ENCYCLOPEDIA TYRANNICA

A Research Guide to Authoritarianism

This book was developed in the framework of the Erasmus+ project: *Mapping & Organizing Research on Dictatorships – Open access Repository*. More information about this project can be found at the back of this book).

The M.O.R.D.O.R. project (2021-2024) is co-funded by the Erasmus+ program of the European Union. Project number: 2021-1-PL01- KA220-HED-000023034.
Additional co-funding has been provided by *Adam Mickiewicz University, Poznań*, and the *University of Essex*.

Views and opinions expressed in this work are, however, those of the authors only and do not necessarily reflect those of the European Union or the National Agency in Poland (FRSE). Neither the European Union nor National Agency (FRSE) can be held responsible for them.

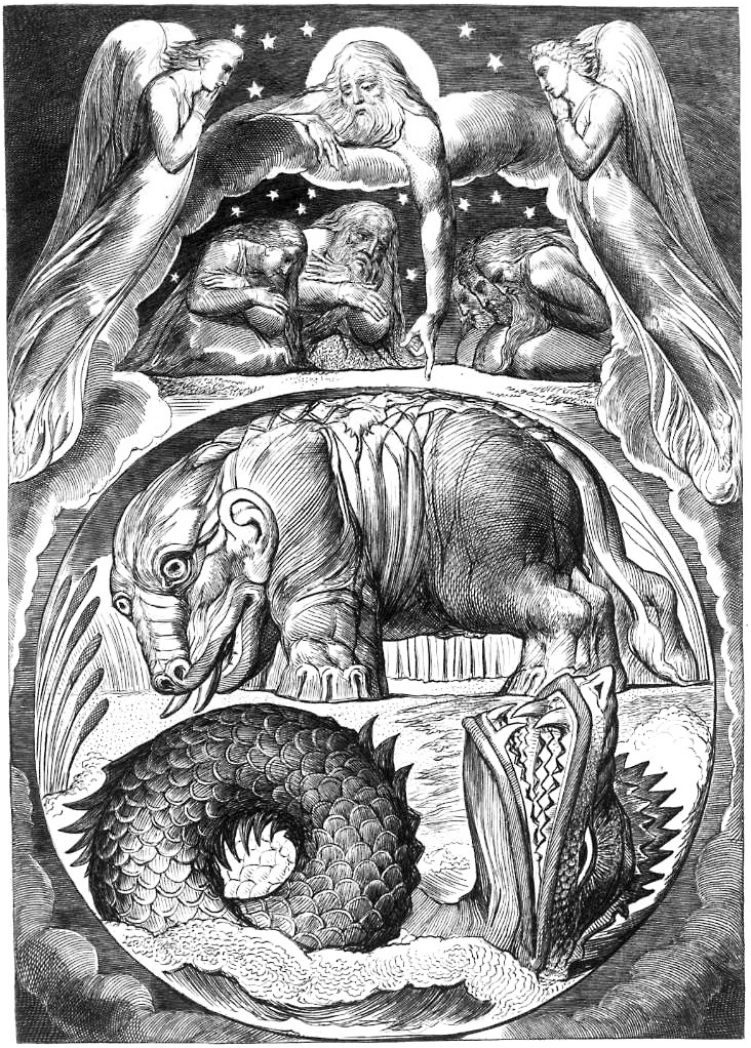
Printed in the EU

For all those students of dictatorship disoriented in the seemingly boundless literature review, I hope this book will help you find the path again and travel further than you imagined.

For Justyna and Zuza, who both suffered my absence during this editorial death march. Justyna, thanks to you, I survived, and I am immensely grateful for keeping things from falling apart at home, and for letting me back in. I love you both dearly.



To my co-editor, Natasha: "No road is long with good company."

JVdB

This was a really fun project to work on and enabled me to meet many new academics from all over the world. I dedicate this to all of the academics working hard to understand authoritarianism better.

To my co-editor, Jeroen: This was a huge undertaking. I have no idea how you managed to do it all, but we got there in the end!

NL

On the Cover Illustration

The centerpieces on this book's cover are William Blake's two monsters, 'Behemoth' (top) and 'Leviathan' (bottom) from his *Illustrations of the Book of Job* (1826).

The political thinker Thomas Hobbes used a similar symbolism as he penned his (lesser-known) sequel titled *Behemoth* (1681) to his earlier and famous *Leviathan* (1651). The two works contrast each other, with *Leviathan* being a treatise on the ideal, powerful state, and *Behemoth* covering the chaos of the English civil wars.

In line with Jeremy Bentham's words: *"Tyranny and anarchy are never far asunder"* (1843), our cover image likewise contrasts both monsters: Just as dictators justify their aspiration for absolute control (the Leviathan) by pretending that only they can shield the people from chaos and anarchy – incarnated in the primeval chaos-monster, the biblical Behemoth.

Foreword

The start of 2025 is a gloomy period for global democracy. For over a decade, there has been a pervasive understanding that democratic ideals are under threat and that the specter of authoritarianism has reared its ugly head. While this feeling started around 2010, the pandemic lockdowns seem to have cracked humanity in more ways than we anticipated. Isolated and withering during quarantine, many of us have fallen prey to structural angst and are driven by disappointment, mistrust and frustration. Populists, spin doctors, and demagogues are having a heyday fueling and channeling this anger through hateful identity politics.

In this digital age with nascent AI, the nefarious influence of potent tech plutocrats preying on a global pandemic of dopamine-addicted electorates is felt beyond the developed nations. The world seems to be slipping into a double hell: one described by Orwell in *1984* and the one in Huxley's *Brave New World*. Not only can a totalitarian-tech state track everybody's identity, movement and preferences, but people are so flooded with disinformation that they no longer seem to care about the truth. Sometimes, we no longer recognize family members and neighbors.

In the international arena, parallels are being drawn with the interwar period, exactly a hundred years ago. There has been a myriad of explanations given, ranging from staggering global inequality, unsustainable climate deterioration, turbulent markets, and the return of great power politics where 'might is right.'

For spectators, there is solace in the Persian saying "این نیز بُگُذَرَد" (*īn nīz bogzarad*' – this too shall pass'), and autocrats are usually undone by the fallout of their own mistakes eventually. However, for those suffering autocratic rule, change is not possible without people standing up for themselves and others. In this globalized world, we need a moral international order to stand up for the oppressed and safeguard the planet we live on. Understanding the world better is the first step.

Moreover, that is why we created this *Encyclopedia Tyrannica*: to help understand how dictatorships emerge, usurp power, their strategies to cling on, and how they eventually break down but leave stubborn

stains on institutions and collective memories alike. The world is too complex for a single road map, of course, and history never repeats itself in the same way. Like all political regimes, authoritarians have to innovate, adapt, and structure reality. Recognizing their patterns, capturing these in theoretical frames and gaining a better understanding is the first step to lasting change. Scholars and political thinkers have been doing exactly this for centuries.

The encyclopedia was not written as a witty guidebook for wannabe authoritarians but intended as a repository of the most important knowledge derived from comparative authoritarianism from the last seventy years or more. It is the starting place for anyone trying to make sense of this increasingly mad world and hopefully to make it better.

When we embarked on this project in 2021 in the framework of the M.O.R.D.O.R. project (Mapping & Organizing Research on Dictatorships – Open access Repository, an EU-funded Erasmus+ project for higher education), we could not have predicted how much more needed this book would become in 2025.

We would like to thank all our authors for completing this encyclopedic fellowship. Along this journey, we have heeded the wise council of regional experts in Abu Dhabi, Bishkek, Buenos Aires, Dubai, Dushanbe, Johannesburg, Manila, Potchefstroom, Pretoria, Seoul, Tashkent, Tbilisi (to name but our official visits) and we are grateful to all those others guides we encountered underway to recalibrate our understanding of regional affairs and point to useful literature. Also, a big thank you to our anonymous peer reviewers for showing us the path when we traversed on thinner ice.

More information about the M.O.R.D.O.R. project and a full overview of its involved partners can be found at the end of this book.

Our gratitude goes out to the EU donor and the Polish National Agency (FRSE), as well as our publisher, ibidem Verlag, for their trust in this project and for making it all possible. We are grateful to our own respective institutions, Adam Mickiewicz University, Poznań and the University of Essex, for providing the additional funding needed to publish this book that grew more than double its size in three years.

The editors

Jeroen J.J. Van den Bosch
(Adam Mickiewicz University, Poznań)

Natasha M. Lindstaedt
(University of Essex)

List of Authors

EDITORS

Jeroen J.J. Van den Bosch
Independent Scholar, Project coordinator at the International Centre (CWWM) Adam Mickiewicz University, Poznań

Jeroen Van den Bosch (PhD) studied Area Studies (Slavonic Studies) and Political Science (International Relations) at the Catholic University in Leuven (Belgium) and Poznań (Adam Mickiewicz University, Poznań – AMU). Since 2018, he works as an Erasmus+ project coordinator at AMU, raising funds and managing complex, consortium-based, educational, capacity-building and research projects. His previous projects include: EISCAS, EISIPS, M.O.R.D.O.R., CAGHAN-P. In parallel, he is active as an independent scholar, and has written *Personalist Rule in Africa and Other World Regions* (Routledge, 2021) and co-edited: *The European Handbook of Central Asian Studies: History, Politics, and Societies* (ibidem Verlag, 2021), *Handbook of Indo-Pacific Studies* (Routledge, 2023), *Research Handbook on Authoritarianism* (co-edited with Natasha Lindstaedt, Edward Elgar, 2024). His research fields encompass theories of dictatorships, their classification, autocratic cooperation, democratization, political regimes theory, Sub Saharan Africa and Central Asia. This *Encyclopedia Tyrannica* was created in the frame of the M.O.R.D.O.R. project (2021-2024), coordinated by J. Van den Bosch.

Natasha M. Lindstaedt
Professor of Government, University of Essex

Natasha Lindstaedt (PhD) is a Professor of Government at the University of Essex, where she also served as the Faculty Dean for Education in the Social Sciences. Her research focuses on authoritarian regimes, governance, democratic backsliding, and human security. She has published extensively on these topics including *Dictators and Dictatorships* (Bloomsbury, 2011), *The Politics of Dictatorships* (Lynne Rienner, 2011), *Failed States and Institutional Decay* (Bloomsbury, 2013), *Democracies and Authoritarian Regimes* (Oxford University Press, 2019), *Democratic Decay and Authoritarian Resurgence* (Bristol University Press, 2021), and most recently, the *Research Handbook on Authoritarianism* (co-edited with Jeroen Van den Bosch, Edward Elgar, 2024). At the University of Essex, she has taught courses in Authoritarian Politics, State Building and Governance, International Development, International Security, Latin American Politics, Asian Politics and Middle East Politics. In addition to her teaching and research, she has consulted for the United Nations Economic and Social Commission of Western Asia, and has worked on projects with the European Union External Action Service and IDEA International.

AUTHORS

Joanna Barszcz
Head of the International Centre (CWWM), Adam Mickiewicz University, Poznań

Joanna Barszcz holds a MA in Clinical Psychology and MA in Anthropology and Cultural Studies. Her research interests and publications during her doctoral studies focused on communication theory in the cognitive sciences and the perspective of postmodern philosophy, as well as issues of resilience and chronic stress. She is currently working mainly in international projects, continuing her doctoral studies in the field of social responsibility of science in an international context.

Agnieszka Bógdał-Brzezińska
Associate Professor at the Faculty of Political Science and International Studies (University of Warsaw), Faculty of Social Sciences (University of Gdańsk)

Agnieszka Bógdał-Brzezińska (PhD) specializes in geopolitics of cyberspace and outer space, theory and history of International Relations, the role of Artificial Intelligence in international relations, decision-making processes in IR, and the individual as an international decision-maker.

Ana Bojinović Fenko
Professor at the Faculty of Social Sciences, University of Ljubljana

Ana Bojinović Fenko (PhD) is professor of International Relations at the Faculty of Social Sciences. Her theorization fields are Foreign Policy Analysis, International Regionalism, EU external action and cultures of anarchy. Empirically, she focuses on post-Yugoslav small states, EU enlargement policy towards Western Balkans and the Mediterranean region. She has published in *Mediterranean Politics*, *Mediterranean Quarterly*, *Southeast European & Black Sea Studies*, *Journal of European Integration*, *Journal of Intervention and Statebuilding* and in lead IR journals in the CEE states.

Aleksandra Bolonina
Research Fellow, Paris Panthéon-Assas University

Aleksandra Bolonina is a PhD candidate researching China-Russia political engagement in Central Asian states and the implications for regional dynamics at the Thucydide research center. Her academic work is particularly centered around the concept of regional construction, analyzed as a tool used by China and Russia to protect their economic interests and to influence foreign policy decision-making in the Central Asian countries.

Teresa Almeida Cravo
Associate Professor and Researcher, University of Coimbra

Teresa Almeida Cravo (PhD) is associate professor of International Relations at the Faculty of Economics, a researcher at the Centre for Social Studies, and the coordinator of the PhD Program in International Politics and Conflict Resolution, at the University of Coimbra. She has a PhD in Politics and International Studies from the University of Cambridge. Her research interests include critical perspectives on peace, violence and global interventionism, particularly within the context of Portuguese-speaking countries.

Sarah da Mota
Assistant Professor and Researcher, University of Coimbra

Sarah Carreira da Mota (PhD) is assistant professor of International Relations at the Faculty of Economics of the University of Coimbra, and an integrated researcher at CEIS20 – Centre for Interdisciplinary Studies. Specialized in Security Studies, her research currently focuses on new security challenges related to the use of technology. She has published on critical theories of security, NATO, the use of drones, European space architecture, and Portuguese participation in Afghanistan, among others.

Bruno De Cordier
Associate Professor at the Department of Conflict and Development Studies, Faculty of Political and Social Sciences, Ghent University

Operating on the interface of history and political science, Bruno De Cordier (PhD) is particularly interested in the extents and ways in which past histories continue to be reflected in present realities, identities and *Zeitgeists*, and how history can inspire ways to deal with a likely turbulent future. Before academia, he was a relief worker for some ten years, particularly in areas of the former Soviet Union and the former Yugoslavia.

Tomáš Drobík
Assistant Professor at the Department of Human Geography and Regional Development, University of Ostrava

Tomáš Drobík (PhD) is a political geographer at the University of Ostrava. His main focus is on critical geopolitics, popular geopolitics, and politics in the MENA region.

