affecting the urgency of the succession process and the strategies of both the incumbent and any potential successors (**age & health**). In a way analogous to 'lame ducks' (Box 3.14), as leaders grow old the likelihood of a leadership transition becomes more apparent and pressing, especially in systems based on informal rules. This can lead to growing urgency and potential instability, especially in **personalist regimes** without an acceptable designated heir. In systems with **term limits**, the incumbent's age is less of an uncertainty factor, although it may still impact elite infighting and instability if incumbents extend their rule by casting such term limits aside, putting off successor designation or even delaying the successor's takeover date (Lucas 2012; Kim & Edge 2022).

In contrast, younger leaders often have longer time horizons (Box 5.5) and may prioritize institutionalizing clear succession rules, thus contributing to stability. However, they might also pursue dynastic ambitions by grooming successors early in their tenure, as observed in Togo and Gabon (Brossier 2024). Ultimately, although the age of a leader is not determinative, it influences succession dynamics alongside other factors like regime type, succession mechanisms, and the strategic choices made by incumbents and successors. These elements collectively shape the outcome of the succession process.

(C) Unregulated vs. Regulated Kurrild-Klitgaard (2000) differentiates between 'eligibility rules' and 'selection rules' in historical succession contexts. Eligibility rules determine who is eligible to inherit power, often emphasizing brother inheritance or father-to-son successions in hereditary regimes, or shared membership in the same ruling organization in non-hereditary contexts. In monarchies these rules focus on familial lineage to establish the line of succession. In contrast, selection rules involve choosing leaders through some form of election or acclamation, indicating a more participatory approach in which leadership is confirmed by broader approval or consensus from the **winning coalition** (see **selectorate theory**).

Succession models in pre-modern dynastic polities navigated the challenge of selecting competent leaders while avoiding civil war. We can identify four main systems for polities that were not equally divided among eligible heirs. Some still apply to modern times: open succession (I), designation (II), procedure (III) and election (IV), each with variations and combinations.

Open Succession (I) Survival of the fittest, common in military polities with nomadic roots – with no tradition of strict land ownership – emphasized merit and allowed for infighting, trusting that the strongest 'eligible' candidate would prevail. This system transferred to settled polities, as with the first Ottomans (Fletcher 1979, cited in Haeri 2020), and often adopted hereditary elements to maintain the integrity of royal estates.

In some cases, the lack of clear succession mechanisms led to cyclical instability. For instance, the Byzantine Empire, lacking a defined process for selecting leaders, experienced frequent coups and civil wars. Similar patterns of chronic instability, caused by succession issues, were observed in Mamluk Egypt and the Ottoman Empire. In extreme examples, *"civil war and rebellion become, in effect, the regular means of selection and elimination"* (Goody 1966: 18, cited in Kokkonen et al. 2024).

Designation: Groomed vs. Appointed (II) Selecting successors while the incumbent is still in power separates the actual 'selection process' from the 'transfer of office,' thus mitigating some uncertainties (Goody 1966: 15) and restructuring leader-elite and intra-elite conflicts (Konrad & Mu 2017).

This is effective if there is a pool of suitable (eligible and capable) candidates to choose from. Of course, this 'eligibility' of candidates can easily be extended to adopted children and protegees. 'Grooming' a candidate, by offering them several years in a top position in the regime, is likely to prepare them for the highest office. (Even under open succession (I) potentials heirs can be groomed by appointing them to a governor-like position in a distant province far from the capital.) However, the process of nominating and grooming a successor should not begin too early, as the heir-apparent might become impatient and attempt to hasten their ascent, leading to the 'crown-prince dilemma.'

Zhou (2023) models the dynamic between a ruler and their successor as a delicate balance. The ruler grooms a successor to ensure a smooth transition of power but is wary of being overthrown by them, while the successor fears being dismissed by the ruler. To manage this, the successor quietly amasses power without posing a threat to the ruler, maintaining a low profile to extend their relationship. Over time, the ruler grows increasingly intolerant of the successor's rising influence but becomes less motivated to replace them as they near the end of their reign. This makes conflict most likely in the middle of their relationship. Additionally, having a predetermined order of succession can heighten the chances of conflict by limiting the ruler's options. In scenarios with multiple candidates, a strong candidate may have an edge, but the likelihood of conflict increases.

Logically, the voice and choice of the current supreme powerholder dominates any discussion on this topic (Goody 1966: 15). The longer their tenure (and the stronger their position), the more likely it is that their dynasty will persevere (Abramson & Rivera 2016). Gray and Smith (2023) highlight that while nepotism (Box 1.1) is commonly associated with incompetence, successors chosen this way also inherit functioning neo-patrimonial networks, which offer several advantages for regime **longevity, stability & resilience**.

Without established rules, there is never the complete assurance that fellow elites will honor an outgoing ruler's choice. The situation worsens if a ruler dies early, unexpectedly (or in battle) *without*

appointing a successor, as this effectively results in open succession (I). Such circumstances could lead to civil war or invite foreign invasion, supported by competing inheritance claims – an outcome that is a nightmare for elites seeking to protect their privileges and possessions.

Procedure (III) In **traditional rule**, hereditary practices provided clear succession schemes for monarchies through agnatic seniority or primogeniture (Box 5.10), predominantly favoring male heirs. This reduced conflict by establishing predictable lines of succession. The phenomenon was more common in larger polities (Gerring & Knutsen 2019). Despite its stability, hereditary rule faced challenges when monarchs were inept, or died young and unexpectedly, either heirless, or with designated successors who were still infants or children (too young to rule and unable to produce their own offspring to secure the dynasty) – but while this was true of all hereditary ruling systems, (European) monogamous royal marriages were more at risk than their polygamous counterparts. Harems (Box 5.11) served as **coup-proofing** systems by isolating legitimate successors from conspirators and managing court politics. These systems aimed to balance competence with order, and all had their strengths and vulnerabilities in the maintenance of stability and the continuity of leadership.

As regards contemporary regime types and legal-bureaucratic rule, Frantz and Stein (2017) find that formalized succession rules reduce the likelihood of dictators confronting coups. Meng (2021) finds that an effective succession rule must address two key challenges: ensuring a peaceful exit for incumbents and a peaceful entry for successors. Firstly, the system should allow incumbents to leave power without the threat of coups. Secondly, it should enable the designated successor to assume power smoothly. Constitutional rules are instrumental in addressing both issues, especially when they designate the vice-president as the successor. The latter's access to material resources operates as a deterrent against other factions contesting the succession process; on the other hand, appointing successors who lack a power base proves ineffective.

Finally, with established succession mechanisms in authoritarian parties (especially those that predate the incumbent) it becomes much harder to install one's offspring. North Korea is a notorious exception (Brownlee 2007).

Election (IV) Elective monarchy offered a more peaceful alternative with rules and procedures, like the Celtic tanistry system: a (clannish) elite electoral process to choose a capable chief as well as his immediate successor, both being of full age and worthy of leadership, inspiring competition among potential candidates. However, this did not work for larger and more complex polities: compared to primogeniture, electoral monarchies were more unstable as rulers were forced to call upon parliaments to confirm power-sharing arrangements or to address unpopular policies (e.g., raising taxes) (Kokkonen et al. 2022: 142).

When the authority to choose successors shifts from an individual to a collective body, as in a politburo, a party congress, or a broader electorate, it becomes significantly harder, if not impossible, to designate a successor to ease succession struggles. A competitively selected candidate is less likely to have had an apprenticeship in national leadership tasks, creating an opportunity for opposition parties to gain electoral ground (Zeng 2020: 787). In addition, elected candidates in party-based regimes are beholden to their 'selectorate' and more likely to reduce economic volatility (in order to avert criticism of their leadership) (Doces & Lupton 2023).

Democratic systems are uniquely adept at managing peaceful successions due to inherent structures and norms that prioritize the orderly transition of power. **Democracies** by definition have established procedures (constitutional rules and electoral processes) that facilitate the smooth transfer of authority. The peaceful transition of power is central to democratic governance, where the outgoing leadership hands over control to newly elected officials without any party resorting to violence or coercion.

In consolidated democracies the losers of ruling coalition-building processes act as a loyal opposition, or accept such temporary setbacks, and retain influence. Furthermore, the predictability and regularity of elections in democratic systems reduce the likelihood of power struggles, as leaders are held accountable to the electorate and can be peacefully replaced if they lose public support (without suffering bad **fates**).

(D) Hereditary vs. Non-Hereditary Hereditary succession provides predictability and reduces uncertainty by establishing a clear line of succession. It allows the early grooming and preparation of successors, ensuring they are well trained for leadership roles. Goody (1966: 26) finds that it is not the lineage itself that gives rise to strain; rather, it is the 'presence of a plurality of royals' and their competition for the crown (i.e., title, office, lands, wealth), seen as common property. Hereditary rule provides a focal point for selection successors and thus minimizes power struggles among supporting elites, as long as succession is not disputed by the eligible heirs, compiling their own 'winning coalitions' and thus splitting elite loyalties in the process.

The generational age gap of 'primogeniture' (Box 5.10) allows the grooming of the designated heir, who is patient enough to inherit power peacefully. In contrast, siblings might not wait very long (Brownlee 2007; Tullock 1987). Additionally, hereditary succession can contribute to dynastic stability and a long-term vision, as power is consolidated within a single family, fostering policy continuity and predictability.

However, as already mentioned, rigidly-arranged hereditary succession risks putting incompetent or unpopular rulers in power based solely on lineage, which can lead to instability. Furthermore, it limits the talent pool by restricting leadership to a specific lineage, potentially excluding capable individuals from outside the ruling family. Non-hereditary succession offers meritocratic potential by allowing

leaders to be chosen based on competence and popular support, rather than birthright. This system provides flexibility and adaptability to changing circumstances, enabling alternative leaders to be selected if necessary. (Prescribed rotating or alternating dynastic succession is a hybrid system that counters the growing inequality between elite families, as each dynasty (in turn) identifies the next successor.)

Last but not least, hereditary succession does appear in democratic systems. Smith (2012) finds that 'legacy' candidates enjoy an 'inherited incumbency advantage' (cf. Box 8.2) in both the selection and election stages of their careers. However, the extent of the advantage conferred by inherited incumbency differs greatly depending on the institutional contexts of the electoral system and the candidate recruitment process within parties. Chandra (2016) and Ghosh (2023) look closely at Indian political **dynasties**.

METHODOLOGICAL ISSUES One key challenge is defining and conceptualizing 'succession,' which can be ambiguous and open to contestation. While it is often seen as the formal transfer of power from one leader to another, this process is rarely straightforward, and may or may not include **ousters** or account for *de facto* rulers highjacking the process (temporary regents or *éminences grises* – cf. Box 2.3 on invisible rule).

In assessing regulated succession, researchers must consider multiple aspects of succession, such as its antecedents, the events creating a power vacuum, the means and procedures of transfer, and its consequences. This entails grappling with the complexities of these stages and acknowledging both the interplay between formal rules and the informal practices that shape succession dynamics, and that all successful successions are **elite pacts** that require negotiation and consultation.

Identifying causal mechanisms and isolating variables constitute another challenge. Succession outcomes are influenced by a complex interplay of factors, including institutional structures, informal power dynamics, individual agency, and historical contingencies (e.g., the proximity of eligible candidates to the locus of power at the moment that a ruler is incapacitated). Disentangling these factors requires careful research design and methodological rigor. Additionally, accessing reliable data is difficult, especially in authoritarian regimes where such data may be secretive and unavailable; details of historical data may be lost in time.

Succession dynamics also vary in different regimes, time periods, and cultural contexts. Generalizing findings across diverse settings requires sensitivity to specific historical trajectories and cultural norms. Balancing quantitative and qualitative approaches is crucial. While the former can reveal broad patterns, qualitative methods, like case studies and archival research, provide insights into the nuanced power dynamics that shape individual cases.

REGIONAL VARIATION *Latin America* remains rather under-explored, although Behrend (2021) covers Mexico. Other regions have received much more attention.

Sub Saharan Africa See Ammutabi & Nasong'o 2013 (various case studies). Older publications include Hughes & May 1988 (the Cold War); Govea & Holm 1998 (covering 102 successions from 1963 to 1988); Londregan et al. 1995 (on the relation of ethnic politics to succession); Nwosu 2012; Battera 2023 (for 1990-2020). For the tension between succession and democratic rules in South Africa, see Delius 2021.

MENA Herb (1997; 1999) was one of the first comparative works. For cases and specific topics, see Lucas 2012 (for the Gulf States); Billingsley 2009 (on the role of tribal codes); Stacher 2011; Yates 2022 (for Syria); Joffe 1988 (on Morocco).

Eurasia Above all, contemporary Central Asia, where most founding (personalist) presidents did not have eligible sons, has been the subject of comparative speculation as much as analysis regarding succession. Of course, both have a long tradition (see Box 3.2 on Kremlinology): Ambrosio 2015; Isaacs 2015; McGlinchey 2016; Horák 2018; Lemon 2021; Anceschi 2021.

Indo-Pacific For a comparative analysis of hereditary rule and the dynasties in the region, see Thompson 2012; Purdey 2016; Teehankee et al. 2023; Kenawas 2015. For case studies, see Ebrey 2013 (on China); Schafferer 2023 (on Taiwan); Ockey 2005; Nishizaki 2022 (on Thailand); Kenewas 2023 (on post-Suharto Indonesia); Basu 2016; Chandra 2016; Ghosh 2023 (on India). For the infamous case of North Korea, see Park 2011; Cumings 2012; Park & Park 2022; Kim & Edge 2022; Yates 2022.

NEW FRONTIERS Despite how crucial the topic is for autocratic survival, Large-N historical comparative succession research has only recently gained traction. Its indirect influence on the creation of proto-parliaments, and the ensuing democratization as a result of succession crisis in European monarchies (Kokkonen et al. 2022), and a reappraisal of gender and succession dynamics (Duindam 2021) are but two examples of this burgeoning field.

Box 5.10 Primogeniture: Optimal Hereditary Succession

Le roi est mort, vive le roi!
(The king is dead, long live the king!)
– traditional proclamation

Primogeniture is a preference in inheritance (of an office or estate) given to the eldest child by law, custom or usage. For **monarchies** this means the throne should go to the oldest child of the ruler, or – in case there is no (legitimate) offspring – to the ruler's younger sibling. Throughout history, most monarchies have been patrilineal, meaning only sons (or brothers) can succeed. Sometimes women were considered if there were no direct male heirs. Matrilineal hereditary rule used to be common in early human kinship communities, but neither anthropologists nor evolutionary biologists can agree amongst themselves on how widespread the phenomenon was, or on the factors that displaced it with patrilineal forms. Yet, up to this day, pockets of this practice can be found in Africa, South and Southeast Asia and among some indigenous peoples in the Americas. In Eurasia it is very rare, although the Picts practiced it from the first until the fourth centuries. Some practices, like the 'Salic Law' (*Lex Salica,* 507-511 CE) were dusted off in medieval Western Europe to explicitly deny any succession by women (or even the male offspring by daughters of rulers) (Woodacre et al. 2003: 414; Middleton 2015). By extension, some of the most powerful women on the throne in Eurasia were usually wives of (deceased) kings or their mothers but seldom their daughters (cf. **female rulers & powerful women in regimes**).

As a **succession** practice, patrilineal primogeniture has many purposes: it prevents the division of a household's *patrimonium*, keeping the estate of the deceased *pater familias* intact. In agricultural societies with dense populations, it was a way to halt the partitioning of land. It was also a way to lower sibling infighting, by providing clear succession rules (traditional legitimacy) and equipping the eldest to defend the inheritance and bestow office (in case siblings challenged the claim). This forced younger siblings to become more ambitious and entrepreneurial (to make their own way and provide for themselves), channeling many into the church or military service. At another level, widespread primogeniture protected the power and prestige of the aristocracy (from trans-generational erosion and diffusion of wealth). From a state-building perspective, it kept aristocratic tax bases intact, making it easier to centrally measure and extract state revenues.

While European monarchic **dynasties** had universally adopted the practice by 1801 – or perished (Kokkonen & Sundell 2014) – in China the custom was introduced as early as the northern Wei (386-535) (McMahon 2013). The Ottomans in contrast, never installed a lasting system of (patrilineal) primogeniture to regulate succession; they either adhered to the (nomadic) Central Asian tradition of 'survival of the fittest' (until the sixteenth century) – by sending all sons (and their retinues) to provinces as governors and letting them fight it out after their father's death – or adopted agnatic seniority from the seventeenth century onward, which is a patrilineal system placing younger brothers before sons in the line of succession (Quataert 2005: 91-92).

Succession practices always meandered between the need to identify competent successors and avoid

succession struggles spilling into civil war. Those descending from nomadic pasts – untethered by strict land ownership – aimed at fostering meritocracy and the display of charisma among eligible candidates, either by appointment or 'open succession', accepting the risk of infighting. At times, even such traditions were adjusted to halt the erosion of the royal estate, for instance, by embracing the *levirate* system, where a widow would be married to a brother of her deceased husband (McMahon 2013: 137-138). A more peaceful alternative would be a variation of the Celtic system of *tanistry* – a (clannish) elite electoral process to choose a capable chief as well as his immediate successor, both of mature age and worthy of leadership, inspiring competition among potential candidates.

A. Kokkonen and A. Sundell (2014) aptly describe the dilemmas of (monarchic) rulers regarding primogeniture, arguing that the risk of elevating an incompetent eldest child to the highest office was still a better alternative to the risk of open succession (violent elite struggles) or the appointment of siblings (who might be capable, but too eager to speed up the process and thus depose the incumbent). The generational age gap of primogeniture allows the grooming of a designated heir, patient enough to inherit power peacefully (Brownlee 2007). Children (unlike siblings) still lack the network (or expertise) to oust their father, nor are such youngsters able to convince other elites that they are competent enough to rule in his stead (e.g., military skill for external defense), thus lowering the threat of ouster for the incumbent. Additionally, the system provides clear succession rules, offering a framework of order and stability (a long time-horizon) to other (non-royal) elites, rallying around the heir-apparent and currying favor, allowing the former to realign their positions and the latter to consolidate power over time.

However, the system is not foolproof. Political crises emerge when monarchs are incapable of ruling, or die young and unexpectedly, either heirless, or with appointed successors still infants or children (too young to rule and unable to produce their own offspring and secure the dynasty), but this is true of all hereditary ruling systems. The main issue with primogeniture is that inexperienced youngsters and children could be unfit to organize and manage a state's external defense. So, in the short run, Kokkonen and Sundell (2014: 448) find that many European polities were hesitant to adopt the practice, until the long-term effects of domestic elite stability paid off and became an attractive feature rendering primogeniture the most common succession method.

In contemporary times, patrilineal primogeniture is still dominant (and effective) among today's surviving autocratic **monarchies**. Hereditary succession has also been identified as a characteristic feature of **personalist rule** or neo-sultanism (cf. **sultanism & neo-sultanism**) where local contexts permit.

Box 5.11 Harems, Concubines & Consorts

The tree the leopard mounts no other animals dare climb
– Benin proverb

Polygyny has always been an affirmation of male potency in patriarchal ruling systems and "some form of polygamy was the rule rather than the exception in royal courts throughout the world." In most cases it was institutionally regulated and even under systems of Christian monogamy the practice of polygynous mating was common, with mistresses and 'bastards' often able to obtain positions of power and wealth (McMahon 2013: 11).

The foremost sedentary (centralized) polities developed elaborate systems with radical socio-spatial separations between the 'inner and private' and the 'outer and public' into which they sorted (and kept) the household members of rulers. J. Goody (1976: 53) finds that dowry-systems, in which marriage bonds are conditional on the transfer of property to brides, are bound to foster a sharp distinction between 'wives' (formally married with property allocation) and concubines (informal, no property), similarly distinguishing between their offspring's inheritance rights (and 'step-parenthood' animosity). Such cultural differences transferred to the ruling households of such polities would shape the level of institutionalization. For instance, more egalitarian, polygynous systems in Sub Saharan Africa differentiated 'co-wives' according to seniority, but did not have a separate word for 'concubine' (or step-parent, for that matter) (Goody 1976: 63).

This box reflects upon the function of various 'harem systems' as a political institution in different world regions. Slave trading was a foundational pillar to maintain a steady influx of girls, boys, women and men who were forcefully assigned various roles, ranging from handmaids, servants, dancers to eunuchs and concubines. For a select few, upward mobility was possible, but this *"was little compensation for the experience of the many more women and girls* [and boys] *uprooted from their homes and families to be objectified, assaulted, and violated. No matter its size, the royal harem could not account for the untold numbers trafficked into this condition and unable to significantly alter their trajectories"* (Gomez 2018: 302).

A harem (حريم – *ḥarīm* in Arabic) refers to the restricted section within a Muslim household as well as its members, most of them female. While often translated as 'forbidden' or 'unlawful' the Arabic root *h-r-m* also translates as 'sacred,' 'inviolable' or 'taboo' and it is in the latter sense the concept should be interpreted, as 'sanctuary' or 'sacred precinct' (Peirce 1993: 3-4). A sixteenth-century Italian synonym was *serraglio* (*sérail* in French) – derived from the Persian *sarāy* (palace) and probably adapted in contamination with the Latin *seraculum* and *serrare* ('enclosure' and 'to lock up'). On the Indian subcontinent, the word *zenana* exists, from the Persian *zan, zanāna* ('woman, female'). Scholars have noted similarities to the Sanskrit word *anthapura* (अन्तःपुर), translating 'inner apartment' of a household, meaning the practice predated Mughal rule (Sharma 2009).

While embedded in notions of sexual propriety – specifically, the belief that unmarried men and women who might lawfully enter into a sexual relationship must be kept apart – 'sexuality' was not the ordering principle within this part of the household. It is true that Muslim males, historically, could have up to four wives legally, and an unlimited number of (slave) concubines, if they could afford it, but the harem was also the home for children (also boys until they reached puberty), the (widowed) mother, and any unmarried, divorced or widowed female relatives of the husband. In addition, the harem included different classes of female slave servants (and eunuchs), who could be owned by either the women or the men in the family (Peirce 1993: 5-6).

The Ottoman Imperial Harem (Harem-i Hümâyûn) grew out of the need to manage, educate and control a sultan's offspring and integrate his extended family into the state's patronage system in line with each individual member's status. It was run by wealthy and powerful women, who became patrons of the arts and commissioners of fine public buildings in their own right, but were confined to the harem premises, leaving only under the tight surveillance of eunuch guards.

Long before Mehmed II the Conqueror (1432-1481) codified the practice, the fratricide of a new sultan's rival siblings was the norm (usually by strangulation so as not to spill royal blood). Any surviving rival heir to the throne could be become the nexus of an opposing faction at court or – worse – a puppet ruler to legitimize a coup by disgruntled Janissaries (cf. **presidential guards & praetorians**), the sultan's slave regiment).

By the seventeenth century, **succession** was regulated by agnatic seniority (brothers trumping sons), replacing the earlier system of 'open succession,' an unregulated process where sons fought to claim the throne. The ancient practice of royal fratricide (to get rid of the competition) once the throne was assured, now turned into the more humane confinement of younger brothers in the *kafes* (cage), a separate, secluded part of the harem complex, where they were kept under house arrest in luxury with their own servants and (barren) concubines. In this gilded cage brothers could spend decades waiting for their fate to be decided (sudden execution or being called to the throne), resulting in a series of unfit Ottoman rulers, maladapted to the overwhelming reality outside the *kafes*. The use of the *kafes* faded out when the *Topkapı* palace was abandoned in favor of the *Dolmabahçe* palace in 1856. From then only the younger (half-)brothers to the heir were kept in the harem.

In opposition to common belief, and often missed by historical Western sources on the functioning of the Imperial Harem, it was not the sultan's wife or favorite concubine who held the most important position in the harem system, but his own mother, the *valide sultan* (lit. 'mother sultan'). Note that the term was only bestowed on living 'legal' mothers. Biological mothers who passed away before the designated heir became sultan did not receive the title, and instead another legal caretaker

would take her place and sometimes her title (Peirce 1993: 126-127).

Motherhood (not sexuality) was one of the criteria to accord status: A *valide sultan* would get a daily stipend of two-three thousand *akçe* (*aspers* – silver coins) and thus outranked the favorite concubine or chief consort, the *haseki sultan* (*ḫāṣekī sulṭān* – translated as 'exclusively belonging to the sultan'), whose daily stipend would hover around a thousand *akçe*. As the mother of a potential future ruler, her status towered over the sultan's own sisters and aunts (the princesses of the ruling dynasty), despite the fact she had no blood relation to the ruling family and most often had slave origins. *Haseki* was a title for life, and retained in retirement; meaning the period *after* the death of the ruler, but *before* her son ascended the throne – following the logic of seniority – and she became *valide sultan* (Peirce 1993: 127-128). By the late seventeenth century, *haseki* was replaced by the less-prestigious title of *kadın* ('consort') to signal more equality among concubines, as well as to reduce their public influence (Peirce 1993: 104-108).

Of course, not all concubines were elevated to the level of 'favorites' and the harem thus counted a large number of women undocumented by historical records: e.g., mothers of princesses or princes too far removed in lineage to ever ascend the throne. These slave concubines were labeled *umm walad* (mother of their master's child) and according to Islamic Law their offspring would be free from bondage (if the master acknowledged them), meaning the mother could not be sold, and automatically would become free themselves after the master's death (Gomez 2018: 301). Concubines unable to get pregnant were often sold off – underlining the importance of procreation as the harem's basic function.

Other important functions in the harem were: the *daye khatun* (Sultan's wet nurse), a filial relation with great ceremonial status; the *ketkhüda khatun* (harem stewardess) – the senior administrative officer of the harem; and a sophisticated system of servant classes and eunuchs.

The Ottoman harem system was clearly designed to contain the emergence of inimical factions in court (**coup-proofing**). The removal of younger brothers, together with the uncertainty about which wife or concubine would produce the next designated heir, would keep disgruntled factions in the capital from coalescing around one candidate. The influx of outsider (but loyal) slave women and their elevation to top positions (as mothers or favorite consorts) purposefully limited the systematic influence of aristocratic families over ruling dynasties. If anything, the harem system exposed the political precariousness of Ottoman rulers, and highlights the key role of non-Muslim slave women in maintaining the adaptability of this absolute monarchy.

The Mughal Zenana differed from the Ottoman system in that the mothers of the Delhi sultan (*walida*) wielded much less political power, although many rulers revered their sisters and foster mothers (wet nurses of noble descent – *anagas*), bestowing upon them important ceremonial functions, and even the title of *sadr-i-anas* ('chief of women') – head of the *zenana*.

Mughal royal women were less secluded than their Ottoman counterparts. They engaged in international and domestic trade (some even owned fleets), acted as mediators for noblemen, patronized the arts and construction works, some taking key positions in the royal administration. Beyond the extended royal household, the remainder of the *zenana* was made up of entertainers (*kanchani*) and servants (*bandis*). Quite unique were the *(urdu)begis,* a guard regiment composed of female slave warriors, highly skilled with the bow and lance, which existed alongside the traditional *khwaja sara* eunuch guard-servants and their *nazir* supervisors (Lal 1988; Shivram 2007: 375; Sharma 2009: 161-168; Bano 2008).

The Mughal court was often on the move between capitals, so the *zenana* infrastructure spanned several palaces and forts, with only a selection of wives and concubines (with their retinues) traveling alongside the sultan every time. Since Mughal rulers appointed their successors themselves, the *zenana* did not share the Ottoman function of dividing and ruling subversive court factions; although it did serve as an additional line of defense within palaces and, on, average sultans spent most of their down time inside these safe premises. If anything, the *zenana* had a more integrative function in the Mughal empire, accepting girls and eunuchs given as tribute, and routinely marrying off princesses (once they came of age) to local lords with the goal of strengthening the latter's ties to the ruling family.

The Chinese concubine system was likewise designed to foster and manage the male offspring of the current ruler. To avoid jealous reprisals and chaos at court, the system with multiple wives became more institutionalized and hierarchical over time with only one empress or 'principal wife' towering in status over all secondary wives: the latter group roughly divided in royal consorts (妃 – *fēi*) and other concubines (妾 – *qiè*). Throughout the dynasties many complex hierarchy systems would be established, with old categories like *ying* (媵 – *yìng;* additional brides granted as dowry) to be replaced by a plethora of other categories (McMahon 2013: 17-18, 23). The recruitment pool varied: In dynasties where emperors wanted to break the power of aristocratic families, they drafted concubines from commoners; when they wanted to tie the royal family to important elites, they selected women from the nobility (Walthall 2008: 138).

This political world was similarly divided between an inner, household (內 – *nèi*) and an outer, public (外 – *wài*) realm. The whole system was accompanied by prescriptive moral guidelines for the correct, exemplary behavior of all parties, structured by ritual, ceremony and protocol. Like in many other systems eunuchs were primary gatekeepers between both worlds (McMahon 2013: 29, 34, 45).

The emperor's mother (dowager or queen regent) usually asserted most political influence over her son, while the empress was preoccupied with the running of the 'harem' section of the court, which would later be known as the 'back palace' (後宮–*hòugōng*). If the primary wife died, no secondary wife could assume her status. If she failed to produce a son, she would adopt one from the second wives. Any intrigues (like unbridled philandering by the emperor or favoritism toward the sons of concubines) could perturb the conjugal harmony of the ruler and empress, upset this established hierarchy, and thus end up fraying the traditional legitimacy of the royal court. Blood relations between wives – as sisters,

cousins, or aunt and niece – were expected to diminish any jealousy among them (McMahon 2013: 23-27).

The Japanese Shogun (1185-1868) and Korean (*Chosŏn*) dynasties (1392-1910) developed more bureaucratic systems, divided into offices, called the 'Great Interior' (大奥 – *ōoku*) and the 'Inner Court' respectively. Besides the empress, all palace women were formally employed as servants, ranked according to merit and seniority. All were sexually available to their masters, but none were elevated to high positions until they had given birth to a ruler's child. In Japan, only the mother of the heir apparent got a top position. Other legitimate sons were not allowed to stay in the palace. Concubine servants were recruited mostly from middle-class families (often nieces recommended by aunts), groomed from an early age (sometimes as young as three), receiving special training in the arts, crafts, music, and management, and kept in seclusion in the palace. They were a holistic part of court rituals and ceremonies. Of course, they could not marry during their employment, but did meet men in the course of their daily duties, and were also able to visit their families on official leave. Elaborate retirement systems were in place for loyal 'matrons' who had dedicated decades of service to the palace (Walthall 2008: 175-188, 281-294). The institution never operated as a **coup-proofing** measure.

Southeast Asian polities found themselves on a spectrum, with those (on the mainland) closest to Chinese culture, embracing stricter hierarchies that clearly separated a primary wife of noble descent (usually a relative (cousin) of the ruler) from other concubines. B.W. Andaya notes that Islamic rulers in this world region followed the practice of temporarily divorcing wives to marry pregnant *sĕlir* (abbreviation for *silĕrilan* – "chosen ones" in several Indonesian languages) to stay within the designated number of four wives. (Note: women only received the title *sĕlir* after they got pregnant.) Southeast Asian succession did not mandate primogeniture and the region had a valiant tradition of matrilineal **rulership**, so the main function of harem systems was **spectacle politics**, radiating power and prestige through large courts, boosting legitimacy by symbolically linking male virility to land fertility (Walthall 2008: 24-30; Kumar 2003: 62).

African harem systems are understudied, especially non-Islamic and precolonial ones. Although heavily influenced by Islamic practices (and mostly regulated by the same customs), the elevation from slave to 'co-wife' was a cornerstone of (Western) African polities. Slave women and girls were either captured through military conquest, or traded or gifted as tribute to royal courts. Their potential to produce the next male heir would give their territories of origin an important stake in collaborating and identifying with the ruling regime.