Bernardo Teles Fazendeiro
Assistant Professor and Researcher, University of Coimbra

Bernardo Teles Fazendeiro (PhD) is assistant professor of International Relations at the Faculty of Economics of the University of Coimbra, and a researcher at the Centre for Social Studies. He was a lecturer at the University of St Andrews, where he obtained his doctorate, and at the Central European University. His research interests encompass IR theory, armed conflict, the former Soviet space, particularly former Soviet Central Asia.

Slavomír Horák
Associate Professor at the Faculty of Social Sciences, Charles University, Prague

Slavomír Horák (PhD) holds an associate professorship in Political and Cultural Geography. His research includes Central Asia's political, social, and economic issues, namely the informal political structures and processes, as well as state- and nation-building. He pays particular attention to the systematic research on Turkmenistan's domestic issues. Recently, he has extended his research purview to the modern history of Central Asia, particularly the question of Czechs and Slovaks in Russian Turkestan and the Soviet Union.

Ajda Hedžet
Research Fellow and Teaching Assistant, University of Ljubljana

Ajda Hedžet is a PhD candidate at the Chair of International Relations at the University of Ljubljana, where she also teaches. In her PhD project, she investigates the recognition of youth in the issue-area of international protection of human rights.

Tomáš Hoch
Associate Professor at the Department of Human Geography and Regional Development, University of Ostrava

Tomáš Hoch (PhD) studied Political and Cultural Geography at the Department of Human Geography and Regional Development, University of Ostrava, Czechia, where he is currently working as an associate professor. His research focuses on nationalism, separatism, and conflict transformation. His recent publications include articles in *Comparative Southeast European Studies*, *Soviet & Post-Soviet Review*, and *Problems of Post-Communism*. He is the co-editor of the monograph *De facto states in Eurasia* (with Vincenc Kopeček, Routledge 2020).

Marko Hočevar
Assistant Professor at the Faculty of Social Sciences, University of Ljubljana

Marko Hočevar (PhD) is a researcher and assistant professor at the Faculty of Social Sciences, University of Ljubljana, Slovenia. His research interest include: political theory, theories of state, comparative political economy, industrial relations and political history. He is currently serving as the president of the Slovenian Political Science Association.

Daniela Irrera
Professor of International Relations, School of Advanced Defence Studies (CASD), Rome

Daniela Irrera (PhD) is professor of International Relations at the School of Advanced Defence Studies (CASD) in Rome, Chair of the ECPR, Leader of the GLITSS COST Action Working Group 2, Visiting Professor of Political Violence and Terrorism at the OSCE Academy, Bishkek, Associate Editor of *Journal of Contemporary European Studies* (JCES) Book series editor *Non state actors in International Relations* (Springer), consultant for the UN Working Group on the Use of Mercenaries.

Anna Jordanová
Research Fellow and Assistant Professor, Charles University, Prague

Anna Jordanová is a PhD student and specializes in contemporary Central Asia, particularly Kazakhstan, Kyrgyzstan, and Uzbekistan. Her main focus is on the internal political dynamics of local autocratic regimes, with particular attention to the various survival strategies of the national political elites and selective regional cooperation in this context. More broadly, she examines the future of relations between Central Asian states and European actors, considering the priorities and limitations on both sides.

Faris Kočan
Assistant Professor at the Faculty of Social Sciences, University of Ljubljana

Faris Kočan (PhD) is assistant professor at the Chair of International Relations, University of Ljubljana, Faculty of Social Sciences. Currently, he is the principal investigator of the University of Ljubljana team in the Horizon Europe project RECLAIM – Reclaiming Liberal Democracy in Europe in the Postfactual Age. He has published, among others, in the *Nationalities Papers*, *Ethnopolitics* and *Southeast European & Black Sea Studies*, primarily investing the securitization of identities in the context of European integration of Bosnia and Herzegovina.

Vincenc Kopeček
Associate Professor at the Department of Human Geography and Regional Development, University of Ostrava

Vincenc Kopeček (PhD) is the head of the Centre for Political and Cultural Geography, University of Ostrava, Czechia. In his research he focuses on ethnic minorities, de facto states, political regimes, and informal politics in the South Caucasus. He has published in *Europe-Asia Studies*, *Problems of Post-Communism*, and *Caucasus Survey*, and he is also a co-editor (with Tomáš Hoch) of *De Facto States in Eurasia* (Routledge 2020).

Michal Kubát
Professor at the Institute of International Studies, Charles University, Prague

Michal Kubát (PhD) is professor of political science at the Institute of International Studies of the Faculty of Social Sciences, Charles University. He has published several monographs and journal articles in Czech, English, Polish, and German. His recent research has been on comparative politics (especially democratic and non-democratic regimes), the social sciences methodology of Giovanni Sartori, and the political systems of Central Europe, especially the Czech Republic and Poland.

Lukáš Laš
Assistant Professor at the Department of Human Geography and Regional Development, University of Ostrava

Lukáš Laš (PhD) is an interdisciplinary political and cultural geographer with experience across Europe and Asia. As an assistant professor and international coordinator at the University of Ostrava, he fosters partnerships with Asian universities and contributes to research projects and teaching on Asia, Indo-Pacific. A member of CEIAS (Central European Institute of Asian Studies) and CACAS (Czech Association of Contemporary Asian Studies), his work bridges academic research and cooperation.

Ellen N. Leafstedt
Senior Research Manager, BBC Media Action, Independent Researcher

Ellen Leafstedt is Senior Research Manager for global media development projets at BBC Media Action. Previously, she worked as an Evidence and Research Officer at the European Partnership for Democracy. Leafstedt holds a Master of Philosophy in Russian and East European Studies from Oxford University. Her independent research focuses on media narratives and authoritarianism in the former Soviet Union.

Igor Lukšič
Professor at the Faculty of Social Sciences, School of Economics and Business, University of Ljubljana

Igor Lukšič (PhD) is a professor doctor, with a research focus on democracy, political culture, political system of Slovenia, political doctrines, comparative political systems, political anthropology, and history of political ideas. He published eight books. He was a minister of Education and Sport (2008-2012) in the government of the Republic of Slovenia and served as a dean of the Faculty of Social Sciences (2001-2003). Now he is Head of the division of Political Theory.

Melika Mahmutović
Research Fellow, University of Ljubljana

Melika Mahmutović is a PhD student and researcher at the Chair of International Relations, Faculty of Social Sciences, University of Ljubljana. Her research interests include left-wing emancipatory movements in the post-socialist Balkans, municipalism, populism as well as production of knowledge in and about the liberal international order. She is a managing editor *at Journal of International Relations and Development* and secretary general of the Slovenian Political Science Association.

Aleksandra Monkos
Specialist at Demagog, Independent Scholar

Aleksandra Monkos (PhD) studied political science in Poznań. Since 2022, she is an Independent Scholar, a News and Information Literacy Specialist in Demagog Association and a Lecturer of International Relations at the Faculty of Political Science and Journalism at Adam Mickiewicz University, Poznań (AMU). Previously, she held fellowships at AMU, Taras Shevchenko National University of Kyiv, and Stockholm University. Her books cover Polish and Ukrainian NGOs in development cooperation with the media in Ukraine (Adam Mickiewicz University Press, 2022). Her papers have been published by, among other outlets, *Europe-Asia Studies*, *Cambridge Review of International Affairs*, *Nationalities Papers*, *Journal of International Relations & Development*, *Central European Journal of Communication*.

Arkadiusz Nyzio
Assistant Professor at the Institute of Political Science and International Relations, Jagiellonian University

Arkadiusz Nyzio (PhD) is assistant professor at the Department of National Security of the Institute of Political Science and International Relations of the Jagiellonian University. He also teaches at the Faculty of Law, Administration and International Relations of the Andrzej Frycz Modrzewski Kraków University. His research focuses on the political history of Central and Eastern Europe and the internal security issues (police forces, intelligence services, crises).

Jure Požgan
Assistant Professor at the Faculty of Social Sciences, University of Ljubljana

Jure Požgan (PhD) is assistant professor and researcher in International Relations at the University of Ljubljana, Faculty of Social Sciences. His research focus is the European integration process and EU's external action, particularly its Enlargement policy towards the Western Balkans, post-conflict reconstruction and international cooperation. His recent publications include two co-authored chapters to the edited volume *Challenges and barriers to the European Union expansion to the Balkan region* in 2022 and a co-authored chapter (Protection of the global climate in EU-Russia relations: an assessment of norm strength and logic of action) for the edited volume *Making the European Green Deal work: EU sustainability policies at home and abroad*.

Petra Roter
Professor at the Faculty of Social Sciences, University of Ljubljana

Petra Roter (PhD, Cambridge) is professor at the Faculty of Social Sciences at the University of Ljubljana. She teaches courses on International Relations and on international protection of human rights, minority protection, conflict management. Her research covers international institutions and norms, particularly on diversity management through minority rights. As an independent expert on minority rights,

she co-operates with international institutions and is president of the Advisory Committee on the Council of Europe's Framework Convention for the Protection of National Minorities. Her papers appeared in edited volumes published by Cambridge University Press, Oxford University Press, Routledge, Wiley, Brill and others, and her papers have been published in, among others, *Journal of International Relations & Development, Journal of Minority and Group Rights*, *Parliamentary Affairs*, *Mediterranean Quarterly*.

Larbi Sadiki
Research Fellow at the Japanese Society for the Promotion of Science, Chiba University, Japan

Professor Larbi Sadiki (PhD) studied Politics and International Relations in Sydney (Sydney University) and Canberra (Australian National University). Since 2024, he is a Fellow of the Japanese Society for the Promotion of Science at Chiba University in Tokyo, Japan. Previously, Sadiki held fellowships, lectureships, and professorships at Australian National University, University of Exeter, Qatar University, Middle East Council on Global Affairs (Doha). He is a non-resident Senior Fellow at the Middle East Council on Global Affairs; and a Fellow at the Toda Peace Institute, Japan. He is also editor of the series *Routledge Studies in Middle East Democratization and Government*. His most recent co-authored book (with Layla Saleh) is *Revolution and Democracy in Tunisia: A Century for Protestscapes* (Oxford University Press, 2024).

Layla Saleh
Research Fellow at the Center for Relational Studies on Global Crises, Chiba University, Japan

Layla Saleh (PhD) is a research fellow at the Graduate School of Humanities and Studies of Public Affairs at Chiba University (Japan) and Director of Research at Demos Tunisia–Democratic Sustainability Forum. Her publications include US Hard Power in the Arab World: Resistance, the Syrian Uprising and the War on Terror (Routledge, 2017). She is Associate Editor of the journal *Protest* and co-author, (with Larbi Sadiki) of the new book *Revolution and Democracy in Tunisia: A Century of Protestscapes* (Oxford University Press, 2024).

Edmund J.G. Stewart
Associate Professor at the Faculty of Arts, University of Nottingham

Edmund J.G. Stewart (PhD) specializes in Ancient Greek History and his research concerns three main areas: first, Tyranny and the comparative study of ancient and modern forms of personalist dictatorship; second, ancient economic history; and third, the study of ancient drama, especially Greek Tragedy. His current book project reassesses ancient Greek tyranny, both as a theoretical concept and historical reality, through the use of political science approaches and comparative data from modern personalist dictatorships. He is the co-founder of the *Tyrannica research network* (with Mateusz Stróżyński), dedicated to interdisciplinary approaches to the study of dictatorships.

Mateusz Stróżyński
Associate Professor at the Institute of Classical Philology, Adam Mickiewicz University, Poznań

Mateusz Stróżyński (PhD, dr hab.) is an Associate Professor at Adam Mickiewicz University in Poznań and a member of the Cambridge Centre for the Study of Platonism. His research interests focus on the Platonic tradition. He is a co-founder

of the Tyrannica research network (with Edmund Stewart), an interdisciplinary network dedicated to the research on tyranny. His most recent book is Plotinus on the Contemplation of the Intelligible World: Faces of Being and Mirrors of Intellect (Cambridge University Press, 2024).

Žiga Vodovnik
Professor at the Faculty of Social Sciences, University of Ljubljana

Žiga Vodovnik (PhD) is professor of political science at the Faculty of Social Sciences, University of Ljubljana, Slovenia. He has held teaching and/or research positions at Boston University, Harvard University, University of Pittsburgh, University of Washington, Hawai'i Pacific University and, most recently, as a Fulbright Scholar at the University of Hawai'i – Mānoa. His scholarship resides at the intersection of political theory, democracy, social movements and the Global South.

Blaž Vrečko Ilc
Assistant Professor at the Faculty of Social Sciences, University of Ljubljana

Blaž Vrečko Ilc (PhD) has a wide range of research interests that include the historical and contemporary forms and systems of racism and sexism, the history of capitalism and the nation state, the climate crisis, sustainable development, and political ecology in general. He also studies the political and economic systems of the USA and China and their development, entanglement, contradictions and conflicts, as well as the politics of capitalist technology(ies) and technological development and their obfuscated authoritarian dimensions.

Kateřina Ženková Rudincová
Assistant Professor at the Department of Human Geography and Regional Development, University of Ostrava

Kateřina Ženková Rudincová has a PhD in Political and Cultural Geography. Her research has been focused on International Relations, politics, conflict, and human rights in Africa, with a particular emphasis on political developments in the de facto state of Somaliland and South Sudan. In this context, she has conducted research at the African Union Commission in Addis Ababa. She has published in peer-reviewed journals such as Ethnopolitics, and *Bulletin of Geography: Socio-Economic Series*.

INTRODUCTION

The *Encyclopedia Tyrannica* (hereafter: EncTyr) is more than a classical encyclopedia. It aims to serve as a research guide for students and scholars of comparative authoritarianism, transition and democracy studies, as well as non-academic experts and policy-makers who are less familiar with the theoretical bases of commonly-used concepts.

The EncTyr is also much more than just an "introduction to." It places key concepts in their historical, theoretical and methodological contexts; provides a (sufficiently) exhaustive literature review for any reader to check if they have no personal 'unknown knowns,' and goes even further by presenting entries' variation of application in (the study of) different world regions. Moreover, entries' impact on policy-making, new frontiers in the literature, and a literature review in non-English languages are explored. (Note: The EncTyr does *not* provide an overview and classification of all authoritarian regimes in this world. This has been done before repeatedly in datasets, and would require regular updating in order not to lose relevance. This is not our mission.)

The EncTyr addresses a growing issue that scholars of authoritarian studies are facing today: the ever-expanding sprawl of political theory focused on authoritarianism and its proliferation of niche specializations on its various dimensions (legitimacy, regime behavior, etc.). This is particularly challenging for newcomers to the field, who sometimes need years to start orientating themselves in this vast literature canon, and for those seeking to craft mental maps of how these research traditions have merged and separated and why key concepts evolved.

The field of comparative authoritarian studies has been rapidly evolving since WWII, encountering several paradigm shifts along the way. This has resulted in a somewhat fragmented scholarly community with very differentiated fields of interest. Usually, scholars tend

to specialize in one chosen subset of regimes (e.g., battered democracies, hybrid regimes or closed autocracies). Alternatively, they focus on just some aspects of regime behavior (transition, emergence, repression, etc.). In addition, there is much variation regarding the use of theories and concepts per world region: African studies, Eurasian Studies and Latin American studies (to name but a few), and all these have distinct research traditions with their own interpretation of key concepts (often ignoring alternative approaches). Another issue is the historical evolution of conceptual notions: their original meanings, their current trends (either becoming more refined or more diluted over time), as well as their short-hand use in everyday (non-academic) contexts. This has led to some confusion regarding defining and applying theoretical frames and concepts.

To recap, there is so much specialized literature out there that interested scholars find themselves unable to cover, uncover and discover the relevant literature for related topics. This leads to several issues that have plagued the field. For example, scholars of democratization do not always have a comprehensive understanding of the heterogeneous nature of dictatorship, leading to all kinds of methodological pitfalls. Typically, most of them focus solely on hybrid regimes, but their findings cannot be universally applied and are too often context-dependent. In turn, theorists of authoritarianism find it hard to keep track of the myriad discoveries coming from in-depth case-study work challenging existing beliefs and necessary to update mainstream theories. Area study experts too often hold on to dated theoretical models, unaware of revised versions or better alternatives. As a result, advancements in the wider field tend to be haphazard and with limited synergy.

The mission of the EncTyr is thus aimed at guiding all these different readers, providing them with an (almost) exhaustive treatise of all core concepts in the field, presenting their methodological limitations, their varied application to different world regions, as well as other insights required to facilitate research, prevent blind spots and show which trodden paths lead somewhere (and which ones are proven dead-ends).

The EncTyr does not have the usual (pure alphabetical) outlook of an encyclopedia. It is divided into eight thematic sections, and entries are logically organized per section. Some sections present entries

alphabetically (e.g., concepts), others will follow a logical taxonomy (e.g. classifications of dictatorships) or chronology. The goal is to present information to readers in a sensible way so they can easily compare related information and/or recognize how entries find themselves placed in the general research literature. Additional info boxes are placed near related entries to add background on local phenomena, offer additional examples and expose understudied aspects. For easy reference, there are two tables of contents (structural and alphabetical) for all main entries, in addition to a top-notch Index for relevant details to make retrieval easy.

This is the first work of such depth with a specific scope on authoritarianism and dictatorship studies. Of course, several aspects of democratization and democracy support overlap with this purview (and are included to some degree), but the EncTyr's main focus remains on autocracy, their classifications, related concepts, their behavior and their impact on the polities they rule. EncTyr is designed to become the 'go-to book' for every scholar in this field, regardless of their experience and research purpose.

Intended readership

Students of comparative politics, area studies and democracy studies should find in the EncTyr the most comprehensive compendium (to date) when browsing for definitions of common concepts and their theoretical contexts (including examples). Those writing research papers or dissertations benefit especially from the literature review and methodological sections explaining the scope and limitations of said concepts.

Established scholars can rely on EncTyr to check for personal blind spots – niche aspects of authoritarian studies that they might not have encountered before – and use the detailed literature review to complete or prioritize their own reading lists when doing research. With its internal references to related entries, EncTyr supports browsing and background reading.

Policy-makers and experts working on democratization are offered all the benefits listed above, but on top of this, they are also provided with a structural overview of the field of dictatorship studies and how its niche specializations relate to one another.

Area study experts are invited to use the EncTyr to explore alternatives to outdated (middle-range) theories when doing country studies. The entries' sections on 'regional variation' provide guidance on how concepts may differ in meaning and usage depending (on their application in) world regions. They can benefit from the concise theoretical overview to reframe useful concepts in a wider context.

Educators, last but not least, may find a useful teaching resource in the EncTyr, either to prepare their courses or to present to students as free study materials. Tailor-made for this group, the EncTyr's **didactic companion** offers concrete lesson plans and learning outcomes for several basic courses on authoritarianism.

Didactic Companion

By offering students a solid starting point and experienced scholars a taxonomy to cover their literature review for research, the EncTyr aspires to become a standard reference regarding comparative authoritarian studies. By also offering ready-to-use teaching materials for educators, and easy-to-access background theory for practitioners, the EncTyr thus targets a very broad readership.

The state of comparative authoritarianism

The field of comparative authoritarianism has undergone a remarkable transformation over the past quarter-century, marked by significant theoretical and methodological advancements. This encyclopedia aims to capture the dynamic nature of this discipline, providing researchers, educators, and students with a comprehensive overview of its evolution and current state.

In recent decades, scholars have made substantial progress in understanding the complexities of non-democratic regimes. The field has moved beyond simplistic dichotomies to explore the nuanced landscape of **hybrid regimes**, which often share institutional features with liberal democracies while maintaining authoritarian control. This shift has led to more sophisticated analyses of regime behavior, resilience, and stability.

One of the most significant developments has been the recognition of authoritarian regimes as active agents in the international arena rather than passive, closed, self-centered objects of study. This has given rise to new areas of research, such as **authoritarian learning** and **authoritarian collaboration**, which examine how non-democratic

regimes adapt, innovate, and cooperate in response to shared domestic and international challenges.

The discipline draws from a rich tapestry of intellectual traditions, forming what can be described as an archipelago of multiple modernities. Concepts and theories trace their lineage from various classical or pre-modern thinkers alongside new concepts by contemporary counterparts, creating a diverse theoretical landscape. This encyclopedia seeks to navigate this complexity by elucidating the origins, applications, and evolution of key concepts in authoritarian studies while also highlighting their methodological limitations and blind spots.

A recurring theme in the field is the interplay between **legitimacy**, **repression**, and **co-optation** as strategies for regime stability. Scholars continue to debate the extent to which these elements function as communicating vessels, adapting to changing circumstances and challenges. Scholars explore new authoritarian practices (like **digital authoritarianism** and new forms of **censorship**) and try to appraise and re-evaluate older concepts gathering dust (like the study of **purges**).

While much of the field focuses on institutional analysis, there remains a persistent sub-stream in leader-centric approaches. These interdisciplinary frameworks attempt to systematize our understanding of rulers' characteristics, including **age & health**, **background**, and **psychological profiles**. However, this area of study suffers most from fragmentation and a lack of reliable Large-N data, presenting opportunities for future research and methodological innovation.

The phenomenon of **personalization** in political regimes has gained renewed attention in an era of increasing global inequality and offshore financial havens. Scholars are keenly interested in tracing the pathways to **personalist rule** and its impact on regime dynamics. This focus echoes back to classical concepts of **tyranny** and **despotism**, with each generation of political thinkers introducing new concepts or reinterpreting existing ones to capture the corruption of personalist power and its effects on political systems.

Trust emerges as a critical currency in authoritarian regimes, where institutional checks and balances are often absent or weakened. The study of how trust is cultivated, maintained, or eroded in these contexts and its relationship to cronyism, meritocracy, and information-gathering remains a central concern in game-theoretic models of authoritarianism.

As the field has proliferated, it has also fragmented. We now lack a unified, comprehensive classification system for political regimes that can adequately capture the complexity of contemporary governance structures. Scholars have built upon and reinterpreted concepts over generations, often in response to the global advance of democracy. This has resulted in an inherent bias toward democratic norms as the standard against which other regime types are measured.

The dominance of liberal democratic ideals in political thought, as famously (and controversially) articulated by Fukuyama's *The End of History and the Last Man* thesis, has created a pervasive democracy vs. non-democracy dichotomy. While understandable (and relevant), this dominant perspective does hinder our ability to grasp the heterogeneity of non-democratic regimes fully. The conflation of terms like **authoritarianism**, **autocracy**, and **dictatorship** further complicates our analytical frameworks.

Current practice periodizes comparative authoritarianism into generational blocks of scholars and core ideas since WWII. However, the 'first' generation, with their introduction of **democracy** vs. **totalitarianism**, has unwillingly overshadowed alternative approaches of interwar scholars and early-modern thinkers and steered the mainstream onto its current path. It is useful to go back to earlier concepts and thinkers and track down the terminological distinctions they adhered to and why they considered these relevant. For all main concepts, the EncTyr provides such insights.

Moving forward, the field must continue seeking organizational principles and analytical frameworks that are not exclusively anchored in democratic norms. By doing so, we can develop a more nuanced and comprehensive understanding of the diverse range of political systems that have existed throughout human history and continue to shape our world today.

This encyclopedia strives to capture these ongoing debates and developments, providing a platform for critical engagement with the evolving field of dictatorship studies and comparative authoritarianism. By offering a comprehensive overview of concepts, methodologies, and theoretical frameworks, we aim to equip scholars and students with the tools necessary to navigate this complex and vital area of political science.

How to use this book?

The EncTyr contains about 208 entries and almost 80 boxes. Entries are of different lengths and depths, dependent on their salience for comparative authoritarianism and the scope available. With limited space, we have opted for shorter reviews, pointing readers in the right direction instead of omitting relevant topics. Smaller, less relevant topics (i.e., 'Caesarism') can be tracked down using the Index.

Boxes are (usually) shorter, stand-alone pieces on specific topics, either interesting cases (Apartheid, Mobutu's Zaire, North Korean Soft power,) a short historical treatise (e.g., primogeniture, the Japanese Imperial Shōwa regime, de-Stalinization), a larger theoretical debate (bar fight theory, coup belts), or a reflection on a well-known (notorious) phenomenon (e.g., genocide, terror, torture). These are placed logically near the most relevant entry (space permitting) and meticulously indexed. Their topics are listed in the alphabetical register and treated on par with other entries. They, too, contain pointers for future reading.

To optimize locating entries, we offer two registers of the main entries: an alphabetical register and a traditional table of contents (ToC). The alphabetical list of entries is longer, includes the topics from the boxes, and, in some cases, breaks down topic titles and lists them twice. For example, Andreas Schedler's classification of electoral authoritarianism is filed under the author's last name and 'electoral authoritarianism.' The ToC, in contrast, presents the entries within the overall structure and the exact order in which they appear and highlights the division into eight logical book sections, which is handy for readers who want to gauge the scope of the EncTyr's coverage.

As mentioned at the onset, the EncTyr is not a mere alphabetical list of all concepts but presents its content in a structured and logical way, organized in eight book sections. (Their detailed overview and logic can be found below.) We do the same with the entries.

To make scanning and retrieval of information easier for readers, the main entries themself are broken down into 'entry sections.' This topical breakdown is roughly the same for all entries, but entry sections were removed if they do not apply, or they can be merged for

clarity and brevity. Also, the exact order of these entry sections differs per entry as information is presented most logically and economically, avoiding repetition where possible. Some shorter entries do not require such a formal breakdown and are written as one piece.

After introducing each topic in plain English, entry sections usually start with the scholarly **DEFINITION**, listing and comparing the most prevalent definitions as well as the entry's defining characteristics. All main entries have a **SEE ALSO** part where they are contextualized in their larger field and how they relate to other entries in the book. **KEY SIGNIFICANCE** illustrates the relevance of a concept within its respective fields, how it changed a certain study field (for good or for bad) and why it is worthy of study. **ORIGIN** traces back its original meaning or use and/or provides information about the inventors of the concept. Whenever we can, we show when and how a concept entered the scholarly mainstream. **LITERATURE** provides a comprehensive overview of the best-known and relevant works dealing with this concept but also mentions important theoretical comparisons, constructionist overviews, etc. Not all entries have **CLASSIFICATIONS**, but where this applies, authors present the most important (sub-)classifications of the concept, as well as their limitations.

METHODOLOGICAL ISSUES and **MEASUREMENT** are crucial entry sections. The first presents the scope and limits of the concept, the inherent biases and pitfalls of its use in mainstream research, as well as any blind spots that have to be taken into account when applying it in research. The second part is often related and provides guidance on how to measure the concept and any problems related to this, as well as current and popular datasets that collect related data or offer alternative approaches in operationalizing concepts for empirical research. **EXAMPLES**, if not provided before, are meant to bring concepts to life. We have taken additional steps to roam across the larger universe of dictatorships and include lesser-known examples where possible.

Finally, the **IMPACT ON POLICY** is added if a certain concept reframed policy-making in some way. **NEW FRONTIERS** presents current and cutting-edge research or new interpretations (if authors are aware of its existence). **OTHER LANGUAGES** (an optional entry section for authors) offers a selected inroad in non-English treatises on the concept.

REGIONAL VARIATION provides a spatial, geographical overview per world region to note if a concept differs in application or interpretation across various area studies or when it was applied uniquely to a particular world region. Our (world region/area studies) categories are very broad and intended as such. As per general practice, we divide the world into Latin America (including the Caribbean); Eurasia (differing between Western, Central and Eastern, Southern Europe, the Balkans, the Caucasus and Central Asia, depending on the concept); the Middle East & North Africa (MENA); Sub Saharan Africa and the Indo-Pacific (lumping South, Southeast and East Asia together, unless specified). We are absolutely aware that several, if not all, of these terms: Latin America, Eurasia, MENA, Sub Saharan Africa and (especially) the Indo-Pacific have political connotations and carry emotional meanings. We do not use these terms to formulate judgments about the nature of rulership in those states in an essentialist manner. Our approach is purely spatial, following convention and grouping the fragmented taxonomy of smaller area studies.