Therefore, African rulers often applied a policy of inclusion encompassing co-wives of disparate backgrounds and ethnic origins, indirectly contributing to the political unification of rival factions and remote regions, strengthening state-building through strategically arranged marriages with their freeborn offspring. Moreover, these women brought with them knowledge about the traditions and customs of their homes, and could genuinely advocate for their communities.

In contrast to other systems, F.E.S. Kaplan finds that in some periods African harems were less secluded and more egalitarian, with royal co-wives overtly active in politics, and enrolled in the state's bureaucracy, often granted means of economic independence for herself and her children. The senior (but not necessarily first) co-wife was usually in charge of the harem. Despite the revered role of queen mother, in some cases she had no role in running the king's harem and even resided in a separate palace (as in Benin/Dahomey) (Walthall 2008: 115-135). For instance, in Kano (northern Nigeria) they were co-opted into the state's grain distribution (a tax commodity) and the royal monopoly on indigo-dyed cloth (Gomez 2018: 303; Nast 2005).

In Latin America, we know less of Mayan practices. Takeshi Inomata notes that there was male-female segregation and that women had their own meetings, rituals and spaces, but there is absolutely no evidence of closed harems: Classic Maya court women were highly visible both to other elites and non-elites, even though they remained in the shadow of more prominent men. Still, they actively participated in court politics and rituals, and probably the palace economy (Walthall 2008: 45-64). S.T. Evans finds that the Aztec practice of large female households for rulers and nobility had primarily an economical function (women produced valuable cloth) and thus conveyed splendor, but were not crucial for managing reproduction or **coup-proofing** (Walthall 2008: 219). The same is true for the Incas – the *sapa inca* ('unique leader') who usually married a full-blooded sister as primary wife (*coya*), but could have around a hundred secondary wives (from noble families or conquered peoples). None of their offspring would become rulers; instead, they would be employed in the state bureaucracy (Somervill 2005: 62-63).

To summarize, all harems, other than the polygamy systems in the Americas, developed over time to regulate, monitor, and keep in check the rulers' progeny. All these acted as training centers for slave girls to groom future 'wives' and integrate them in a reward system for loyalty, dangling the ultimate prize – becoming the mother of the next ruler – in front of them.

Almost all had an integrative function, tying noble families, newly conquered territories (and their elites) or valuable interest groups to the royal seat of power by offering them a stake in its survival. This was more pronounced in the less centralized polities of Africa or the expansive Delhi sultanates. The Ottoman harem and Chinese concubine system were elaborate in their coup-proofing function, keeping influential aristocratic families guessing about the next heir, thus countering the emergence of factions. Women were much more than just "borrowed wombs" and their role in *protecting* the ruling dynasty and maintaining authoritarian control over other elites has thus remained overlooked. The higher levels of seclusion in Ottoman and Mughal courts also rendered them safe havens for rulers during mutinies, defended by loyal guard regiments (eunuchs or *urdubegis*).

Egalitarian cultures made less sharp distinctions between principal wives and 'concubines' and greatly determined the level of freedom and power palace women could obtain. All these pre-modern institutions were deeply tied to systems of slavery and servitude, and any 'modern' equivalent under dictatorships, like that of Muammar Qaddafi (Cojean 2013), can only be

established on similar systematic human trafficking, routine abduction and serial rape, but *without* the veil of traditional legitimacy.

Totalitarian Legacies

The ideal subject of totalitarian rule is not the convinced Nazi or the dedicated communist, but people for whom the distinction between fact and fiction, true and false, no longer exists.
– Hannah Arendt, *Origins of Totalitarianism* (1951)

You don't have to burn books to destroy a culture. Just get people to stop reading them.
– Ray Bradbury (1920-2012)

Like the societies it engineered, scholars are coming to terms with the heritage of **totalitarianism** and how it differs from **authoritarian legacies** (Borejsza et al. 2006; Tucker 2015). Totalitarian legacies are distinct from other political legacies due to their comprehensive and pervasive impact on society. Unlike **authoritarianism**, which primarily focuses on the maintenance of political power – and thus may tolerate existing social structures if they do not pose a threat – totalitarian regimes aim for a complete societal transformation that affects every aspect of life, including social structures, culture, and even language. This comprehensive reach leaves a profound and lasting legacy that persists long after the regime itself has collapsed (Linz 2000).

Totalitarian regimes engage in systematic social engineering to align all aspects of life with their guiding **ideology**. This involves transforming family structures, educational systems, and leisure activities to fit their ideological mold. The legacies of such deep social penetration can persist even after the regime's fall. For instance, there is significantly lower participation in civil society organizations in post-totalitarian societies than in those with authoritarian legacies (Bernhard & Karakoç 2007), highlighting the destruction of organic social bonds beyond formal structures. In post-communist countries, the mean participation level in civil society organizations is notably lower (0.69) than in countries with an authoritarian legacy (1.13), illustrating the long-lasting effects on civic engagement (Bernhard & Karakoç 2007: 553). The dynamics behind these findings are given greater nuance by Riley and Fernández (2014).

In a way similar to **revolutionary legacies**, these regimes dismantle pre-existing institutions and eliminate potential alternative elites during intense periods of revolutionary upheaval. This creates a void in the post-totalitarian period, often resulting in a continuity of personnel and practices that hinder genuine democratic development. (Former elites transition from political to economic dominance.) The absence of alternatives extends beyond the replacement of figureheads to affect available forms of civic action. The duration of a totalitarian regime plays a crucial role in determining the success of democratization efforts, as seen in the challenges faced by post-totalitarian states in fostering protest

behavior and civic engagement (Tucker 2013; 2015: Linz & Stepan 1996).

Totalitarian regimes manipulate language to eliminate nuance, distort meaning, and hinder independent thought – a concept extensively explored by George Orwell and observed in real-world examples like the USSR. This manipulation extends beyond **propaganda**, affecting data interpretation and reporting during the regime's existence. In post-totalitarian contexts, analyzing data requires careful consideration of the 'wooden language' (Linz 2000) used under the regime, highlighting how deeply ingrained linguistic manipulation can be. Authoritarian regimes use propaganda without necessarily distorting language itself.

Tucker (2013) specifies three enduring linguistic legacies of late-totalitarian ideology. First, it undermines the ability of language to convey meaning about the world by gradually erasing the distinctions between different and even opposing concepts. When words or concepts can mean their opposite, they lose their ability to differentiate aspects of reality, rendering language ineffective and meaningless. Second, this ideology normalizes the use of logical fallacies as standard forms of argumentation. Third, totalitarian legacies perpetuate a fragmented view of the individual as merely a collection of basic needs and fears, stripped of personality, responsibility, and communal identity, making individuals susceptible to manipulation based on these needs and fears.

Filipache (2022) finds that these systems harm individuals by damaging their self-esteem and identity. It discusses the psychological trauma and societal oppression faced by people living under such regimes, using Romania's communist past as a case study. Neundorf and Pop-Eleches (2020) offer a theoretical framework to study the heterogeneous socialization processes of indoctrination in such disparate legacies.

The pursuit of a Utopian vision often leads to a disregard for due process and the rule of law. Thoroughly compromised **judiciaries** were part of a security apparatus aimed at repression and control, not to check, constrain or judge elites and their actions. *"There were 'judges' and 'policemen,' courthouses and 'lawyers,' 'constitutions' and 'law schools.' However, all were entirely subservient to the totalitarian state, eviscerated of their meanings in liberal contexts. Judges and policemen were low-level officials in the united executive hierarchy, trained and disciplined to follow instructions from above. The low salaries of judges, the dilapidated state of their offices and court houses reflected this status. Prosecutors had better salaries and facilities, as befitting their higher position in the same hierarchy"* (Tucker 2015: 60).

Show trials, arbitrary arrests, and extra-judicial killings created a legacy of injustice that is difficult to address in the post-totalitarian period. Even when aiming for retributive justice in the latter, concepts of justice have been warped. In various cases, 'lustration' (Box 3.7) was only partially implemented in post-communist states, indicating that the very framework for achieving justice had been compromised.

Such levels of **repression**, state terror and invigilation erode political **trust**. Totalitarian regimes institutionalize paranoia and encourage citizen surveillance more pervasively than authoritarian regimes. Combined with **indoctrination** and **propaganda**, this fostered a feeling of cynicism and distrust toward political institutions among the populace.

Monistic totalitarian legacies pose significant obstacles to democratic development. Having fostering an environment where pluralism is unfamiliar, they thereby hinder the establishment of democratic institutions. The pervasive legacy of fear and apathy – in line with the epigraph from Ray Bradbury at the top of this entry – further complicates efforts to build these institutions. Additionally, the destruction of independent social organizations leaves citizens unprepared for democratic participation, as they lack the experience and structures necessary for engagement. This is compounded by a legacy of atomization and distrust, which makes rebuilding social capital a challenging endeavor. The intellectual sphere is not immune to these effects, as some public intellectuals remain attracted to totalitarian ideas even after regime change, perpetuating the influence of these ideologies.

Last but not least, the transition from a state-controlled market resulted in significant economic turmoil. This was seen in post-Soviet states, riddled by **systemic corruption** during the 1990s – a decade marked by hyperinflation, asset stripping, and the rise of oligarchs (since rapid privatization processes favored former elites).

Understanding totalitarian legacies requires recognizing their multifaceted nature and persistence over generations. They continue to shape social, political, and cultural landscapes in subtle and obscure ways long after regime change. **Totalitarianism** leaves a distinct mark on the social, political, economic, architectural, educational, linguistic, etc., fabric of these polities. Nonetheless, it is necessary to go beyond the commonalities between totalitarian regimes because their differences are the key to analyzing the variations in post-communist pathways (Bozóki et al. 2017).

Transitions

You can do anything you like with bayonets except sit on them.
– Prince Talleyrand (1754-1838)

The principal imperative and instinct of non-democratic regimes is self-preservation and survival (Izquierdo-Brichs & Serra-Massansalvador 2021: 1-39). Yet no regime in the world, whether autocratic or democratic, goes unchanged and unchallenged forever. The changes it encounters may come from within (internal reform, personal reshuffle of elite members, coordinated ascendance of the new ruler – succession) or from the outside (**coup** d'état, **revolution**, **foreign invasion**, collective action of the **opposition**). To meet such challenges, a regime possesses various tools, depending on its internal features and the nature of the challenge, and inevitable transitions may take various shapes and occur in accordingly different circumstances (even violent ones). After all, the change of supreme powerholder(s) represents a significant change for the entire system of power constructed around the leader(s), and may even result in an existential threat to the polity if the transition process goes wrong.

This entry concerns the internal dynamics of regime transitions – that is, it does not address transitions caused by the fatal intervention of significant external actors initiating the process (foreign military intervention, revolution, etc.). It explores the factors that play a role in power transfers from one group or individual to another. It is worth mentioning that a transition from a form of autocratic rule does not automatically imply **democratization**, or even a 'better' form of autocracy, accompanied by better governance.

DEFINITION A transition in comparative authoritarianism means a significant, fundamental change in an existing authoritarian power structure that brings a new group to power to influence policy and leadership choice. In contrast to intra-regime power transfers (a palace **coup** or a **succession**), in this case the composition of the previous ruling group is replaced by another **ruling coalition** made up of stakeholders from different regions, religions, ethnicities, or tribes. With reference to the theoretical framework of Bueno de Mesquita et al. (2003), both the **winning coalition** and **selectorate** are affected by such transitions. At times such a power shift can eliminate civilian collaborators from the inner circle or replace one military faction with another (Geddes et al. 2018: 6-7). Depending on their context, such changes may result in a fundamental alteration in the nature and execution of governance, recomposing a new blend of formal and informal institutions and practices.

SEE ALSO For **ousters** driven by actors outside the regime, see **revolution** and **foreign invasion**. A coup d'état is usually committed by state actors, quite often regime actors (see 'palace coups' under **coup**). Purely internal processes fall under **succession**, and require at least some degree of coordination and negotiation. **Democratization** usually occurs once divided regime elites (in part) side with actors pushing for liberalization. The paradigmatic assumption that all transitions bend toward democracy is called 'transitology' (see Box 5.3).

KEY SIGNIFICANCE Given the current position of autocracies globally, and the rise of authoritarianism in spheres previously considered democratic (Apolte 2022: 162), it is difficult to overestimate the study of autocratic systems, regimes and governance features, and all transitions merit a closer look.

Understanding these transitions helps scholars and policymakers predict and manage future changes, offering opportunities for policy learning and adaptation. By examining past transitions, stakeholders can identify successful strategies and avoid previous mistakes, leading to more effective governance and policy-making. Furthermore, political transitions are often accompanied by significant social, economic, and political upheavals, especially when transitions fail and result in state collapse (see **state fragility & failure)**.

Analyzing these processes aids in mitigating negative impacts and promoting stability and development during and after transitions. Additionally, transitions can drastically affect **human rights** and governance structures, making it essential to study these changes to promote democratic values and protect human rights during periods of political change.

Distinguishing between transitions from authoritarianism to democracy and those from one form of authoritarianism to another is essential due to the fundamentally different dynamics and outcomes involved. Transitions to democracy (**democratization**) involve building new democratic institutions and practices, whereas transitions within authoritarianism often involve power consolidation or redis-

tribution among elites. The strategies and policies required to support a transition to democracy differ from those needed to manage a transition within an authoritarian regime. For example, promoting civil society and political pluralism is crucial to democratization, while maintaining stability and elite cohesion are more relevant in authoritarian transitions.

For the scholarly community, distinguishing between these transitions permits more precise theoretical frameworks and empirical research, which require adequate **classifications & typologies**.

In addition, international organizations and foreign governments often tailor their support and interventions based on the type of transition. Understanding the specific needs and challenges of each transition type ensures that **foreign aid** and **democracy support & assistance** are effective and appropriate.

ORIGIN Western scholarship has started the in-depth study of autocratic transitions, especially following the development and expansion of democracy studies (O'Donnell et al. 1991) and the (presumed) necessary link with markets and economic prosperity, thus framing **democratization** as a means of political modernization (Rustow 1970: 337-363). Now that the vision of the ultimate prevalence of democracy at the 'end of history' has collapsed, and the global turn to democracy has not materialized, the time has come for a greater focus on the internal mechanisms of autocracies.

At present, significant attention has been paid to the countries of the former Soviet Union and the dynamics of their (in)complete democratization (incomplete state-building). This can be explained by their geopolitical importance to Europe and the momentum of the **color revolutions**. Previously, the decolonized and newly independent countries of Africa and Asia (Van den Bosch 2021) and Latin America (Stoner & McFaul 2013; Brinks et al. 2014) were the main focus after the start of the third wave of democratization (see Box 6.3).

Undoubtedly, the unmet expectations of a looming widespread democratization partly stemmed from researchers' own assumptions and general popular belief; however, in some cases, the heads of the newly independent (post-Soviet) states did play with the idea of introducing at least some elements of democracy and liberalism – before changing their minds and opting to consolidate and secure their own power instead (Isaacs & Frigerio 2019).

LITERATURE In the 1970s and the 1980s, research on autocracies was predominantly undertaken in opposition to studies of democracy and democratic diffusion, at the expense of non-democratic forms of governance (Huntington 1991).

However, the dissolution of the bipolar world in the 1990s, and the democratization of East European countries, while initially encouraging democratic optimism, occurred side by side with the persistence of authoritarianism in other regions. Academic debate turned on both the perceived rollback (Diamond, 2015) and the specific conditions undermining or supporting democratization, such as the level and direction of economic development (Geddes 1999: 115-144) and the role of institutions in the back-and-forth processes (Wright & Escribà-Folch 2012: 283-309). Other authors argue that the perceived democratic slowdown is more a correction of the initial excessive optimism than a genuine retreat (Levitsky & Way 2015: 45-58), and in part a reaction to the decline of external autocracy-sustaining patronage and aid (Marinov & Goemans 2014: 799-825).

The debate on **democratization** and **autocratization** has so far proceeded in tandem, with growing contribution from non-Western contexts; it is likely to extend further (Mohamedou & Sisk 2017; El-Affendi & Al Anani, 2021). Besides growing academic inclusiveness, the research reflects rising global non-democratic actors and their normative influence, especially the People's Republic of China.

Academic and political research into the persistence and even prosperity of autocratic regimes naturally explores the reasons for their survival, evolution and diffusion, attentive to the dynamics within the regimes and to external, systemic causes.

Abandoning the disputable democracy-dictatorship dichotomy, sectoral and topical approaches were developed to study autocracies, including regime changes and the evolution of regimes in the autocratic realm. Among these, there is the seminal work of Daron Acemoglu and James Robinson, which examines the economic aspects and functioning of nondemocratic regimes and their transitions (Acemoglu & Robinson 2001; 2006). Other vital works focus on different factors, such as institutions in autocracies (Gandhi 2008) or their motivations for adapting seemingly democratic institutions to local authoritarian contexts (Schedler 2006).

However, the transition literature covers a myriad of autocratic transition types, and their consequences regarding regime stabilization, civic participation, as well as system analyses of dictatorships in the international arena. A semi-independent research tradition has sprouted from each of these topics, as shown below.

CLASSIFICATIONS Different transition scenarios have been devised based on various dyads between the previous regime type and how its power structure stands up to changes (A), the mode of transition itself (B), or the actors driving the changes (C). All these factors have been known to affect transition scenarios and the likelihood of democratization. Whether transitions are for the better or the worse, their effects (D) on the regime and the rulers are studied separately.

Sorted by regime type (A) As covered by the section on **classifications & typologies** the **Geddes, Wright & Frantz** classification distinguishes between (a) personalist rule, (b) single-party regimes, (c) military regimes and (d) monarchies (Geddes et al. 2014). For each regime type, game theory is applied to the internal power constellation to determine the (most likely) **exit options** for rulers and thus their most likely transition scenario.

Note that all transitions are power transfers, but not all power transfers are transitions. The differ-

ence is sometimes difficult to classify (because new leaders might radically alter the organizational basis of their regime after taking supreme power); however, a key indicator of the type of change is whether the power transition was planned by the existing regime (managed transition) or not.

Personalist rule, as a key regime feature, is defined by the supreme, unconstrained, arbitrary power of the leader as a person rather than of the office or institution they occupy and represent. (This does not necessarily denote omnipotence, however.)

The critical condition of a personalist regime transition is the transfer of *de facto* power, and not merely the nomination of another face to occupy a formal office. Examples of fictitious or incomplete transitions can be found in the Putin-Medvedev tandem in Russia; following the appointment of Kassym-Jomart Tokayev in Kazakhstan; or in President Gurbanguly Berdymukhamedov's promotion of his son Serdar to higher office, while still hold the reins, in Turkmenistan. In all of these cases, the previous presidents retained power despite formally leaving office. Nevertheless, in the Kazakh case, the so-called Bloody January events in 2022 demonstrate the possibility of a formal succession turning into a genuine regime transition.

Depending on the context, informality can play a significant role in the arrangement and distribution of power, stretching from being one functional component among others to playing the decisive role in communication (instead of hollowed-out institutions) (Ezrow & Frantz 2011; Betts & Huntington 1985: 141).

Usually, there are two principal, possibly fatal challenges to this regime type: the death or incapacity of the ruler or a significant blow to the ruler's economic sources, which holds his power base together through rent distribution. The rich research on personalist autocracies concludes that, given the organization of the power base under an individual rather than an institution, such regimes rarely survive their leaders (Ulfelder 2005: 311-334), as too many power links need to be rearranged around the new leader. Furthermore, if the elite is uncertain about the future sustainability of economic rents (for example, when the president becomes seriously ill and there is a high risk of death), this uncertainty might even lead to a preemptive strike and an attempt to impose a new guarantor of stability (Kendall-Taylor & Frantz 2016: 156-171). De-personalization can also happen under certain conditions (Van den Bosch 2024).

Single-party regimes – even in this regime type, individual politicians and other actors may prosper and navigate their affairs outside of party structures. Nonetheless, the party and its related structures are vital for every major decision or political appointment. This does not necessarily mean strict adherence to every single written rule of the party (for example, a leader might be selected by informal consensus). However, the party framework serves as the main reference to integrate new recruits and validate their loyalty, assigns a hierarchical structure inside the regime network to identify key decision-makers, doles out **patronage** and co-opts challengers. The party oversees military structures and often creates its own militia or paramilitary to protect its supreme power-holders (**coup-proofing**).

Party regimes usually set up procedures for the succession to the highest office; therefore, when they have consolidated, they can enjoy a longevity sometimes spanning multiple generations. In the case of revolutionary regimes, where the party alone bears public legitimacy, generational turnover within the party can almost mimic regime change. The first generation of 'true' revolutionaries usually shared a different threat perception, ideological fervor and/or *esprit de corps* than their successors, who focus more on stabilizing and running the system from a bureaucratic perspective. The change might also involve the demise of a charismatic first-generation leader and his replacement by a collegial elite pact (Dimitrov 2013; Smith 2005: 421-451; Herz 1952: 19-40).

Military regimes – when the state is controlled by soldiers following a **coup** – take different forms. Its rulers do not necessarily represent the leading positions in the state, but the **junta** determines who occupies critical positions and controls the main political strategies of the state. The main source of their **power** is the (near-)monopoly on the physical repression of civilians. Their effectiveness depends on their capacity to intervene in civic politics and the state economy, both in the short term (such as the cyclical interventions of the Pakistani military) and in the long term (e.g., Pinochet's rule in Chile). They often pose as a non-politicized, effective, stabilizing force in opposition to corrupt, incompetent politicians.

Any internal power transition requires respecting the formal military hierarchy, making the regime vulnerable to other ambitious individuals. Alternatively, the military may select a new civilian leader and hold on to power behind the scenes, especially when large-scale public opposition and unrest are likely to undermine the regime's legitimizing image of stability. In such cases, a consolidated military dictatorship needs to rely on civilian infrastructure and institutions to sustain long-term rule. Such (over-)reliance renders it structurally vulnerable as non-military institutions tend to clash with military control and instill mission creep.

Forced transitions open up other scenarios, in which the military can negotiate an exit with opposition forces (**elite pacts**) and return to barracks, rather than engage in open war with the masses or in civil war (being forced to fight its own troops). Such transitions might lead to **democratization**, but they usually include immunity provisions for the key military decision-makers and do not dismantle their power base, thus providing options for continued political interference.

Monarchies have been widely prevalent throughout history. As long as the source of the ruler's legitimacy was presumed to be divine will or tradition, challenging the power arrangement meant challenging the prevailing order (although criticism and deposition of incompetent individual rulers could emerge – see 'regicide' under **assassination**). Monarchical regime changes have been closely linked to much broader socio-political reforms (and **revolu-**

tions) outside the regime. Internally, transitions mostly take the form of (mostly hereditary) **succession**, although, historically, monarchies have known a plethora of leader transfer methods.

At present, absolute monarchical bastions remain in the Islamic world areas of the Middle East and in the Indo-Pacific. The Middle Eastern regimes proved resilient *vis-à-vis* the most significant wave of popular discontent in the region, the so-called **Arab Spring**, due to a combination of factors, such as stronger distributive power (utilizing rents from **resource curses** to lower economic discontent), religious legitimacy and a stable security apparatus. Some, including Saudi Arabia, Kuwait and Bahrain experienced coup attempts, which the ruling elites frequently attributed to alleged foreign sponsorship (Scholvin 2009: 78-96).

Mode of transition (B) Changing the supreme power holder, **succession**, is mostly defined as a planned regime decision, and entails the orchestrated public introduction of a new ruling agent (person) to the highest office. When endorsing a successor, the existing ruling elite counts on preserving the regime as a whole, including the *status quo* of power distribution within the network. In contrast, a regime change assumes the fundamental reorganization of the attached power sources and power structure.

There are two primary ways to pigeon-hole modes of transition, by measuring the accompanying violence (violent/non-violent) and by measuring control over the process (controlled/managed/uncontrolled).

Violence may emerge as a pretext for regime change, for example, by triggering public protests to speed up the collapse of a regime. Usually, some degree of violence can be found in any form of non-democratic regime transition, because new elites need to ensure their position when taking over the economic and security capacities of the state, which requires pushing out their predecessors.

Various factors may contribute to the intensity of violence. In general, lack of control and uncertainty strengthen the risk of violence, incentivizing clashes between various intra-state actors, such as the security services (Crescenzi 1999: 192-212; Gledhill 2012: 43-82), who fight to ensure their position in the new order.

When new rulers feel insecure or need to establish their ideological credentials, they may feel the need to deter the previous elite from even contemplating an attempted comeback. In the most extreme situations, rulers may strive for full elimination – the Bolsheviks murdering the Russian tsar and his whole family during the Russian civil war being a notorious example. A much less Draconian example is Kazakhstan after Kassym-Jomart Tokayev's emancipation. His predecessor Nursultan Nazarbayev's affiliates were persecuted to various degrees (**purges**); however, for the sake of Tokayev's international reputation, to preserve the rest of Nazarbayev's legacy as founder of the state, and the necessity of co-opting existing power structures, the purges were limited to the political level. Hence, violence may take place both during the regime change and afterwards, as a consequence of creating a new political arrangement. In less stable and less consolidated autocracies, the moment of regime change may inspire opportunistic actors within the state to use violence in order to demand more concessions from the new rulers in exchange for their loyalty.

Furthermore, some political systems may be especially prone to violence during regime change. Gino Vlavonou demonstrates such a risk in the case of neo-patrimonial, personalist system in the Central African Republic, where every regime change unbalanced and jeopardized vital economic lifelines to accommodate multilevel social groups and their clients, thus ousting former elites (cutting them off from rents) and providing them with strong incentives to fight back (Vlavonou 2016: 123-142).

Regime change imposed or initiated from abroad may contain elements of *Putsch*, coup or revolution, except when it operates indirectly and incentivizes domestic actors to act on their own – for example, by increasing the pressure for change through imposing **sanctions** (Levin & Lutmar 2020). Although a foreign actor may succeed in deposing the existing elite, installing a durable regime afterwards, whether democratic or autocratic, might be a much tougher challenge, as multiple great powers have realized in recent decades in the case of Afghanistan.

Sorted by actor (C) During regime change, individual decisions and preferences may determine the outcome. Elites in autocracies expect much harsher treatment than their counterparts in democracies due to the absence of the rule of law, institutional guarantees of safety and the low potential of making a comeback in the future (Goemans 2008: 771-794). A credible chance of retaining their freedom with protections for the property rights of former leaders and their affiliates might significantly lower their urge to fight to the very end. Naturally, the reluctance of battered leaders to use violence against protesters, even at the cost of their own position, can itself be a violence-reducing factor, as in the case of Sooronbay Jeenbekov in Kyrgyzstan during the 2020 protests.

In addition to leaders and their allies, there are two relevant actors who may challenge the regime in power: those in the ruling class and those excluded by the regime (Gandhi 2008; Schedler 2013). Researchers have elaborated on the numerous context-specific mechanisms in which actors play a role, on how their motivations may shape transition dynamics (Driscoll 2015), and on regime responses to such threats and challenges (Svolik 2015; Magaloni & Kricheli 2010: 123-143).

Theories of political transitions often focus on different sets of actors, and this shapes their perspectives and conclusions. For instance, actor-centered transition theories emphasize the strategic interactions among political elites, highlighting how their negotiations and power struggles can drive or hinder regime change. In contrast, structuralist approaches might focus more on the role of institutions and economic actors, considering how entrenched systems, institutional legacies, and economic interests influence transitions. The inclusion of civil and **uncivil society** actors, such as NGOs and

grassroots movements, underscores the bottom-up pressures that can catalyze democratization, while the exclusion of these actors might lead to an overemphasis on elite-driven processes. Theories that incorporate international actors examine the external influences on transitions, such as foreign aid and diplomatic interventions, which can significantly alter the dynamics of regime change. By including or excluding certain actors, theories can either provide a more comprehensive understanding of the multifaceted nature of transitions or risk oversimplifying the complex interplay of forces that drive political change. Regimes and repertoires (see Box 5.8) also matter, meaning that transitions' contestation script builds on previous interactions between such actors.

At times, intra-elite clashes resulting in regime change and the ouster of **incumbents** can take place in weak and unstable autocracies, in which multiple groups compete for power by electoral and other means, perhaps even utilizing public discontent against each other. The 2010 protests in Kyrgyzstan are sometimes analyzed through this lens (Collins 2011: 150-164). In this perspective, civil war resulting or accompanying regime change could constitute an extreme example. Frameworks of **patronalism** are well-equipped to capture such intra-elite infighting.

The effects of transitions (D) Not only is the change in leadership important for the study of political regimes, but also its aftermath – in particular, the fate of the previous autocratic ruler, his close allies and the winning coalition.

Autocratic leaders' expectations about their post-tenure fate significantly influence regime behavior during transitions. Leaders fearing severe consequences, such as exile or death, are more likely to engage in aggressive action to maintain power. This is particularly evident in **personalist regimes**, where power is concentrated in one individual, often leading to violent ousters and harsh post-tenure outcomes.

Factors affecting leaders' post-tenure expectations include regime type, economic performance, and time in office. Poor economic conditions and longer tenures increase the likelihood of violent transitions and negative outcomes. Additionally, reliance on foreign aid and political instability in neighboring countries heighten the risk of adverse fates, prompting leaders to take aggressive actions to stave off potential ousters (Frantz et al. 2014).

The method by which regimes come to power in the first place also plays a role. Leaders who come to power through irregular means often face irregular and violent exits (see 'coup traps' in Box 5.2). In contrast, regimes with institutionalized succession processes tend to ensure safer retirements for outgoing leaders. Understanding these dynamics helps explain why some autocratic regimes are more prone to conflict and less likely to democratize during transitions. Leaders who anticipate severe post-tenure consequences are more likely to cling to power and engage in belligerent actions to prevent their ouster, affecting regime behavior during transitions (Frantz et al. 2014).

Kate Gillespie and Gwenn Okruhlik (1991: 77-95) use the example of corruption-linked political cleanups to illustrate the relationships between new and old elites based on the way they came to power. In a post-coup situation, the newcomers have an incentive to continue assaulting the old elite both to legitimize their action and to prevent revanchist actions. On the contrary, post-succession and post-election situations require maintaining the perception of continuity, regardless of the degree of genuine regime change behind the scenes.

Kai A. Konrand and Stergios Skaperdas (2007: 623) outline two general approaches to negotiations regarding (mainly) the fates of outgoing during leadership transition in non-democratic regimes, a 'conclave strategy' and a '*divide et impera* strategy.' In the latter, a new leader strengthens their power at the expense of the predecessor's elite, usually stripping them of their power and position. The conclave strategy provides space for the survival of even those in the elite ranks who were 'defeated,' assuming they are willing and able to demonstrate sufficient and credible loyalty.

Escribà-Folch (2013) examines the post-exit fate of dictators (**exit options**), focusing on regime types and performance. He finds that **personalist regimes**, characterized by concentrated power and patronage, are more likely to result in dictators being exiled, imprisoned, or killed. Anceschi (2021: 673) confirms that every completed power transition includes 'de-personalization' – removing the influence of the former leader – and 're-personalization' by the usurper. This process is highly relevant for building public legitimacy, but also to prevent the previous regime from attempting a return. The dynamics of succession are more context-dependent, and the mode of transition affects these processes (Van den Bosch 2024).

Military and personalist leaders face higher risks of imprisonment compared to monarchs or leaders of single-party regimes. Economic crises and military defeats increase the likelihood of punishment for dictators, as poor performance signals incompetence and corruption (Escribà-Folch 2013).

Military regimes, while remaining threats to their successor regimes (and thus a likely target for repression post-exit – see Frantz et al. 2014), are nevertheless more agreeable to a transition to democracy, because they expect that punishment – including death – would be less likely from a new democratic order than from other dictators (Debs 2016).