Overview of the book sections

The EncTyr offers a logical breakdown of all terms, concepts and theories related to comparative authoritarianism, but we are convinced that a fully alphabetical list of all entries would not benefit readers. Entries relate to one another, and the larger field and their position in the EncTyr should reflect this, hence our use of book sections. For this reason, we have sorted all entries into eight logical sections, which are described below. Our choice of how to present these entries differs somewhat per section. For most, an alphabetical order suffices, but for Section 2 (Classifications & Typologies) and Section 8 (Actors & Institutions), we have applied a more coherent structure.

SECTION 1 – Concepts & Archetypes – (alphabetically)

This section of the encyclopedia serves as a comprehensive repository of key concepts and archetypes essential to the study of dictatorships and authoritarian regimes. It is designed to provide researchers, analysts, educators, students, and policy-makers with a robust foundation for understanding the complex landscape of non-democratic governance and the prevalent theoretical approaches.

The concepts and archetypes presented here span from ancient Greek and Latin political thought to cutting-edge contemporary research, offering a panoramic view of how our understanding of authoritarian rule has evolved.

The EncTyr covers all the foundational regime archetypes from ancient Greek philosophy: **autocracy**, **democracy, despotism, oligarchy**, **tyranny,** even **aristocracy**, **monarchy** and **timocracy**; and several from Latin: **authoritarianism** and **dictatorship**. These enduring concepts continue to shape our understanding of political systems and provide a historical context for modern regime typologies.

The influence of Max Weber's sociological approach to political authority is reflected in the inclusion of concepts such as **charismatic rule**, **traditional rule**, **patrimonialism** and **sultanism**. These Weberian archetypes have been instrumental in shaping modern comparative politics and remain relevant in contemporary analyses of authoritarian regimes, but even these concepts are not without fault.

In the wake of WWII, the concept of **totalitarianism** temporarily sucked up all the oxygen, with **autocracy** and later **authoritarianism** being related to residual categories between the free world and totalitarian regimes in the specialized literature. Like with **dictatorship**, we explain how these terms bounced back, but with different meanings.

Building on these classical and sociological foundations, we explore more recent regime archetypes that emerged in the scholarly discourse since WWII and continue to be archetypes today. These include **military regimes**, **single-party regimes**, **personalist rule**, and **monarchies** (as the oldest regime type, we provide deeper regional overviews for monarchies). We also delve into nuanced categories that dominated between the 1960s and 1990s, such as **anocracy**, **kleptocracy**, **neo-patrimonialism**, **neo-sultanism**, and **bureaucratic authoritarianism,** which capture the diverse manifestations of authoritarian governance from the previous century but lost traction today.

Recognizing the fluid nature of political systems, we include in-depth discussions on **hybrid regimes**, which blend elements of democracy and authoritarianism and remain a source of continuous confusion in the literature. Additionally, we explore emerging concepts that reflect new dimensions of authoritarian rule, such as **digital authoritarianism** and the role of political **trust** in non-democratic contexts.

Beyond regime categories, this section encompasses a wide array of analytical tools and analytical concepts crucial for understanding the functioning of authoritarian systems. We explore the intricate dynamics of **clientelism** and **corruption**, which often form the backbone of authoritarian power structures. The role of **informality** and **state capture** in shaping political outcomes is examined, providing insight into how authoritarian leaders manipulate institutions to consolidate their rule.

Legitimacy and political **trust** are dissected to understand how non-democratic regimes maintain their grip on power beyond mere coercion. The complex web of **ruling coalitions** and power dynamics within authoritarian systems is unraveled, offering a glimpse into the internal machinations that sustain these regimes. Furthermore, we explore lenses such as **ethnic politics** or **dynasties** to understand authoritarianism.

The primary aim of this section is to offer a comprehensive overview of the conceptual toolkit available to scholars and students of comparative authoritarianism. By tracing the origins and evolution of these concepts, we provide readers with a nuanced understanding of how they have been applied and interpreted across different historical contexts and scholarly traditions.

Our approach is both historical and analytical, ensuring that readers grasp not only the definitions of these concepts but also their theoretical underpinnings and practical applications in research. We have made a concerted effort to include foundational concepts that have stood the test of time alongside once-prominent ideas that have fallen into relative disuse but remain historically significant. Evergreen concepts that have evolved in interpretation but retain analytical value are presented alongside cutting-edge ideas that reflect the changing nature of authoritarian rule in the twenty-first century.

By presenting this rich tapestry of concepts and archetypes, we aim to equip our readers with the intellectual tools necessary to navigate the complex field of dictatorship studies and comparative authoritarianism. This section serves as a crucial reference point for understanding the subsequent parts of the encyclopedia, which delve deeper into specific aspects of authoritarian behavior, governance, performance and much more.

SECTION 2 – Classifications & Typologies – (sorted by type of classification, chronologically)

This section of the EncTyr is dedicated to the critical examination of political regime classifications and typologies, with a particular focus on non-democratic systems. It serves as an essential resource for researchers, educators, and students seeking to understand the diverse approaches to categorizing and analyzing political regimes throughout history and in contemporary scholarship.

The section presents over 50 classification systems (about 35 in detail), organized not alphabetically but chronologically within thematic subsections. This structure allows readers to trace the evolution of regime typologies and understand how different approaches have built upon or diverged from one another over time.

The content is divided into several key subsections. We begin with **Classical & Early Modern Political Regime Classifications**, exploring foundational typologies from ancient and early modern political thought. This subsection focuses on thinkers who developed comprehensive classification systems or significantly innovated upon existing ones rather than those who introduced singular concepts. Following this, we delve into modern political regime classifications, which are further divided into three parts based on the number of categories used: **dichotomous categories**, **trichotomous categories** and **polychotomous categories**. This organization allows readers to understand how the complexity of regime classifications has evolved. The final subsection examines **continuous measures**, exploring more recent approaches that view regime types as points on a spectrum rather than discrete categories. Each subsection begins with an introduction that contextualizes the typologies within the broader evolution of political thought and comparative politics.

All entries in this section are concise yet comprehensive, providing essential background information on each classification system. To this end, the introductory entry to this section, **Classifying Political Regimes & Rulers**, illustrates the taxonomy of all regime classifications and according to which criteria they are presented to readers.

Each entry explores the historical and intellectual context in which a typology was developed, the methodological approach and criteria used for classification, and the specific problems or questions each typology aimed to address. Furthermore, they briefly discuss the

strengths and limitations of each classification system, as well as its impact and legacy in the field of comparative authoritarianism.

The primary goal of this section is to provide a nuanced understanding of how political regimes, particularly non-democratic ones, have been conceptualized and categorized throughout history. By presenting these classifications chronologically and thematically, we aim to illustrate the evolving nature of comparative politics and the ongoing challenges in defining and distinguishing between different forms of governance. We aim to equip readers with the tools to critically assess the methodological underpinnings and practical applications of various regime classifications they may encounter in their research or studies.

This section emphasizes that each classification system represents a specific analytical lens through which political regimes can be examined, compared, and understood. We encourage readers to approach these typologies critically, recognizing that no single classification system is perfect or universally applicable. Ultimately, this section aims to enhance the methodological rigor and conceptual clarity of research in dictatorship studies and comparative authoritarianism, providing scholars and students with the tools to navigate the rich and complex landscape of regime analysis.

SECTION 3 – Regime Behavior – (alphabetically)

This section introduces readers to regime behavior in authoritarian regimes. Indeed, authoritarian regimes are not monolithic. Some authoritarian regimes are more benevolent, while some authoritarian regimes, like Cambodia's *Khmer Rouge* regime under Pol Pot, killed approximately two million people, or about a third of its population at the time. Authoritarian regimes engage in all types of behavior that deserve a much closer investigation.

In selecting various types of behavior for this section, we have focused on the most common tools of autocracies and how these tools actually help regimes become more autocratic. As such, this section begins with an entry on **autocratization**. One of the trends in comparative politics literature is to study what is sometimes conceived as the reverse process of democratization – or the gradual degradation of a regime's democratic institutions and processes. Autocratization is a process that is not limited to democracies, however, as two-thirds

of all autocratization episodes around the world are taking place in regimes that are no longer democratic. Thus, this field of inquiry also acknowledges that there are varying levels of autocracy, not just democracy. This section provides deeper insight into how autocracies (or non-democracies) gain a stronger grip on power.

At the heart of understanding authoritarian politics is a story of survival, and regimes use various instruments at their disposal to elongate their rule. Authoritarian regimes were previously conceived as mostly focused on **repression,** but there is a much wider range of behaviors that autocracies engage in beyond more stereotypical tactics of oppression and state terror (Box 3.13). Authoritarian regimes still use terror, torture, **purges** and show trials, but there are also non-violent methods of cementing authoritarian rule as well.

One of the well-noted tools used by authoritarian regimes is to brainwash the population with **propaganda** and **disinformation**. These tactics were common among totalitarian-style dictatorships during the Cold War, but research has demonstrated that **indoctrination** of citizens with propaganda and building **personality cults** are frequent tools of modern dictatorships as well. China under Xi Jinping, Ethiopia under Abiy Ahmed, and Azerbaijan under the Aliyev family are more recent examples of this.

In addition to relying on charismatic forms of legitimacy, authoritarian regimes also offer carrots of **co-optation** and **patronage** to maintain authoritarian rule. This ensures that autocracies do not have to rely solely on repressing their own people, which could trigger a backlash. While co-opting the opposition serves the purpose of neutralizing pushback, offering jobs and other perks to their supporters to help authoritarian regimes build legitimacy.

Another way in which authoritarian regimes build legitimacy is through utilizing democratic institutions. More recent scholarship has argued that autocracies mimic democracies, not to become more democratic, but because using democratic-like institutions actually prolongs their rule. Autocracies are increasingly likely to use elections and constitutions to demonstrate their popularity and to offer a veneer of commitment to the rights of their citizens. The issue, of course, is that authoritarian regimes find ways to use elections to their advantage, engaging in vote buying, voter suppression and other forms of **electoral malpractice** and fraud while also eliminating term

limits to ensure that power-hungry autocrats can stay in power indefinitely.

This section aims to provide a comprehensive overview of how the behavior of authoritarian regimes has evolved and how these behaviors have helped to solidify authoritarian forms of rule.

SECTION 4 – Ideologies & Worldviews – (alphabetically)

This section introduces readers to a diverse array of worldviews, specifically focusing on those ideologies that are deeply intertwined with authoritarianism and dictatorship. The concepts of liberal democracy, liberalism, and capitalism are not included here, as they are not the focus of this book. For a comprehensive definition and conceptual understanding of '**ideology**' itself, readers are invited to consult this entry under 'Section 1 – Concepts & Archetypes.'

The ideologies presented in this section are not merely theoretical constructs but have historically shaped how political regimes structure their understanding of the world and justify their power. These ideologies play a crucial role in organizing how elites collaborate, establish hierarchies, and legitimize their authority. They also contribute to the development of social constructs that reinforce centralized authoritarian control, often internalized by the populace through propaganda and indoctrination.

However, this is not a one-way process. Prevailing worldviews also influence the perspectives of elites, offering them not only justification for their rule but also a blueprint for what they consider a 'just' political order. Ideologies define what is an ideal ruler, which examples to follow, and what is perceived as the correct or moral path forward. Beyond legitimizing power, these systems of thought shape policy formulation and serve as transformative forces that reshape state-society relations.

Violence is often a tool employed by regimes to implement these ideological visions, which in turn alters the relationship between the state and individuals. Ideologies provide both a road map for justifying action and a framework for its implementation. Ideologies can also be used to mobilize support, muster resources, attract allies, convince the populace, and, at the same time, exclude or persecute certain groups deemed undesirable. These ideological visions may be utopian – whether reactionary (a romantic image of an idealized

past) or progressive (a new, better order) – in any case, they demand conformism, and participation is often not voluntary. The degree of tolerance for alternative worldviews varies across regimes.

A regime's ability to adapt and reformulate its guiding ideology is often key to its long-term survival. Max Weber's theories on a charismatic and traditional rule, along with his concept of routinization of rulership by designing institutional settings, touch upon this idea of ideological evolution.

In selecting ideologies for this section, we have focused on those with the most comparative merit. For example, **racism** and **Fascism** cover their different manifestations in various countries, while **Nazism**, **communism**, and **socialism** are treated rather briefly here due to their specific historical contexts. In turn, their shared formative dynamics can be found under the archetype of **totalitarianism**. We did our best to sketch out internal variations within Marxist movements by contrasting them within one entry (Box 4.9) rather than treating each individually.

Religions have also played significant roles in shaping political ideologies. **Political Islam** has merited its own entry due to its complex and varied tradition, while other major world religions have been grouped under **Religions of the World & Statecraft**. Unfortunately, space constraints have prevented us from including pre-Islamic African religions, pre-colonial Latin American belief systems, shamanistic practices, Jainism, Sikhism, Daoism, Shintoism, or Zoroastrianism. We have made a deliberate effort to include important non-Western ideologies such as Chinese **Legalism (the *Fa* tradition)**, Confucianism, Hinduism and Buddhism (under **Religions**).

This section aims to provide a comprehensive overview of how various ideologies have shaped authoritarian regimes in pre-democratic times, like **Absolutism** and **Republicanism**. Emotional appeals like **ultra-nationalism** and **populism** contrast scientific innovations embraced by **modernization theory** that challenge liberal democracy like **Corporatism**.

SECTION 5 – Origins, Transitions & Breakdowns – (alphabetically)

This section introduces readers to how authoritarian regimes emerge, how they handle transitions and how they fall apart. Thus, this section provides an overview of the various moments and events of regime

instability in authoritarian regimes, and the legacies that have helped shape the emergence and persistence of authoritarian rule.

The section looks at key modes of authoritarian regime and leader breakdown, namely **assassinations**, **coups d'état**, **ousters, depositions** and **abdications**, and **revolutions**. These often-violent modes of transition are driven by a wide range of factors, which these entries uncover and discuss. As these entries highlight, though revolutions are comparatively rarer than other modes of transition and thus harder to predict, the seeds of revolution are often similar to the drivers of military coups. Coups d'état have been the primary mode of leadership transition in some countries, particularly in Sub Saharan Africa in the 1970s and 1980s. While the 2000s saw a dip in the number of coups worldwide, coups seem to be making a comeback. The rich literature on coups is explored in depth, helping to explain why this may be the case.