Dictators from party-based regimes (**single-party regimes**) also face less punishment if succeeded by democracies, as the latter often provide exit guarantees (see **elite pacts**) for former elites. Dominant party regimes can safeguard former elites' interests by leveraging party institutions to mobilize support and maintain power in new democratic systems, thus preventing punishment. These regimes often perform well in post-transition elections, ensuring favorable exit options for former elites and reducing exit costs. In Communist Europe's single-party systems, transitional justice was avoided because **opposition** members had collaborated with the political police. Consequently, new party leaders upheld

promises of amnesty to avoid exposing their own past. Such negotiated transitions can protect former elites, ensuring a peaceful and stable political shift (Escribà-Folch 2013: 163).

Escribà-Folch and Krcmaric (2017: 4) describe the risks for the leaders of the transition process *per se*. If the transition does wrong, or if the relationship with the new leader deteriorates, a ruler may expect severe retribution or punishment from the new elites. Such punishment may include being stripped of power and wealth, even imprisonment or death, including for family, relatives and other close associates.

Hence, regarding post-transition exit options, leaders are likely to seek refuge abroad in exile. There are several reasons why exiled rulers seek to stay in foreign countries relatively close to their home countries, running from a leader's limited radius of action (if fleeing in haste) to the opportunity of indirectly influencing the situation at home.

Conversely, some countries may have an incentive to offer refuge to deposed autocrats. One is the motivation to provide shelter to avoid their fighting to the bitter end, thus prolonging the power struggle and related violence. The reputation of the leader also plays a role in whether they are welcomed or barred entry (see Mogadishu line in Box 3.12); and this signals the difference between Mohammad Reza Pahlavi, the former shah of Iran (who eventually ended up in the US), and the ousted war criminals Charles Taylor of Liberia and Mengistu Haile Mariam (Ethiopia), who were denied entry to several countries due to their human rights abuses or active international arrest warrants. In Libya, Muammar al-Qaddafi's inability to find a country that would realistically host him safely may have contributed to this dictator's decision to prolong his fight for survival in the civil war.

Understanding what happens to dictators after they leave power provides valuable insights into predicting the behavior of autocratic regimes. It can help us assess how leaders are ousted, their likelihood of transitioning to democracy, and the policies they may implement while they are battered, but still in office. Under pressure, a leader who expects exile, imprisonment, or execution after being deposed will make very different decisions than one who anticipates a peaceful retirement – especially in matters of international conflict (Frantz et al. 2014).

MEASUREMENT The comparative analysis of regime transitions emerged hand-in-hand with designing regime typologies (Alvarez et al. 1996: 3-36; Gasiorowski et al. 1996: 469-483). They have also accompanied the debate between transitologists (Box 5.3), who assume a dichotomy between autocracies and democracies, and incrementalists, who emphasize a continuum between the two (Maerz et al. 2021).

Geddes et al. (2014: 313-331) have made the best-known and probably most frequently employed autocracy-autocracy dataset on regime change in the critical post-1990s period. It still serves as a valuable referential framework for studying transitions. Another dataset designed to study democratization, by Hadenius and Teorell (2007), updated by Wahman et al. (2013), finds that electoral institutions matter in transitions to democracy.

According to the regime transitions dataset between 2000 and 2015 elaborated by Gianni Del Panta (2019: 139-155), after the fall of a dictatorship, it was almost twice as likely that a new authoritarian regime would be installed than there would be steps toward democratization. Alongside criticism of an inherent expectation of democratization in the 1990s, the 'failure of democratization' should be considered a valid criterion in cases where there was a provable attempt to introduce democracy.

Newer datasets have deepened our perspective, looking beyond the unified regime layer to obtain richer and more nuanced understanding of regimes' features and their actors' agendas (Bjornskov & Rode 2018; Maerz et al. 2023).

The *Episodes of Regime Transformation* (ERT) dataset (Maerz et al. 2023), which allows a unified analysis of **democratization** and **autocratization**, addresses the limitations of previous approaches by considering regime transformation as an uncertain and continuous process. It finds that not all episodes of transformation lead to actual regime transition. Only about 40% of autocracies that liberalize transition to democracy, while 77% of democracies experiencing autocratization eventually break down.

METHODOLOGICAL ISSUES Research about transitions under authoritarian rule faces the same challenges as any other research concerning autocracy – including a lack of available, verifiable data. Power transitions are usually the most vulnerable and uncertain moments in authoritarian life cycles, and their stakeholders voluntarily share even less credible information than usual. Many regime changes remain a black box for many years; others are lost in time, with valuable data destroyed in their chaotic aftermaths.

Because of the lack of credible information, the difference between regime change and **succession** might not be very clear in some cases, and even regime change may predate or follow formal succession by a significant period of time. The criteria and thresholds to classify changes as either one or the other, predetermine research findings.

Furthermore, as all regimes evolve over time, transition trends change. The patterns of change are influenced by a myriad of factors, including the geopolitical situation, technological and economic opportunities – or else they are closely linked to information-sharing and **authoritarian learning** and **collaboration**. Since these factors often have a transnational character, transitions may occur in clusters, perceived as waves of democratization or autocratization (see Box 6.3).

Specific methods may help overcome these blind spots, such as detailed process-tracing (Pedersen & Beach: 2019) or comparative case studies. Furthermore, as a consequence of the fast-growing literature on autocracies, prevalent regime typologies have become more nuanced and hyper-specific, and therefore sometimes terminologically confusing, with categories that do not fully overlap, further

complicating quantitative comparisons. On the other hand, the higher capacity for research has opened more opportunities for qualitative and context-specific understanding.

For example, special attention needs to be paid to the situation when the founding generation of revolutionary regimes or regimes of newly established states is in the process of disappearing, either politically or because of old age. The 'founding aureole' is a unique, hardly transferable legitimization tool, allowing them to remain in power even when their political and economic performance was poor. Regardless of how they ascended to power, the subsequent second generation of leaders must inevitably find another model for legitimizing and enforcing their rule. Usually, in this second phase, much more attention is paid to the economic performance of the regime and anti-corruption campaigns – marking two fundamentally different types of transitions with different sets of data for comparison (Levitsky & Way 2013: 5-17).

Arab Spring

The people want....
– Protestors across the Arab geography (2011)

The Arab Spring refers to the series of popular uprisings and revolutions that began in Tunisia (Dec. 2010-Jan. 2011) and traveled across the Middle East and North Africa. Its implications and consequences are still in the offing. This tsunami of bottom-up political change rebuffed the notion of 'Arab exceptionalism' (see Box 6.1) that had long exiled the region from studies and expectations of democratization.

DEFINITION The Arab Spring can be defined as the set of uprisings and revolutions traveling from Tunisia and across the region (Sadiki 2015a). Protestors demanded freedom and dignity, seeking to oust dictators in countries where various brands of authoritarianism had entrenched repression, corruption, and underdevelopment since independence from colonial rule in the mid-twentieth century. Chanting in public squares from Egypt's Tahrir (Sadiki 2012) to Bahrain's Pearl Roundabout, protestors also made adept use of technological tools such as social media (Tufeki 2011). Initially successful in Tunisia, Egypt, and Libya, publics removed rulers and created democratic openings in a series of processes that began to dismantle authoritarian institutions. Reverberations of the Arab Spring were felt across the entire region, including Saudi Arabia and Palestine (Haddad et al. 2012). The revolutions came up against counterrevolutions, however. In some cases, they devolved into armed conflict (Libya, Syria, Yemen, and later Sudan). By Summer 2021, the coup in Tunisia cemented the counterrevolutionary trend (Mnasri 2023) and democratic degeneration has taken hold across the board.

SEE ALSO A number of concepts and phenomena themselves 'sprang' from the **protests** and popular uprisings, and **revolutions** beginning in 2011. In its initial changes, the Arab Spring opened the door to **democratization** through parliamentary and presidential elections and new constitutions (Sadiki 2014). The backlash against these revolutions sparked a number of counterrevolutions by authoritarian leaders, eventuating in democratic setbacks.

KEY SIGNIFICANCE This was the first set of regional uprisings since independence from European (British and French) rule. Regional post-independence structures came unstuck in the Arab Spring. Accumulating and interrelated problems became unsustainable. These were economic (dependency, crony capitalism and liberalization), political (monarchical and republican authoritarianism operating through repression, clientelism, and corruption), and social (dashed and frustrated expectations where publics did not find the sought-after freedom or self-realization promised by independence).

Normatively, the Arab Spring is rooted in an ongoing popular mobilization or *hirak* (حراك), years and decades in the making before 2011 (Sadiki 2016). This traveling peoplehood was an intensified version presaged, for example, by the popular bread riots of the 1970s and 1980s in Algeria, Egypt, Jordan, Morocco and Tunisia. In the latter, marginalized publics protested the withdrawal of state subsidies compelled by international financial institutions, paradoxically resulting in some form of political liberalization in the respective countries. Hence, the Arab Spring was a riposte to Orientalist accounts that attributed passivity and acquiescence to authoritarianism to the region's publics. The Arab Spring uprisings demonstrated the moral repositories of protestors, who invoked values not far from the familiar Western liberal ones: freedom, justice, equality, inclusiveness, gender parity. Above all, the Arab Spring confirmed the unequivocal agency of Arabs for whom neither authoritarian rulers nor Western Orientalists or policymakers actually 'spoke.'

Pedagogically, the Arab Spring lends itself to learning more about the bottom-up dynamics of change and what happens below the state. Specifically, it draws attention to the forces and discourses contributing to a new brand of politics (cooke 2022), one that interrogates post-independence history marked by rigid authoritarian rule. The variety of Arab authoritarianisms, both monarchical (see **Arab monarchies**) and republican (see Box 4.5 on Baʿath parties), can be summarized by the absence of several features critical to democratic governance: participation and contestation, the rule of law, and a vibrant civil society. In this regard, the Arab Spring introduces a new stock of values, marshalled by individuals and groups, conducive to democratic practice. If allowed to thrive, this 'democratic learning' (Sadiki 2015b) could represent the promise of evolution of democratic government in the region.

A second pedagogical implication of the Arab Spring is that its diverse cases offer live and contemporary material for deep learning in classroom practices. Since 2011 there has been a proliferation of subaltern voices that 'speak' and express agency. From Morocco to Yemen, the varied unfolding of protests, uprisings, and revolutions provides abundant resources for investigation. The experiences and struggles of political parties, civil society organizations, activists, and former prisoners who have penned poignant memoirs supply a rich canvas of stories about social and political change.

ORIGIN The term is an English neologism applied to the Arabic-speaking region. Its translation in Arabic is *ar-rabīʿ al-ʿarabī* (الربيع العربي), and commonly used across the region. On the one hand, the term rebuts the *exclusivity* of the concept, in this case extending to the Arab World. The idea of 'Spring' hearkens back to Prague, the **color revolutions**, the historic 'Spring of Nations,' etc. However, these other (Western) instances of spring are analogous to the ones in the locale. In this, 'Arab Spring' also signals a *connectiv-*

ity to prior events. For instance, the Tunisian 'Spring of 1968' was replete with university student activism that preceded that of Paris and other European capitals, coinciding with a worldwide wave of university student unruliness at the time. Thus, the moral symbolism of political and social rebirth (Sadiki & Saleh 2024) resonates in the Arab setting.

LITERATURE Some works have approached the phenomenon comparatively, in edited collections (Lynch 2014; Brownlee et al. 2015), sometimes investigating relative successes in **democratization** across cases (Fraihat 2016; Mako & Moghadam 2021). Even when scholars dispute the extent to which the Arab Spring uprisings were full-fledged **revolutions** (Tripp 2013), there is a consensus that they ushered in an era of immense social and political upheaval (Bayat 2022).

In the years prior to the uprisings, many scholars puzzled over 'authoritarian persistence' in the region, using a number of theoretical paradigms, from state institutions to international influence (Hinnebusch 2006). The stalling of democratization can be due in part to the 'coercive' or 'co-optative' capacities of authoritarian regimes, according to Hinnebusch (2015) – see also **repression** and **patronage**. Similarly, Eva Bellin (2012) did not much alter the contours of her pre-Arab Spring argument about the centrality of the 'coercive apparatus' and of its organization to 'robust' authoritarianism, even in the face of popular protest (2012). From the viewpoint of authoritarian studies, the Arab Spring and its counterrevolutions pushed topics like **authoritarian collaboration** (von Soest 2015) and **authoritarian learning** into the mainstream.

Seeking to avoid the fate of Tunisia's Ben Ali and Egypt's Mubarak, leaders such as Assad in Syria used violence 'strategically,' for instance, while Gulf leaders pre-empted the impetus for protest by distributing financial largesse (Heydemann & Leenders 2011). The deployment of similar strategies, when authoritarians learn from one another and exhibit 'policy transfer' to confront popular protests, is sometimes evident across different regions, from Arab leaders to China, Russia, and other post-Soviet states (Hall & Ambrosio 2017). Also, the topic of monarchical resistance gained traction recently, with a few studies exposing the **black knight** behavior of Western democracies towards their autocratic allies in the region.

CLASSIFICATIONS Some call the initial revolutions the 'first wave' of the Arab Spring. These countries where protest and revolution broke out in 2011 include Tunisia, Egypt, Libya, Yemen, Syria, Bahrain, and, to a lesser extent, Morocco.

Another smaller group of revolutions comprised what some consider the 'second wave' of the Arab Spring, including Algeria, Sudan, and Lebanon in 2019 (Osman 2022). In Palestine, the Great March of Return took place in the Gaza Strip (2018-2019) to protest the Israeli blockade and demand the return of refugees to the occupied territories.

Unlike the **color revolutions** (e.g., Georgia, Kyrgyzstan, Ukraine, the former Yugoslavia, etc.) that took place in post-Soviet states, the Arab Spring was not set off by contested election results. Instead, the popular uprisings erupted in authoritarian systems characterized by 'elections without democracy' (Sadiki 2009) – or expectations of it by the masses. Furthermore, the Arab Spring was not staged under the ideological umbrella of Western/American liberal democracy in the manner of the color revolutions.

METHODOLOGICAL ISSUES The Arab Spring took most observers and even researchers by surprise (Aarts 2012). Epistemologically, the recent phenomenon has cast doubt on dominant lenses through which Middle East politics has been studied. This was (and sometimes still is) characterized by a twin focus on the various 'upgrades' of 'robust' authoritarianism and state structures and institutions. The uprisings and revolutions of 2011 demonstrated that the neglect of other types of political protests, online activism, etc., namely those from below, through new social movements (Beinin & Varel 2011), renders investigations of the region's politics incomplete. The result has been a subversion of the dominant intellectual approaches and a paradigm shift.

Consequently, any methodology for studying the Arab Spring and its ongoing implications must take into account the popular 'pulse' (Mariz 2012). It is important to analyze the discourses and behavior of social movements, civil society actors, media and new media, as well as wide-ranging and dynamic public opinion. Collecting data in the form of official statistics or statements by policymakers or state news outlets will yield a wholly incomplete picture. Even quantitative or qualitative measures of armed conflict in places such as Libya and Syria cannot provide an adequate picture of civic activism (Saleh 2018), politics from below, or expressions of dissent. Additionally, historical methods can be suitable for understanding the 2011/2018 uprisings, their precursors and the numerous protests since then. Finally, intra-regional and international factors have been paramount in shaping the trajectory of the Arab Spring in each country. These influences must be examined as well for any historicized, contextualized study of the Arab Spring in any single country or as a region-wide phenomenon.

Country-by-country approaches, as opposed to a regional brush, are one way to study the Arab Spring. Much can be said for in-depth case studies of Egypt, Libya, Tunisia, or any other country, for instance. Against the backdrop of commonalities inherent in the region-wide *hirak*, specificities inhere within each case. These are well-deserving of study in this new set of watershed events in the Arab world. Furthermore, the theoretical and empirical value of the comparative method (Whitehead 2021) is at a premium. This is one method for outlining the anatomy of the Arab Spring, identifying similarities and differences and enhancing our understanding of the manifold complexities at hand.

IMPACT ON POLICY On the one hand, the Arab Spring brought the democratization agenda to the forefront of Western policies towards the MENA

region. The European Union (most prominently Germany, through bilateral aid and its political foundations) and the United States have provided extensive funds to civil society across the region (Huber 2013). Additionally, International Financial Institutions were quick to step in through the Deauville Partnership for the Arab countries 'in transition,' with an eye to stabilizing the region in 2011 (OECD 2011). The United States has also invested heavily in security reform in countries like Tunisia. Here the contest between 'freedom' and 'order' has been marked. The security agenda of the United States (Saleh 2017), exemplified in its war on ISIS (see **Islamic states**) that began in 2014, has often crowded out policies of **democracy promotion** since the onset of the Arab Spring.

NEW FRONTIERS Given the complexity and geographic breadth of the phenomenon, recent research on the Arab Spring has taken a number of different angles. One is the role of women and the study of gendered revolt (Khalil 2016), sometimes linked to activism in the years before the 2011 uprisings (Pratt 2020). **Political Islam** and Islamist movements are another topic of research, since the story of the ascent and unraveling of Islamist political parties and their democratic performance (Esposito et al. 2018) in Egypt, Libya, Morocco, and Tunisia (McCarthy 2018) has been a major plotline of the Arab Spring. Youth activism (cf. **youth bulge**) and contentious politics (Sika 2017) are another avenue for scholarly investigation. The nexus of the Arab Spring and authoritarianism, including the sharpened skills and tools of ruling elites, warrants study, from puzzling allegiance to longstanding dictators in conflict (Wedeen 2021) to democratic reversals. Democratic setbacks since 2011 have prompted conceptual and comparative work (Sadiki & Saleh 2023).

Box 6.1 Arab Exceptionalism: A Stubborn Myth

Confragosa in fastigium dignitatis via est.
(It is a rough road that leads to the heights of greatness)
– Seneca the Younger (ca. 4 BCE – 65 CE)

Most homegrown national 'exceptionalisms' have been positive constructs until they are used against the nation after a geopolitical fallout. History is full of them, as the examples below show.

American exceptionalism is rooted in the idea that the United States is unique due to its revolutionary origins and commitment to liberty, democracy, and individualism. This sense of moral superiority and a belief that the US has a special mission to promote these values globally has (at times) been central to its foreign policy and domestic identity.

Chinese exceptionalism (中国例外主义 – pinyin: *Zhōngguó lìwài zhǔyì*) is modeled on China's millennial history as a civilization-state and its distinct political culture shaped by Confucian values (and ethnic Han culture). It emphasizes China's unique path of development and governance, often contrasting it with Western models of liberal democracy. Chinese leaders have framed their country's rise to global hegemony as peaceful but distinct from Western norms, positioning China as a model for development, especially under the leadership of its current leader, Xi Jinping (i.e., the 'China dream' – 中国梦 – pinyin: *Zhōngguó mèng*).

Russian exceptionalism and its contemporary revitalized ideological manifestation of 'Eurasianism' (евразийство) is rooted in Russia's own belief in its spiritual and civilizational uniqueness. This idea often emphasizes Russia's role as a defender of Orthodox Christianity and its (once) distinctness, (now) opposition to Western liberal values.

Japanese Exceptionalism (日本人論 – *Nihónjinron*) refers to a body of discourse or theories about the uniqueness of the Japanese people, culture, and society, stressing its imagined cultural uniqueness and (ethnic) homogeneity. This discourse highlights Japan's distinct social structures, work ethic, and historical isolation as factors that set it apart from other nations, particularly Western democracies. Its more extreme forms are associated with nationalistic or xenophobic ideologies.

German Exceptionalism (*Sonderweg* – 'special path') also has a long history that has been twisted and turned for various political ends. Originally it took pride in the modernizing German authoritarian imperial model – the 'golden mean' between European democracy and Russian autocracy. After WWII, it became a retrospective interpretation used by historians to explain Germany's unique path to **Nazism**. In recent decades, historians have also explored how post-war West Germany consciously distanced itself from its pre-1945 past by embracing liberal democracy and aligning itself with Western Europe. This shift has been interpreted by some scholars as marking the end of Germany's *Sonderweg*, suggesting that post-war developments brought Germany back onto a more 'normal' path within Western democratic traditions.

The Israelis, French and British also have their exceptionalisms, but Arab exceptionalism has been truly unique in the sense that it is fully imposed, covers a diffuse area with several polities, is a normatively negative assessment and has dominated the academic **transition** literature for the Middle East and North Africa.

Arab Exceptionalism refers to the notion that Arab states are uniquely resistant to **democratization**, distinguishing them from other developing nations. This concept has been widely debated and critiqued for its methodological flaws, problematic comparisons, and potential to perpetuate stereotypes about Arab societies.

The concept is rooted in Western perceptions of the Arab world, shaped by historical tensions, colonial stereotypes and biases. These frame Arab societies, utterly permeated by **informality**, **clientelism** and **patronage**, as inherently incompatible with democratic (read: Western) values. Colonial legacies have influenced such views, Orientalist thought, and geopolitical interests that have historically portrayed the region as resistant to political liberalization.

Arab Exceptionalism gained prominence in social science research during the late twentieth century. Organizations like **Freedom House** (FH) played a significant role in popularizing this idea through their cross-national surveys that purportedly revealed a 'democracy deficit' in Arab states when compared to other regions (Freedom House, 1980). However, these studies have faced significant criticism for their methodological shortcomings (and Cold War bias).

Still, these findings and their circulation have had a considerable impact on academic and policy discussions. Scholars such as Alfred Stepan and Graeme Robertson (2004) presented overwhelming evidence that non-Arab Muslim states tend to be more electorally competitive than their Arab counterparts. Eva Bellin (2004) found that the prerequisites are just not there. While the authors acknowledged this gap, they refrained from attributing it to any essentialist qualities of Arab societies.

Critics have raised several key objections. First, methodological weaknesses undermine the validity of the imposed 'exceptionalism' thesis. The inconsistencies and biases inherent in measurement techniques used by organizations like FH cast doubt on the accuracy and reliability of their findings (Harik 2006). Second, the assumption that all Arab countries are uniformly resistant to democratization ignores significant variations in their political systems, histories, social structures, and economic conditions. Third, the concept of a cohesive 'Arab' political community is tenuous due to the diverse ethnicities, cultures, and political experiences within the region. Fourth, focusing exclusively on 'Arab' identity often neglects the role of Islam in shaping political outcomes. By excluding Islamic factors from the analysis, scholars risk oversimplifying the complexities of political development in the region. Fifth, emphasizing **elections** and institutions as the primary indicators of

democracy overlooks other crucial aspects of democratic governance, such as freedom of expression, the rule of law, and the protection of civil liberties. Finally, stereotypes and biases stemming from colonial history and Western-Arab relations can cloud objective assessments of political development in the region.

In the end, it was solely the unmet expectations of Western observers (cf. transitology – Box 5.3) that resulted in this label. The fact that MENA states have been fluid and moving (incrementally) along various measured continuums in both directions (toward and away from democracy) shows there is nothing static about these regimes, although they have proven to be resilient.

Some scholars offer alternative evidence that challenges the notion of Arab exceptionalism. For example, Iliya Harik (2006) argues that many Arab states have made strides toward democratization since the 1970s, albeit at varying paces and not on the indicators usually benchmarked to measure 'democraticness.' Attributing their lack of progress solely to 'exceptionalism' oversimplifies the complex dynamics driving political change in these countries, as shown in the in-depth case study of Kuwait by Dazi-Heni (2015). The 2011 Arab uprisings (**Arab Spring**) challenged the notion by demonstrating that these regimes were not as stable as previously thought, but the authoritarian crackdown that followed has, in turn, strengthened the myth and dashed hopes. (Massoud 2015)

The main distortion of 'Arab exceptionalism' is that it has ignored the regional and international political context while being unable to (convincingly) prove any essentialist causal factors at the country level. (Grimm 2013) The geopolitical tensions (and high stakes) in the Middle East have always provided **gatekeeping** possibilities for local autocrats (Salamey 2009). In addition, the oil wealth of Arab Gulf **monarchies** has put them in a unique position to leverage their influence in neighboring countries (Beck 2015), effectively acting as 'authoritarian gravity centers' (Box 6.2) and **black knights** as became overly clear in the wake of the Arab Spring. Therefore, theoretical frames of **authoritarian collaboration**, **authoritarian learning** and **authoritarian regionalism** are likely to bring us much closer to explaining Arab exceptionalism than any explanations tied to the inherited undemocratic nature of Islam or the Arabs.

Authoritarian Collaboration

There is no 'I' in team
– American saying

Sticks in a bundle are unbreakable
– African proverb

Authoritarian collaboration refers to general collaboration between authoritarian regimes at the international level. This can occur as either formalized collaboration, as in regional organizations or (cyclical) summits (e.g., **authoritarian regionalism**), or in informal forms such as *ad hoc* consultations and personal ties.

DEFINITION Authoritarian collaboration is the deliberate, intentional coordination between two or more authoritarian regimes in economic areas, political consultation, the sharing of military intelligence, and mutual support. Autocracies work together to share best practices, techniques and laws. We limit the definition to cases where authoritarian regimes work together and the primary intended or unintended consequence is the maintenance of authoritarian stability. Therefore, we exclude instances of collaboration in war or trade.

Authoritarian collaboration has mostly been reactive, undertaken in order to stave off unrest and suppress dissent. Authoritarian regimes collaborate when there is a perception that support is needed to bolster a beleaguered like-minded autocrat, particu-

larly those in the same neighborhood. Authoritarian regimes can support each other during crisis events by providing reliable information quickly. Authoritarian regimes provide electoral support when an autocratic ally faces defeat by a challenger who plans democratic reform, or some form of undesired regime change. For example, Russia collaborates when there are protests and ruptures for reform in neighboring countries, like Belarus, which threaten Russia's geo-political ambitions and its own political survival (von Soest 2015). More recently, there have been cases of pre-emptive authoritarian collaboration. In these, autocracies collude not in response to any immediate threat, but more generally to counter **democracy promotion**.

Authoritarian collaboration does not refer to authoritarian imposition by a great power, or a country with significantly more powerful capabilities and resources *vis-à-vis* other countries. Nevertheless, authoritarian collaboration can be characterized by a degree of asymmetry.

SEE ALSO Other similar terms used include 'authoritarian coordination' and 'authoritarian cooperation.' Christian von Soest (2015) refers to 'collaboration' instead of 'cooperation,' because the latter is viewed as more formal and entails adjusting behavior to the actual or anticipated preferences of others (Keohane 2005: 51).

KEY SIGNIFICANCE with the rise of authoritarianism around the world, more attention has been paid to the factors – both internal and external – that may be to blame for this. Authoritarian collaboration explores the deliberate actions of authoritarian regimes to actively support each other and offers an international explanation for why authoritarianism may be more robust. It also helps shed light on the behavior of authoritarian regimes towards one another and on their objectives, in particular thwarting **democracy promotion** by democratic actors.

ORIGIN Authoritarian collaboration has occurred for some time now, but the way in which it takes place has evolved over time in the face of new threats. Much of the authoritarian collaboration of the past involved sharing methods of repression. For example, during the Cold War, the Southern Cone countries that were part of *Operation Condor* traveled to Brazil to learn interrogation techniques and other methods of repression (McSherry 2002; Olar 2019). Since the 1980s, the Arab League has also met regularly to share new technologies of repression (Yom 2016). Today, authoritarian regimes collaborate more to share techniques on how to deal with NGOs, civil society groups, opposition parties, election monitors, and, more specifically, on how to win elections.

LITERATURE Scholars have been increasingly interested in how collaboration between authoritarian regimes contributes to authoritarian persistence (Bader et al. 2014; Dobson 2013; Vanderhill 2013; Aleprete & Vanderhill 2013). One question in this area of study concerns how to differentiate deliberate forms of authoritarian collaboration to fend off democratization pressures from learning, on the one hand, and general authoritarian diffusion and contagion, on the other. While some scholars place all forms of authoritarian collaboration in one category, authoritarian collaboration is more commonly associated with more *direct forms* of collaboration.

Direct collaboration refers to processes that result from proactive and intentional efforts by autocracies to share best practices with others. This collaboration takes place through networks and relationships, both at government and non-government levels (see **linkage & leverage theory**). Passive collaboration is more indirect and is sometimes referred to as emulation, demonstration effects or **authoritarian learning.** Regime officials learn from the mistakes and successes of other authoritarian states and behave accordingly. In this entry, we only focus on direct forms of collaboration.

Generally speaking, there are mixed views on the impact and intensity of authoritarian collaboration. Some scholars argue that authoritarian collaboration plays a role in deterring democratic development around the world. The rise of authoritarianism provides like-minded leaders with alternative sources of support that facilitate the maintenance of authoritarian regimes. Some argue that authoritarian regimes are increasingly trading with one another as part of a larger survival strategy to foster linkages with like-minded regimes that will build support for the *status quo* (Tansey et al. 2016).

Other scholars question whether or not this collaboration has any impact, arguing instead that domestic factors are far more important in explaining democratic decline (Brownlee 2017). Nevertheless, although there is no clear evidence that regimes are becoming increasingly authoritarian because they collaborate with one another, greater cooperation is taking place among authoritarian regimes.

Scholars have noted that collaboration and cooperation between authoritarian regimes does not come as naturally as it does for democracies. Laurence Whitehead (2014) claims that authoritarian regimes would struggle more to collaborate and cooperate compared to democracies due to much higher levels of mutual distrust. Authoritarian regimes are less likely to enter legally binding agreements which would weaken sovereignty. They are also less likely to engage in symmetrical forms of policy coordination (Mattes & Rodríguez 2014).

Von Soest argues that this is because authoritarian collaboration is nothing more than a 'self-serving project' and that authoritarian states, in fact, do not intend to promote autocracy. Instead, collaboration takes place to strengthen power at home. Autocratic powers only spend resources to help another autocratic regime if there is something to gain from it (Tolstrup 2015). This collaboration is far from ideological; it is pragmatic.

MEASUREMENT It is difficult to measure authoritarian collaboration, as this entails looking at instances where authoritarian regimes have coordinated and assisted one another, but not as simply a case of modeling, learning or diffusion. It may be measured by looking at points of policy and/or behavior har-

monization between authoritarian regimes. As the section that follows explains, it is hard to establish that policy or behavior harmonization took place due to interactions between two or more authoritarian regimes. More expansive definitions of authoritarian collaboration might refer to instances where authoritarian regimes work together, as in a conflict effort or in trading with one another. We highlight that it is important to exclude cases of cooperation or alliance in conflict, and would argue that measurement should focus on instances whose primary aim is authoritarian stability.

METHODOLOGICAL ISSUES As stated earlier, the biggest methodological issue is that it is hard to prove that best practices were shared, and some interaction between authoritarian regimes has occurred. Policy transfer may have taken place, but changes may have taken place independently. As also stated previously, because the outcome of authoritarian collaboration is so similar to that of authoritarian modeling, learning and diffusion, it is difficult to distinguish and measure these concepts. Another issue is that some authoritarian collaboration is passive or covert, which makes it difficult to know when (and whether) collaboration took place.

For those interested in measuring greater levels of authoritarianism as a result of authoritarian collaboration, there are also issues. It is difficult to decide whether you are looking at clear cases whose outcome resulted in greater levels of authoritarianism or simply at the process of authoritarian regimes providing horizontal support to other like-minded regimes.

EXAMPLES There have been numerous examples of authoritarian regimes collaborating with each other, particularly to resist efforts at democratization or reform. China, Saudi Arabia, Venezuela and Russia have engaged in extensive collaboration to help support other authoritarian regimes in their neighborhoods.

One example of collaboration is for one autocracy to provide electoral support for an autocratic ally to win an election. For example, during Nicaraguan President Daniel Ortega's 2011 re-election campaign, Hugo Chávez provided low-interest loans on oil payments to Nicaragua, which helped Ortega appeal to voters by funding social programs and keeping energy prices low. Chávez also offered advice on how to eliminate opposition television stations.

During the **Arab Spring**, the Gulf Cooperation Council (GCC) supported monarchies in the region facing protests (Odinius & Kuntz 2015; von Soest 2015). In response to the **Arab Spring**, some authoritarian leaders began to share information-blocking technology.