The section also examines **transitions** more generally, looking at succession, elite pacts and what the **exit options** are for authoritarian regimes and leaders. In order to avoid violence, authoritarian regimes may try to institutionalize **succession** as this provides greater certainty and prevents power struggles. Succession has been successfully executed twice in North Korea, from father to son to grandson, while Cameroon's leader Paul Biya (who is in his 90s) has not yet cemented his son Frank's control over the country. While succession denotes that there has been a leadership transition, it does not indicate if there has been a transition to democracy. As this section explains, institutionalizing succession is actually an indicator of **longevity, stability & resilience**, serving as a sign of continuity rather than radical change.

Elite pacts, on the other hand, are usually associated with pacted transitions to democracy, representing the start of the democratization process. To understand better the aftermath of regime breakdown, this section also explores the process of **democratization** and **democratic consolidation**. Rather than exploring democratization as a process that is driven by the momentum of different factors, the entries in this section add to our understanding of transitions by giving a better grasp of how previous experience with autocracy impacts these processes and the chances for democratic consolidation.

To understand better how the past shapes these transitions, this

section also offers entries on various important legacies, such as **authoritarian legacies**, **colonial legacies, revolutionary legacies** and sentiments such as **authoritarian nostalgia**. All of these factors have important implications for transitions to and the consolidation of democracy and help explain why many new democracies struggle to fend off the forces of autocracy.

This section offers a comprehensive overview of the various modes of change in authoritarian regimes – running the spectrum from elite-led military coups to citizen-led revolutions. Furthermore, while change is an important theme in this section, through various entries, we explain how these legacies of the past continue to shape the regimes of the present.

SECTION 6 – International Relations – (alphabetically)

This part examines the intersection of comparative politics and International Relations in understanding authoritarian politics. Authoritarian regimes are a primary area of focus in comparative politics, but the spread of authoritarianism and democracy is greatly affected by international factors as much as domestic ones.

Much has been written about democratic diffusion and how democracy has spread around the world. While we do provide information about how democracy is promoted (cf. **democracy support** and **democracy promotion**) in authoritarian settings, the importance of **autocratic diffusion** is also explored. Thus, one of the key areas of inquiry in this section is how international factors drive the spread of authoritarian rule. In understanding this, various entries focus on what role powerful autocracies have played in promoting authoritarianism (or **authoritarian promotion**) and what the impact of **authoritarian learning** and **authoritarian collaboration** has been.

Much of the cooperation and sharing of best practices among authoritarian regimes was in response to the fear of democracy spreading through bottom-up revolutions, such as the Flower or **Color Revolutions** and the **Arab Spring**. In both cases, authoritarian powerhouses in their respective regions (Russia and Saudi Arabia) shared with their regional allies how to prevent the overthrow of autocratic regimes and how to best contend with rising levels of citizen frustration and activism.

In addition to sharing the tools and tactics to stay in power, autocra-

cies are also focused on **foreign aid**. For the most part, authoritarian regimes have been on the receiving end of foreign aid, either from being coaxed into transitioning to democracy or to supporting the geo-political concerns of a more powerful ally. After a lull in the post-Cold War period, authoritarian regimes became more intent on influencing and shaping their neighborhoods and beyond, as seen by the more aggressive stance taken by both Russia and China to exert soft and sharp power. This is all part of an effort by authoritarian regimes to enhance their **external legitimacy**.

In addition to exploring less violent options for exerting power and influence, authoritarian regimes are also willing to engage in conflict. While authoritarian regimes have certainly been on the receiving end of **foreign invasions**, they have also been willing to take on these risks as well. This all illustrates that the **foreign policy** of authoritarian regimes is incredibly variable and depends greatly on leadership characteristics, elite structure, capacity levels and geo-political factors.

As authoritarian regimes are often at least one of the actors involved in a conflict, they have also been subject to reprisal by the international community. The most commonly used tool in response to conflict has been to implement sanctions (and the vast majority of regimes that face sanctions are authoritarian regimes). The 2022 Russian invasion of Ukraine is just one example of **international sanctions**, which pack a punch but usually fail to compel authoritarian regimes to change their ways.

This section explores the most important concepts in international relations involving authoritarian regimes to understand better their motivations and actions and how effective authoritarian regimes are in achieving their objectives and thwarting efforts to weaken their power.

SECTION 7 – Performance – (alphabetically)

This section examines the performance of authoritarian regimes. During the Cold War, much attention was given to authoritarian regimes, arguing that they held certain strengths in generating economic growth and industrialization – known as the 'authoritarian advantage.' The logic was that without checks and balances or any sort of gridlock, they were less likely to face policy paralysis and had

the stability to pursue long-term economic plans.

Moreover, while some authoritarian regimes have managed to achieve impressive poverty reduction, such as China which lifted hundreds of millions of people out of poverty, most authoritarian regimes do not perform as well comparatively speaking when it comes to economic **development**. Some authoritarian regimes do offer public goods and welfare, but many authoritarian regimes fail to help their citizens meet the minimum standards of economic security or food security. As Nobel Prize-winning economist Amartya Sen remarked, there has never been a famine in a democracy (cf. Box 7.4).

While there are exceptions, many authoritarian regimes also fail to protect their citizens from various types of external shocks, whether it be **disease management** or **disaster management**. After Venezuela was autocratized, it saw a return of malaria and yellow fever, two diseases that were under control when the country was more democratic. Syria had an abysmal response to a devastating earthquake in 2023, as had Myanmar after various cyclones.

In addition to performing poorly with respect to disease and disaster management, authoritarian regimes are also more likely to violate the **human rights** of their citizens, violate minority rights, and fail to uphold or acknowledge the rights of the LGBTQ+ community (Box 7.5). Though **gender equality** can exist in authoritarian regimes, in most cases, women do not possess genuine political power. Studies have also shown that gender equality is an important precursor to democracy, which gives more reasoning for autocrats to pink-wash – or pass pseudo-gender-friendly policies that have little meaning in practice.

The **conflict** behavior of **authoritarian regimes** is another well-studied area of inquiry. For the most part, though there is little consensus on whether or not authoritarian regimes are more conflict-prone than democracies, many authors have concurred that it is personalist regimes that are the most risk-acceptant and unpredictable. The relationship between authoritarian regimes and **terrorism** is another well-studied topic that has looked at the extent to which autocrats are more likely to host terrorist groups and more likely to be the target of acts of terrorism.

While there is also not a linear relationship with regard to the level of autocracy and terror threats, there is a clearer relationship between

authoritarianism and **state fragility & failure**. Just as democracies have not experienced famines, democracies also do not tend to fail. Additionally, it is within these failed states, or states that are experiencing, at the very least, pockets of failure, that we see the emergence of **narco-states** or states that have been captured by organized crime.

The threats posed by organized crime are definitely pervasive, yet other less conventional forms of warfare, such as **cyber-warfare** and **nuclear policy,** also pose psychological, tangible and direct threats to the enemies of authoritarian regimes. Again, there is no consensus on whether or not authoritarian regimes are more likely than democracies to pursue nuclear weapons, but personalist regimes have emerged as the most likely to build nuclear programs in order to offset the inherent weaknesses of these types of regimes. Cyber-warfare is another tool autocracies use in order to overcome their comparative military disadvantage with other democracies. Like terrorism, cyber-warfare is an example of asymmetric warfare that is popular with weaker actors.

Education is one area where authoritarian regimes have a mixed record. While some authoritarian regimes were able to ensure near-perfect literacy rates, other authoritarian regimes have seen dwindling rates of school enrolment. In contrast to democracies, authoritarian regimes use education not just to improve human capital, something that is necessary to foster a healthy civil society and private sector but also to control their citizens through the use of indoctrination. It is the educational system where the vast majority of indoctrination efforts take place, as education during one's impressionable years is critical to making an indelible impact.

Because the goal of most dictatorships is always the survival of the regime first and foremost over the flourishment and success of their citizens, no matter how well autocracies may perform in certain areas and cases, the vast majority fail to live up to the expectations of the 'authoritarian advantage.'

This section provides an overview of all of these theories of authoritarian performance. In doing so, it offers detailed examples of how autocracies perform and what explains the variance in performance levels both within autocracies and compared to democracies as well.

SECTION 8 – Institutions & Actors – (sorted by type, then alphabetically)

This section of the encyclopedia provides a comprehensive examination of the key actors and institutions that shape authoritarian regimes. It is designed to offer a deeper look into the complex power dynamics within non-democratic systems.

Rather than following an alphabetical order, this section is organized into four concentric circles of power, each representing a different level of proximity to the regime's core. This structure allows for a systematic exploration of how power is distributed, exercised, and contested within authoritarian systems.

At the center of our analysis are the supreme power holders and their closest allies. This subsection delves into the personal characteristics of autocratic leaders, including their **background**, **age & health** and **psychological profiles**. It also examines the often-overlooked role of **family** members in sustaining and shaping authoritarian rule. A significant contribution here is the dedicated entry on **female rulers & powerful women** in authoritarian regimes, addressing a critical gap in the existing literature.

The second circle encompasses the institutions and actors directly serving the regime. This includes the key pillars and their central administration: **bureaucracy**, **executives**, **judiciaries**, and **legislatures**. Special attention is given to the coercive apparatus of the state, with in-depth entries on **armed forces**, **police forces**, **intelligence services**, and elite guard units like **presidential guards & praetorians**. The role of political **parties** in authoritarian contexts is also examined, complementing the entry on single-party regimes found in the archetypes section.

The third circle focuses on actors who, while not integral parts of the regime, can be employed to bolster its power. This includes **mercenaries**, **paramilitaries & death squads**, and militarized **youth movements**. These groups, though not present in all authoritarian systems, can be used by autocracies to undermine and threaten the opposition. They can be tools to violate the human rights of their citizens without being directly held responsible for these atrocities.

The outermost circle comprises actors outside the ruling coalition who seek to challenge, disrupt, or replace the regime. This subsection covers **anti-party candidates**, **rebel groups**, **warlords**, NGOs, **civil**

society organizations, and **opposition** movements. It also explores the concept of **uncivil society** and its role in authoritarian contexts.

Throughout this section, we emphasize the interaction dynamics between these various actors and the ruling group. By examining these relationships, we aim to provide a comprehensive understanding of how power is maintained, challenged, and negotiated within authoritarian regimes.

It is important to note that while this section focuses on institutionalized groups and their interactions with the regime, broader societal movements and popular **protests & uprisings** are addressed in other sections of the encyclopedia, particularly under Section 5, 'Origins, Breakdowns, & Transitions.'

Some remarks on transliteration, terminology and the Index

Regarding **transliterations**, we have adhered to the most universal standards of contemporary times. However, exceptions were made for names and concepts that have entered mainstream English usage, such as 'Glasnost' or the spelling of names like 'Gorbachev,' 'al-Qaddafi,' 'Zelenskyy' (not insinuating that these are in the same league), here we have followed the preferred spelling used by authoritative newspapers such as *The New York Times* or *The Guardian*.

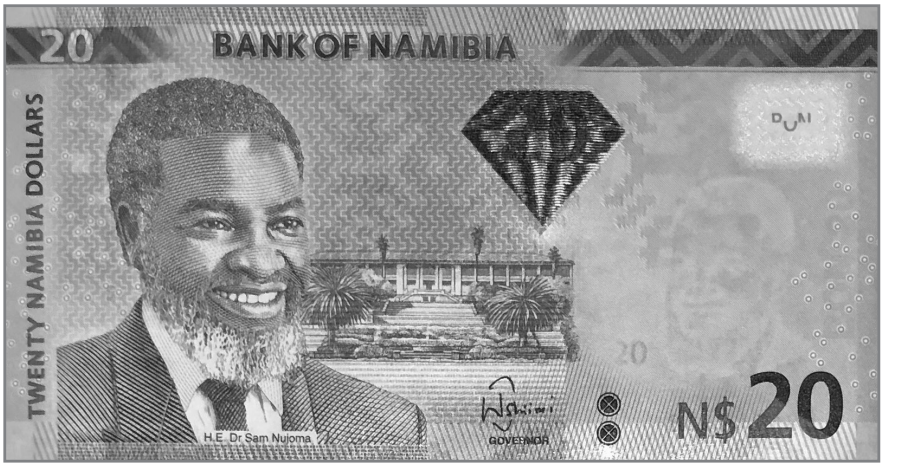
When it comes to **terminology**, the editors decided to conform to mainstream practices, using terms like 'authoritarianism,' 'autocracy,' and 'dictatorship' interchangeably unless specified otherwise. Of course, the respective entries in the EncTyr reflect these terms' historical meanings, their evolution over time, and the methodological or conceptual stretching that has accompanied changes. For our purposes – and stylistic consistency – we use all these terms synonymously with 'non-democracies' throughout the book.

A final word on the **Index**: it contains an extensive array of lesser-known concepts and terms that one might encounter in the literature. It also provides specific background information on numerous regimes, both historical and contemporary. However, we have not indexed broad periods, such as the Renaissance or the Cold War, in relation to specific regimes. Instead, users will need to search by country name or regime name to account for these periods. Regimes are listed either by the name of their supreme power holder or (for

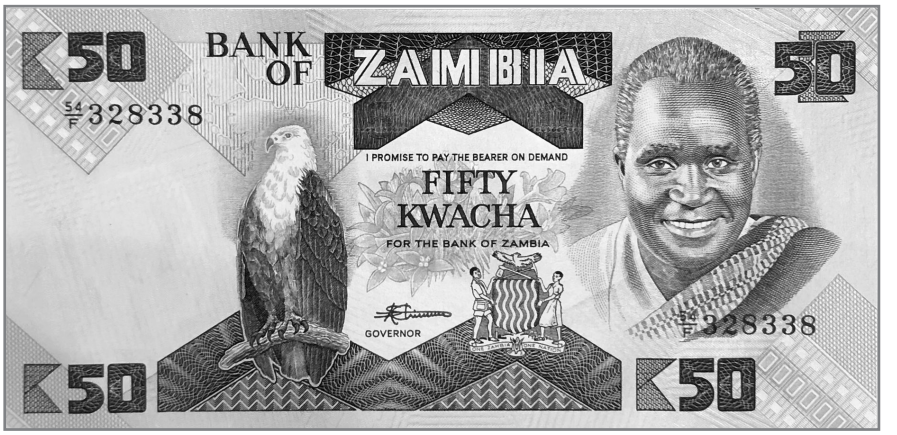
collegial regimes) by the acronym or name of their leading political party or ruling institution (e.g., *junta*) when a single clear power holder cannot be identified.