In other instances, military and financial support was offered. Saudi Arabia supported Bahrain with $500 million to boost the Bahraini economy while also sending over 1,200 armed troops to help quell protests (Hassan 2014). The GCC provided a $10 billion development fund to both Bahrain and Oman, as well as a five-year aid package to non-member states Jordan and Morocco (Theodoulou 2011). These actions were not imposed on the Gulf states; instead, the Gulf states were willing partners.

Authoritarian collaboration also takes place before the precipitation of a crisis. After the Cold War ended, many African leaders began to advise each other about how to hold democratic elections without being voted out of office (Bratton 1998). Russia and China have broadcast to other authoritarian regimes way to resist threats to their control; some autocratic leaders are more active in seeking out advice from Russia and China.

Since the 1990s, the Russian government has supported a wide range of autocrats in the region with military and financial aid: Alexander Lukashenko (1994-present) in Belarus, Eduard Shevardnadze (1995-2003) in Georgia, Vladimir Voronin (2006-2009) in Moldova, Emomali Rahmon (1994-present) in Tajikistan, and Leonid Kuchma (1994-2005) in Ukraine. Russia also made serious attempts to back former Ukrainian prime minister and president Viktor Yanukovych during the presidential election in 2004 and mass protests in 2013.

After the **color revolutions**, Putin offered training to other countries to deal with these types of threats. Russia shared techniques and laws to suppress dissent, which have been adopted by a number of states, such as Belarus, China, Egypt, Ethiopia, Kenya, Kazakhstan, Venezuela and Zimbabwe. Both Russia and China also share technology on how to monitor online dissent, what surveillance technology to use and how to target opposition leaders (Ademmer & Borzel 2013; Koesel & Bunce 2013).

China also shares best practices by providing training programs for foreign officials and government managers, involving discussion of how its regime has managed to open up its economy, maintain a supportive middle class and avoid socio-political instability (Kurlantzick & Link 2009). Since 1990, China has supplied Myanmar with more than $1 billion in military equipment and offered military training. Russia and Iran also coordinated to help prop up Bashar al-Assad in Syria.

Organizations also play a role in facilitating authoritarian collaboration, to help preserve authoritarian systems (Ambrosio 2008). Regional organizations like the *Shanghai Cooperation Organization* (SCO) and the *Association of Southeast Asian Nations* (ASEAN) have encouraged cooperation amongst autocrats and have actively defended fellow authoritarian regimes (Cooley 2015). ASEAN has provided Myanmar with 'ideological support' because the organization refuses to criticize the internal affairs of other member states. China has also become more active collaborating with other states in the *Like-Minded Group* (LMG) in the *UN Commission on Human Rights*. This group of countries in the latter's successor after 2006, the *UN Human Right Council*, have been a key source of support for China's positions, including its resolutions. Working together, authoritarian regimes in this group aim to constrain the UN's human rights regime and weaken its ability to hold states accountable when violations occur (Inboden 2022).

Authoritarian regimes have also collaborated to

help mitigate the costs imposed by Western **sanctions**. In August 2011, a European-sponsored draft attempting to impose UN sanctions on Syria included asset freezes, travel bans and an arms embargo. Russia and China opposed it, which emboldened the Syrian president, Bashar al-Assad. Russia props up Belarus by exporting energy resources at below market price, costing Russia about $2.4 billion a year (Slobodian & Ptasnyk 2018). Both Russia and Iran have offered significant support for Venezuela's Nicolas Maduro and Assad. China provides Kim Jong-Un massive amounts of food and fertilizer, and over $55 billion in exports (Davies 2021). China continues to be Russia's main source of support in weathering the onslaught of sanctions from the West since its 2022 invasion of Ukraine.

POLICY IMPLICATIONS Democracies have collaborated for some time now. Democracies assist and support each other, and have shared best practices. As authoritarian regimes have learned to collaborate more with each other, sometimes in the areas of conflict and sometimes in the area of authoritarian stability, democracies have sought to better understand how to respond. The response to Russia's 2022 invasion of Ukraine is a good example of both democratic collaboration and authoritarian collaboration. In response to the unprecedented sanctions, Russia has benefited greatly from China's support. Because authoritarian regimes collaborate whether or not they are in crisis, this complicates the policy response by democracies, which have fewer options about how to isolate or punish authoritarian regimes that engage in dangerous behavior.

Authoritarian Diffusion

The spread of evil is the symptom of a vacuum. Whenever evil wins, it is only by default: by the moral failure of those who evade the fact that there can be no compromise on basic principles.
– Ayn Rand (Alisa Z. Rosenbaum)

Authoritarian diffusion is the process by which an authoritarian innovation or precedent in one country increases the probability of its imitation or replication in a variety of other countries.

DEFINITION Authoritarian diffusion involves a process in which an earlier authoritarian practice by one actor affects the probability of its being adopted by other actors, who have not yet employed this practice (Strang 1991). More broadly speaking, authoritarian diffusion is concerned with how different authoritarian innovations and political phenomena travel – such as the adoption of institutions, organizations, ideas, policies, strategies and norms that are designed to strengthen, protect and establish authoritarian rule (Ambrosio & Tolstrup 2019; Koesel & Bunce 2013; Starr 1991; Weyland 2017). Diffusion has also been defined more generally as the process whereby an innovation is communicated over time (Rogers 1983).

In contrast to **authoritarian collaboration** or coordination, diffusion is unintentional and uncoordinated. Diffusion arguments focus on structural conditions such as geographic proximity, as well as social, cultural, political and economic linkages, which could increase the chances of ideas traveling. Diffusion spreads inadvertently from one actor to other actors, who subsequently learn, imitate or emulate these policies and strategies (Weyland 2017). One actor setting a precedent may increase the likelihood of other actors following suit. For example, with democratic diffusion, protests in one country might affect protests taking place in another country. The democratization of countries in a specific region may affect the likelihood of other countries in that same region also democratizing.

Diffusion also stands in contrast to **authoritarian promotion** because diffusion is predominantly horizontal. It occurs without any direct collaboration or imposition (Elkins 2005). Diffusion is not about a hegemon promoting authoritarian policies and does not entail coercion. Autocratic diffusion is a process that takes place without much agency.

There are numerous differences between autocratic and democratic diffusion that are worth noting. Early phases of democratic diffusion may create swelling optimism about the prospects for regime change and powerful international pressure for reform. This does not happen with autocratic diffusion since there is no international pressure to autocratize. Instead, autocratic diffusion might be more aptly characterized as a resistance to democratic diffusion (Gunitsky 2014).

Responding to democratic diffusion may be a case of **authoritarian learning**. Authoritarian elites learn how to counter pro-democracy diffusion and adapt, making their regimes more resilient. Russia and China learned what to do after witnessing revolutions in other authoritarian regimes. Both states responded to the **color revolutions** by controlling information available about the protests (Koesel & Bunce 2013). They framed the protests negatively and, by doing so, made it impossible for their own citizens to coordinate and carry out their own uprisings. Both governments targeted key constituencies, such as youth, opposition groups, and civil society organizations. While the youth were co-opted through the creation of patriotic pro-government youth movements, civil society groups and opposition movements were externally repressed (Koesel & Bunce 2013)

SEE ALSO Contagion, domino theory, cascade, authoritarian emulation, **authoritarian learning**, authoritarian modeling, neighborhood effects, autocratic reverse waves, all these topics are related and associated with authoritarian diffusion.

KEY SIGNIFICANCE Diffusion has been used to explain policy change and why policies are adopted in the social sciences, and how knowledge spreads across state borders (Simmons & Elkins 2005; Zito & Schout 2009). The study of authoritarian diffusion in particular has gained momentum after scholars were alarmed by democratic backsliding and debated the existence of an autocratic wave (see Box 6.3).

ORIGIN The majority of the literature has not addressed authoritarian diffusion directly, drawing instead from studies of democratic diffusion, which has been used to explain the different waves of democracy and the spread of democratic values (Huntington 1991; O'Loughlin et al. 1998). Thus, the field of autocratic diffusion is relatively new. Nevertheless, autocratic contagion has long been an important concept in foreign policy and international development. Under the Eisenhower administration, the US warned of a domino effect of communist countries causing other non-communist countries in their region to fall to communism as well. Though this did not specifically focus on authoritarian regimes, the idea behind the domino theory could be applied to autocratic diffusion. The domino theory proved to be only partially correct, but due to waves of autocracy and democratic slumps, there has been renewed emphasis on autocratic diffusion.

In the field of international economic development, dependency theory can also make a contribution to the autocratic diffusion literature. One aspect of dependency theory argued that the structure of the global economic system could explain why repression diffused in countries in the periphery and semi-periphery. As dependency theorists saw it, the structure of the global economic system drove elites in the periphery to repress and exploit their populations in order to maintain their alliance with other elites in core countries (Cardoso & Faletto 1979; Wallerstein 1974).

LITERATURE The authoritarian diffusion literature seeks to explain the paths along which authoritarian ideas and methods spread. Studies of authoritarian diffusion have mostly followed the broader diffusion literature by looking at the strategies and policies that authoritarian regimes have adopted, and how this might increase the probability that they might be followed (Ambrosio 2010). Some authors are concerned with the process of autocratic diffusion rather than with its outcome, but here we look at both.

A large body of literature has studied democratic diffusion – or the idea that certain principles and practices spread in an uncoordinated fashion (Elkins & Simmons 2005). Sometimes this takes place through emulation (Simmons et al. 2006), at other times it takes place through the idea of contagion (Whitehead 1996). Democratic rules are spread through neutral and non-coercive channels. These ideas have attracted the attention of scholars of international relations and comparativists, who have provided explanations for how international factors may influence domestic outcomes.

Theories of democratic diffusion have looked at the importance of clusters in space and time (Kopstein & Reilly 2000; Brinks & Coppedge 2006; Gleditsch & Ward 2006). For these studies, geographic proximity is an important factor. Authoritarian diffusion and cooperation by authoritarian regimes are stronger at a regional level. Håvard Strand and his colleagues (2012) wrote that the neighborhood in which a country resides and the global context act forcefully as a pull on a country's political system. Brinks and Coppedge (2006) write that countries tend to resemble other countries in their neighborhood over time. According to Bunce and Wolchik (2006), the more similar countries are (in language, tradition, religion, identity, values and norms), the more likely it is that innovation will travel.

One of the first studies of authoritarian diffusion looked at how countries in close proximity to Russia became increasingly authoritarian (Gel'man & Lankina 2008). Nicole Jackson argues that Central Asian consumption of Russian news and culture helps to explain why these countries are authoritarian. Wilson and Popescu (2009) echo that Russian **soft power** has been an effective countervailing force against the EU's democracy support programs in the European Neighborhood Policy. Tomila Lankina (2016) and her colleagues look at how Russian trade with post-Soviet states may condition patterns of authoritarian diffusion. Johan Langerkvist (2009) notes that China's relationships with countries in Africa has helped to diffuse authoritarianism.

Theories of policy diffusion look at the importance of actors in spreading policy solutions to one another through a learning process. In addition to authoritarian states, international organizations are also important in autocratic diffusion. The *Shanghai Cooperation Organization* (SCO) can act as a defense against democracy and helps to transmit authoritarian values and strategies in China, Kazakhstan, Kyrgyzstan, Russia, Tajikistan, and Uzbekistan (Ambrosio 2008).

Diffusion has been traditionally characterized as a process in which past events increase the likelihood of future events (Oliver & Myers 2003; Strang 1991). However, scholars have noted that diffusion is not a linear process, and past events do not always make future events more likely to happen (Gunitsky 2013). Additionally, some scholars are skeptical of the power of autocratic diffusion theory – instead claiming that the primary cause of autocracy is internal rather than a result of cross-border diffusion (Burnell 2010; Brownlee 2020)

CLASSIFICATIONS Different types of diffusion have been noted. Some diffusion takes place vertically – that is, it moves from a more powerful actor to a less powerful actor. Diffusion could also be horizontal, where the original actor is not necessarily a regional hegemon. Other scholars differentiate between a type of diffusion that is contagious, spreading without any intentional behavior by either actor (this is sometimes referred to as external diffusion), and diffusion that is a form of emulation, where one actor seeks to emulate and learn from the behavior of another actor (this is sometimes referred to as internal diffusion or learning and modeling). As it concerns the former, global hegemonic transitions can unintentionally influence waves of diffusion (Gunitsky 2019). Seva Gunitsky (2014) writes that a period of hegemonic shocks creates incentives and opportunities for waves of domestic transformations.

MEASUREMENT Scholars who work to measure diffusion seek to identify convergent outcomes, measure relations between countries and identify the mechanisms involved in policy and strategy transfer. Through diplomacy, trade, and cultural ties, it is possible for a country to transmit political practices and norms even without any intention to do so; however, it is difficult to ascertain if a practice in one country was adopted in another country due to contagious effects or independently. Diffusion can be measured by looking at points of policy convergence and instances where policies, practices and beliefs have converged in time and space. This may demonstrate some sort of correlation, but proving a causal relationship is more challenging.

METHODOLOGICAL ISSUES The biggest issue with the diffusion literature is that diffusion is difficult to measure and often used to explain events that cannot be explained. Measuring diffusion accurately may require testing a counterfactual. Would the adoption of a practice/policy have occurred absent the earlier policy innovation? Would a country autocratize if the initial actor did not exist? It is also difficult to ascertain if an actor is undergoing **autocratization** because of the strategies, actions or policies of another actor or for other internal reasons. It is difficult to find hard evidence about a regime's decision-making processes as this would require using archival information and elite interviews, which are difficult to acquire (Ambrosio & Tolstrup 2019).

While there have been plenty of theoretical studies that investigated diffusion, there is a dearth of empirical studies that have tested diffusion. Some studies have looked at cross-national variation (Lip-

set 1959; Powell 1982; Brunk et al. 1987; Stepan & Skach 1993; Berg-Schlosser & De Meur 1994), while other studies have analyzed changes in one country over time (Linz & Stepan 1996; O'Donnell et al. 1986). A study by Kurt Weyland (2016) examined the private diaries and letters of rulers and their elite support group regarding the deliberations that shaped the strategies adopted by states to fight against popular revolutions in Europe in 1848.

EXAMPLES There are numerous examples of autocratic diffusion, but these examples often overlap with authoritarian cooperation, modeling and learning, and it is difficult to isolate diffusion taking place on its own, or to determine that authoritarianism was contagious. One of the most notable periods of autocratic diffusion was the inter-war period, between World War I and World War II. During this wave, many once democratic regimes in Europe reverted to dictatorship, among them Italy, Spain and Germany. It is not entirely clear why and how fascist-style regimes appeared to form in quick succession in Europe; however, within a very short period of time, fascist ideals became a huge threat to Europe and beyond. In contrast to the post-World War II period, where authoritarianism was somewhat imposed from above by the Soviet Union across Eastern and Central Europe, the spread of **fascism** may be a better example of authoritarian diffusion.

If we fast-forward to the twenty-first century, we have entered another period of autocratic diffusion. There are a greater number of autocracies in the world today than there have been for some time. In fact, thirty years after the Cold War ended, democracy is at roughly the same level as it was in 1989 (Varieties of Democracy 2022). Again, it is difficult to measure the extent to which the current democratic slump can be blamed on autocratic diffusion, but giving some credence to this literature, waves of autocracy (see Box 6.3) seem to cluster in both time and space.

In regional terms, there was a wave of autocratic diffusion in Latin America that started with the rise of Venezuela's Hugo Chávez in the early 2000s. Left-wing autocratic populism seemed to diffuse across the region. There was a rise of leadership that aimed to circumvent institutions, challenge pre-existing civil liberties and eliminate **term limits**. Central Asia appears to be another region affected by autocratic diffusion. Autocratic diffusion may help to explain why Central Asia, sandwiched between Russia and China, has remained so staunchly authoritarian (Allison 2008; Collins 2009). The autocratic diffusion literature has also looked at Russia and China. Most studies of autocratic diffusion have scrutinized the role of both countries as regional hegemons, and as the two most powerful authoritarian regimes today, either through the lens of authoritarian gravity centers (Box 6.2) or as **black knights**.

Authoritarian Learning

It wasn't raining when Noah built the ark.
– The Hemphills, *Hemphills Hits,* 1989.

Wood already touched by fire is not hard to set alight.
– African proverb

Authoritarian learning is a process by which authoritarian regimes learn from the survival strategies of other dictatorships based upon the prior successes and failures of other governments.

DEFINITION Authoritarian learning consists of the way regimes adopt survival strategies based upon the prior successes and failures of other authoritarian governments (Hall & Ambrosio 2017). Stephen G. Hall (2023a: 5-7) points out important characteristics when it comes to defining authoritarian learning. Regime learning needs to incorporate both individual and collective learning. Learning combines the effect A has on B with the analysis of the actions of others. This sequence of processes allows learning to be gauged; empirically, one needs to witness a change of beliefs, skills, or procedures based on such an observation and interpretation of experience. While this itself is the result of learning, regime learning is actually a process of engagement, leading to the development of such beliefs, skills, ideas, and discernment (Hall 2023a: 5).

When a powerful authoritarian actor *offers* lessons learned or best practices to another like-minded regime, we see this as **authoritarian collaboration**. Another difference between authoritarian learning and authoritarian collaboration is that, with the former, policy can be transferred without the actors being in contact with one another. With authoritarian learning, regimes model, emulate and/or take note of past policies and strategies with the objective of maintaining authoritarian rule. For example, Russian laws restricting NGOs inspired laws in Belarus, China, Egypt, Kazakhstan, Tajikistan, Uzbekistan, Venezuela, and Zimbabwe (Koesel & Bunce 2013). Additionally, since the **color revolutions**, authoritarian regimes have learned from past mistakes. They have demonstrated how to limit NGO access to foreign funding and the best strategies for the security institutions to deal with unrest (Carothers & Brechenmacher 2014). After the 2004 Orange Revolution in Ukraine, Belarus studied the protests, learning from past mistakes in order to prevent similar events from ensuing at home (Korosteleva 2012).

In the case of authoritarian learning, authoritarian practices may be adopted without the first adopter actively promoting these policies. The role of the first adopter is to unintentionally inspire emulation (Elkins & Simmons 2005). The actor who adopts policies based on the previous actions of another actor is

the main actor with agency. The main actor learning could be a less powerful authoritarian/autocratizing regime or it could be a hegemon. For example, the more powerful state of Russia learned from Georgia and Ukraine in their revolutions. Russia learned from the missteps of those regimes and actively undermined pro-democracy NGOs, especially those with links abroad. They established their own pro-regime organizations to manage civil society. Russia noted that youth organizations were key to these revolutionary movements. The more powerful Gulf states watched closely the events of the **Arab Spring** to not make the same mistakes. Authoritarian learning may also consist of countries following an authoritarian regime that has high levels of prestige and soft power, and thus serves as a model for others to follow (Ambrosio 2010). Putin's growing power in Russia and the world may inspire other leaders to try to copy his tactics. Though it is impossible to know exactly what inspires leaders to make the choices they do, in the case of Hungarian Prime Minister Orbán, we know that his public statements reveal a strong admiration (Buzogány 2017).

This contrasts with **authoritarian promotion**, where the main actor with agency is always the more powerful authoritarian state. This also contrasts with authoritarian collaboration where all actors involved have some agency. Additionally, with 'authoritarian modeling,' the main actor being emulated is usually a powerful hegemon, but the main actors with agency are all of the other states that are emulating the hegemon's behavior and policies.

Authoritarian learning can also be distinguished from **authoritarian diffusion**. Authoritarian learning focuses on the act of adopting policies, while authoritarian diffusion looks at how policies and knowledge spread across state borders through a network of actors. Diffusion consists of the idea that the adoption of a practice alters the probability that other states will adopt the same practice (Strang 1991). Diffusion is about waves of policy changes across a region, beginning in one place and spreading to other countries (Weyland 2009).

There is some disagreement over whether or not diffusion is intentional and over what the level of agency is. Again, with authoritarian learning, agency lies with the learning actor. Diffusion is supposed to be contagious, and there is less of a focus on agency, as a big event could lead to waves. Nevertheless, Bunce and Wolchik (2011) describe diffusion as the transmission of tasks by activists, indicating some agency. Hale (2019) argues that diffusion is the *active* transfer of techniques across borders and the cross-border coordination of activists. In spite of these arguments, diffusion tends to be explained more in terms of structural factors such as geographic proximity, trade and interdependence, and cultural and political similarities. As a case in point, while Russia learns from others, it is a key source of authoritarian diffusion as a regional hegemon, particularly in Central Asia, where Russian news and popular culture are heavily consumed (Jackson 2014). **Soft power** is a notable means by which authoritarian values are diffused (Popescu & Wilson 2009); however, **soft power** does not really play a role in authoritarian learning, as the power of the state from which others are learning does not really play a significant role.

S.G. Hall (2023a: 11) finds that authoritarian learning involves the integration of policy transfer, diffusion, linkage and leverage (see **linkage & leverage theory**), and lesson-drawing. Elites with authoritarian inclinations frequently collaborate to exchange best practices for maintaining power. Contrary to perceptions common in the existing literature, authoritarian learning is not very hierarchical. This contrasts with the concept of authoritarian gravity centers (cf. Box 6.2), which suggests that learning primarily flows from dominant authoritarian regimes to lesser ones (i.e. authoritarian modeling)

SEE ALSO Authoritarian learning is distinct from **authoritarian promotion** and **authoritarian collaboration**, but all three are actor-involved processes. When contrasted with a more systemic viewpoint, such learning is often associated with **authoritarian diffusion**, policy diffusion and policy transfer.

KEY SIGNIFICANCE Authoritarian learning is a concept that is important to explaining authoritarian **longevity, stability & resilience**. Authoritarian learning has been used to explain the significance of international factors and events in impacting the policies and strategies of authoritarian regimes (Heydemann & Leenders 2011).

ORIGIN & REGIONAL VARIATION As a concept in political science, 'authoritarian learning' was introduced into the English-language mainstream around 2005. While it is difficult to pinpoint the exact source, an important early contribution was an interview with Larry Diamond titled *Authoritarian Learning: Lessons from the Colored Revolutions* (Diamond et al. 2006). With the **color revolutions** and the **Arab Spring**, the concept has attracted growing interest, alongside frameworks of diffusion and collaboration, foremost in the Middle East and North Africa and the post-Soviet region. Beyond these world regions, the concept remains under-explored – see 'methodological issues' below.

The **color revolutions** and **Arab Spring** brought forth the concept of authoritarian learning and hence most case studies and comparative works are found in MENA and Eurasia. The latter, especially, due to the shared Soviet legacy (see **totalitarian legacies** and **authoritarian legacies**), has offered greater opportunities for rulers to adapt and transplant ideas from neighbors. Besides the **soft power** of the 'Singapore model' there are almost no case studies for the Indo-Pacific, Latin America or Sub-Saharan Africa.

MENA Most works are comparative and focus on the lessons from the **Arab Spring**: Heydemann & Leenders 2011; 2014; Bank & Edel 2015; Leenders 2016.

Eurasia Regarding the **color revolutions**, see Diamond et al. 2006; Gilbert 2020; Ohanyan & Kopalyan 2022. For comprehensive comparative works for the whole post-Soviet region, see Hall 2020; 2023a;

Lemon & Antonov 2020. For lessons from the **Arab Spring** in Central Asia, see Dorr 2018; for individual cases, see Golosov 2017 (Russia's electoral system); Ambrosio 2017; Popova 2013 (Ukraine); Frear 2018; Hall 2023b (Belarus); Terzyan 2018 (Armenia); Polese et al. 2017 (Turkmenistan).

Indo-Pacific On China, consult Jia 2022 (on cadre training); Lang 2018 (legislative changes to China's civil society policy); and Ortmann and Thompson 2014; 2020 (for China's obsession with the 'Singapore model'). A rare case on Myanmar's electoral system can be found in Dukalskis and Raymond 2018.

Latin America Roman Olar (2019) investigates the case of 'Operation Condor' to study the transnational dimension of state repression and authoritarian interdependence in Latin America.

Note that in sociology and the educational sciences, a different concept of authoritarian learning exists, pertaining to the impact of 'teaching styles,' based on the original typology of 'parenting styles' (authoritarian, authoritative, permissive, and, added later, indulgent) developed by Diana Baumrind (1966) in the 1960s.

LITERATURE The term 'learning' is often broadly used to denote any policy change connected to a previous policy change. 'Learning' is a change of procedures, actions, strategies or skills based on observing and interpreting past events (Bunce & Wolchik 2011; von Soest 2015). Some scholars have also referred to this process as adaptive capacity (Heydemann 2007; Schlumberger 2007; Smit & Wandel 2006). For more on the literature, see the 'classifications' below. Bank & Weyland (2019) compile the most important articles from *Democratization* and state that there is no proof or an organized international effort to advance autocracy; rather, they find that autocratic learning and collaboration is mostly defensive and reactionary.

Hall (2023a: 144-145) stresses the importance of elite connections within regimes – *intra-elite links*: regularly working together, exchanging ideas, engaging in dialogue, and learning from others' failures and successes. This denotes regime institutions (security councils, presidential administrations, etc.) as a crucial object of study to assess how such relationships are forged. In additions, he stresses the international linkages between elites (*inter-elite links* as a form of social linkage; see **linkage & leverage theory**) – and thus the importance of external networks and regional organizations (**authoritarian regionalism**).

CLASSIFICATIONS Where classifications are concerned, we rely on the work of Stephen G. Hall and Thomas Ambrosio (2017). In their overview of authoritarian learning, they conceptualized several different concepts worth noting here – policy transfer (a) and isomorphism (b).

Policy transfer (a) is a type of authoritarian learning. It is the process by which knowledge, ideas and institutions in one political system are used to develop policies and arrangements in another political system (Dolowitz & Marsh 2000). Policy transfer is sometimes referred to as 'policy learning,' which examines how policies are transmitted from one state to another through a process in which individuals in the recipient state actively seek out policy options from other states (Brady & Curtin 2012; Lemon & Antonov 2020; Zito & Schout 2009). The actors involved include civil servants, political parties, pressure groups, policy experts, elected officials and supra-national institutions, and policy transfer is facilitated by cultural ties, comparable ideologies or similar prior policies.

In the case of isomorphism (b), policies are followed as a result of constraints, and not necessarily the desire of the actor. With isomorphism there is a tendency on the part of countries to follow similar policies at least superficially – largely due to international organizations developed in the Global North, which have legitimized certain types of policies (Hedin 2016).

Another interesting distinction of types of learning is that between rational learning (i) and bounded learning (ii). Covadonga Meseguer (2005; 2006), building upon Fabrizio Gilardi (2003), nuances between two learning mechanisms – both aimed at problem-solving policy in governments. Rational learning (i) implies a maximum of analytical capabilities and a minimum of discriminatory abilities – that is, actors consider *all* policy experience, irrespective of its origins, and rationally update their beliefs about policies in light of experience. In contrast, with bounded learning (ii), although governments likewise engage in information-gathering activity, they do not scan all available experience, instead using analytical shortcuts and cognitive heuristics to process information, and therefore only consider a relevant peer group.

This distinction acknowledges governments' limited potential for learning, the costs of information gathering, the socio-cultural outlook bias of elites in search of models, and the importance of geographical proximity for adopting available and relevant models (Van den Bosch 2020: 91). Bounded learning relates to the (urgent) need for problem solving and regime survival, related to institutions and administrative practices, while rational learning would be more long-term: goal-oriented, related to policy, norms and practices, and aimed at becoming more competitive. For example, the emulation of liberal trade practices in Latin America, based on East Asian cases (Meseguer 2005: 30, 32).

MEASUREMENT Authoritarian learning is measured by tracing the cross-national copying of legislation, policy changes and changes to rules and institutions. It's possible to assume that learning has taken place if there is evidence that one state has learned from another state. If there is no proof from documents or interviews about the inspiration of policies, the next best bet is to see if the policy or action implemented is sufficiently unique that it would be unlikely that the second state pursued it independently.

METHODOLOGICAL ISSUES It is difficult to study authoritarian learning. While scholars can witness

changes in skills (e.g., how tactics change) and procedures (e.g., legislative changes and institutional structures), ascertaining a change in beliefs in regimes is very hard to establish (Hall 2023: 6).

Also, such studies require identifying the sources of policy change. There are many possible intervening variables and explanations that make it difficult to pinpoint cause and effect (Zito & Schout 2009). For this reason, it is difficult to prove that authoritarian learning has taken place – that a prior event shaped a future outcome – rather than just a correlation between one set of policies followed by another similar set of policies. Not all change actually involves learning, and testing it directly is not that straightforward.

This is especially true of non-democratic settings, given their general lack of transparency. The information necessary to trace learning processes is far more available in democracies; authoritarian systems are closed, with deliberations and decision-making taking place out of public view (Hall & Ambrosio 2017).

Another issue affecting the study of authoritarian learning is that convergence in policy adoption is not sufficient proof that learning has occurred; both sides could have arrived at the same policy independently, a concept called 'spurious diffusion,' not be confused with **authoritarian diffusion**. With authoritarian learning, it must be shown that, prior to adoption, the adopter knew of the policy innovation, evaluated its merits and adopted it based on this evaluation.

EXAMPLES Detailed case studies have explained how authoritarian learning took place in the **Arab Spring**. Authoritarian incumbents took note of how the uprisings unfolded in Tunisia, Egypt and Libya, and used these observations to develop strategies to maximize their survival when they faced popular unrest (Heydemann & Leenders 2011). After the Orange Revolution in Ukraine in 2004, Belarussian security services studied the protests in order to prepare lessons for how to prevent a similar event in Belarus (Korosteleva 2012). After the **color revolutions**, the Central Asian states readily emulated Russia's example by restricting the activities of NGOs, especially Western ones or those which had accepted Western financial assistance, promoted democracy and engaged in election monitoring (Cooley 2012). Central Asian governments also model policies regarding civil society based on the activities of Russia and China. Additionally, due to COVID-19, there have been more examples of authoritarian learning, as states learned from China's surveillance technology and became more active in tracking and monitoring their citizens based on China's example.

IMPACT ON POLICY Like **authoritarian collaboration**, authoritarian learning presents dilemmas and challenges for democracies and organizations that engage in **democracy promotion** and support. Essentially, authoritarian regimes are doing a better job of learning from past mistakes and adapting, as today information travels much more quickly than it did in the past. This makes it difficult to intervene. Concurrently, 'authoritarian modeling' also presents difficulties. In the past, democracies served as a model for regimes around the world, as democratic **soft power** was much more substantial. Today, democracies are struggling to present models that other regimes aim to emulate. Democracies thus have to work to contest the narratives that the best lessons to be learned come from authoritarian regimes.

NEW FRONTIERS Due to ongoing methodological challenges, this recent dictatorship studies subfield is still very much evolving. Davis (2020) and Goldring & Greitens (2020) attempt to distinguish learning patterns from other types of diffusion and differentiate among regime types, while nuancing the role of proximity.

Authoritarian Promotion

If there is no enemy within, the enemy outside can do no harm.
– African proverb

Authoritarian promotion is when a powerful authoritarian actor actively stimulates the spread of authoritarianism.

DEFINITION Authoritarian promotion is when a powerful authoritarian state actively and intentionally contributes to the spread of authoritarianism through various forms of persuasion, economic incentives, electoral interference and/or political and military pressures. In cases involving the use of political violence to oust the current leadership in another state, the phenomenon is labeled forcible **regime promotion**.

Authoritarian promotion is a form of vertical policy transfer – or coercion by a hegemonic power or powerful international organizations.

With authoritarian promotion, the results and adoption of decisions are not completely autono-

mous. The primary actor in authoritarian promotion is the more powerful authoritarian regime, not the target country. In extreme cases, these vertical forms of promotion are cases of coercion. While **authoritarian diffusion** is about contagion and convergence, and **authoritarian collaboration** and **authoritarian learning** are about consent, authoritarian promotion is about control and manipulation.

Authoritarian promotion is not the mirror image of **democracy promotion** and support. Democracy support aims at supporting countries to become more democratic. Authoritarian promotion is more focused on blunting the effectiveness of democracy support and creating global conditions that help achieve this objective (Ambrosio 2010). The goals are less ideological and more concerned with safe-guarding economic and geo-strategic interests (Bader et al. 2010; Carothers 2009; Tansey 2015; Whitehead 2015). Their main objective is their own survival and creating conditions that prevent the spread of democracy (Ambrosio 2010). This is achieved by restricting access to democratic ideas and developing negative narratives about Western democracy (Vanderhill 2017). A powerful authoritarian regime usually tries to promote autocracy in response to pressures to democratize. Autocratic regimes also pre-empt liberalization in other authoritarian regimes that might threaten their own stability.

Russia might be the exception to this, however. Russia has attempted to interfere in democratic elections, including the 2016 US presidential election and France's 2017 presidential election, and Brexit. Russia is concerned with relative gains and how powerful it is *vis-à-vis* the US and other Western actors such as the European Union. As such, Russia has become more assertive in its efforts to undermine democracy.

Authoritarian promotion takes many different forms. One type of authoritarian promotion is the promotion of authoritarian norms – such as security, traditional values and nationalism – that directly challenge democratic norms. The discourse around Western democracy is increasingly negative, repeatedly pointing out the failures of the West, the European Union, the US invasion of Iraq and the Eurozone crisis. In addition to authoritarian regimes, regional organizations are also very active in advancing non-democratic regional norms, among them the *Shanghai Cooperation Organization* (SCO), the *Association of Southeast Asian Nations* (ASEAN), and the *Gulf Cooperation Council* (GCC). The SCO has offered generous loans, while the GCC has supported military intervention if needed (Libman & Obydenkova 2018a). When promotion takes place through regional organizations, this is sometimes referred to as vertical diffusion.

One of the tools at the disposal of authoritarian regimes to spread authoritarian norms is the use of state-owned media and social media to control narratives about their own regimes and about anyone perceived to be an opponent or threat to the regimes. Authoritarian regimes fund major international television networks, such as Iran's *Press TV,* China's CCTV, Russia's RT, and Venezuela's *Telesur,* to challenge Western interpretations of major world events. In these cases, they may not have a specific target state, but they disseminate norms that are conducive to authoritarianism and which portray authoritarian regimes in a positive light.

Authoritarian regimes can also promote their influence through cultural organizations. In the case of Russia, influential organizations that promote Russian influence include the *Russkiy Mir* (Русский мир) foundation and *Rossotrudnichestvo* (Россотрудничество), created in 2007 and 2008 respectively. Both aim to spread Russian language and culture, support compatriots in the former republics and provide international development assistance (Ziegler 2016).

Another way of supporting authoritarianism is to undermine elections. Russia allegedly facilitated voter fraud in Ukraine in 2004 and the violent repression of protesters in 2014. Putin has also undermined democracy in Ukraine and other neighboring countries by manipulating political opinion, relying on negative campaigning and sponsoring fake candidates. Election monitoring by the *Commonwealth of Independent States* (CIS) sought to protect electoral authoritarian regimes by undermining any electoral monitoring taking place by the *Organization for Security and Cooperation in Europe* (OSCE) (Cooley 2015; Merloe 2015). These sponsored 'alternative' election-observation missions have sowed confusion and helped to cover up electoral abuse.

SEE ALSO Authoritarian promotion is often associated with **authoritarian learning**, **authoritarian collaboration** and support. These are all general processes that are intended to make countries more autocratic and thwart democracy promotion efforts. Structural changes towards **autocratization** in the international system are captured under the umbrella concept of **authoritarian diffusion**. A concept related to authoritarian promotion is the idea of **black knights**. 'Black knight' is the name given to a country that engages in authoritarian promotion. Thus, black knights are countries that use economic, military, and diplomatic assistance to support authoritarian regimes (Levitsky & Way 2010). Russia is seen as the classic case of a black knight, using its resources to protect and aid other authoritarian regimes (Lebanidze 2014).

Some studies have focused on authoritarian gravity centers (Box 6.2) like Russia and China, which promote authoritarianism but also lead to the diffusion of authoritarian norms and policies and authoritarian modeling, or learning. They act as transmission belts for the active promotion of authoritarianism. Authoritarian promotion is also connected to the terms 'authoritarian international,' 'authoritarian advance,' 'democracy pre-emption' and 'authoritarian backlash' (Ambrosio 2016).

KEY SIGNIFICANCE Authoritarian promotion illustrates the importance of external factors in supporting authoritarian rule and norms around the world. It also indicates that powerful authoritarian regimes are not only concerned with their own stability but with the stability of their neighborhoods.

In extreme cases like Russia, authoritarian regimes intervene outside of their neighborhoods and take action to undermine democracies as well, as seen in the recent 2016 US presidential election.

ORIGIN The term 'democracy promotion' has been around in policy circles for some time now (notable efforts include the Marshall Plan after World War II, and the work done by proponents of **modernization theory**), but 'authoritarian promotion' is a relatively new term. During the Cold War, the Soviet Union and, to a lesser extent, China aimed to promote authoritarian stability by supporting like-minded Communist states, but this was rooted more in ideological linkages rather than the desire to promote authoritarianism in general.

It is hard to pinpoint when the term 'authoritarian promotion' became widely used. The late Belarussian scholar Vitali Silitski coined the term 'authoritarian international.' This referred to a loose alliance and coordination among diverse autocracies to combat threats from democracies (Silitski 2007). This term may have closer connections to authoritarian coordination and cooperation, but there are similarities with authoritarian promotion as well. Silitsky explains that both Russia and Belarus have spent decades trying to pre-empt democracy, which could be construed as autocracy promotion. Authoritarian promotion has also sometimes been referred to as 'authoritarian advance,' noting the growing power of China and Russia to increase their spheres of influence.

LITERATURE The literature on authoritarian promotion focuses on investigating a few questions – such as how authoritarian promotion takes place, whether or not it is actually effective and poses a threat to democracies around the world, and what authoritarian regimes are trying to achieve when they intervene in other countries' affairs.

Because of concerns about the democratic slump facing the world today, the first two questions have been explored extensively. Some scholars have argued that authoritarian promotion is a major threat to democracy around the world, and derives in part from the efforts of autocracies to promote autocracy (mostly within, but not limited to, their own neighborhoods). For example, Russia has facilitated rollbacks of civil liberties and pluralism in the former Soviet Union.

However, Lucan Way (2016) and Jason Brownlee (2017) claim that the influence of autocracy promotion is limited. They both argue that it is nearly impossible to prove and that powerful authoritarian regimes like Russia and China are forcing states to become more authoritarian than they would be. It is hard to identify the places where authoritarian promotion actually worked. Andre Bank and Kurt Weyland (2019) argue that where authoritarianism has taken hold, it was driven by domestic impulses and not foreign conspiracies. Way (2016) adds that Russia's foreign policy is actually counter-productive as regards the goal of encouraging authoritarianism. Russian support of Eduard Shevardnadze in Georgia in 2003, Leonid Kuchma in Ukraine in 2004, and Viktor Yanukovych in Ukraine in 2014 was not enough to prevent their collapse. Additionally, outright authoritarian promotion can lead to a huge backlash. When Russia campaigned for Yanukovych on Ukrainian television, voter fraud and obvious Russian interference led to massive protests in Western Ukraine and eventually the Orange Revolution (see **color revolutions**). When Russia tried to block Ukraine from signing an association agreement with the European Union, this led to huge demonstrations and the ousting of Yanukovych, who had been elected in 2010 (Way 2016). Christine Hackenesch (2015) concurs that any effort by China to promote authoritarianism in Africa through substantial volumes of aid, loans and direct investment has not been successful in counteracting Western **democracy promotion** efforts.

Nevertheless, not all authors see the impact of authoritarian promotion as negligible. For example, in the case of Russia's promotion of authoritarianism in Ukraine, Russian interference did bolster popular support for Yanukovych in the 2004 election (Sushko & Prystayko 2006; Wilson 2005). Russia has also been guilty of legitimizing emergent regimes, such as supporting breakaway regions in the former Soviet Union. According to Jakob Tolstrup, Russia's support and involvement in Crimea bolstered opposition forces against the pro-democratic Ukrainian government that came to power after Yanukovych was removed from power. Russian troops on the ground and tight coordination between Russian and pro-separatist Crimean lawmakers derailed the pro-democratic and Western agenda in Kyiv.

Scholars also argue that authoritarian promotion has little to do with the intrinsic value of promoting authoritarian values around the world. Julia Bader and her colleagues (2010) claim that authoritarian regimes are more interested in supporting friendly neighbors, regardless of what regime type they have. China is more interested in preserving regional stability than propping up dictators (Bader 2015). Thus, the focus in Russia and China is more defensive than actively engaged in promoting regime change.

Rachel Vanderhill (2013) and Nathan & Scobell (2012) concur that China is not trying to promote authoritarianism around the globe but is instead focused on gaining access to natural energy resources and promoting its own economic development, growth and political stability. Way (2015) argues that Putin's interests in undermining pro-Western leaders such as Mikheil Saakashvili in Georgia and Viktor Yushchenko in Ukraine in the 2000s were less about their moves to democratize and more about how these leaders might challenge Russian geo-political power (Way 2015). It is less an ideological matter and more one of self-interest; authoritarian regimes are mostly indifferent to democracy promotion unless it affects their economic and geo-political interests. Policies which have the effect of supporting autocracy may in fact be the result of other reasons, and authoritarian survival may simply be a by-product (Hall & Ambrosio 2017). According to these authors, Russia's support for authoritarianism is also more selective since

Russia does not bother to support all authoritarian regimes around the world. Bader and her colleagues (2010) argue that authoritarian regimes have a preference for encouraging like-minded governments in close proximity.

But is this still the case for Russia? Russia's recent initiation of war against Ukraine seems linked to larger goals of empire. Russia may be the outlier here, as its recent actions in Ukraine have called into question just how far its ambitions go.

CLASSIFICATIONS Authoritarian promotion often gets conflated with other concepts such as authoritarian learning, diffusion and coordination/cooperation. While these concepts are all related, we see some distinctions. As we have already highlighted, different actors with different objectives are involved in authoritarian promotion. In some cases, authoritarian promotion is spearheaded by a regime, while in other cases it is done through a regional organization. Some authoritarian promotion aims to block democratic diffusion while in other cases authoritarian promotion is itself the goal. Ultimately, we see authoritarian promotion as intentional and coercive, rather than passive and unintentional. Nevertheless, some scholars see authoritarian promotion as a type of authoritarian diffusion, rather than seeing them as two distinct concepts (Gel'man & Lankina 2007; Roberts & Ziemer 2018). For these scholars, authoritarian transfers can be both active and passive and diffusion can also be coercive. In contrast, we see Putin's advancement of authoritarian ideals and practices as promotion, while the linkages and leverage that Russia enjoys in the region constitute examples of diffusion (see **linkage & leverage**). Others, like Von Billerbeck and Tansey (2019) distinguish between explicit (intentional) and unintended promotion of autocracy, using the example of peace-keeping missions in the DRC.

In our entry on **autocratic diffusion**, we introduced the term 'isomorphism,' but that term is more closely related to authoritarian promotion. Isomorphism is a process that forces one unit to resemble other units that face the same set of environmental conditions (Hall & Ambrosio 2017). Policy transfer and learning focus on the choices of the actor which change their behavior, and implies the actor's greater degree of freedom in making changes. In contrast, isomorphism explains how institutions are forced to emulate specific behaviors because of internal and/or external constraints. In some cases, the process of emulation occurs because a particular policy or institution is needed, but not necessarily desired (Thatcher & Sweet 2002). In other cases, emulation takes place by force applied by a powerful state or organization that compels other states to copy certain policies, practices or strategies (Farquharson 2013). When this happens, it is known as coercive isomorphism (DiMaggio & Powell 1983). We see collective isomorphism and authoritarian promotion as one and the same.

MEASUREMENT authoritarian promotion is measured by looking at instances of policy congruence or convergence in key areas such as constitutional law, electoral rules, laws on NGOs, and other electoral legislation. The more difficult task, however, is to determine the intent of the more powerful state so as to ascertain whether or not it is a case of diffusion or intentional promotion.

METHODOLOGICAL ISSUES Scholars have argued that the field of autocracy promotion is fraught with conceptual issues, and offers very tentative conclusions (Burnell 2010; Tansey 2015; Tolstrup 2015). Very little is known about the impact of autocracy promotion and how it might differ from any other type of assistance.

Along these lines, the biggest methodological issue is how to define the concept. Oisín Tansey (2015) has argued that we need a stricter conceptualization of autocracy promotion, one that is limited to cases where the external actor clearly intends to promote authoritarian rule in part due to an ideological commitment to authoritarianism. Thus, we need to distinguish between unintended and intended autocratic influences. Any authoritarianism that is an unintended consequence would be labeled **authoritarian diffusion**. However, if definitions of autocracy promotion are limited to cases where there is an ideological commitment to autocracy, this might exclude every instance of promotion,, since much of the literature on this topic sees autocracy promotion as more pragmatic than ideological. The other question has to do with the blurry line between resisting democracy promotion efforts and advancing autocracy. Is resisting democracy the same as advancing autocracy? It is also unclear if autocracy promotion only occurs in cases where an impact has been made. These are methodological issues that make measuring autocracy promotion a challenge.

EXAMPLES The most notable examples of authoritarian promotion involve Russia and its neighbors. In the early 1990s Russia worked to convince the pro-Russian parliamentary opposition in Belarus to accept Alexander Lukashenko's closure of parliament to introduce a more personalized style of rule. This support has helped maintain Lukashenko in power for several decades, and at this point Russia and Belarus are coordinating and cooperating, as in Moscow's support for Lukashenko during the 2021 protests.

Russia has flexed its power and influence most with its neighbor Ukraine. One of the notable (albeit unsuccessful) cases of authoritarian promotion involved Russia's involvement in the 2004 Ukrainian election. Russia may have spent as much as $600 million to support Viktor Yanukovych's 2004 campaign (Åslund 2009).

Before the run-off election in Ukraine between Yanukovych and Yushchenko, Putin met to advise Yanukovych about using smarter rigging by inflating the turnout in regions where he already had high levels of support, rather than falsifying the votes. Russia also repeatedly attacked the opposition through smear campaigns. Yushchenko was slandered on television while Yanukovych was praised (Åslund 2009). Russian prosecutors reopened a case of embezzlement against Yulia Tymoshenko, a popular

Box 6.2 Authoritarian Gravity Centers: Black Holes of Democratic Hope

Black holes ain't as black as they are painted. They are not the eternal prisons they were once thought.
– Stephen Hawking

Authoritarian gravity centers (AGCs) are a conceptual framework used to understand the influence exerted by powerful authoritarian regimes on neighboring countries. This concept, developed by Marianne Kneuer and Thomas Demmelhuber, is particularly useful in explaining the regional clustering of autocracies and the diffusion of authoritarian practices across different geopolitical contexts.

The theoretical underpinning of AGCs is rooted in the idea that certain authoritarian regimes act as centers of attraction or contagion for nearby countries. These regimes can actively promote authoritarianism (push factors) or serve as passive models that others may emulate (pull factors). The concept draws from theories of International Relations (IR) and comparative politics, particularly those exploring the diffusion of political norms and practices. AGCs are seen as influential due to their geopolitical proximity and their capacity to project power and ideas across borders.

Both intentional and unintentional influences originate from the AGC and provoke reactions at the domestic level of target states, leading to interaction and reciprocity. The framework suggests that while *control* is the most coercive form of influence, *hard leverage* occupies a middle ground, and *subtle leverage* employs the least coercive measures. Diffusion processes are facilitated by structural similarities and networks that enhance communication and idea exchange.

The application of AGCs is evident in various regions where authoritarian regimes have exerted significant influence. For instance, countries like Russia, China, and Saudi Arabia have been identified as AGCs due to their ability to shape political developments in neighboring states. These regimes use a combination of economic incentives, political pressure, and cultural influence to promote authoritarian norms and practices. Empirical studies have shown that these centers can affect regime types in nearby countries, either by supporting existing autocratic governments or by undermining democratic institutions through various means, such as media manipulation, economic dependency, and diplomatic pressure (cf. **black knights**).

While the concept of AGCs provides valuable insights into the dynamics of **authoritarian diffusion**, **authoritarian collaboration** and **authoritarian learning,** it also has limitations. One major limitation is that it does not differentiate between regime types nor distinguishes between various types of gravity centers. A second issue is the difficulty in empirically measuring the influence of AGCs and untangling it from other factors that might contribute to autocratic tendencies in a region. Additionally, the frame is time-bound and does not overcome the 'democracy vs. non-democracy' dichotomy.

opposition leader, and sent a request to Interpol for her arrest. Putin also held several high-profile meetings with Yanukovych praising his political skills (Petrov & Ryabov 2006). Putin then praised Yanukovych on Ukrainian national television and took part in a 90-minute question-and-answer session with Ukrainian voters (Åslund 2009).

IMPACT ON POLICY In the past, democracies and international like-minded organizations focused on **democracy promotion** and support, without considering the additional obstacle of autocracy promotion. Support was offered on how to build legislative and judicial institutions, how to hold elections, and how to support civil society. Democracy support efforts now have to consider the more aggressive actions of authoritarian regimes and their efforts to respond more effectively to democracy promotion.

REGIONAL VARIATION Most works have focused on Russia and China as authoritarian gravity centers (Box 6.2). Russia, Cuba, Saudi Arabia and Iran have also often been labeled **black knights**. The phenomenon has been less studied in other world regions, especially Africa and South and Southeast Asia. For broader comparative studies, see Vanderhill 2013; Kneuer & Demmelhuber 2020; as well as Fossati (2022) and others case studies in the *Revista Euro*

latinoamericana de Análisis Social y Político and its 2022 and 2023 editions (which also contain articles in French and Italian).

Eurasia For Russia and its near abroad, see Way 2015; Babayan 2015; Lewis 2016; Obydenka & Libman 2015; Libman & Obydenka 2018b; Ginsburg 2020; Kolstø 2021. On Belarus, see Yakouchyk 2016; Sejersen 2019; and for the unintended effects of democracy support, see Pikulik & Bedford 2019. For Central Asia, see Jackson 2014; Zuegker 2016; Sharshenova & Crawford 2017; for a comparison of Russia and China, see Melnykovska et al. 2012; Bader & Kästner 2016; Chou 2017.

Latin America Venezuela and Cuba are the most famous cases because ideology also played a role. For Venezuela and Chávez' export of Bolivarianism, see Kneuer 2022; for Maduro's regime as a recipient of autocratic support, see Gratius 2022. For a comparison of the two cases, see Menegol 2022.

MENA For a case study of Saudi Arabia, see Zumbrägel 2020; Zumbrägel & Demmelhuber 2020; and (in Italian) Morelli 2022. For Erdoğan's Turkey, see Canzut 2023. For the unintended effect of democracy support in Morocco, see Khakee 2017. Michelutto (2023) offers a welcome new case, studying Egypt's efforts at autocracy promotion in Libya and Tunisia.

Indo-Pacific For China's *One Belt One Road* project, see Bader 2015; Chou & Bryant 2015; Bryant & Chou 2016; Mandelbaum & Weiffen 2023; for its impact on Hong Kong, see Fong 2021; and on Myanmar and Thailand, see Tonetto 2022. Strating (2020) studies **black knight** behavior by Australia.

Sub Saharan Africa Billerbeck and Tansey (2019) look at peace-building missions in the DRC and how they have enabled autocracy. Autocracy promotion in this world region remains very much understudied.

NEW FRONTIERS Political science researchers are working to better understand the processes of **autocratization** and how various forms of international and domestic resistance can respond. Van den Bosch (2020) applies a framework of regime clusters to distinguish between the contexts and the drivers of autocracy promotion. K. Yakouchyk (2019) offers a fine review of the current debates within this subfield.

Colonial States

The worst thing that colonialism did was to cloud our view of our past.
– Barack Obama

Gereza si kuta
(A prison can exist without walls)
– Swahili proverb

Colonialism is a highly heterogeneous process covering almost five centuries and including all continents. Modern colonies can be defined as territories in which (i) political sovereignty has been seized by a foreign political power and (ii) the indigenous population is treated by the conquering state as fundamentally inferior (Steinmetz 2008: 591). These two criteria can be summarized as the sovereignty criterion and the rule of colonial difference criterion, which meant stressing differences between colonial subjects and preserving the alien-ness of the ruling group (Chatterjee 1993: 10).

Colonial administrations were able to gain relative autonomy from the metropolitan state and district governors. In particular, colonies were able to gain further autonomy from colonial governors (Steinmetz 2008: 592). According to Comaroff (1998: 341), in nineteenth- and twentieth-century Africa, the colonial state was often an ephemeral and ineffective entity, regardless of the presence of governmental agencies.

DEFINITION There is no widely accepted definition of the colonial state. Some authors consider them only as appendages of metropolitan states, while others argue that colonial states may not even be considered states (Steinmetz 2007: 27). Crawford Young (1997: 43-45) identifies three attributes of state-ness that colonial states lack: (a) sovereignty; (b) the idea of the nation; and (c) being an actor in the international scene. Steinmetz (2007: 28) claims that colonial regimes were generally state-like, their defining feature being the transfer of sovereignty from indigenous inhabitants to foreigners. The typical colonial state was staffed by a small group of colonial officers and had an undemocratic form of rule similar to **despotism** (Steinmetz 2007: 31). Steinmetz (2008: 596) also identifies similarities between the colonial state and those nondemocratic states or empires with political regime types like **absolutism** or **totalitarianism**. The essence of colonialism is the practice of segregation: institutional, territorial, and social (Chelati Dirar 2007). Achille Mbembe stresses the role of violence and terror in these processes, noting that in colonial states *"absolute lawlessness stems from the racial denial of any common bond between the conqueror and the native"* (Mbembe 2003: 24).

Jackson and Rosberg (1982: 15) consider the definition of the administrative aspect of a colonial state and suggest that the colonial state in Africa was based on bureaucratic rule (see **bureaucratic authoritarianism**). Colonial governments were led by administrative officers, appointed by a European authority. According to Steinmetz (2007), the colonial officers were interested in learning the languages of their subjects, their cultural traditions and traits, and this leads to the claim that colonial states were 'ethnographic states' (Ivarsson & Rud 2017), meaning that they were compelled to prioritize native policy, emphasizing the importance of asserting ethnographic expertise (Steinmetz 2007: 52–53).

Another conceptualization of colonial states is suggested by Comaroff (1998: 338), who states that *"colonial states, like states everywhere, depend(ed) at once (i) on instrumental, institutional, tangible forms of coercion, (ii) on means of violence either immanent or manifest, physical or symbolic, (iii) on diffuse, invisible modes of surveillance and discipline, and, in some measure, (iv) on the positive production of consent."*

As regards economic factors, according to Lonsdale and Berman (1979: 489), the colonial state may be seen as a variant of the capitalist state. The economies of colonial states were connected by forced labor. In Spanish America, economic activities were driven by the use of Native Americans' labor (Sokoloff & Engerman 2000). Enslaved people from Africa were imported to serve on American sugar and cotton plantations in the colonies of all the European powers (Sokoloff & Engerman 2000). Between 1400-1900 the Atlantic Ocean hosted the largest slave trade route across continents, the trans-Atlantic slave trade. In addition, there were another three routes: the trans-Saharan, the Red Sea, and Indian Ocean slave trade routes, which temporarily preceded the trans-Atlantic trade (Nunn 2008). Slavery and forced labor were used to increase economic development in other European colonies, such as Italian Somalia (McPherson-Smith 2021). The slave trade disintegrated the African kingdoms in Western and Central Africa, leading to successful European penetration (Nunn 2008).

All these proposed conceptualizations of colonial states build on the definition of the colony, which, according to Osterhammel (2005: 10) and adjusted by Olsson (2009: 536), refers to an enduring political entity established outside of Europe by 'Western' nations (European countries excluding Russia, but encompassing Western offshoots such as the United States, Australia, New Zealand, and Canada) between the fifteenth and twentieth centuries, achieved through invasion, conquest, and/or settlement colonization. The rulers of a colony preserve a continuous reliance on a geographically distant mother country or imperial center, which asserts exclusive ownership rights over the colony or significantly influences its political landscape in various ways.

SEE ALSO Colonial states incorporated the **ideology** of **racism** in almost all spheres of their politi-

cal organization, hence the scholarly comparisons to some aspects of **totalitarianism**. Because of the absence of legal protection for their 'subjects,' these regimes and their centralized rule shared some characteristics with **absolutism**, **despotism**, **tyranny** – three concepts that were applicable to 'Western' **monarchies** and to some degree also to the republics they evolved into. Their high levels of **repression** and systemic violence, combined with low accountability to (democratic) audiences in the metropolis, suggest some parallels with **patrimonialism** and **sultanism & neo-sultanism**. For the impact of colonial states on the postcolonial development of states, their economic performance, and on a variety of social factors, see the entries on **colonial legacies** and **imperial legacies** in this volume. For the influence of anti-colonial liberation movements, consult **revolutionary legacies**. Box 4.9 provides a comparison of post-colonial interpretations of Socialism, like African Socialism and Arab Socialism; for more detail on 'Baʿathism' – see also Box 4.5.

KEY SIGNIFICANCE Colonial states had a great impact on both the colonized and on the colonizing societies. Crawford Young (1997) calls the colonial system and European colonizers in Congo *Bula Matari* ('Breaker of Rocks' in Kikongo), signifying that the colonial state encompassed revolutionary changes in African societies (see **colonial legacies**). Colonial states profoundly influenced former colonies by distorting economic development, entrenching inequalities, imposing new governance structures and altering demography (the slave trade, forced displacements). They fostered social segmentation, cultural assimilation, and environmental degradation. These impacts disrupted traditional practices, introduced new species and diseases, and created lasting economic and political challenges, shaping the post-independence trajectories of these societies. To understand the impact of colonial states on the colonized and on the colonizing societies, it is necessary to focus on the relations between colonial states and civil society (Lemarchand 1992).

The study of colonial states has also wider implications for the analysis of weak statehood and explains the emergence and development of non-democratic regimes. Relations between state capacity and the **repression** of citizens (e.g., Roberti (2019) addresses the case studies of Senegal and Belgian Congo) *"explain the heterogeneous levels of state capacity in non-settler colonies and have policy implications for present autocratic regimes"* (Roberti 2019: 247). Since colonialism has an impact on state institutions, it is necessary to investigate the potential impact of colonial states' character on state-building in post-colonial states (Lange 2003). Understanding the dynamics of and within colonial states is also important because colonial states are characterized by the coercive nature of their governments, later leading to the emergence of underdeveloped, weak, and even failed postcolonial states (Ivarsson & Rud 2017) (see **state fragility & failure**).

Van den Bosch (2023: 108) argues that a colonial regime, much like a colonial state, is not considered a fully functioning political entity. As mentioned above, colonial states differ from sovereign states in lacking three key aspects: (a) sovereignty, (b) a unified national identity, and (c) independent agency in foreign affairs. Colonial states emerged first when European kingdoms were themselves evolving into modern states, resulting in extensive institutional and legal variation over time (Young 1997: 43). Before the establishment of the United Nations, various forms of statehood, such as protectorates, fiefdoms, vassal states, colonies, and satellite states, were more common. However, the absence of sovereignty, representation, and foreign policy agency posed significant challenges for these colonial entities during and after their transition to independence (see **colonial legacies**).

Their transition to independent states was marked by strained civil-military relations and distrust of former collaborators who had been part of the colonial administration. Colonial bureaucracies were primarily designed for population control and resource extraction rather than service delivery. Infrastructure was similarly biased towards facilitating such extraction and political control, leading to disparities between wealthy urban centers and impoverished rural areas. This bias was particularly pronounced in regions like the South Asian archipelagos due to their late colonization (Van den Bosch 2023: 108).

Colonial regimes are distinct from other **political regimes** in that the ultimate power-holders are foreigners who are part of an international network, often overseeing multiple colonies. (This, for instance, precludes the possibility of a **coup d'état** by local elites, since the ultimate locus of power lies not in the capital, but in the colonial metropolis.) Despite their autocratic nature, these regimes had a surprising level of formalization, clearly defining the vertical power relations between colonizers and the colonized, even though the latter were largely excluded from decision-making processes. The horizontal power relations with local elites varied significantly, and the simple dichotomy of 'direct' versus 'indirect' rule does not fully capture this complexity. Over time, local institutions that collaborated or were co-opted by the colonizers evolved, sometimes gaining legitimacy among the colonized (Van den Bosch 2023: 108).

The moral decline of the colonial system eventually led to greater autonomy for subaltern organizations, some of which became significant political entities during the transition to independence. However, even when local elites were included in the colonial regime's **selectorate**, they were junior partners with limited influence over decision-making and no control over key military or foreign policy functions. The colonizers employed divide-and-rule tactics to prevent these elites from gaining too much power, ensuring their loyalty through constant monitoring and manipulation of factional rivalries.

Subaltern elites, much like elites in **personalist regimes**, were kept divided and unable to challenge the colonial power effectively. Their subjugation to colonial law and their inferior legal status kept them distant from central power. At times, the high level of

legal-bureaucratic formalization, entrenching **racism** as a political **ideology**, was omnipresent for the colonized, thus resembling **totalitarianism** in those territories that were directly ruled by an extensive **bureaucracy**. Despite these similarities, their unique characteristics (see a,b,c, under 'key significance' above) make it difficult to equate colonial governing networks with independent political regimes.

ORIGIN The conceptualization of the colonial state emerged from the state-centric approach (Ivarsson & Rud 2017) illustrated e.g., by Evans et al. (1985), A. Giddens (2002) and his concept of the nation-state, or Bourdieu (2014). Steinmetz (2007: 27) claims that the uniqueness of the very existence of the colonial form of the state has been denied by theorists and historians, and suggests instead that the concept of colonial state be a part of the theoretical discussions of organized forms of political domination.

LITERATURE There is a large literature on the subject of the colonial state. One of the most influential books on the conceptualization and characteristics of colonial states is *African Colonial States in a Comparative Perspective* by Crawford Young (1997), which focuses solely on African colonies. The impact of colonial states on the creation of postcolonial patrimonial autocracies in Africa is provided by e.g., Young (2004). The edited volume *Rethinking the Colonial State* (Ivarsson & Rud 2017) provides diverse analyses of various aspects of the colonial state in colonies in different parts of the world, including territories generally neglected in the analysis of colonial states, like Samoa and the Danish West Indies.

CLASSIFICATIONS There are several possible classifications of colonial states according to either the characteristics of colonial rule or the particular colonial power. Olsson (2009) enumerates different types of colonialism: (a) 'full colonies,' which were possessions and considered parts of colonial powers; (b) 'protectorates,' which were more loosely tied to colonial powers. The exact type of colonial administration was chosen according to certain select features, including the era of colonial encounter. As Olsson (2009) claims, the selection of colonial policy may have been influenced not only by factors including the national identity of the colonizer, geography, disease, and population density, but also by the timing of the colonial enterprise and the level of resistance the colonizers faced.

Direct and indirect rule – Colonial states may be classified according to the type of rule characterizing their administration. The basic classification would thus be of colonies administered by 'direct' or 'indirect' rule (Müller-Crepon 2020; Ivarsson and Rud 2017). Migdal (1994: 9) equates the 'integrated domination for centralized governance' of colonies with direct rule, and 'dispersed domination for administration with powerful local chiefs' with indirect rule.