Polities (countries, territories) are indexed only insofar as they include specific information about their political history and authoritarian legacies.

The names of authors and political thinkers have been indexed up until 1950; after that date, only selected scholars and thinkers who made significant theoretical contributions are included. Without this cutoff, the Index would become bloated with too many minor references to authors commenting on or nuancing various political concepts, thus diminishing its retrieval validity.



These choices ensure that users can efficiently locate relevant information while maintaining a focus on substantial contributions to the field.



The editors

Jeroen J.J. Van den Bosch
(Adam Mickiewicz University, Poznań)

(University of Essex)

SECTION 1
CONCEPTS & ARCHETYPES

20 Dollars, Namibia (1996), depicting Sam Nujoma, independence leader (SWAPO) and first president.

50 Kwacha, Zambia (1986-1987), depicting Kenneth Kaunda, independence leader and first president (UNIP).

1000 Shillings, Tanzania (2011), depicting Julius K. Nyerere, independence leader and first president.

Anocracy

More Murder in the Middle
– Helen Fein (1995)

Anocracy is a label for a group of regimes that fall short of being democracies but are also too pluralistic or unstable to classify them as autocracies. The concept mostly appears in publications that cite or use the **Polity Index** of political regimes or the related reports by the *Center for Systemic Peace* and is used to study the relation between regimes in transitions and political violence.

DEFINITION Anocracies are a residual category in the **continuous measure** *Polity IV* to classify **political regimes**. The *Polity project* was created by T.R. Gurr (1936-2017) in 1975 and continued under M.G. Marshall by the *Center for Systemic Peace*. As a motley group of regimes clustered in the middle space of a numeric scale measuring democracy and closed authoritarianism, anocracies are mistakenly branded as a distinct (categorical) regime type – see 'methodological issues' lower.

Hegre et al. (2001: 33, 35) juxtapose anocracies to "institutionally consistent democracies and stark autocracies" and states that these "semi democracies" are "partly open yet somewhat repressive." Fearon and Laitin (2003: 75-76, 81) added the element of state weakness, attributing them to "politically weak central governments," which are unable to maintain their monopoly on violence.

Van den Bosch (2013: 85) finds that the category foremost captures the level of regime weakness, that is, when a political regime has weakened to such a degree that it finds itself in the unstable equilibrium between collapse and transformation. However, since the term is widely accepted and does describe a specific set of conditions that can apply to any regime, it might be prudent to just refer to such cases as finding themselves in a "state of anocracy." Still, while regimes in this state can face similar challenges and opportunities, it is probably their (categorical) regime type (democratic or autocratic, with subtype differentiation) that will be more salient to predict how they engage with their environment.

SEE ALSO Anocracies are often equaled to **hybrid regimes** but in contrast to the latter, the **Polity Index** typology was designed to probe the level of political instability (and not the electoral mimicking of democracies). They overlap with other confusing terms like semi-democracies, quasi-democracies and pseudo-democracies (cf. **democracies with adjectives**). Anocracies correspond fairly well to the 'partly free' label of the **Freedom House** ranking, which also uses a **continuous measure** of regimes.

MEASUREMENT *Polity IV* uses two scales: one to measure democracy (0 to +10) and a different one (0 to -10) to gauge consolidated autocracy. Their combined score becomes the polity score, which can range from -10 to +10. This numeral scale is then (erroneously) transformed into regime 'types' encompassing full democracy (+10), democracy (+6 to +9), anocracy (+1 to -5), and autocracy (-6 to -10).

CLASSIFICATIONS Anocracies are subdivided between 'open anocracy' (+1 to +5) and 'closed anocracy' (-5 to 0). The former is a result of failed transitions to democracy and is thus characterized by greater openness, with contesting actors from outside the regime. The latter are regimes with a failed autocratic consolidation, where regime insiders challenge central power (Marshall & Cole 2014).

ORIGIN The term is a neologism derived from the Greek *ἀν* (*'an'* – not, without, lacking) and κράτος (*'kratos'* – power, strength), and is said to be coined by the Austrian-Jewish philosopher Martin Buber (1950) in his work *Pfade in Utopia (Paths in Utopia)*. Buber actually used the German term *Akratie* ('acracy') in a different context, referring to the 'absence of domination' in juxtaposition to anarchy (absence of government). (Wojtaszczyk & Jakubowski 2003: 2-23) His translator, R.F.C. Hull, rendered *Akratie* into 'anocracy' in the English version (Buber 1958: chapter 5).

The American political scientist H.H. Eckstein (1924-1999) suggested the term to Ted R. Gurr, who applied it to denote lowly institutionalized regimes where executive power is weak and contested. Gurr hints that the concept is actually an ideal type and that no real-life case comes close to its extreme form (the complete absence of power or control) (Gurr 1974: 1487). (Note that such extreme cases (cf. **state fragility & failure** or civil war) are covered but coded as 'failed regimes' in the *Polity IV* index).

KEY SIGNIFICANCE According to the *Polity IV* data, anocracies are more prone to political violence, in particular civil war (Hegre et al. 2001; Fearon & Laitin 2003; Regan & Bell 2010) or terrorism (Chhabra 2020). While these findings have been criticized – see 'methodological issues' – the *Polity IV* categories can be individually used for diachronic and/or Large-N comparative analysis on leader constraints. For instance, Schofield and Gallego (2011) use the frame to explore the relationship between an autocrat and his supporters during crises. Today, the **Polity Index** dataset is still widely used in Large-N quantitative research, but usually in combination with other indexes and accompanied by control variables. Often, the frame and dataset are used to gauge democratization patterns (toward and from) (Colomer et al. 2016; Croissant & Martín 2006) or the relation between such processes and the rise of political violence (Mansfield & Snyder 2005).

METHODOLOGICAL ISSUES Whenever anocracy is treated as a categorical regime type, scholars risk committing a serious fallacy. There are just too many variables in order to group such an ostensibly heterogeneous bunch of cases under one label that is not even grounded in theory. Gandhi & Vreeland (2004), for instance, show that for a score of zero on the polity scale (its exact middle), there are 17 distinct combinations of the five components. Thus, the group of

anocracies encompasses a range of regimes that can literally be composed of hundreds of combinations (Cheibub et al. 2010).

Another major methodological issue is that among the five components that make up the *Polity IV* index, two of them explicitly refer to political violence, making the correlation of anocracy with civil war 'virtually tautological' (Vreeland 2008; Cheibub et al. 2010). For a general review of the **Polity Index**'s methodological issues, consult the entry directly.

LITERATURE The best (methodological) overviews that cover anocracy are: Vreeland 2008; Cheibub et al. 2010. Frantz (2016) offers a more detailed look at their most common trajectories (back to democracy or full autocracy). Other key texts are mentioned under 'key significance,' higher.

Aristocracy

Simply the best
– Tina Turner, *(Simply) The Best.* Capital Records (1991)

The concept of aristocracy was framed differently by Socrates, Plato, and Aristotle (cf. **Plato & Aristotle**), reflecting their distinct philosophical approaches to governance and the role of virtue in political life. Socrates, as presented in Plato's dialogues, considered the perfect constitution to be based on the rulers' contemplative and dialectical knowledge of the Idea of the Good. For Socrates, this higher knowledge rendered irrelevant whether there was one ruler (a monarchy) or several (an aristocracy), as what mattered was their philosophical wisdom and ability to govern in accordance with the Good. Thus, aristocracy, for Socrates, was not merely a political structure but a reflection of the rulers' intellectual and moral alignment with universal truths.

This elitist view subscribed to a normative order where it was natural that the power of a particular group surpassed its proportional size. Beyond ancient Greece, the dominant influence of distinguished minorities was justified by their perceived superior wisdom or virtue,

Exemplified by Plato's concept of the 'guardian' class of rulers. The Greek term (ἀριστοκρατία – *'aristokratia'*), a precursor to the English notion of aristocracy, referred to governance by 'the best men' *(aristoi)*. The defense of elite rule during this period rested on the empirical belief in the unequal distribution of the highest human qualities, a systemic feature in the face of abundant illiteracy, exclusive citizenship, slavery and poverty in these stratified city-states or empires (Maloy 2023).

Plato, building on Socratic thought, developed a more systematic typology of constitutions in works like *The Republic* and *The Statesman*. In the former aristocracy is presented as the ideal regime, ruled by philosopher-kings who possess wisdom and virtue. However, in *The Statesman*, Plato introduced a classification based on two criteria: (A) the number of rulers (one, a few, or many) and (B) whether the rule of law is present. Aristocracy, in this framework, is one of the 'good' regimes – ruled by a few for the common

good under the law – contrasted with its corrupted form, **oligarchy**, where the few rule for their own interests. For Plato, aristocracy was thus both an ideal form of governance and a practical category within his broader typology.

Aristotle refined Plato's framework while grounding it more firmly in empirical observation. In his *Politics*, Aristotle adopted Plato's deductive criterion of the number of rulers but emphasized that the distinction between oligarchy and democracy lay not in numbers but in socioeconomic dynamics: oligarchy represented rule by the wealthy few, while **democracy** represented rule by free citizens. Aristotle's classification also distinguished good regimes – kingship, aristocracy, and polity (a mixed regime) – from bad ones: **tyranny**, oligarchy, and democracy without law (Miller 2009; Saxonhouse 2015). For Aristotle, aristocracy was defined as rule by the morally and intellectually superior few who governed for the common good. This emphasis on virtue and public interest aligned with his broader ethical philosophy but also reflected his pragmatic approach to analyzing real-world political systems (Miller 2009; Saxonhouse 2015).

Up until early modern times, classifications of aristocracy were variations on these models. In classical antiquity, Polybius (ca. 200 – ca. 118 BCE) integrated aristocracy into his theory of mixed government, arguing that combining monarchy, aristocracy, and democracy could prevent degeneration into tyranny, oligarchy, or mob rule. His focus on balance influenced later republican thinkers (cf. **republicanism**).

During the early modern period, figures like Niccolò **Machiavelli** (1469-1527) and Jean **Bodin** (ca. 1530-1596) explored aristocracy within republican frameworks. Machiavelli saw aristocracy as potentially functional within non-monarchical states but warned against its tendency to devolve into oligarchy. Bodin acknowledged aristocracy as a legitimate form of government but stressed its feasibility only when collective rule by an elite group was effective.

In Enlightenment thought and revolutionary discourse, thinkers like **Montesquieu** (1689-1755) emphasized aristocracy's role in mixed governments that balanced monarchical and democratic elements. James Harrington (1611-1677) and Edmund Burke (ca. 1729-1797) championed the idea of a 'natural aristocracy,' where governance was entrusted to individuals selected for their virtue and wisdom rather than hereditary privilege.

Burke defines 'natural aristocracy' as a principle rooted in nature and reason, which recognizes that only a minority in society possesses the superior qualities necessary for political leadership. This aristocracy is not a separate or isolated interest within the state but is integral to it, embodying legitimate presumptions of virtue and wisdom. These qualities are often associated with those occupying eminent social positions, such as landowners, high-ranking magistrates, professionals, scientists, and wealthy merchants. Burke argues that these groups are naturally suited to govern due to their proven ability and societal standing (Panizza 1992: 85-86).

However, Burke's natural aristocracy does not equate to meritocracy (Box 1.9). He emphasizes that property ownership should hold a predominant role in representation over individual talent or ability. This preference stems from his belief in the stabilizing influence of property on the social and political order. Property owners, particularly large proprietors, are seen as a 'ballast' for the commonwealth, countering the risks posed by the centralization of power or the potential tyranny of the majority (Panizza 1992: 102). Burke also expresses concerns about the rise of intellectual elites – disconnected from traditional social structures whom he viewed as a destabilizing force akin to the French *philosophes*.

In terms of representation, Burke integrates the concept of 'natural aristocracy' with two other key ideas: 'interest representation' and 'virtual representation.' He contends that parliament should represent the general interests of society rather than specific local or individual interests. This perspective aligns with his broader critique of radical demands for universal suffrage and personal representation, which he saw as rooted in an abstract theory of natural equality and popular sovereignty (Panizza 1992; MacCunn 1913).

Burke's organic, collectivist view of society further underpins his argument. He perceives society as a cohesive entity composed of interconnected communities – families, professions, and corporations – rather than a collection of isolated individuals. Aristocracy was a necessary element to maintain harmony.

Modern interpretations associate aristocracy with hereditary privilege or elite governance based on wealth or status rather than virtue or merit – a significant departure from its classical connotations. For example, Thomas Paine (ca. 1737-1809) already critiqued hereditary aristocracy as corrupt and argued for merit-based governance. Thinkers like Thomas Hobbes (1588-1679) described it as a commonwealth ruled by a select group but noted its potential to become oligarchic if unchecked.

Modern interpretations of aristocracy in ancient societies often reflect misconceptions influenced by European medieval models. These interpretations assume that ancient aristocracies were stable, hereditary ruling classes similar to those in later European history. However, this view is misleading when applied to ancient societies, where social structures and power dynamics were more fluid (Van Wees & Fisher 2015).

First, there is a misconception that ancient elites were primarily hereditary, whereas, in reality, wealth and personal merit often played significant roles in determining status (cf. **oligarchy**). Second, the assumption that ancient aristocracies had distinct values exclusive to them is challenged; these values were not necessarily unique to elites and could be shared by other social groups. Third, the belief that aristocrats monopolized both political power and landownership is questioned, as evidence suggests that wealth, rather than birth, was the main social divide. Lastly, the idea of a rising middle class

challenging aristocratic power is seen as anachronistic; power struggles often occurred within the propertied elite itself rather than between distinct social classes (Van Wees & Fisher 2015).

Kailitz and Stockemer (2017) explore the relationship between legitimacy and aristocracy. The authors argue that autocracies with a regime legitimation strategy that ties the fate of the ruling elite to the survival of the regime, such as **monarchies** and communist **ideocracies**, tend to be more durable than other types of autocracies. This is because monarchies derive legitimacy from historical or divine rights, supported by a cohesive aristocracy whose status and privileges are linked to the monarchy's continuation. The unity among the aristocratic elite is crucial for regime durability as it minimizes internal challenges and provides a strong front against external pressures to change or overthrow the regime (Kailitz & Stockemer 2017).