The British were noted for their use of indirect rule, but this form of administration was used also by the Belgians, Portuguese, and French (Bayart 2009). The British colonial empire (Lange et al. 2006) combined both direct and indirect forms of rule: in Nigeria and Uganda, they relied on local chiefs; Jamaica and Singapore lacked chiefs completely (Lange 2004); and the USA and Australia were administered directly as settlement colonies (Olsson 2009). For the difference between land management and schooling systems, and the general inequalities between the US and Canada, on one side, and the rest of America during colonialism, consult Sokoloff & Engerman (2000).

The case studies of four British colonies – Nigeria, the Gold Coast (now Ghana), Nyasaland (now Malawi), and Kenya (Bolt & Gardner 2020) – present how Native Authorities were incorporated into colonial administrations. The process of creating Native Authorities as well as the power granted to them differed across British colonies. In most cases, Native Authorities had the right to collect particular taxes and establish Native Courts. Bolt and Gardner (2020) also discuss the role of chiefs in British colonies administered by indirect rule.

Numerous academic works comparing British indirect and French direct colonial rule focus on education (Bolt & Bezemer 2009) or on their economic consequences (Iyer 2010). There are also regionally-oriented comparative studies of West Africa (Whittlesey 1937). Cameroon is an interesting case. British indirect rule in Cameroon led to the empowerment of communities and their self-reliance with an important role for elites, in contrast to French Cameroon, which applied an assimilation policy (Fonchingong & Fonjong 2002). Lee (2012) contrasts the French policy of assimilation and promotion of Western education in Cameroon with native traditions in (indirectly ruled) British Cameroon. He finds that the French system was in fact 'quasi-direct' which means that the French used German-era chiefs whom they hired for concrete services in the colony's administration (Lee 2012: 11). Lee compares, *inter alia*, the civil and common law in both colonies, religion, education, and labor policy. The colonial law in the British colony of Burma was studied by Saha (2012), who found that the law was applied in colonies individually and influenced by corruption.

These differences between direct and indirect rule also applied to the divergent effects of civil law and common law in conflict prevention and providing access to conflict resolution in Africa, as shown by Joireman (2001). For instance, the French colonial administration applied *(code de) indigénat,* an arbitrary set of oppressive measures, which empowered colonial officers with the right to punish colonial subjects on the spot with up to two weeks in prison (Joireman 2001: 579). The British system, in contrast, included indigenous forms of justice with the judiciary involvement of traditional leaders in conflict resolutions.

As for the analysis of British indirect rule, according to Mamdani (2018), indirect rule created 'the bifurcated state,' which contained the duality of urban, colonially-imposed power, and rural, customary, indigenous power. However, as Lee (2017) claims and proves in the case of India, colonial administrations favored pre-colonial elites only when they were

financially and militarily secure. Lee discusses the relations between the colonial state and local elites. The colonial administration had to take into account apprehension about potential uprisings and military challenges, the need to generate income, and the impracticality and cost associated with completely replacing indigenous landholding elites (Lee 2017: 183).

Settler and extractive colonies – Another distinction is between settlement colonies and extractive colonies (Acemoglu et al. 2001; Lange 2004), where differences in colonial rule were induced by variations in local geographic endowments as well as climate and disease burdens (Acemoglu et al. 2001). Advances in medicine (in particular malaria treatments based on quinine) enabled British colonialists from the nineteenth century onward to establish colonial settlements in tropical climates and sped up the 'scramble for Africa' (Seth 2018; Curtin 1989). (This finding, however, is disputed by Bolt & Bezemer (2009), who find no relationship between settler mortality and institutions in their analysis of a sample of African colonies.) In settler colonies, institutions protecting the private property and a portion of the liberties of the population were established. On the other hand, in extractive colonies, small groups of European elites monopolized economic and political power. After independence, former extractive colonies typically produced autocratic regimes.

Similarly, Lonsdale and Berman (1979) distinguish between colonies of peasant export production and colonies of white settlement. Ola Olsson (2009: 535) claims that the colonial era should be divided into an early 'mercantilist' wave and a later 'imperialist' wave, with different characteristics. The distinction between colonial policies is influenced by differences in legal systems and ideologies: the difference between common law (British tradition) and civil law (French tradition). Established economic activities are also an important factor, as illustrated by the case of Somalia, divided between British and Italian colonial systems. McPherson-Smith (2021) focuses on institutions, approaches to education, religion, land tenure and labor, and identifies differences in climate and physical geography features that determined economic activities in Somalia – pastoralism in British Somaliland, and agriculture in Italian Somalia.

Type of colonial power – Academic works on colonial states often explore the administrative differences among various colonial powers. For instance, Blanton et al. (2001) compare French and British colonial systems, while Lange et al. (2006) examine Spanish and British colonies. Grier (1999) discusses the distinctions among British, French, and Spanish colonial systems. Firmin-Sellers (2000) focuses on British and French colonial systems in West Africa, particularly Ghana and Côte d'Ivoire, and their impact on land policies, class formation, and the role of chiefs.

Some scholars emphasize the political aspects of colonial administrations and their effects on the treatment of colonized populations. Blanton et al. (2001), using statistical analysis from the *Minorities at Risk* dataset, find that Francophone states were more autocratic than Anglophone states and that the treatment of ethnic groups was worse in French colonies than in British colonies.

Economic aspects are also analyzed, with Spanish colonies favoring mercantilist policies focused on resource extraction. Spanish and Portuguese colonial ambitions were driven by the desire to extract precious metals in the Americas and control the spice trade between Europe and Asia (Olsson 2009), as well as large-scale agriculture (Sokoloff & Engerman 2000). Grafe and Irigoin (2012) discuss the stakeholder model in Spanish colonial rule in America, in which individual colonies operated as independent territorial units managing their own revenues and expenditures.

MEASUREMENT Colonial systems have been measured and compared in various ways. Lange (2004) identifies several factors that influenced the character of the colonial administration, regardless of its type of rule (direct or indirect): (i) the presence or absence of European settlers; (ii) the economic potential of the colony; (iii) the disease environment of the colonies; (iv) the presence of the local population. There are also quantitative studies of the impact of various factors on the character and quality of colonial institutions. For instance, Acemoglu et al. (2002) find that indigenous population density affected the quality of colonial state institutions.

METHODOLOGICAL ISSUES One of the biggest methodological issues is the discussion about whether colonial states can even be considered states (Steinmetz 2008: 591). According to Young (1997), for example, colonies cannot be seen as states (or as having states) at all, because they lacked that status in international law. Sometimes there can be a bias in defining colonialism exclusively from a Western perspective. For example, the one provided by Olsson (2009: 536) is problematic since it omits non-Western colonies, such as Japanese possessions in Korea and China, or Russian colonialism.

There are some identifiable differences between Japanese and European colonialism. Unlike European states, Japan colonized proximate territories (Cumings 1984; Kohli 1994), and therefore invested in infrastructure in its colonies. Its preferred military form of administration meant there was a land army resident directly in the colony. Japan also located heavy industry in its colonies, and its colonial policy was much more influenced by internal developments and reforms during the Meiji period (Kohli 1994).

IMPACT ON POLICY The international system was forged through imperialism and colonialism; thus, international interactions between now independent states are shaped by lingering dependencies, cultural ties, alliances and anti-colonial struggles, which, for this book's purposes, translate into patterns of **authoritarian collaboration**, **authoritarian learning** and **authoritarian regionalism**, among others.

In individual territories, **colonial legacies** left undemocratic institutional imprints on their **polit-**

ical regimes. Their colonial history can have a considerable impact on **foreign policy**. It helps current postcolonial states or secessionist territories (**de facto states**) to legitimize their claim to independent existence. For example, Somaliland legitimizes its claims to independence by the fact that it has a distinct colonial past compared to the former Italian colony of Somalia (Hoch & Rudincová 2015; Bradbury et al. 2003; McPherson-Smith 2021). Similarly, there has been discussion about the **external legitimacy** of the Eritrean state given the fact that Eritrea was an Italian colony (Chelati Dirar 2007).

NEW FRONTIERS Currently, the scholarship on the colonial state does not only focus on political and economic issues, but stresses the role of different actors in the shaping of colonial societies: teachers, African translators, tax collectors and missionaries (Sharkey 2013; Gilmour 2007). Building on Foucault's concepts of biopower, biopolitics, and governmentality (Foucault & Senellart: 2008) and postcolonial theories (Said 1979), the analysis of colonial states embraces the practices and behavior of various actors, since colonial states were understood as a reflection of European ideas about modernity (Ivarsson & Rud: 2017). In addition to focusing on non-state-centric approaches to studying the developments and characteristics of colonial states, Ivarsson & Rud (2017: 16) also suggest highlighting the diversity of colonial administrations and various colonial state formations. To accomplish this, it is important to adopt a multi-disciplinary approach that enables the mapping of the social context of the colony and knowledge production on and in colonial states (Chelati Dirar 2007).

Color Revolutions

The color revolution virus affects only weak countries.
Belarus does not have any breeding ground for this
– Alexander Lukashenko, dictator of Belarus

Some of the post-communist countries of Central Europe (e.g., Poland, the Czech Republic and Hungary), but also of the former Soviet Union (the Baltic States), democratized during the first decade after the fall of the communist regimes faster and became part of Western political, economic and military structures between 1999-2004. It was reflected in their accession to the EU and NATO. In some others (e.g., Serbia, Ukraine, Georgia) democratization was slower, and a political establishment that came to power, was perceived by parts of civil society as corrupt and having only the *façade* of Western liberal democracy. In these countries, since the late 1990s and especially at the beginning of the new millennium, non-violent public protests began to emerge with the aim of overthrowing unpopular governments and replacing them with political representatives with more democratic credentials. Although only two of these efforts to establish democracy from below had color in their very names (the orange revolution in Ukraine and the rose revolution in Georgia), all of these protests and movements shared a number of common features. This has led many area studies experts, local politicians, journalists and academics to view them as a single phenomenon, mostly referred to as colour/color or flower revolutions.

SEE ALSO This series of **protests & uprisings** created a wave of turmoil in the early 2000s in Eurasia and was followed by the **Arab Spring** in 2011 in MENA, raising even more expectations that a new democratic wave was underway (cf. Box 6.3), and even temporarily challenging the myth of Arab exceptionalism (Box 6.1). By affected autocrats, these protest waves were framed as Western **regime promotion** and destabilization campaigns. Despite their group labels, the actors and dynamics in individual protests differed greatly, as did their outcomes.

DEFINITION & EXAMPLES The terms 'color revolution' or 'flower revolution' are used to describe a number of non-violent protests that succeeded in overthrowing authoritarian regimes at the turn of the 1990s and in the first decade of the twenty-first century – for examples, see Box 6.4. In each of this protest movements, leaders adopted colored flags to rally under (Ó Beacháin & Polese 2009: 810).

While some authors (e.g., Way 2008; Bunce & Wolchik 2006) refer to color revolutions as **transitions** from non-democratic regimes (**personalist rule**) that grew out of the power vacuum following the collapse of the communist bloc, a broader concept understands color revolutions as all of the popu-

larly instigated collapses of authoritarian regimes or their attempts not only in the post-communist space, but also in the Middle East (**Arab Spring**) and Southeast Asia (e.g., Carothers 2011). While the Arab Spring and color revolutions are both instances of mass **protests & uprisings** seeking political change, that have relied on civil disobedience, and social media to mobilize large segments of the population, they have some distinct characteristics and driving forces. The term color revolution typically refers to a series of non-violent, peaceful uprisings, the Arab Spring uprisings on the other hand were a mix of both peaceful and violent protests, depending on the country and its specific circumstances. In some countries, such as Libya and Syria, civil wars have arisen as a direct outcome of these events. Another important difference between the color revolutions and the Arab Spring was their motives. The color revolutions were very closely linked to elections and the desire of disaffected citizens to replace corrupt and, in their eyes, undemocratic politicians with a more democratic opposition in free and fair elections. In the motives behind the Arab Spring, economic reasons were often one of the driving forces, and elections have not been at the epicenter of the protesters' attention. These differences are pointed out by van Antwerp & Brown, who referred to the events in Tunisia and Egypt as to an example of non-electoral transitions (van Antwerp & Brown 2018: 199). Generally speaking, coups in the Arab macro-region are an example of revolts against ruling autocratic regimes, but they differ from the color revolutions in the post-Soviet space in terms of motives and character, and thus are not classified by many authors as an example of color revolutions.

Some scholars trace color revolutions back to the 1990s, to the events in Slovakia (Ó Beacháin & Polese 2009: 810) or even to the earlier events in Romania and Bulgaria (Bunce & Wolchik 2006: 284), however most authors consider the events in Serbia in 2000 (the bulldozer revolution), Georgia in 2003 (the rose revolution), Ukraine in 2004 (the orange revolution) and Kyrgyzstan in 2005 (the tulip revolution) to be classic examples of color revolutions (Tucker 2007: 536).

Though differing in content, all these color revolutions had in common a proposed socio-political transformation intended to introduce democracy from below. As David Lane (2009) convincingly demonstrated they shared a common strategy: *"Mass protests occurred within the constitutional framework to widen forms of public participation in the regimes. They were legitimated as a movement for 'greater democracy.' They were all targeted on removing the incumbent political leaderships. Electoral procedures, allegedly fraudulent, were a regular focus for the insurgents. The public gatherings were constituted from a mass base of young people, particularly students"* (Lane 2009: 114). In comparison with traditional political demonstrations, a novel feature was the modern way of convening demonstrations via cell phones, the internet and social networks with a significant supporting role of domestic and foreign media. Compared to the revolutions of 1989-1991, the color revolutions also differ in that people who disagree with the regime were no longer dissidents, but were in fact opposition politicians supported by the emerging civil society. Demonstrations were usually accompanied by mass cultural events, which helped mobilize, create solidarity, and entertain mass audiences. The promotion and organization of these popular manifestations required considerable resources. Musicians, entertainers and organizers received payment and subsistence during the events (Lane 2009: 114). The aforementioned revolutions thus received moral and financial support from external sources, especially Western organizations and foundations or governments supporting democratic processes and the development of democratic institutions (e.g., George Soros Open Society Foundation, National Endowment for Democracy, International Republican Institute, Albert Einstein Institute, etc.). This has led to the frequent perception of color revolutions by incumbent governments in Eastern Europe to be an externally sponsored form of regime change and the part of a Western strategy to spread its influence in the region.

ORIGIN Dubbed the 'color' or 'flower' revolutions, in reference to the symbols that were often used by opposition movements, have a long history. They have been used in mainstream media since the early 2000s, however it should be noted that the protest movements in Serbia, Georgia and Ukraine were greatly inspired and instructed by Gene Sharp's (1993) manual for non-violent action entitled *From Dictatorship to Democracy*. Gene Sharp thus essentially became an ideologue of non-violent movements not only in the context of the color revolutions, because he has compiled a list of approximately two hundred possible specific methods by which political resistance can be carried out.

LITERATURE There is a noticeable difference in the academic literature on color revolutions produced in the West and in the Russian Federation and other authoritarian regimes. The majority of Western scholarship on the subject was published during the first ten years following the revolutions in Ukraine, Georgia and Kyrgyzstan. From a Western perspective, popular uprisings against authoritarian and/or corrupt leaderships are seen as an expression of support for democratic forms of governance and a triumph for the will of people. On the other hand, Russian approach to color revolutions is framed in the opinion, that they are connected to the implementation of a **coup**, part of a Western strategy of maintaining power through the creation and manipulation of conditions of chaos around the world in order to weaken strategic competitors (German 2020: 549-551; Solovei 2015; Petrov 2020).

Among the most important Western publications analyzing the causes and conditions under which the color revolutions took place in the post-communist area are above already mentioned texts written by Bunce & Wolchik (2006), Tucker (2007), Way (2008), Ó Beacháin & Polese (2010) and Lane (2009). Other widely cited works devoted to analyzing not only the causes but also the consequences of the color revo-

lutions undoubtedly include Hale (2006), D'anieri (2006), Beissinger (2007) and Mitchell (2012). Equally important, however, were case studies that either analyzed only one specific case: Serbia (Birch 2002); Ukraine (McFaul 2007; Kuzio 2013); Georgia (Cheterian 2008; Whetley 2017); Kyrgyzstan (Marat 2006; Lewis 2008), and comparative studies that tried to look for similarities and differences between two or more cases of color revolutions (Tudoroiu 2007; Ó Beacháin 2013). These publications have had a significant impact on the way we think about the possibilities of democratization, strategies for its implementation but also the limits of civil society.

Another important area of research was Russia's response to the color revolutions and the ways in which it adapted to changes in the 'near abroad' (Ambrosio 2007; Wilson 2013; Finkel & Brudny 2014; German 2020). Nor can we forget analyses and perspectives on the color revolutions from Russian sources (Марков 2005; Денчев & Павлова 2016; Филимонов et al. 2016).

KEY SIGNIFICANCE & IMPACT ON POLICY The color revolutions have had a strong impact on subsequent developments in countries where regime change has occurred as a result (e.g., Ukraine, Georgia and Kyrgyzstan), but their effects can also be seen in countries where mass anti-government protests failed, the existing regime suppressed them and remained in power (e.g., Azerbaijan or Belarus) and also in countries with authoritarian regimes that felt threatened by the color revolutions and whose security apparatus began to prepare for mass protests and created proactive measures against them (Russia, China).

Most Western reactions to the color revolutions, whether from politicians, academics or journalists, saw their aftermath in a positive light, as a victory of liberal values, where illiberal leaders were replaced by their liberal counterparts (Bunce & Wolchik 2006: 284). The legitimacy of these mostly non-violent ousters was based on the broader framework of global social transformations within the Third Wave of democratization identified by Samuel Huntington (1993). Critics argue that what looked like democratization from below with broad support from disaffected citizens was essentially a **coup** in disguise, where opposition elites unable to mobilize effectively against incumbent governments, organize revolutionary events to galvanize support and legitimate a transfer of power (Lane 2009: 116).

Unsurprisingly, most of the critical voices came from countries with authoritarian regimes, which themselves feared the possibility of a color revolution, with Russia in first place. Russian politician, N.A. Narochnitskaya argues that the so-called voice of the people is in reality an illegitimate use of modern media technology (TV, radio and the press) to create public opinion to force political change. NGOs with powerful foreign sponsors, become political bodies working through networks and the media – rather than being rooted in civil society and acting on behalf of citizens. These NGOs directly or indirectly financed by foreign governments, become involved in insurgent activity, defining democracy in terms of their own conceptions and magnifying election frauds to promote and legitimate a coup d'état to their political advantage (Нарочницкая 2008: 11-22).

Other authors as Denchev and Pavlova (Денчев & Павлова 2016) or Bel'skiy and Klimenko (Бельский & Клименко 2014) consider color revolutions as a manifestation of the struggle for dominance in the post-Soviet area that has been taking place between Russia and the United States with the clear western aim to isolate Russia from its neighbors. As German (2020) convincingly shows in her article, the perceived threat posed to Russia from colored revolutions has become a central theme in Russian security discourse. Reaction to the events in the 'near abroad' have during the past twenty years become a *Leitmotif* in Russian strategic thinking formed by the Russian military and political elites (German 2020: 541). This clearly shows that the whole study of color revolutions has gone far beyond discussions in academic circles, but has a very tangible reflection in the political sphere, in international relations and in the security agenda of individual countries.

OTHER LANGUAGES The key writings on the color revolutions written in English or Russian (translated as: Цветная революция) have already been discussed above (see: 'literature'). However, given their importance not only for academic circles but also for *Realpolitik*, it is quite obvious that important works on the topic of color revolutions can be found in other languages such as Turkish, Polish, Armenian, Georgian, Chinese and Arabic. In German the concept is translated as *Farbrevolutionen*, in Dutch as *kleurenrevoluties*, in French *révolutions de couleur*, in Spanish *revoluciones de colores*.

NEW FRONTIERS Although at the beginning of the second decade of the twenty-first century it might have seemed that scholarly interest in the topic of color revolutions has been waning in the West, events in Armenia, Belarus and Russia in the late second and early third decades of this century, as well as growing unrest in a number of other regions, have reopened a number of questions related to the possibilities of democratization and the instruments of repression in states that are not liberal democracies. A new study focusing on changes in Russian civic activism is presented by Sundstrom, Henry and Sperling (2022). The article written by Tertytchnaya (2023) provides one of the first causal tests of the mass opinion effects of preventive repression. It draws on evidence from detailed data on unauthorized and authorized protests from Russia and concludes that when authorities engage in preventive repression, such as when they deny protest authorizations, protesters' ability to generate support is compromised. Another area that is definitely worth following is the area of **patronalism**. It was introduced in 2014 by Henry Hale, who used the concept of patronal politics to gauge the dynamics behind color revolutions in the Eurasian space. This was followed up by Kosienkowski (2019), who looked at patron-client relations between Russia and Transnistria, and Kolstø (2021), who examined whether Russia functions as a **black knight** and exports its autocratic political

system to **de facto states** in the post-Soviet space. Far from being limited to Russia's relations with de facto states, patron-client relations have been shown, for example, by Newnham (2020), who embedded Russia's relations with Belarus within this concept. After the start of the war in Ukraine, Russia's position in the post-Soviet space has changed significantly, and many authors (e.g., Götz 2022; Busygina & Krivokhizh 2023) have begun to look more closely at what this change will mean for the level of democracy in the region. However, the main question of the moment is the impact of the perceived fear of possible public protests in authoritarian states that are strongly opposed to the West and take the possibility of mass protests as a very serious threat to their stability and geopolitical position. Therefore, it is clear that the topic of color revolutions and, more broadly, the whole area of regime change and information warfare will continue to be more than topical.

De Facto States

To live in an unrecognized state is to have a 'life in quotation marks'
– Rebecca Bryant & Mete Hatay

De facto states are entities capable of performing some of the administrative, legislative, executive and judicial duties of a sovereign state, and hold military power over their territories, but they struggle for independence, and lack international recognition. At best, they are recognized by only a few other states. During the past twenty years, several competing terms have appeared in the scholarly literature – including 'unrecognized states,' 'quasi states,' 'contested states,' or 'pseudo states.' However, 'de facto state' remains the most commonly used term. For a discussion of the different terms and conceptualizations, see e.g., Broers et al. (2015).

DEFINITION Kolstø (2006) identifies a de facto state as a territory: (a) where state institutions control the entire territory to which they lay claim (or at least the majority of the territory) and administer that territory; (b) which is attempting to gain international recognition of its independence, but which has failed to gain such recognition (or has only gained limited recognition); (c) which has existed for more than two years (Kolstø 2006: 725-726). Most authors dealing with issues of separatism and state legitimacy (e.g., Pegg 1998; Berg & Toomla 2009; Caspersen 2012) share this view and consider de facto states as territorial units that apply their sovereignty and exercise governance over a defined territory, but whose statehood lacks broad international recognition.

Some authors (e.g., Hoch 2020; Kosienkowski 2023) raise the question of whether seeking international recognition of independence is a prerequisite for de facto statehood. According to them, de facto states could also seek to join another country or to maintain the *status quo*. Their aims can also change over time, and under certain circumstances may also overlap with each other. Generally speaking, however, there is a fairly widespread consensus surrounding the basic elements of how to define a de facto state. As Scott Pegg (2008) notes, disagreements arise only around the edges of the definition, and do not dispute its basic elements.

ORIGIN Although de facto states (at the time referred to as quasi-states) were mentioned as early as the 1980s by e.g., Jackson (1987), the beginnings of systematic research on the phenomenon of de facto states began more in earnest in the second half of the 1990s. Scott Pegg's 1998 monograph *International Society and the De Facto State* is a landmark work in this regard. It was not only the first to develop theoretical criteria for defining de facto states, but also included case studies of individual de facto states.

LITERATURE In 2001 Charles King labeled de facto states as "informational black holes" (King 2001: 550). While little may have been written about the concept in the past, the last twenty years of social science research on de facto states has documented many aspects of their internal political, social, and economic dynamics and also their external relations with the outside world (see Broers 2013; Pegg 2017; Comai 2018; Hoch 2019).

EXAMPLES There is a relatively widespread scholarly consensus among experts that the following cases constitute de facto states: Abkhazia, South Ossetia, Nagorno-Karabakh (ceased to exist on 1 January 2024), Transnistria, Northern Cyprus and Somaliland (e.g., Pegg 1998; Kolstø 2006; Caspersen 2012). Other cases are more open to debate. For example, Caspersen and Stansfield (2011) demonstrate that 21 de facto states have emerged on the global political map since the end of World War II, while Florea (2014) has identified 34 such entities for the same period. Although it is possible to encounter texts which classify entities such as Taiwan, Kosovo, Palestine, Western Sahara or Iraqi Kurdistan as de facto states, these examples are more generally considered borderline cases.

KEY SIGNIFICANCE & IMPACT ON POLICY De facto states face many challenges. First, their non-recognition by other states has a negative impact on their development. They struggle to attract foreign investment; face difficulties obtaining loans from international financial institutions; have limited export opportunities; have problematic borders with the parent state; and face obstacles related to the non-issue of visas. Thus, people in de facto states are separated from the rest of the world by a significant wall of isolation, which is also largely reflected in the lower economic level of development in every de facto state compared with its parent state. The existence of a de facto state does not only result in negative impacts on economic and social development in the separatist region, but also harms the economy of the parent state. Due to a lack of control over the separatist regions, parent states lose their ability to collect taxes in de facto states and the possibility of benefiting from the sale of raw materials, products and services that – illegally or locally, through traffickers – reach the markets of neighboring countries. This is how parent states lose millions of dollars every year.

Despite their small size and a low number of associated inhabitants, de facto states have a significant impact on international security. As a result of the conflicts in Abkhazia, South Ossetia, Transnistria, Nagorno-Karabakh, Northern Cyprus and Somaliland an estimated 60-70 thousand have died, and these conflicts have generated almost two million refugees and Internally Displaced Persons. Thus, de facto states pose a problem not only in the economic and political sphere, but also in the sphere of social development and international security.

Since around 2006, official state representatives in de facto states started emphasizing the importance of democracy promotion in their political units. This surge took place shortly before Kosovo's unilateral

declaration of independence and its subsequent recognition by most of the Western world. Elites in de facto states usually compare their entities to Kosovo, believing that democracy and respect for human rights could legitimate claims to independence and international recognition. These public proclamations came to be known as the 'democratization for recognition' strategy. Since then, a number of studies have begun to address the topics of democracy in de facto states, and the relationship between democratization and the possibility of international recognition. Protsyk (2009) focused on democratization in Transnistria, Azam (2014) on Somaliland, Kolstø & Blakkisrud (2012) on Nagorno-Karabakh, and Kopeček et. al. (2016) and Ó Beacháin (2019) on Abkhazia. If we generalize from these debates, the main questions concern whether these public statements should be understood as a political tool and thus merely political declarations, or if such intent can proceed further to real and measurable shifts towards a more democratic and free society. Furthermore, what factors triggered such a shift (in policy) and what are the specific conditions of this process for de facto states?

A decade later, it became clear that political sentiments and declarations in favor of democratization should not be taken at face value. Whether de facto states have been democratized at all can be determined by means of the **Freedom House** dataset *(Freedom in the World)*. Classic datasets, such as *Polity IV, Index of Democracy,* or *Nations in Transit*, only contain data on internationally recognized states. Only *Freedom House* has gradually included territories which are not internationally recognized as independent states in its evaluations. Northern Cyprus has been evaluated by *Freedom House* since 1982, Nagorno-Karabakh since 1994, soon followed by Transnistria and Abkhazia. Somaliland was added to the index in 2007 and the last de facto state, South Ossetia, in 2008. After a careful examination of the dataset for each de facto state, it can hardly be asserted that de facto states have experienced steady democratization. For Transnistria and South Ossetia, the score for the entire monitored period remained almost identical (*Not Free*); Abkhazia, Nagorno-Karabakh and Somaliland recorded slight up and down fluctuations, but are still rated as *Partly Free*; and the index identifies Northern Cyprus as a *Free* country for the last more than 20 years (albeit with visible democratic backsliding in recent years). If we compare these results for de facto states with those of their parent states, unrecognized entities generally fare worse. Georgia is also rated as *Partly Free*, but its democracy rate is higher in comparison to Abkhazia, not to mention South Ossetia. The Republic of Cyprus also scores better than Northern Cyprus and Moldova better than Transnistria. The only exceptions are Nagorno-Karabakh, which is much freer than Azerbaijan, and Somaliland, which scores higher than Somalia. From the above list it can be seen that de facto states are far from being oases of democracy. However, it cannot be argued that international non-recognition automatically implies strong authoritarian rule in de facto states.

OTHER LANGUAGES The most prominent academic publications on de facto states appear in English, yet there are naturally publications on de facto states in other languages as well: In French: Dembińska 2021; in Russian: Колосов et al. 2021; in German: Relitz 2015. Since de facto states are closely linked to conflicts, many publications are naturally of domestic origin and written in local languages (Armenian, Georgian, Azeri, Moldovan, Greek and Turkish).

NEW FRONTIERS Despite growing interest in the topics connected with de facto statehood, some aspects of this issue still remain relatively under-researched and suggest interesting prospects for future research. One of them has been offered by Comai (2018). He argues that scholars focusing on the issue of de facto statehood are locked into a way of thinking oriented to the contested status of these entities and compare them mostly with other unrecognized states or conflict regions. A similar need for more comparative work, including not only de facto states but also other adjacent phenomena, has been raised by Pegg (2017). Another direction may also be a historical approach that would focus on similarities and differences with entities that existed in the past. However, the very nature of a topic focused on a variable social reality, which changes dynamically depending on many internal and external phenomena, constantly raises the need for new knowledge.

Democracy Promotion

Dictatorships are one-way streets. Democracy boasts two-way traffic.
– Albert Moravia, Italian novelist and journalist

In general, democracy promotion is a mechanism designed to promote the establishment and strengthening of democracy in a non-democratic polity. It *"involves helping to build institutions and foster a democratic culture"* (Smith 2014: 122) by incorporating democratic principles into administrative rules and practices. Democratic promotion and support can come from domestic sources such as citizens and civil society organizations, or from external sources such as third states and international organizations (van der Brug et al. 2021; Gisselquist et al. 2021). However, democracy promotion should not be understood merely *"as the mechanical transfer of some political design principles"* but rather *"as a cooperative process 'cultivating' or even 'nurturing' locally pre-existing democratic potentialities"* (Whitehead 2012: 21).

DEFINITION Democracy promotion can be defined as a foreign policy tool covering diplomatic, economic and political carrots and sticks that foster democratic change, and also as international cooperation and assistance that aim to encourage democratic development (Burnell 2007a; Carothers 2020). These include election observation and monitoring, technical assistance, financial aid, material support for a broad range of local civic and political actors (McFaul 2004).

The terms 'democracy promotion' and '**democracy support & assistance**' are often used interchangeably, but they represent distinct approaches to international democracy assistance. Democracy promotion involves active efforts by countries or organizations to establish democratic systems of governance in other nations through activities like advocating for free elections and supporting civil society. It can be seen as more interventionist and politically driven, aligning with foreign policy objectives. On the other hand, democracy support focuses on long-term development and strengthening democratic institutions within a country. It emphasizes creating conditions conducive to democracy, such as capacity-building and socio-economic development, without direct political intervention. Democracy assistance is usually more narrowly interpreted as 'democracy aid' and its implementation is more project-based and pragmatic, covering different spheres: *"Civil society projects support the media and various overseas NGOs. Governance projects support more transparent and accountable government institutions. Political-processes projects aid elections, legislatures, and political parties. Rule-of-law projects strengthen constitutions, human rights, and legal institutions"* (Bush 2015: 7).

SEE ALSO Other terms are also used by scholars and international organizations to designate democracy promotion, such as 'support for democracy-building', 'good governance' or 'democracy aid' (Burnell 2013: 266). Although these differ as regards the range of tools and instruments used, and who they address, they can be subsumed under democracy promotion. In terms of discourse, democracy promotion is considered a foreign policy tool, a more forceful one (on par with **regime promotion**), challenging the sovereignty of the states targeted and essentially labeling them as 'lacking in democracy.' **Democracy support & assistance** are the more politically correct labels. The former implies that the political system in a target requires 'fixing,' the latter subscribes to a more equal, voluntary partnership. However, depending on the context, all three types can favor interests over values, provide undeserved democratic legitimacy to authoritarian allies, and, in the worst case, enable and entrench undemocratic elites. These terms are also often linked, though not equated,

to the process of **democratization** – which can be a purely domestic process.

KEY SIGNIFICANCE As a foreign policy tool, democracy promotion can be used in different contexts: either in closed authoritarian regimes (with no democratic elements), semi-authoritarian states (**hybrid regimes**) that allow some political freedoms but no alternation of power-holders, or in newly democratizing countries that are generally open and receptive to democratic change (but have unstable political systems and usually low state capacity – see **state fragility & failure**). Scholars and practitioners alike agree that democracy promotion is inherently difficult to achieve from the outside and that such attempts may sometimes even undermine democracy itself (Burnell 2013; Smith 2014).

ORIGIN Although contemporary democracy promotion appeared with the third wave of democracy (Huntington 1991), it started in the mid-1970s with the involvement of certain European states and organizations in the democratization processes of Southern Europe. By the 1980s it had spread to Latin America and parts of Asia. But it was not until the 1990s that democracy promotion truly gained global significance (Carothers 2008: 123-125). The global spread of democracy, the end of the Cold War and the attachment of democracy promotion to the development agenda were among the key drivers of this change (Gisselquist et al. 2021).

Disentangled from Cold War politics, democracy promotion allowed the development of an orthodoxy relating to democracy, good governance, development and peace (Smith 2014: 145). It became something of a norm, rather than a mere instrument of foreign policy, making regimes' legitimacy conditional on compliance with a set of international democratic rules (Clark 2007). Moreover, the Vienna Declaration of 1993 promoted democracy as a universal principle and changed the perception of the concept of non-intervention, allowing states and international organizations to intervene to promote democracy (Martin-Chenut 2007: 37-39). However, by the start of the 2000s this global democratic trend and democracy promotion itself became more controversial and slowed down significantly.

LITERATURE Scholars agree that democracy is an essentially contested concept (Kurki 2010), meaning that there are different interpretations of what democracy and democracy promotion mean and no one version should be considered the right one (Burnell 2013: 277). In parallel, two different approaches to democracy promotion can be identified in the literature. A minimalist approach focuses on support for regular, free elections and is mostly reflected in the democracy promotion model of the United States (Carothers 2020). A broader approach to democracy promotion also addresses political and socio-economic developments in non-democracies, using political and diplomatic instruments (e.g., summits and dialogues), and trade, cooperation and development agreements (Giselquist et al. 2021). This approach is exemplified by the European Union's democracy promotion efforts and is well-documented in Youngs' (2010a) edited book *The European Union and Democracy Promotion*. For a more detailed study of what causes democratic changes see J. Teorell's (2010) *Determinants of Democratization: Explaining Regime Change in the World, 1972–2006*. This book focuses on economic factors, peaceful uprisings and intra-regime splits to explain democratization, but also covers non-domestic factors that affect such processes – in particular, international trade, neighbor diffusion and pressure from regional international organizations.

In addition, the edited volume by Hobson and M. Kurki (2012) *The Conceptual Politics of Democracy Promotion* underscores the importance of local context in democratization efforts, stressing that successful democracy promotion must take into account the specific political, cultural, and historical conditions of target countries to avoid ineffective or counterproductive approaches. It also scrutinizes the role of external actors – such as states, international organizations, and NGOs – in democracy promotion, cautioning that while their involvement can be beneficial, it must be carefully balanced to prevent undermining local ownership of the process. Furthermore, the book introduces the concept of 'conceptual politics' into democracy promotion, underscoring that the endeavor is inherently political and involves contentious debates over the interpretation and implementation of democratic principles.

METHODOLOGICAL ISSUES One of the main problems regarding how to analyze democracy promotion derives from the absence of any agreed definition of **democracy** and of which democratic values should be promoted and considered universal (Clark 2007). Democracy promotion generally assumes Western liberal notions of democracy, including *"political (party) pluralism, competitive elections and a raft of political rights and civil liberties secured by the rule of law"* (Burnell 2013: 276). However, these are not universally accepted as democracy remains an 'essentially contested' concept (Gallie 1956). For this reason, it has not been codified in international agreements, i.e. there is no individual or collective right to democracy nor an absolute duty of states to be democratic (Arts 2000), which further limits the possibilities of legitimizing and spreading democracy promotion from the outside.

Other methodological challenges involve the conceptual and measurement difficulties associated with defining democracy aid, and the absence of a unified system to evaluate democracy promotion efforts. When tracking regime transformations, using **classifications & typologies**, binary **dichotomous categories** oversimplify complex political realities. **Continuous measures** provide a range of 'democracy levels' but may suffer from subjective coding and aggregation issues and lack conceptual benchmarks. **Trichotomous categories** are too focused on the nature of elections, few of them embracing a maximalist definition of democracy.

Attributing the success or failure of democracy promotion efforts to specific interventions is difficult due to the interplay of numerous internal and exter-

nal influences. The long-term effects of democracy assistance programs may not be fully apparent for years, making it challenging to evaluate their impact comprehensively. Additionally, evaluations often focus on specific projects in particular countries rather than providing systematic, thematic evaluations that cut across multiple activities. This fragmented approach to evaluation limits the ability to draw broader conclusions about the effectiveness of democracy promotion efforts. This additional lack of consensus impedes the creation and acceptance of a unified theory of democracy promotion and the ability to measure its effectiveness accurately (Leininger 2019; Burnell 2007b).

Furthermore, the impact of aid modalities and the domestic political environment within recipient states add another layer of complexity to the study of democracy promotion. Different types of aid – such as democracy aid versus developmental aid – have varied impacts on democratization, but the evidence on the effectiveness of specific aid modalities is limited. The effectiveness of aid is also conditioned by the domestic political environment, which can facilitate or hinder democratization efforts (see **linkage & leverage**; **gatekeeping**). Additionally, interaction with authoritarian aid (**black knights**) and the polarization it creates in recipient countries further complicates the assessment of democracy promotion efforts.

EXAMPLES According to Carothers (2020: 115) and Smith (2014: 123), the 2001 attacks and the US-led interventions in Iraq and Afghanistan have had negative consequences for democracy promotion. By linking the lack of democracy with international **terrorism**, democracy promotion was instrumentalized and understood as imposing political reforms through regime change and unauthorized military intervention in select autocratic regimes. This kind of assertive or even coercive democratization (**regime promotion**) not only conflicts with the liberal respect for the self-determination of nations, but also casts doubt on the legitimacy of using military force and other coercive means (such as economic **sanctions**, travel bans, arms embargoes, etc.) to promote democracy. As a result, (electoral) autocratic regimes (such as Belarus, China, Ethiopia, Eritrea, Nepal, Russia, Uzbekistan, Venezuela, etc.), were able to gain popular support for resisting any form of democracy promotion from the outside, or by external actors, in the name of protecting sovereignty and opposing foreign interference (Carothers 2020).

IMPACT ON POLICY Democracy promoters (mostly Western countries) have tolerated autocratic regimes in some parts of the world (such as Central Asia, the Middle East and some parts of Sub-Saharan Africa) for geopolitical reasons. Such selectivity has damaged the legitimacy of democracy promoters. As the practice of democracy promotion often confirms that 'interests trump values,' i.e. the prioritization of stability, economic and security interests over (democratic) political processes (Carothers 2008). For example, given the crucial role of Pakistan in the war on terror, democratization and the inherent policy-making logics of (democracy) support for increased governance capacity were not considered as mutually supportive (Youngs 2010b: 13) by democracy promoters (mostly the US). Despite Pakistan being a military dictatorship, the result was increased aid and a closer relationship with the US. Similarly, the EU's democracy promotion in its eastern neighborhood was taken hostage by the 'Russia first policy,' which favored non-confrontation and undisrupted (energy) trade relations with Russia despite its non-democratic *status quo* (Dandashly & Noutcheva 2020: 111). At the same time, in its southern neighborhood, the EU avoided supporting fundamental democratic reforms, and had to face its discredit among the new democratic leaders and civil society in the post-Arab Spring period (Khakee 2019).

Democracy promotion has also suffered because of questionable practices by democracy promoters. There is a challenge to democracy within Western societies, most visible in the rise of illiberal and anti-democratic populism, the decay of traditional political parties and more contentious and divisive politics regarding certain core liberal democratic principles (Carothers 2016), such as the rule of law, media freedom and reproductive rights. Democracies themselves can also be **black knights** and often infringe on democratic norms in their external behavior by supplying weapons to non-democratic regimes (Russia, Saudi Arabia, Egypt, etc.) or by violating the rights or engaging in the poor treatment of prisoners and detainees as was the case in Iraq, Afghanistan and Guantanamo, further weakening the legitimacy of democracy promotion (Carothers 2006).

NEW FRONTIERS The dominance of the Western model of democracy promotion is being challenged by both major non-Western (rising) democracies such as Brazil, India, Indonesia, and South Africa and by non-democratic global powers such as China, Russia and Turkey (Carothers 2016). If in the early 2000s non-Western democracies served as a compelling example that democracy can succeed outside of the Western hemisphere, even undertaking their own efforts in democracy support, in recent years they too have witnessed democratic backsliding and stagnation, characterized by a rise in authoritarian or illiberal tendencies (Carothers 2020: 16). Increasingly China and Russia, but also other autocratic regimes such as Iran, Saudi Arabia and the United Arab Emirates, try to influence political developments in other countries (Aydin-Düzgit 2020), either by limiting or reversing democratic progress or by presenting *"a governance model that offers an alternative to Western liberal democracy"* (Aydin-Düzgit 2020: 117).

Box 6.3 Waves of Democracy & Autocracy

Each wave becomes top-heavy with big expectations that it will change everything and be the one solution we've been waiting for. These expectations eventually exceed what the wave can support, and it comes crashing down.
– Josh Lerner (2024: 10)

Most scholars agree that democracies tend to cluster in time and space, something that Samuel Huntington referred to as 'waves of democracy.' Though there has been less research on this topic until fifteen years ago, the same can be said of autocracies. In particular, more recent research has highlighted waves of autocratization, or periods when autocracies have spread, especially in certain regions. Autocratic values have spread, autocracies have learned from one another, and more and more countries have become autocratic (for more on this, see entries on **authoritarian diffusion** and **authoritarian learning**). After many decades of democratic advancement, we are currently experiencing the third wave of autocratization, which started in the early 2010s, and the pendulum has not yet swung back in the other direction.

The concept of 'waves' in political science metaphorically describes the clustering of regime changes, particularly **democratization** and **autocratization**, over time and space. It emphasizes the episodic and nonlinear nature of these shifts, highlighting how changes in one country often influence others through processes of diffusion. These processes can occur *vertically*, driven by global power shifts like wars or the collapse of empires, or *horizontally*, spreading through regional networks and shared grievances. Democratization waves often involve spontaneous uprisings or revolutions, which are fast-moving but prone to failure due to poor organization. In contrast, autocratization waves are typically more deliberate and organized, often led by established actors like militaries, resulting in slower but more durable outcomes.

Despite its influence, the wave metaphor has significant limitations. Critics argue that it oversimplifies complex phenomena and lacks explanatory depth. It focuses on patterns without fully accounting for the underlying causes or variations in regime transitions. Measurement challenges also arise, as broad metrics like percentages of democracies fail to distinguish between different types of **transitions** or varying levels of democracy across countries (**dichotomous categories** vs. **continuous measures**). Additionally, interruptions such as foreign occupations differ from genuine regime changes but are often conflated within wave analyses.

The metaphor's emphasis on clustering may also obscure deeper domestic and international drivers of regime change, such as economic conditions, institutional structures, and geopolitical dynamics. Moreover, identifying reverse waves, such as autocratization since the mid-1990s, remains contentious due to disagreements over their significance and coherence.

While the wave metaphor captures important pat-

terns in regime change and remains influential, its analytical limitations necessitate more precise definitions, refined measures, and deeper exploration of causal mechanisms to understand the dynamics of democratization and autocratization fully.

FIRST DEMOCRATIC WAVE The first wave was a multifaceted phenomenon driven by a combination of international shocks, modernization processes, hegemonic transformations, and the diffusion of ideas. While scholars differ on its precise timing, with estimates ranging from 1820 to 1926, this period marked the emergence of **democracy** as a viable political model in various parts of the world. Huntington (1991) identifies this wave as spanning from 1828 to 1926, while others, such as Seva Gunitsky (2018) and Renske Doorenspleet (2000), propose alternative timelines that highlight distinct subwaves, including the First Constitutional Wave (1820-1821), the Romantic Nationalist Wave (1830), and the Spring of Nations (1848).

The causes of the first wave are complex and debated. Some scholars argue that international shocks, such as World War I, weakened existing regimes and created new states more inclined toward democratic governance. However, this explanation is tempered by the observation that many new democracies were fragile and prone to backsliding into authoritarianism. **Modernization theory** provides another lens, suggesting that industrialization, urbanization, and rising literacy rates during the nineteenth century fostered conditions conducive to democracy. Additionally, shifts in global power dynamics – such as those triggered by the Latin American wars of independence – highlight the role of hegemonic transformations in creating opportunities for regime change. Horizontal diffusion also played a critical role; for instance, the revolutionary fervor of the 1848 Spring of Nations spread rapidly across Europe, inspired by events like the overthrow of the French king, Louis Philippe.

The effects of this wave were significant but uneven. It led to a notable expansion in the number of democracies worldwide, though many were short-lived and succumbed to authoritarian reversals in the 1920s and 1930s. The failures of uncoordinated uprisings like those in 1848 underscored the need for organized political movements, paving the way for mass-based parties and labor unions. This wave also shaped future democratization efforts by influencing theoretical frameworks and strategies for regime change.

SECOND DEMOCRATIC WAVE This wave occurred primarily between 1944 and 1957, emerging in the aftermath of WWII. This period saw a significant expansion in the number of democracies worldwide, driven by a combination of geopolitical shifts, decolonization, and the influence of victorious democratic powers. However, like the first wave, it was followed by a reverse wave in the late 1950s and 1960s, underscoring the fragility of many of the newly established democracies.

One of the primary causes of the second wave was the Allied victory in WWII. Democratic powers such as the US and Great Britain played a critical role in reshaping the global political order, imposing democratic systems on defeated Axis powers. Germany, Italy, and Japan were notable examples where democracy was imposed under Allied supervision to rebuild these nations and prevent the resurgence of **authoritarianism**. Additionally, the ideological appeal of democracy gained momentum as it became associated with victory and reconstruction.

Decolonization also contributed significantly to the second wave. The decline of European colonial empires after WWII led to the emergence of numerous newly independent states in Africa and Asia. While these states adopted various forms of governance, many initially embraced democracy as part of their post-independence political frameworks. The weakening of colonial powers, coupled with international support for self-determination, created opportunities for democratic experiments in these regions.

The Cold War provided an important but less explicitly discussed context for this wave. The ideological rivalry between the democratic West and the communist Soviet bloc likely influenced democratization efforts, with Western powers promoting democracy as part of their global strategy. However, this period also highlighted vulnerabilities; many nascent democracies lacked institutional stability and succumbed to military coups or authoritarian reversals during the subsequent reverse wave.

The second wave thus expanded democracy globally but revealed persistent challenges in consolidating democratic regimes amid internal weaknesses and external pressures (as anti-communism trumped democratic deepening).

THIRD DEMOCRATIC WAVE Spanning from the mid-1970s to the 1990s, this wave marked a transformative period in global political history, characterized by an unprecedented surge in democratic transitions. Its causes were multifaceted, reflecting a combination of systemic shocks, negotiated processes, diffusion of ideas, and international pressures. The collapse of the USSR and the end of the Cold War were pivotal in this wave, particularly in Eastern Europe (but not to be dismissed in Sub Saharan Africa as well). The disintegration of Soviet power undermined communist regimes and empowered pro-democracy movements across the region. This aligns with broader theories that systemic shocks, such as the end of major geopolitical conflicts, create openings for democratization.

Unlike earlier waves, the third wave was notable for its reliance on pacted transitions (**elite pacts & pactology**). In regions like Latin America, democratization often occurred through negotiation and compromise rather than mass uprisings. Organized political actors, such as parties and interest groups, played a central role in these transitions, favoring structured bargaining over risky revolutions. Spain's transition to democracy became a model for other nations in Latin America, demonstrating how negotiated processes could achieve stable outcomes. Additionally, the spread of democratic ideas and successful precedents from other countries encouraged emulation and adaptation, further fueling the wave.

International pressure was another defining feature. Western democracies actively promoted democracy through diplomatic efforts and support for civil society organizations. While these efforts were not always immediately effective, they contributed to a global environment more conducive to democratization.

The third wave resulted in an unprecedented expansion of democracy worldwide but also revealed new

challenges. Many countries transitioned to **hybrid regimes** that seemed to combine democratic and authoritarian elements. Furthermore, the success of this wave paradoxically set the stage for a gradual erosion of democracy in subsequent years. Rather than outright coups, this 'third wave of autocratization' concerned the electoral dimension with the manipulation of laws and institutions to undermine democratic norms under a legal *façade*.

The third wave initially fueled optimism about liberal democracy's triumph, epitomized by Francis Fukuyama's 'end of history' thesis (cf. Box 5.3 on transitology). However, the rise of autocratization has since challenged this narrative, prompting scholars to reassess the durability of democratic gains. The unique characteristics of the third wave – such as hybrid regimes and **autocratization** – have also led some to question whether the wave metaphor adequately captures the complexities of regime change. Some argue that post-communist transitions represent a distinct 'fourth wave' due to their unique historical context.

FOURTH DEMOCRATIC WAVE? The existence of a fourth wave of democratization remains a contested topic among scholars. Michael McFaul (2002) argues for a distinct fourth wave, focusing on the post-communist transitions following the collapse of the USSR. He contends that these transitions differ fundamentally from those of the third wave in their causes and outcomes. Unlike the negotiated transitions characteristic of the third wave, post-communist transitions often involved non-cooperative dynamics, revolutionary upheavals, or imposed reforms from above. For instance, revolutionary transitions in the former communist bloc frequently produced stable democracies, contrary to third-wave expectations that such methods were less conducive to democratic consolidation. Additionally, challenges like border disputes and nationalist conflicts further distinguished post-communist transitions from earlier patterns. This divergence led critics such as Svend-Erik Skaaning (2020) to question the utility of the wave metaphor itself, arguing that it oversimplifies democratization processes and imposes arbitrary periodizations. (Tomini 2021)

FIRST AUTOCRATIC WAVE Looking at data from 1900 onwards, the **Varieties of Democracy** Dataset has noted that the first wave of autocratization started in 1926 with the rise of Benito Mussolini in Italy (Lührmann & Lindberg 2019). Fascism and democratic decline followed in countries such as Germany, Greece, Spain, Argentina, Brazil and Japan, and this autocratic wave continued until 1946.

This interwar period was marked by the rise of **totalitarianism** in Europe and beyond. This wave coincided with the aftermath of WWI, a period of profound global instability (a systemic shock) that created fertile ground for authoritarianism. The fragility of newly established democratic institutions, combined with economic crises such as the Great Depression and widespread social discontent, eroded public trust in democracy, paving the way for autocratic leaders to seize power.

This period saw the emergence of ideologically-driven totalitarian regimes, including **Fascism** in Italy under Benito Mussolini, **Nazism** in Germany under Adolf Hitler, and Stalinism in the Soviet Union. These regimes were characterized by an extreme centralization of power, suppression of dissent, and the imposition of state-controlled **ideologies**. Leaders exploited nationalist and xenophobic sentiments, promising to restore national pride and stability while justifying their repressive policies. The Great Depression further exacerbated these dynamics, as economic hardship left populations vulnerable to the promises of strongman rulers.

Totalitarian regimes during this period sought to mobilize entire societies through **propaganda**, **personality cults**, and coercive control over all aspects of life. While some transitions to autocracy were deliberate power grabs, others emerged from wartime circumstances or **foreign invasions**.

The impact of this wave was profound, leading to catastrophic consequences such as WWII and the Holocaust (cf. Box 1.19 on genocide). It also set a precedent for modern autocracies by demonstrating how crises could be exploited to consolidate power. This wave remains a critical period for understanding the vulnerabilities of democratic systems and the conditions that enable authoritarianism to thrive.

SECOND AUTOCRATIC WAVE The second wave of autocratization started in 1961 after a suite of military coups destroyed the new democracies that were formed in the aftermath of WWII. While military dictatorships took over much of Latin America (Argentina, Chile, Brazil, Peru, Bolivia, Paraguay, El Salvador, Uruguay, Guatemala and Honduras), Africa saw a rise in **personalist rule**, such as Milton Obote and Idi Amin in Uganda and Joseph Mobutu in Zaire (Box 1.7). Military dictatorships also took over in Myanmar, Greece and Pakistan, while personalist rulers seized power in the Philippines and Indonesia.

The second wave of autocracy, occurring roughly between 1960 and 1977, was shaped by the geopolitical dynamics of the Cold War and the challenges faced by newly independent states during decolonization. Unlike the first wave, which saw outright collapses of democracies, this wave primarily involved the erosion of democratic institutions within already fragile regimes, particularly in newly established electoral autocracies. Military **coups** were the dominant mode of transition, reflecting the central role of organized and powerful military establishments in seizing control during periods of political instability.

The Cold War context played a pivotal role in this wave. The ideological struggle between the United States and the Soviet Union created an environment where authoritarianism was often seen as a safeguard against communist revolutions (cf. Box 1.2 on elected dictatorship & protection pacts). For example, the Cuban Revolution heightened fears of leftist insurgencies, particularly in Latin America, prompting elites to support military takeovers to maintain order and protect their interests (cf. *Foquismo* in Box 5.9). Simultaneously, many newly decolonized states in Africa and Asia struggled with weak institutions, economic crises, and internal conflicts, making them particularly vulnerable to autocratization.

The effects of this wave were profound. It led to the proliferation of **military regimes**, especially in Latin America and parts of Africa. These regimes were often characterized by repression, curtailed civil liberties, and concentrated executive power. Even in countries that

did not experience outright coups, democratic norms were eroded through gradual centralization of authority. The **authoritarian legacies** of this period – weak institutions and a culture of impunity – continued to hinder democratic consolidation long after transitions to democracy occurred.

The second wave's reliance on overt military interventions contrasts with later waves, where more subtle methods of undermining democracy became prominent. It underscores how global ideological struggles and domestic vulnerabilities combined to shape patterns of autocratization during this era. The second wave of autocratization would end in 1977 after various dictatorships started to collapse, signaling the beginning of the third wave of democratization.

THIRD AUTOCRATIC WAVE The third wave of autocratization, beginning around 1994, represents a significant shift in the methods and dynamics of democratic decline. Emerging in the post-Cold War era, this wave diverges from earlier waves by operating more subtly and targeting democratic institutions from within rather than dismantling them outright. Unlike the second wave, shaped by Cold War rivalries and overt military coups, the third wave unfolded in a global environment initially marked by optimism for democracy following the collapse of the Soviet Union.

One defining characteristic of this wave is the gradual erosion of democratic norms. Autocratic actors often come to power through legitimate means, such as **elections**, but then incrementally weaken democratic institutions under a legal *façade* (cf. **authoritarian constitutionalism**). This process includes undermining judicial independence, restricting civil society, and manipulating electoral processes. Scholars like Lührmann and Lindberg (2019) emphasize that this 'democratic erosion' stands in stark contrast to the abrupt coups or revolutions of earlier waves.

Another hallmark is the exploitation of societal vulnerabilities. Polarization and **disinformation** have become critical tools for autocratic leaders. By deepening divisions within society and spreading false narratives, they erode trust in democratic institutions and create an environment conducive to authoritarian consolidation. Additionally, elites have learned from past democratization movements, such as the **color revolutions** and the **Arab Spring**, adapting strategies to counter pro-democracy efforts while emulating successful authoritarian models (cf. **authoritarian learning**).

The effects of this wave are global in scope, impacting countries across Eastern Europe, Latin America, and the Indo-Pacific. While many affected states retain some democratic attributes, the quality of democracy has declined significantly. This wave has sparked debate among scholars about its significance and whether it constitutes a distinct 'wave' or reflects broader trends in global politics. Ultimately, the third wave of autocratization underscores the evolving tactics of authoritarianism in the twenty-first century and its persistent challenge to democratic resilience.

Today, there are certain 'authoritarian gravity centers' (Box 6.2) that are actively undermining democratic development and cooperation, which has prolonged this third wave of autocratization. Most scholarly attention has focused on Russia and China, but states like Iran, Saudi Arabia and Venezuela have also had a negative impact in their neighborhoods and beyond. Russia is undoubtedly the most active authoritarian actor (**black knight**) in the push to undermine democracy around the world. Its efforts to do so have been substantial and have had a significant impact on human life.

Democracy Support & Assistance

While the terms democracy 'promotion' (A), democracy 'support' (B) and 'assistance' (C) are frequently interchanged, they actually denote separate approaches to international democracy assistance. This encyclopedia bundles all concepts under **democracy promotion**, but their differences can be considered as follows: 'Promotion' (A) entails proactive endeavors by countries or organizations to institute democratic governance systems in other nations, often through actions like promoting free elections and bolstering civil society. This approach tends to be more interventionist and politically motivated, serving the interests of foreign policy objectives.

Conversely, 'democracy support' (B) is a broader approach with the same end-goal, and prioritizes the sustained development and reinforcement of democratic institutions within a nation. It places emphasis on fostering an environment conducive to democracy, including various forms of aid, capacity-building, electoral and other institutional support, without direct involvement in political affairs: e.g., political dialogue, foreign aid, election observation, and development cooperation projects.

Finally, 'democracy assistance' (C) is even more narrow than 'support,' encompassing only those democracy support issues to be addressed in countries with existing (nascent) democratic systems, but which are either in crisis or otherwise vulnerable or fragile. 'Assistance' is framed as more pragmatic and specifically refers to financial flows and projects intended to support democratic development or reinforce democratic processes, evaluating effectiveness based on impact on democratic institutions, civil society, and human rights

Both democracy support and assistance can be criticized for potentially legitimizing authoritarian rule if not implemented carefully, and the discourse of the latter in particular, might imply that a selected beneficiary state has already achieved some level of democracy, even if it is actually authoritarian. Sarah Bush (2015) finds that those programs that are designed to foster competition and encourage the free exchange of political information, are less likely to be regime-compatible because they directly challenge the incumbent regime's dominance over political power and information. Other programs are designed in ways that do not threaten incumbents, either they are too broad, do not foster competition, or do not challenge the regime's hold on power.

Democracy support and assistance are characterized by their respect for sovereignty and focus on non-interventionist methods, aiming to foster the development of democratic institutions within nations on a voluntary basis. The agents are not exclusively states or international organizations but can be other donors as well (like NGOs and private organizations). By prioritizing long-term development and empowering citizens through education, economic advancement, and civil society support, democracy support is meant to lead to sustainable democratic governance. Additionally, its emphasis on gradual progress reduces the risk of backlash and empowers local populations to build their own democratic frameworks. However, its slower pace and potential for elite capture pose challenges, as it may not yield immediate results and the process in question could be co-opted by local elites, hindering genuine democratic development.

In contrast, democracy promotion takes a more direct and proactive approach, leveraging political and diplomatic measures to support democratic actors or oppose authoritarian regimes: e.g., social pressure; economic sticks and carrots (cf. **international sanctions**); conditionality; diplomacy; and even military intervention. This interventionist strategy can be effective in crisis situations and may lead to quicker democratic reforms. However, it also carries the risk of resentment from populations in target countries as it is often perceived as imposed external interference, triggering (neo-)colonial or imperialist frames. Additionally, democracy promotion (especially regime **ouster**) can sometimes conflict with other foreign policy priorities and may result in (grave) unintended consequences (like destabilization or civil war) if not sensitive to local conditions.

Ultimately, the choice between democracy support and democracy promotion depends on the specific context, goals, and conditions within both the assisting and target countries. Each approach offers distinct advantages and drawbacks, requiring careful consideration to determine the most suitable strategy for promoting democracy effectively. While both support and promotion fall under regime change or **regime promotion,** democracy promotion is not a mirror image of **authoritarian promotion**: the former is a positive, ideologically-driven, proactive activity, the latter is usually a reactive, protective strategy, ultimately self-serving the autocracy promoter (cf. **black knights**) and not necessarily supported by a coherent ideology.

External Legitimacy & Authoritarian Regimes

I have to be seen to be believed.
– Queen Elizabeth II

Legitimacy has long been regarded as an exclusively intra-state or domestic matter and addressed as 'internal' or 'domestic' legitimacy. In this sense, legitimacy has been defined in relation to (state) authority and to those who are governed, and understood as "the right to rule a country" (Odendahl 2015) or as *"beliefs within a given constituency or other relevant audience that a political institution's exercise of authority is appropriate"* (Talberg & Zürn 2019: 585) (see also **rulership**). This means that the exercise of public authority by a government (i.e. the power to make binding decisions) is justified only as long as the governed (the people) recognize and accept it (Caspersen 2014; Langvatn 2016). Although there still is no consensus about the criteria for gaining legitimacy, most scholars agree that these criteria stem from domestic law. They include, amongst others, a set of pre-agreed procedures for the exercise of public authority that are perceived as appropriate or fair, decisions that are consistent with the values and the will of the people, and the right of the people to choose those exercising public authority (Spencer 1970; Odendahl 2015).

Recently, however, some scholars have begun to investigate the development of the international dimension of legitimacy (Odendahl 2015; Talberg & Zürn 2019). They point to an emerging international relations practice in which the (internal) legitimacy of (mostly authoritarian) states is questioned externally, i.e. by other states or international organizations. Odendahl (2015) argues that *"states increasingly accept that their governments have to meet normative expectations of the international community if they strive to be regarded legitimate."* Therefore, external legitimacy (also international legitimacy) posits that a state's legitimacy is acknowledged by other states as equals in the international community (Bull 1977: 82) and that the criteria for legitimacy can be found in international law (mostly treaties establishing regional organizations). The external legitimacy of states is evaluated according to the degree of international involvement or the support they receive from different actors (states, international organizations and companies) in the international community (Caspersen 2014).

The concept of external legitimacy is closely linked with the concepts of 'sovereignty' and 'international recognition' (von Soest & Grauvogel 2015; Caspersen 2014). States were long recognized as legitimate if they met the minimal criteria for statehood as defined by the 1933 *Montevideo Convention on Rights and Duties of State*, particularly the capacity to meet their international commitments and obligations (Biersteker 2010: 162), with no particular provision regarding their regime type. In this context non-democratic states were not only recognized as legitimate but also often protected by the institution of sovereignty. After the end of the Cold War, however, attempts were made to build additional normative constraints into legitimacy. Not only did the criterion of effective and democratic government become a prerequisite for state recognition (Biersteker 2010: 163), it also provided new opportunities for external interventions to influence developments in (already internationally recognized) third countries. For instance, in 1991, the European Community issued a declaration stating that recognition of Central and Eastern European states was conditional upon their respect of the rule of law, democracy and human rights, as well as upon guarantees for the rights of ethnic minorities. The European Community also maintained these criteria as a fundamental part of their (later EU) accession negotiations with newly independent states (Shaw 1997: 301).

At the same time, however, some other states, mostly non- or semi-democratic ones like China, Russia and Malaysia, are reluctant to make legitimacy conditional on the acceptance of democratic government as a universal regime form (Biersteker 2013: 164). This applies to both the practice of state recognition and the practice of using the loss of legitimacy to call on a government to resign or to request intervention. Authoritarian regimes view external legitimacy as a tool to exercise power exploited mostly by Western democratic states in order to promote their interests or else in the broader context of imposing a specific (liberal-democratic) form of world governance (Talberg & Zürn 2019: 584).