With the spread of ideas on legal-rational **legitimacy,** the number of 'natural' rulers eroded, and aristocracy thus lost its status as an (ideal) regime type. Later thinkers adapted these classical ideas to fit changing political ideologies – ranging from **republicanism** to critiques of hereditary privilege – demonstrating how the concept of aristocracy was molded over time to fit later interpretations of the past while still retaining some features of its analytical value.

Authoritarianism

Eternal vigilance is the price of liberty; power is ever stealing from the many to the few.
– Attributed to Wendell Phillips, American abolitionist and liberal activist

Authoritarianism is, next to **totalitarianism**, the second archetype of dictatorship. Unlike totalitarianism, it does not cause so many controversies and polemics. Also, unlike the latter, authoritarianism did not stimulate the imagination of intellectuals and did not cause their uncritical admiration.

There are two basic approaches to analyzing authoritarianism. One is psychological, and the other comes from the perspective of political science. The psychological approach understands authoritarianism primarily in the sense of an authoritarian personality or authoritarian societies (see Pohl 2015). The basic work is the book *Authoritarian Personality* from 1950 (Adorno et al. 1950), which stimulated the research of authoritarianism in this psychological understanding (cf. **authoritarian personality**).

The political science approach considers authoritarianism as a way of governing, i.e., as a type of political system. It is in this sense that authoritarianism is presented in this entry.

DEFINITION Defining authoritarianism is not easy. The reason is the massive occurrence of authoritarianism in diverse variants. It is, therefore, difficult to establish any definition that could cover all existing cases.

Juan José Linz (Storch de Gracia, 1926-2013) presented the basic and still unsurpassed definition of an authoritarian regime based on an analysis of Francoist Spain. Linz's (1970) conception generated considerable response, including criticism, and became the basis for all later research on authoritarianism. No other (newer) definitions of authoritarianism have brought anything fundamentally new, and they all use Linz (Balík & Kubát 2015; Brooker 2014), although, of course, definitions by other authors do exist (see below).

Linz (1970: 255) defined authoritarianism as: *"political systems with limited, not responsible, political pluralism, without elaborate and guiding ideology, but with distinctive mentalities, without extensive nor intensive political mobilization, except at some points in their development, and in which a leader or occasionally a small group exercises power within formally ill-defined limits but actually quite predictable ones."*

According to Linz, authoritarianism allows the existence of different political attitudes, but these are tolerated rather than recognized. However, there may be non-political subcultures more or less independent of the regime, such as churches, cultural institutions, universities, economic entities, etc. Authoritarian regimes are characterized by a zero or

low level of ideologizing the life of the state and society. Ideology either does not exist, is replaced by an 'authoritarian mentality,' or is only limited and not imposed on citizens. This is related to the absence of political mobilization of the population. An authoritarian regime does not force its citizens to demonstrate their loyalty to the regime constantly and does not strive for absolute control of society, including the cultural, scientific, economic, private, and other lives of people. One person (dictator) or a group of persons (**junta** – 'council') rules, and the state is dominated by bureaucratic, military or police structures, but there is no (or only a very limited) mass political party, and there is no fusion of party and state institutions (Linz 2000). In short, one could summarize that authoritarianism deals only with itself, i.e., with political power. Politics is 'reserved' for the rulers, and everything else is relatively free or rather tolerated.

The definition of authoritarianism conceived in this way deserves two additional explanations. The first relates to the term 'authoritarian mentality.' This is a way of thinking and feeling that is emotional rather than rational. The mentality is characterized by a relatively small number of topics to which it can inherently provide an answer. These answers are vague and imprecise; they do not form a sophisticated system. They are often a set of slogans that can be contradictory to each other. The mentality is characterized by general values such as patriotism, truth, economic development, social justice, order, discipline, etc. These are understandable to most social classes. There are several types of authoritarian mentalities – bureaucratic, military, and ecclesiastical, which are partially different, but basically, they are on the same basis, which is order and obedience (Balík & Kubát 2015).

The second explanation concerns the way of defining authoritarianism. Looking at it, it is immediately obvious that it is a 'negative image.' Its definition says what authoritarianism is missing compared to **totalitarianism**. A full comparison can be shown in the form of a simple table.

Although Linz absolutely dominated the conceptualization of authoritarianism, this does not mean that there are no other definitions by other authors. An example is the definition of authoritarianism by Amos Perlmutter (1931-2001). In his definition, Perlmutter (1981) focuses on the institutional aspect of authoritarianism. According to him, authoritarianism is based on three instruments of governance. These instruments are (a) the single authoritarian party, (b) the bureaucratic-military complex, and (c) the parallel and auxiliary structures of domination, mobilization, and control, which mean political police, paramilitary forces, or militant youth movements. In practice, each authoritarian regime uses (combines) these tools with varying intensity according to circumstances and needs.

The importance of Perlmutter's approach compared to Linz's lies in the emphasis on the structural and institutional aspects of authoritarianism. In this sense, Linz's approach innovates but does not negate these aspects. On the other hand, authoritarianism defined in this way is difficult to distinguish from totalitarianism, and Perlmutter himself characteristically understands the classic totalitarian regimes of the communist Soviet Union and Nazi Germany as examples of modern authoritarianism, thereby actually denying the concept of **totalitarianism**.

Table 1.1 – Comparing Totalitarian & Authoritarian Regimes

Characteristic	Authoritarian regime	Totalitarian regime
Autonomy of social structures and the non-political sphere	Yes	No
Control of all aspects of social life	No	Yes
Monopoly control of economic activity	No	Yes
The leading role of a sole mass party	No/Limited*	Yes
Control of state institutions by the party apparatus	No	Yes
Legal or semi-legal political opposition	Limited	No
The existence of a leading ideology	No	Yes
Mass terror affecting the entire society	No	Yes
Violence against political opponents	Yes	Yes
Political mobilization of the population	No/Limited *	Yes
The pursuit of expansion	No	Yes
A model for other countries	No/Limited *	Yes

* Mostly only in the short period of establishing an authoritarian regime.

SEE ALSO Other archetypal terms related to authoritarianism are **autocracy**, **dictatorship** and **totalitarianism**. More info about Linz's classification of political regimes can be found under **Linz & Stepan**.

KEY SIGNIFICANCE Along with totalitarianism, authoritarianism has become a basic concept for the research on dictatorships. Modern research on dictatorships is inconceivable without it. The concept of totalitarianism, in various ways, influenced entire generations not only of political scientists but also of historians, sociologists of politics and others.

ORIGIN The term 'authoritarianism' comes from the word 'authority.' As Giovanni Sartori (1987) demonstrates, this linguistic fact has become the source of many terminological ambiguities and mistakes. Authoritarianism and authority are two completely different things, and mixing them up is an expression of misunderstanding the two concepts. Authority is an old Latin term (*auctoritas*, from *auctor* – originator, promoter) that has not historically been taken pejoratively. It was a thoroughly positive concept, bringing legitimacy to its bearers (Arendt 1961; Friedrich 1972). Today, the situation is different, and the word authority can appear to us in a negative sense as an abuse of power. Sartori notes that it is important, if not to save the term authority from derogativeness, at least to preserve its independence from the term authoritarianism and thus prevent its depreciation. Why is this important? This is not just a linguistic problem but a meritorious one.

Originally, the term authority was not defined (with exceptions) in the categories of power (political power), according to Sartori, until the time when Max **Weber's** term *Herrschaft* was mistranslated into English. This has caused semantic confusion in such terms as authority, power, political power, influence, force, and coercion. 'Authority' is not 'power' (force) or 'political power' (rule) but influence based on prestige or respectability. Authority reflects significance (in a positive sense) – it is moral influence. In any case, authority does not force us to do anything; it does not take away our freedom. Authority is further associated with **legitimacy**, and it is synonymous with leadership, which has received spontaneous support. '**Rulership**' *(Herrschaft)* and 'authority' are symmetrical. Rulership without authority is either oppressive or powerless. Thus, authority is necessary for democracy, and a crisis of authority equals a crisis of democracy. For that reason, we cannot identify 'authority' with 'authoritarianism;' at most, it is an abused authority or a semantic error. Freedom accepts authority, and authority recognizes freedom. Freedom that does not recognize authority is not freedom, and authority that does not recognize freedom is authoritarianism. Democracy needs authority. If it has this, it does not become authoritarianism. The more authoritarian a regime is, the less it relies on authority.

LITERATURE There is an abundance of literature on the topic of authoritarianism, but it is more modest than that on totalitarianism. Nor has authoritarianism become the subject of artistic treatment in the form of novels or films. The works of Juan José Linz (1970; 2000) remain the basic and unsurpassed work, which are the conceptual starting point for all contemporary research on authoritarianism. Later literature focuses mainly on typologies of authoritarianism (see 'classifications' – lower), the functioning of authoritarian regimes (see 'new frontiers'), or the analysis of individual specific cases (see 'examples').

REGIONAL VARIATION Most dictatorships in the world from the twentieth century to the present had or have the form of authoritarianism. Other types of dictatorships, such as **totalitarianism** or, for example, **sultanism & neo-sultanism** (Chehabi & Linz 1998; Linz 2000) and real 'traditional' regimes (e.g., **monarchy**) used to be rare in the 1970s. From this follows the fact that authoritarianism occurs in many regional variants. This is also the reason why there are many typologies of authoritarianism (see 'classifications' – lower).

METHODOLOGICAL ISSUES In connection with authoritarianism, two methodological questions can be identified. Both relate to the question of the distinctiveness of authoritarianism in relation to the concepts of 'dictatorship' and 'totalitarianism.' When it comes to **dictatorship** and authoritarianism, there is a tendency to confuse the two terms or use them synonymously (Geddes et al. 2012; Kailitz 2013; Frantz 2018a/b). This approach has become common in mainstream dictatorship studies; however, such an attitude is an example of conceptual stretching when considering Linz's original framework. As Table 1.2 shows, while each Linzean authoritarian-

ism is a dictatorship (and not a democracy), it is by no means the case that every dictatorship is an authoritarian regime. There are different types of autocracy or dictatorship, and authoritarianism is just one of them.

Something similar concerns the relationship between authoritarianism and **totalitarianism**. Authoritarianism, as already said, is often defined negatively, i.e., it is defined in contrast to totalitarianism. It is, therefore, a category juxtaposed in relation to the latter, but both are unique and distinct concepts. It is by no means a 'softer' variant of totalitarianism authoritarianism – it *"cannot just mean that repression is less intense"* – but rather a separate type of dictatorship (Przeworski 2022: 25). The difference between authoritarianism and totalitarianism does not lie in the degree of oppression, the degree of brutality or obscurity of the ruler, but simply put in the way of ruling, in the sense of its scope and reach. Similarly, other approaches have identified the so-called **hybrid regimes** (cf. Levitsky & Way 2010; Schedler 2006), which can be conceptualized as a separate regime type and not a derivative of (closed) authoritarianism or liberal democracy.

MEASUREMENT In his classic book *The Third Wave*, Samuel Huntington (1991) stated that in the twentieth-century, democratic countries were always less than 50 percent of the global sample. The largest number of democracies was between 1922 and 1990 when it hovered around 45 percent. According to a recent *Freedom House* report (2022), which monitors the state of democracy in the world, the situation has not changed much since then. Currently, it is around 40 percent. This means that some forms of dictatorship have always prevailed and still prevail. Given that totalitarianism is a very rare form of dictatorship – as are, for instance, (neo-)sultanistic regimes and others – then most dictatorships in the world thus take the form of some type of authoritarianism.

CLASSIFICATIONS The most frequently cited typology of authoritarianism is that of Juan J. Linz (2000), who defined seven types of authoritarianism. First (a), there is a *bureaucratic-military regime* in which power is in the hands of persons coming from high state bureaucracy or army headquarters (cf. **bureaucratic authoritarianism**). Often referred to examples are the South American states in the second half of the twentieth century. Second (b), there is *organic statism* that represents European corporatist traditional authoritarianism such as Salazar's Portugal or Franco's Spain (cf. **corporatism**). Third (c), there are the *mobilizational regimes in post-democratic society* that arose as a result of the fall of a corrupt and ineffective democracy. Examples here are some European inter-war authoritarianism. Fourth (d), one identifies the *post-independence mobilizational regime*, a product of the national liberation struggle, in conditions that do not favor democracy. Here examples are the dictatorships in Africa after the fall of colonialism. Fifth (e), there is *racial and ethnic 'democracy,'* which assumes permanent and legally anchored political dominance by a minority racial or ethnic group over a majority group. Within the privileged minority, basic democratic principles are respected. An example is South Africa during Apartheid – cf. Box 4.7. Sixth (f), there are *defective and pre-totalitarian political situations and regimes,* which include regimes that aspired to become totalitarian but were blocked from moving toward totalitarianism. An example can be the process of communist conquest of *power in Central Eastern Europe in the years 1944-1948. Seventh (g) is post-totalitarian authoritarianism,* which is represented by communist states that have completed the process of de-Stalinization (cf. Box 3.4) and have resigned their totalitarian ambitions. Note that in another book, Juan Linz and Alfred Stepan removed 'post-totalitarianism' from their original typology of authoritarianism and turned it into a separate type of dictatorship (Linz & Stepan 1996) – consult **totalitarianism** for more information.

Linz was followed by Guillermo O'Donnell (1973), who defined three types of authoritarianism: traditional, populist, and bureaucratic. The main criterion is the level of modernization (while Linz favored the mobilization criterion). Traditional authoritarianism (i) is characterized by low modernization, populist authoritarianism (ii) by medium modernization, and bureaucratic authoritarianism (iii) by high modernization. Representatives of traditional authoritarianism are mainly classic military regimes. An example of populist authoritarianism is Juan Perón's Argentina. The main examples of **bureaucratic authoritarianism** are Argentina and Brazil in the 1960s.

An extensive typology of authoritarianism – also following on from Linz – was created by Wolfgang Merkel (1999). His typology includes nine types of authoritarianism: (a) communist authoritarianism, (b) fascist authoritarianism, (c) militaristic authoritarianism, (d) organic-statist authoritarianism,* (e) racist authoritarianism,* (f) modernization authoritarianism, (g) theocratic authoritarianism, (h) dynastic authoritarianism, and (i) sultanistic authoritarianism* (see: **sultanism & neo-sultanism**). Those marked with * fully correspond to Linz's original classification.