This confirms that external legitimacy is a slippery concept. On the one hand, the criteria that determine whether a government is internationally legitimate or not are unclear; on the other hand, the international community's practice is inconsistent and selective (Clark 2007: 22-23; Odendahl 2015). In some cases, only grave violations of humanitarian law and the human rights of a state's own population are regarded as leading to the loss of legitimacy, which then justifies external intervention (see also the 'Mogadishu line' in Box 3.12). This happened in Libya in 2011, where the regime's use of military force against its own population served as an indicator that the regime had lost legitimacy, leading to international military intervention. In other similar cases, such as the one of Syria, the international community failed to agree to act. Although most states had rejected the legitimacy of the Syrian government for almost identical reasons as in the case of Libya, external intervention was vetoed by China and Russia in the United Nations Security Council (Odendahl 2015). Similarly, other violations of territorial integrity and of the prohibition of the use of force are not considered to cause the loss of legitimacy, as the examples of the Russian annexation of Crimea in 2014 and the aggression in Ukraine since 2022 most vividly confirm.

Nevertheless, for authoritarian regimes, external legitimacy is also a valuable source of domestic legitimacy (Grauvogel & von Soest 2014). The absence of

external legitimacy can potentially isolate a state on the international stage or jeopardize its existence. A state therefore needs cooperation with other actors within the international system to subsist and prosper (Suchman 1995; Caspersen 2014). There is of course a limit to external actors' freedom to withdraw all forms of external legitimation (or even recognition), partly because authoritarian regimes draw their external legitimacy from the presence of other non-democratic regimes in the world (see **authoritarian collaboration** and **authoritarian regionalism**) or benefit from the West's tolerance of some 'friendly' autocracies, such as China (Brunell 2006: 555).

They can also profit from objections against destabilizing authoritarian regimes on the part of domestic actors in democratic states due to their significant trade, security or geostrategic interests. Moreover, attempts to withdraw external legitimacy can have the contrary effect and strengthen non-democratic regimes instead of destabilizing them. Authoritarian leaders can use these attempts to their advantage by feeding domestic hostility to Western interventions by portraying them as imperialistic (for example, the US in Cuba and North Korea, or Israel in Iran) or by enhancing elite cohesion in their fight for (external) legitimation (Grauvogel & von Soest 2014). As shown by Burnell (2006: 556), international actors have greater means to undermine the legitimacy of oil-importing and aid-dependent autocracies because their economic performance can be better affected through sanctions and by enforcing relevant liberal-democratic conditionalities. Similar conclusions are drawn by Clark (2007: 16) regarding the degree of coerciveness of autocratic regimes. Coercive autocratic regimes are less stable than non-coercive ones and as a result coercive autocratic regimes seem to be less legitimate and more susceptible to external influences. However, as Lambert (2011) has shown for Qatar, authoritarian regimes can also initiate (partial) democratic transformations as part of their own legitimation strategies, seeking more external legitimacy among Western democratic countries to guarantee their countries' security and independence.

Flower Revolutions

The terms 'flower revolutions' and 'color revolutions' are often used interchangeably to describe a series of political movements that aimed to overthrow authoritarian regimes, particularly in post-Soviet states. There is little evidence of a universal logic dictating why some are denoted by colors and others by flowers. However, color revolutions seem to be confined to the Eurasian space, and the flowers selected embrace a broader symbolism when they refer to a national plant. Whichever label is used, these so-called 'revolutions' were mostly mass uprisings and (peaceful) protests, and seldom transformative revolutions that altered political systems, as shown in Box 6.4. Not all were driven by democratic forces, and the actors involved as well as the motivations behind these events varied greatly.

In this Encyclopedia, we distinguish between **color revolutions** and the **Arab Spring**, each set of uprisings having its own respective contestation repertoires (see 'regimes & repertoires' in Box 5.8). An in-depth conceptual comparison between **revolution** and **uprisings & protests** can be found in this book's section on **origins, transitions & breakdown**.

Box 6.4 Flowers, Cloth & Spices – The Editors' Pick of Colorful Uprisings

A revolution is not a bed of roses. A revolution is a struggle between the future and the past.
– Fidel Castro (1926-2016)

The **color revolutions** and **Arab Spring** have significantly shifted the field of comparative authoritarianism. Scholars discovered new theoretical avenues for **authoritarian collaboration** or **authoritarian learning** and renewed attention was given to autocratic **longevity, stability & resilience**.

Even with many of the initial democratic gains undone or countered, these revolutionary waves have left a lasting impression in the Former Soviet Union and MENA, as did similar uprisings in other countries. Below, find a (non-exhaustive) list of uprisings alluding to colors, flowers, etc. and their short context with key sources for their further analysis. This list is a reminder of how different these uprisings were and that grouping them under common labels tends to obscure instead of increase our understanding of their dynamics.

Carnation Revolution (***Portugal***, 1974) The Carnation Revolution, which took place on 25 April 1974, was a nearly bloodless military coup that overthrew the *Estado Novo* regime, ending 48 years of authoritarian rule in Portugal. The revolution was initiated by the Armed Forces Movement (*Movimento das Forças Armadas*, MFA), composed of military officers disillusioned with the regime's colonial wars in Africa and its oppressive domestic policies. The revolution is named after the carnations *(Dianthus caryophyllus)* placed in the muzzles of soldiers' rifles by civilians, symbolizing the peaceful nature of the uprising. It led to the establishment of a democratic government, the decolonization of Portuguese territories, and significant social and economic reforms. It was the first 'flower' revolution and the start of the 'third wave' (Box 6.3) of **democratization**. (Osuna 2014; Fernandes 2024)

Velvet Revolutions There have been two. The most famous one was in Czechoslovakia (1989, in Czech: *Sametová revoluce*; in Slovak: *Nežná revolúcia* or 'Gentle Revolution'). This non-violent transition of power marked the end of 41 years of communist rule in Czechoslovakia. The revolution was characterized by mass protests and the use of the symbol of keys, which protesters jingled to signify the unlocking of freedom. It led to the election of Václav Havel as president and the eventual peaceful split of Czechoslovakia into the Czech Republic and Slovakia. (Wheaton 2018; Zittoun 2018).

The second one took place in Armenia (2018, in Armenian: Թավշյա հեղափոխություն – *T'avshya heghap'vokhut'yun*) was a series of anti-government protests led by opposition leader Nikol Pashinyan. The movement began in response to Serzh Sargsyan's attempt to extend his rule by transitioning from president to prime minister after a decade in power. The protests, characterized by their peaceful nature and widespread participation, culminated in Sargsyan's resignation and Pashinyan's eventual election as prime minister, marking a significant shift towards democratic governance in Armenia. (Iskandaryan 2018; Abrahamian & Shagoyan 2018; Lanskoy & Suthers 2019)

Bulldozer Revolution (***Serbia***, 2000) This uprising led to the overthrow of Slobodan Milošević after he refused to acknowledge his defeat in the presidential elections. Massive protests and civil disobedience culminated in his resignation. It marked the beginning of a series of similar movements in the post-Soviet space. 'Bulldozer' refers to the heavy machinery used by some of the protesters. Officially, this 'revolution' is called Петооктобарска революција in Serbian (*Petooktobarska revolucija* – the '5 October revolution'). (Thompson & Kuntz 2004; Khodunov 2022a)

Rose Revolution (***Georgia***, 2003) Triggered by allegations of electoral fraud, protesters carrying roses as symbols of non-violence forced President Eduard Shevardnadze to resign. The movement led to the election of Mikheil Saakashvili, who promised democratic reforms and closer ties with the West but turned autocratic himself. The protest was significant for its peaceful nature and symbolic use of roses. (Fairbanks 2004; Jones 2006; Khodunov 2022b)

Orange Revolution (***Ukraine***, 2004-2005) Following a disputed presidential election, massive protests erupted, with participants wearing orange to symbolize their movement. The Supreme Court of Ukraine annulled the election results, leading to a re-run that opposition leader Viktor Yushchenko won. This revolution was crucial in promoting democratic processes and reducing Russian influence in Ukraine. It is considered the first color revolution in the post-Soviet space. (McFaul 2007; Katchanovski 2008; Kubicek 2009; Kuzio 2010)

Cedar Revolution (***Lebanon***, 2005) Following the **assassination** of former Prime Minister Rafik Hariri by a truck bomb, large-scale protests demanded the withdrawal of Syrian troops from Lebanon. The movement was named after the cedar tree, a national symbol of Lebanon. It successfully led to the end of Syria's 29-year military presence in the country, but otherwise did not signify a critical break from the previous Lebanese political system. Many treat it as a negative case where Western **democracy promotion** backfired and ultimately reinforced the grasp of sectarian leaders on the political system. (Knio 2005; 2008; Shields 2008; Kurtulus 2009; Clark & Zahar 2015).

Tulip Revolution (***Kyrgyzstan***, 2005) Sparked by parliamentary election fraud, widespread protests led to the ousting of President Askar Akayev. The movement was named after the tulip, although different regions used various symbols. It resulted in significant political changes and highlighted the power of grassroots mobilization in Western narratives, ignoring the dynamics of **patronalism**. (Todoroiu 2007; Heathershaw 2007; Cummings 2010) The 2010 revolution against Kurmanbek Bakiyev, in contrast, was an elite-driven **ouster** against

a 'lame duck' (Box 3.14) without a democratic agenda and did result in significant ethnic violence in the Osh and Jalalabad provinces.

Blue Revolution (***Kuwait***, 2003-2005) This movement was characterized by protests demanding women's suffrage in Kuwait. Allegedly, the blue color symbolized the movement, and it led to the granting of full political rights to Kuwaiti women in 2005. It was significant for advancing gender equality in the region. This is self-styled color revolution branding by civil society suffrage activists, but this struggle has almost nothing in common with the uprisings of its namesakes and is not treated as a color revolution by scholars.

Purple Revolution (***Iraq***, 2005) Coined by US President George W. Bush, this term referred to the democratic elections imposed on Iraq after the fall of Saddam Hussein. Voters dipped their fingers in purple ink to prevent multiple voting, symbolizing their participation in the democratic process. This 'democratic revolution' was foremost a **propaganda** hoax for an imposed political system and to mask a deep, structural crisis that soon after reached boiling point. (Parker 2006).

Denim Revolution (***Belarus***, 2006) This movement aimed to challenge the authoritarian rule of President Alexander Lukashenko, who had engineered a referendum in October 2004 to run for additional terms in office. Protesters used denim as a symbol of their resistance, representing the common people. It was the first of the color revolutions that did not lead to regime change, and its suppression dimmed hopes for future contestation.

Therefore, the enormous 2020-2021 Belarussian protests came as a surprise to Western observers. The first protest wave was sparked by electoral fraud in the 2020 presidential election, where Lukashenko claimed a landslide victory for his sixth term, and the second wave followed his regime's excessive repression. The protests, the largest in Belarussian history, saw hundreds of thousands of people demanding free and fair elections, the resignation of Lukashenko, and the release of political prisoners. Despite facing brutal crackdowns, the flight of presidential challenger, S.H. Tsikhanouskaya, to Lithuania, mass arrests and reports of torture, the movement highlighted the deep-seated desire for democratic reforms and significantly challenged Lukashenko's long-standing authoritarian rule – his regime only survived because popular protests did not lead to elite defection – in any case, they reinforced Lukashenko's reliance on Vladimir Putin and Russia's backing to stay in power. (Silitski 2006, Marples 2008; Stykow 2023)

Saffron Revolution (***Myanmar***, 2007) Named after the saffron-colored robes of the Buddhist monks who led the protests, this movement was against the military **junta** their economic mismanagement and human rights abuses. The protests were violently suppressed, but they drew international attention to the plight of the Burmese people and the oppressive nature of the regime. The lack of linkages (cf. **linkage & leverage theory**) with the isolationist states diluted the limited pressure from the international community on the regime and resulted in the former's inability to influence political change. (Seth 2008; Chowdhury 2008; Shen & Chan 2010)

Twitter Revolution (***Moldova***, 2009) The 2009 civil unrest in Moldova following the parliamentary elections, which the opposition claimed were rigged by the ruling *Communist Party* (CP). The protests were fueled by widespread dissatisfaction with the government's corruption, economic stagnation, and perceived manipulation of the electoral process. The movement was notable for its use of social media to organize and mobilize protesters, but Hale (2013) shows that social media played a secondary role at best. Instead, the turmoil is best understood as the perfect storm of a **succession** crisis, combined with sharp economic decline (as a result of the 2008 financial crisis) and demands for change. (Regarding succession: Vladimir Voronin, the leader of the CP, his 2005 reelection marked his final presidential term. He aimed to maintain political dominance post-presidency, raising concerns about his successor's potential power and Voronin's ability to control the system from another position.) The 'revolution' resulted in a realignment of the opposition parties, gaining the majority and pushing the CP and Voronin into the opposition, but this elite reshuffle hardly brought forth the much-anticipated democratic transformation. (Mungiu-Pippidi & Munteanu 2009; Hale 2013)

Green Movement (***Iran***, 2009) Following the disputed presidential election, millions of Iranians took to the streets wearing green to symbolize their demand for political reform and the annulment of the election results. The movement was significant for its scale and the use of social media to organize protests, although the government ultimately suppressed it at the severe cost of its **legitimacy**. Nonetheless, the **theocracy** was able to avert an **Arab Spring**. (Dabashi 2017; Alimagham 2020; Filin 2022)

Jasmine Revolution (***Tunisia***, 2010-2011) This revolution began with the self-immolation of Mohamed Bouazizi, leading to widespread protests against corruption, unemployment, and political repression. It resulted in the ousting of President Zine El Abidine Ben Ali and sparked the broader **Arab Spring**. The movement was named after Tunisia's national flower, symbolizing purity and resistance. Over the next ten years, the transition managed to move from authoritarianism to an unconsolidated democracy. (Chomiak 2011; El-Khawas 2012; Kuznetsov 2022)

Euromaidan (***Ukraine***, 2013-2014) Initially triggered by the government's decision to suspend the signing of an association agreement with the European Union, the protests grew into a civil revolution against the corrupt regime's authoritarian and repressive reactions to the demonstrators. The movement led to the (protracted, violent) ouster of President Viktor Yanukovych, who fled to Russia in 2014, catalyzing a more aggressive Russian foreign policy, leading to the illegal annexation of the Crimea and the Donbas conflict, and, eventually, the 2022 invasion. (Marples & Mills 2014; Shveda & Park 2016; Kuzio 2018; Oliinyk & Kuzio 2021)

Umbrella Movement (***Hong Kong***, 2014) This pro-democracy movement was named after the umbrellas used by protesters to shield themselves from police tear gas. The movement demanded genuine universal suffrage and greater political autonomy from China. Although it did not achieve its immediate goals, it significantly raised

awareness of Hong Kong's political issues and inspired future protests. The movement has exacerbated social divisions, fragmented the city and reduced compromise. These dynamics will likely lead to more complex and confrontational state-society relations post-*Occupy Central*. (Chan 2014; Yuen 2015; Ortmann 2015)

While not associated with any color, flower or object, the failed 2003 Azerbaijan protests against the contested elections legitimizing the **succession** of Ilham Aliyev taking over from his father, Heydar, is seldom acknowledged because there had been no successful example yet in the Former Soviet Union. Also, the 2005 Andijan 'protest' in Uzbekistan was an early front-runner of the color revolutions but brutally repressed by the Islam Karimov regime (with estimates of up to 1500 protesters killed). The same goes for the 2008 riot in Ulaanbaatar, three days after the contested elections, which resulted in a four-day state of emergency, Mongolia's first. (Baev 2011)

The 2014 fall of Blaise Compaoré in Burkina Faso was seen as the start of an 'African Spring.' However, this label is criticized for oversimplifying Africa's diverse regions and completely ignoring the continent-wide, post-Cold War democratization wave in the 1990s. Africa's unique regional dynamics and its diverse democratization trends make it inappropriate to generalize the continent's political landscape under a single term. (Van den Bosch 2016; Antwi-Boateng 2015).

Foreign Aid To & From Autocracies

A country that relies on aid? Death is better than that. It stops you from achieving your potential, just as colonialism did.
– Imran Khan (2011)

Foreign aid plays a complex and multifaceted role in the study and behavior of authoritarian regimes. This relationship can be viewed through several lenses, presented below. Recent scholarly work has moved towards a middle ground, between aid optimists and aid pessimists, arguing that aid can be beneficial under certain conditions (Svensson 1999; Burnside & Dollar 2000; Kosack 2003; Bearce & Tirone 2010). The key task is to identify the conditions under which aid is either helpful or harmful so that donors can target aid effectively (Kono et al. 2015).

Aid is not solely about humanitarian assistance; it is also a tool for gaining influence and exercising **soft power**. Donor countries may provide aid to authoritarian regimes to strengthen their international standing and influence, creating a sympathetic cohort within the recipient country that can be leveraged in the future. This strategic use of aid can sometimes lead to a paradox, where democratic donors support non-democratic regimes to achieve broader geopolitical goals. If such aid directly strengthens target autocrats and impedes democratization, the senders are considered **black knights**.

The logic behind decisions regarding aid distribution has been analyzed extensively. It is evident that bilateral donors are biased towards trade partners, former colonies, and strategic allies (Alesina & Dollar 2000), whereas multilateral donors are more inclined to assist countries with a strong track record of growth and political stability (Schraeder et al. 1998). Several scholars indicate that donors also prefer politically significant recipients (e.g., rotating members of the UN Security Council) (Kuziemko & Werker 2006; Lai & Morey 2006). Conversely, some scholars argue that aid distribution is more altruistic, or at least more competent, with disaster relief being the primary form of aid to poorly governed countries, while development aid is directed towards better-governed nations (Bermeo 2006). Additionally, there is evidence from the 1990s showing that bilateral donors reduce aid in response to antidemocratic actions in recipient countries (Hyde & Boulding 2008; Wright 2009).

There is an ongoing debate about whether foreign aid can foster **democratization** in authoritarian regimes and is an effective tool for **democracy promotion** (Bader & Faust 2014). Some studies suggest that conditional aid, which is tied to democratic reforms, can incentivize authoritarian regimes to adopt more democratic practices. However, the effectiveness of such conditionality is contingent on the credibility and enforcement of the conditions attached to the aid. According to Dunning (2004), the positive impact of aid on democracy in Africa is observed only after 1986, as it was only then that the threat of Western donors withdrawing aid became credible.

Foreign aid can have unintended consequences on governance and accountability within authoritarian regimes (Koch 2024). The regime type of the target state also matters (Wright 2008; Yuichi Kono & Montinola 2009), although most studies adhere to **selectorate theory** to distinguish between political regimes. It is argued that aid can weaken domestic accountability, sustain authoritarian regimes, increase political instability (Davidson et al. 2022; Nunn & Qian 2011). Using the case of Syria, Martinez and Eng (2016) analyze how and why ostensibly neutral emergency food aid unintentionally assisted

the al-Assad regime by facilitating its control over food, which it used to buttress support and foster compliance. Collier and Hoeffler (2007) investigate its effect on arms races. De Renzio (2007) describes the accountability dilemmas from the point of view of the sender. Hoshiro (2023) brings to the fore unintended consequences stemming from foreign aid rivalry (even unintended aid coordination).

Aid issued by autocratic regimes remains understudied, but can contribute to **autocratization** in target states; however, this can be an unintended effect as not all autocratic donors engage in **authoritarian promotion** (Tseng & Krog 2017). Heurlin (2020) illustrates Soviet aid through the case studies of Vietnam and Ghana, along with a statistical analysis of Soviet economic and military aid to developing countries from 1955 to 1991. Soviet aid, linked to industrial equipment purchases, bolstered state power in communist target regimes by enhancing fiscal capacity and fostering population dependency, thereby solidifying authoritarian rule. In non-communist regimes, however, the lack of alignment with planning institutions and overall institutional weakness resulted in inflation and fiscal crises due to Soviet aid.

Unconditional aid can keep leaders in power (Blodgett Bermeo 2011) and has been likened to the **resource curse** (Khan & Ahmed 2007), similar to other sources of unearned foreign income (**rents**), like remittances (Ahmed 2012). Djankov et al. (2008) state that a windfall of resources to recipient countries may result in similar **rent-seeking** behavior (Svensson 2000). They go further and posit that aid is a bigger curse than oil (Morrison 2009). More on this topic can be found in this Encyclopedia's section on **performance** and the entry on **economic development**.

Foreign Invasion & Autocratic Regimes

Every nation has the right to demand proper treatment and no country should violate the territory of any other country.
– Mustafa Kemal Atatürk

Foreign invasion is a broad term for a series of actions with diverse agendas. Since this interaction takes place between at least two (recognized) political actors, its study is mostly covered by International Relations (IR), Conflict Studies and Foreign Policy Analysis (FPA). From the vantage point of authoritarian studies, this phenomenon has been addressed by trying to peer into the black box of domestic politics in order to recognize agendas of forced regime change, and to map global patterns.

DEFINITION Foreign invasion depicts a military offensive in which combatants belonging to one political entity enter the territory owned by another political entity by force. Foreign invasions have different objectives, spanning from (a) conquering; (b) liberating; (c) re-establishing control or authority over a territory/entity; (d) forcing the partition of a country; (e) altering the established government or gaining concessions from this government (**regime promotion)** (Escribá-Folch & Wright 2015; Sullivan & Karreth 2015; Asadzade & Izadi 2022).

SEE ALSO Deriving from the conceptualizations made by J.N. Rosenau (1964) and H. Morgenthau (1967), the concept of foreign invasion is primarily examined within FPA or studies of civil conflict(s). However, due to the fact that foreign invasion is increasingly studied within broader third-party intervention frameworks, the concept is also applied in the study of geopolitics, political systems (i.e. domestic politics), minority studies (i.e. kin-state) and political psychology (i.e. leadership and **leader personality**). In its extreme version, foreign invasion can accord with the concept of forcible **regime promotion** (**authoritarian promotion** or **democracy promotion**) and the wider study of **conflict & authoritarian regimes**.

KEY SIGNIFICANCE Even though sovereignty and the non-intervention in the domestic affairs of other states are fundamental principles of international law, and therefore of the international community as such, external states frequently intervene militarily (Wolak 2014: 1). According to the *International Military Intervention Dataset*, approximately 650 military interventions were undertaken during the Cold War. Between 1990 and 2005, close to 350 foreign (military) interventions took place (Pickering & Kisangani 2009), which means that foreign intervention rates *increased* during the post-Cold War period (Wolak 2014: 1). As a consequence, foreign (military) interventions continue to be one of the most concerning contemporary issues of the international community, and are hence subject to animated scholarly debates (discussed in the literature and classifications sections).

The book *Leaders and International Conflict* by Giacomo Chiozza and H.E. Goemans (2011) explores the reasons why and the circumstances under which political leaders decide to initiate international crises and wars. The authors argue that the fate of leaders (**exit options**) and the manner in which leadership changes take place significantly influence these decisions. Specifically, leaders who anticipate their regular removal from office, for example through elections, have little to gain and much to lose from initiating conflicts. In contrast, leaders who face the threat of forcible removal, through **coups** or **revolutions**, have little to lose and much to gain from engaging in conflicts

Building on cases from Central America between 1840 and 1918 – foremost *caudillos* (a type of **personalist rule** – see also Box 1.10) – Chiozza and Goemans (2011) open the black box of the foreign policy executive and show why such regimes initiate international conflict for domestic reasons. First, they can neutralize domestic rivals by sending potential coup plotters or rebels to the front lines, thereby reducing the immediate threat to their power. Second, initiating a conflict can create a 'rally-around-the-flag' effect, uniting the population behind the leader against a common external enemy, which temporarily boosts the leader's domestic support and legitimacy, making it harder for rivals to mobilize against them. Third, the chaos and focus on an external enemy can disrupt the plans of domestic opposition groups, allowing the leader to take measures during the conflict that would be unacceptable in peacetime, such as cracking down on dissent or implementing emergency measures that consolidate their power. Finally, victory in an international conflict can bring additional resources and enhance the leader's legitimacy, strengthening their position domestically by demonstrating competence and success, which can deter potential coup plotters.

These findings are theorized into two scenarios. The first mechanism, 'fighting for survival,' allows leaders to reduce the risk of forcible removal regardless of the conflict's outcome. For instance, leaders can send potential coup plotters to active war zones or disrupt planned invasions by rebels, thereby neutralizing immediate threats to their power. The second mechanism, 'gambling for survival,' hinges on the outcome of the international conflict. Victory against an international opponent can enhance a leader's legitimacy and resources, which in turn strengthens their position against domestic enemies and reduces the risk of forcible removal (Chiozza & Goemans 2011: 196).

Their earlier work similarly tries to overcome the 'unfortunate balkanization' between comparative politics and IR by theorizing the relation between international and internal conflict (Chiozza & Goemans 2004; Chiozza et al. 2004). The entry on **conflict**

& authoritarian regimes covers proneness to conflict and distinguishes among regime types.

ORIGIN Foreign (military) interventions as an empirical phenomenon in Western literature date all the way back to the Peloponnesian Wars, when Athens and Sparta intervened in the internal conflicts of other city states (Jentleson & Levite 1992; Young 1968). But when talking about the conceptual contours of foreign invasions, the bulk of the literature appears in the early 1960s, as a direct consequence of the Vietnam War. Grounded in the latter, scholars attempted to understand the relationship between foreign intervention and the dynamics of civil conflict(s). One of the earliest and most influential edited volumes on foreign intervention was published in 1964 by J.N. Rosenau, including essays by authors such as G. Modelski (1964: 14-44) and M.A. Kaplan (1964: 92-121), for example, which showed how invasions – during periods of extreme polarization between domestic disputants – result in appeals for external assistance, and also how bipolar international systems create more incentives for states to intervene than balance-of-power systems.

LITERATURE Rosenau's (1964) *International Aspects of Civil Strife* is considered as *the* seminal work on foreign invasion, and this scholarly treatise on foreign invasion is both conceptually and empirically rich. If one tries to sum up the identified factors deemed most relevant when analyzing the reasons behind foreign intervention, four categories stand out: (A) geopolitical (see Kocs 1995; Jackson 2007; Gent 2010; Peksen & Olson Lounsbery 2012; Kavanagh et al. 2017); (B) domestic (Ostrom & Job 1986; Lagon 1992; Findley & Teo 2006; Trenin 2016; Massie & Zyla 2018); (C) ideational (Dunne 2009; Evans et al. 2013; Way 2015; Ziegler 2016); (D) enablers (Most & Starr 1989; Rost & Greig 2011; Allison 2013). All are presented in the next section.

CLASSIFICATIONS Here, we scrutinize all of the four above-mentioned categories with the factors explaining the likelihood of resorting to foreign invasion. The first (A) is the geopolitical level, where scholars identify the following factors: (a) external threat to sovereignty (Jackson 2007); (b) regional balance of power (Gent 2010); (c) alliance or partnership with host (Yoon 1997); (d) national status (Feste 1992). The second level (B) is the domestic one, where the factors explaining foreign invasion are: (i) domestic politics and legitimacy (DeRouen & Peake 2002); (ii) kinship patterns (Koch & Sullivan 2010); (iii) economic interest (Fordham 2008). The third one (C) is the so-called ideational dimension, where leadership and personality (Meernik 1994) and **ideology** (Way 2015) are the operationalized factors. Finally, the fourth category (D) are enablers, where scholars identify (military) capabilities (Allison 2013) as explanatory factors.

The main issue with foreign invasion is that it is usually studied within separate streams of research (e.g., geopolitics and the other mentioned categories), which offer limited interpretations of the reasons behind foreign invasion. The question of foreign invasion is too complex to be interpreted solely through the lenses of geopolitical or just domestic factors. Bridging IR and comparative politics is often necessary to obtain a more nuanced, complete image.

METHODOLOGICAL ISSUES Researching foreign invasions by dictatorships involves navigating significant methodological challenges. These include difficulties in data collection due to regime secrecy and propaganda, biases in available information, and the complex interplay of motivations and external pressures. Addressing these challenges requires a critical and multifaceted approach to ensure a comprehensive and accurate analysis. Nonetheless, the inner sanctum of an authoritarian foreign policy executive in power remains hard, if not almost impossible, to penetrate (Barros 2016).

The main issue when studying foreign invasions is the tension between positivist, post-positivist and interpretive approaches. This can be particularly observed in all of the four levels (A-D – see above under 'classifications'), where, for example, military capabilities are measured by the number of soldiers, tanks, aircrafts and arms (an evidence-based reality that can be mathematically interpreted), while the ideational dimension is subjected to more qualitative research (individual attitudes and traits, constructivist narratives, etc.).

EXAMPLES With so many to choose from, two controversial examples can be selected. The first is the US intervention in the Dominican Republic of 28 April 1965. US President Johnson made the unilateral decision to invade the island state, driven by erroneous information and (personal) concerns over the possibility of the emergence of 'another Cuba' and the effect that it would have on the ongoing US war effort in Vietnam. As a result, US military forces were deployed to the Dominican Republic under the false pretense of 'protecting American lives.' Eventually the true reason for this invasion was uncovered, namely the overall fear of communism (Gomez 1997). This intervention could thus be interpreted in line with findings from Chioza and Goemans (2011), since the US intervention occurred because of the (ideology-wise) imbalance of power in the region, which could potentially lead to regime change in other countries (as was the case in Central America in the nineteenth and twentieth centuries). In terms of the above-outlined classification, one could talk about the geopolitical level and its relation to the regional balance of power.

An example of an invasion of a 'hybrid nature' would be Syria's intervention in Lebanon. On 31 May 1976, the Syrian regime invaded Lebanon, one year after the breakout of the Lebanese civil war, when the Syrian military began supporting Maronite militias against the *Palestinian Liberation Organization* and leftist militias. The Syrian occupation of Lebanon ended in 2005 (Rabinovich 1979; Dawisha 1980; Deeb 1980). In this respect, the above-outlined hybridity stems from the fact that it is both an external- and domestic-driven attempt to achieve both regime ouster and **regime promotion**. In this respect,

the strategic calculations of the Syrian leadership hovered somewhere between, on the one hand, the idea of Arab unity in general, nurtured by ideas of the 'historical indivisibility' of Syria and Lebanon in particular, and the question of the strategic implications of a divided Lebanon for Syrian-Israeli relations, on the other (Lawson 1984). In terms of the above-outlined classification, one could identify a hybrid of the geopolitical level (regional balance of power and external threat to sovereignty) and the domestic level (national status, kinship policy and domestic legitimacy).

IMPACT ON POLICY One of the most common reactions to foreign interventions would be **sanctions** at the level of international politics. The latter are understood as preventive measures that can be either targeted at specific area(s), such as diplomatic sanctions, or more narrowly, such as arms embargoes, the freezing of assets and economic sanctions. Furthermore, mention must also be made of the United Nations peace and security paradigm, which offers intervention *vis-à-vis* conflict management mechanisms (e.g., mediation, arbitration, facilitation and conciliation).

NEW FRONTIERS One of the contemporary theoretical frameworks applied in studies of foreign invasions is the so-called 'Ontological Security Theory,' which focuses on how security is not only 'security as survival,' but also 'security as being;' the latter referring to being 'free from danger, fear and anxiety.' This theoretical apparatus is increasingly employed in contemporary cases, such as the Russian invasion of Ukraine (e.g., Chrzanowski 2021; Dawsson & Ross Smith 2022). Furthermore, another potential frontier regarding dictatorships and foreign invasions would be the field of **disinformation** and **propaganda** in the Western Balkans, where authors such Jovanović (2022), Herman (2023) and Demeshchuk (2023) show how Putin's **personalist rule** looks even more appealing in certain parts of the region (society-wise).