Note that many other classifications define authoritarianism more broadly – like **Geddes, Wright & Frantz** or S. **Kailitz,** as shown in Table 1.2 – and have their approach to how this heterogeneous regime archetype can be divided into subtypes. For a detailed overview of how regime types can be mapped, consult the section on **classifications & typologies**.

EXAMPLES One notable example of authoritarianism was Portugal from the 1930s to the 1960s. It was headed by the dictator António de Oliveira Salazar (1889-1970), who presented himself not only as a politician but also as a political theorist. He published theoretical texts in which he tried to defend his dictatorship and argued against the three main ideologies of his time – liberalism, **fascism** and **communism**. He openly rejected democracy and did not hide his authoritarian attitudes in any way (Salazar 1937).

Salazar was conservative, anti-democrat, corporatist, and nationalist. His thinking was based on authoritarian traditions and was inspired by the

social teachings of the Catholic Church. According to him, a strong (but not almighty) state, which is limited by morality, law and God, ensures the organic interest of the nation, not the individual. It is a national dictatorship and not a dictatorship of individuals (their personal power and ambition), social classes or political parties. Only in this way can the harmonious development of society be achieved. Politics then ceases to be politicking and governance is competent and efficient. The basis of the state should be the idea of **corporatism**, which is a means against harmful competition in politics but partly also in the economy. Corporations, unlike political parties, unite the state and society and do not destroy private property. The principle of representation based on professional, social, and economic criteria is more complete than representation based on political parties. **Nationalism** is important, but it is not aggressive, xenophobic, racist, or antisemitic (Corte et al. 2021; Gallagher 2020; Salazar 1937).

Rejecting any utopianism and dogmatism, Salazar considered himself a moderately and pragmatically thinking theorist as well as a practitioner of politics. His goal was to create a 'New State' (*Estado Novo*), which, however, became an ordinary organic-statist authoritarianism (Linz). Salazar ruled as prime minister (1932-1968), and at the same time, he was the head of the only legal political party in the country – the *National Union (União Nacional)*. The legal basis of the state was the Constitution of 1932. All state branches (executive and legislative) belonged to the government, which was independent of the parliament and responsible to the president of the republic. The president was the formal holder of power, but in reality, he only fulfilled the representative role of the head of state and nothing more. All power belonged to the government, but above all to the prime minister (PM), who determined the directions of the country's internal and foreign policy and directed and controlled the activities of other ministers. The ministers were only some sort of assistants to the PM. PM Salazar, therefore, ruled the country personally. An interesting feature of the Portuguese governments was their personnel rather than political composition. Salazar claimed that only the PM and the minister of the interior are political positions; the rest are just part of the technical administration of the country. Although there was a bicameral parliament in Portugal (the *National Assembly* and the *Chamber of Corporations*), it did not influence governance (the legislative process was in the hands of the government). The *National Assembly* was dominated by the *National Union*, which won all the seats in the elections from 1934 to 1973, as the opposition could not participate. The *Chamber of Corporations* was not political but corporative. In practice, parliament was essentially only an advisory and passive institution (Gallagher 1983).

António Salazar was a typical representative of the classical authoritarian thought of the first half of the twentieth century. From this point of view, he did not contribute anything groundbreaking in the field of political theory. However, compared to many other dictators of the time, he stood out for his education and the ability to think theoretically. Also, the political system of the *New State* did not deviate significantly from the authoritarianism of the time. It meant the undemocratic monopolization of political power and the absence of political competition or democratic mechanisms (especially regarding the separation of powers). In short, the regime was Salazar's personal dictatorship, which he personally tried to justify in theory.

IMPACT ON POLICY Authoritarianism fundamentally changes the politics of the country in which it appears. It brings a new political system that is fundamentally opposed to democracy. However, authoritarianism does not necessarily change the whole society. The ambition is not to create a 'new human,' according to some ideological assumptions. Authoritarianism does not seek ideological **indoctrination** of society, which either does not exist at all or is weakly manifested.

NEW FRONTIERS Authoritarianism is a very general concept. In practice, it occurs in many different variants. It means that current research on authoritarianism is not so much about its basic conceptualization, but rather about finding and describing its new forms and functioning (Frantz 2018a; Ezrow 2018). The category of so-called **hybrid regimes** played a big role here (Levitsky & Way 2010; Schedler 2006). The best-known forms of hybrid regimes have been illiberal democracy (Zakaria 2007) and delegative democracy (O'Donnell 1991). Is the hybrid regime a type of authoritarianism, or is it a distinct type of political system? According to Jerzy J. Wiatr (2019: 173-174; 2022: 173-175), this is the first case of the 'new authoritarianism.' It is a civilian (not military) regime with free (but not fair) elections and political pluralism. Still, at the same time, it uses various coercive measures, and, above all, the rule of law does not work, and there is a politicization of justice.

An important issue related to new authoritarianism is the current question of **populism** (see Mudde & Kaltwasser 2017) and its influence on the erosion of democracy or democratic backsliding (Lindstaedt 2021). Is populism creating new types of dictatorship, i.e., new authoritarianism? According to some authors, populism is incompatible with democracy. It is, therefore, inherently a denial of democracy and a threat to it (Pasquino 2008) because it opposes its essential elements, such as the mediation of the will of the people through parliamentary and electoral institutions and procedures, party pluralism, separation of powers, protection of minorities and individual rights, etc. In this context, some authors understand populism as even tending towards totalitarianism (Abst & Rummens 2007; Panizza 2005). Populism has become an essential element of a new form of authoritarianism in the twenty-first century, which, in addition to populism, is characterized by the cult of personality, contempt for the rule of law, and politics driven by fear and nationalism (Rachman 2022).

Marlies Glasius (2018) takes an interesting approach by classifying different autocratic practices and their effects on regimes, therefore aiming

to provide a 'positive' definition of authoritarianism instead of a negative one. Her paper goes beyond elections and focuses on accountability, and not only at a national level. At the level of the international arena, others (e.g., Costa Buranelli 2020) are exploring the phenomenon of 'illiberal solidarism' resulting from distinct authoritarian practices that are being emulated and promoted as fundamental pillars of (regional) autocratic orders. Other works focus on the new tools at the disposal of autocrats and are developing concepts like **digital authoritarianism**.

Authoritarian Personality (Adorno & Fromm)

Intolerance of ambiguity is the mark of an authoritarian personality.
– Theodor W. Adorno, *The Authoritarian Personality* (1950)

The authoritarian character worships the past. What has been, will eternally be. To wish or to work for something that has not yet been before is crime or madness.
– Erich Fromm, *Escape from Freedom* (1941)

The authoritarian personality is a personality type characterized by unquestioning obedience to authority and a strict and oppressive personality toward those considered others or subordinates.

DEFINITION The authoritarian personality was a concept developed in order to explain the support for **fascism** and **totalitarianism** (Adorno et al. 1950). The original tool used to measure authoritarianism was the *California F-scale,* which emphasized what characteristics were present in individuals that would make them more predisposed to anti-democratic **propaganda**.

Authoritarians are defined as individuals who have a higher willingness to submit to authority, whether that be political and/or religious leaders. They tend to hold an uncritical attitude toward authorities of the in-group and identify with leaders who project toughness and strength. Seminal work by Theodor Adorno and his colleagues claimed that there is a preoccupation with dominance and submission. According to Adorno, the authoritarian loves authority and wants to subject themself to it (Adorno et al. 1950). The proclivity toward strong leadership may originate from the issues that authoritarians face in managing uncertainty and ambiguity.

They are also characterized by a very rigid cognitive style and struggle to deal with subjectivity. This leads to boxing people into rigid stereotypes and creating in-groups and out-groups (Frenkel-Brunswik 1954). Authoritarians also hold conventional and traditional values and are more likely to prioritize social order and reject non-conformist behavior (Feldman & Stenner 1997; Hetherington & Weiler 2009). They are more likely to be aggressive toward individuals or groups that they perceive to be exhibiting deviant behavior. Generally, they are threatened by non-conformity and exert hostility toward out-groups; they tend to believe that the world is a dangerous place. In contrast, low authoritarians support individual autonomy, higher tolerance of out-groups, dissent and hostility to authority.

SEE ALSO The authoritarian personality is also associated with dogmatism and social conservatism. While studies of **psychological profiles** are preoccupied with profiling rulers, the authoritarian personality concept was developed to measure the proclivities of potential followers (foremost in right-wing dictatorships). Both approaches are part of a psychological lens through which to understand the individual-level predispositions that align with authoritarian regimes.

KEY SIGNIFICANCE The authoritarian personality helped our understanding of the dispositions in character that would explain the rise of **Nazism** in Germany. The thesis had a huge impact on social psychology and what we would now refer to as political psychology (Altemeyer 1981; 1996; Stenner 2005; Oesterreich 2005; Hetherington & Weiler 2009; Titus & Hollander 1957) and in more general discussions of the relation between power and personality (Chancer 1992). This has been the basis for political psychology studies in South Africa (Duckitt 1983) and the Soviet Union (McFarland et al. 1992). From 1952 to 1987, more than 1200 studies were published on this subject. Work by Altemeyer (1988; 1996) has given researchers more empirical evidence of what the authoritarian personality is. Though there is still no consensus on how to measure authoritarianism or its origins, rising levels of authoritarianism have renewed interest in authoritarian personalities.

ORIGIN The term authoritarian personality originated from the works of Erich Fromm who aimed to explain the popular appeal of fascist movements in European societies, and in particular the voting behavior of citizens for the *Nationalist Socialist Party in Germany* (the Nazis) in the 1930s (Baars & Scheepers 1993). At the time, many scholars believed that the Great Depression in Europe would lead to socialist revolutions led by the working classes. Instead, it resulted in mass support for fascist movements that advocated authoritarian leadership.

As an explanation for why this was the case, it was argued that there was a particular personality type that was widespread, that was vulnerable to the appeal of fascist ideologies. Fromm (1941) and later Maslow (1943) argued that social beliefs were the result of the basic needs in one's personality. The personality type described was conservative, fearful of freedom, submissive to authority, obedient, aggressive, and almost sadist (Reich 1975).

By 1950, Adorno and his colleagues introduced a new syndrome and explanation to measure ethnocentric, authoritarian, or pre-fascist attitudes, known as the authoritarian personality, which will be explained in much more detail in the literature overview.

LITERATURE The concept of the authoritarian personality has been highly controversial, but it has made important contributions to political psychology and to our understanding of how attitudes might be a direct expression of personality. Adorno and his colleagues offered a Freudian analysis of the root causes of authoritarian personalities. Accordingly, our personalities are shaped by events that happened in childhood, most notably a childhood of repression (Adorno et al. 1950). More recent perspectives argued that authoritarians were affected by interactions with their environment (Altemeyer 1988; 1996) and, more specifically, perceived social threats (Feldman & Stenner 1997; Stenner 2005; 2009). Karen Stenner argues that the origin of authoritarian behavior stems from their cognitive and psychological incapacity to cope with diversity and stress. The failure to cope causes authoritarians to default to using strategies that require the least amount of cognitive resources, such as relying on authoritarian leadership (Lavine et al. 2002; 2005). Because authoritarians cannot develop more socially adapting responses to threatening situations, they reject what they find threatening and are likely to be drawn to a dominant authority figure that supports maintaining a strong stance against these threats (Oesterreich 2005; Altemeyer 2004).

Thus, authoritarianism, according to some authors, is a coping strategy that has to be triggered when there is a perception of a threat, which causes higher levels of anxiety comparatively speaking to lower authoritarians (Stenner 2005). Authoritarians are less capable of adapting to new stimuli and social situations, which is why they may struggle with

threats from immigrants (Mather & Jefferson 2016).

Many political psychologists argue that when there is a normative threat, this triggers authoritarian behavior and distinguishes authoritarians from the general public. In certain cases of extreme physical threat (such as in the aftermath of a terror attack), the attitudes of low authoritarians may converge with those of high authoritarians (Hetherington & Suhay 2011). While the public may respond similarly to a security threat, it is only authoritarians that are likely to respond after a normative threat, such as threats to the unity and uniformity of society (Stenner 2005). Authoritarians are also more responsive to threatening messages, which can originate from discourse on normative threats (Lavine et al. 1999).

Given that authoritarians can be triggered by social threats or perceived normative threats to the normative order, parties can resonate with these voters if they take policy stances that deliberately address their psychological motivations and cognitions, such as amplifying the threat from immigrants (Brader et al. 2008; Hetherington & Weiler 2009). Other research has confirmed that perceived normative threats, such as from immigrants, matter most for radical right-wing support – even more so than economic threats (Lucassen & Lubbers 2012; Oesch 2008).

Studies that investigated the relationship between economic inequality and personality found that economic inequality could serve as a trigger for authoritarianism. Failure to address inequalities could yield higher levels of intolerance. A study of 15 advanced democracies found that people who live in countries with welfare policies that reduced inequalities were less likely to believe that immigrants reduced wages, stole jobs and drained public services (Crepaz & Damron 2009). In contrast, countries with higher levels of inequality with limited welfare spending were more likely to exhibit authoritarian attitudes and less acceptance of immigration. If authoritarianism worsens with economic inequality, this is evidence that there is an interaction between genes and the environment, and the context matters (McCourt et al. 1999).

As the name would suggest, studies have argued that authoritarian personalities are more likely to support authoritarian forms of rule. Authoritarian attitudes can also create a climate that is supportive of authoritarian movements (Altemeyer 1996). Notably it is the authoritarian's tendency to submit to authority that leads them to unthinkingly follow strong leaders (Adorno et al. 1950; Feldman 2003). Authoritarians also strongly value social conformity, which may lead them to limit the liberties and rights of segments of society that fail to conform to their values (Feldman 2003).

Studies (Altemeyer 1988; Moghaddam & Vuksanovic 1990) show that authoritarians have displayed negative attitudes toward **human rights** and are prejudiced toward out-groups (Adorno et al. 1950; Altemeyer & Hunsberger 1992; Hunsberger 1995; Wylie & Forest 1992). In South Africa, for example, studies of white authoritarians demonstrated that they were more likely to champion Apartheid (Box 4.7) and support detention without trials and persecution of outgroups (Duckitt 1993; Duckitt & Farre 1994). Other studies have demonstrated that authoritarians from ex-communist countries have opposed the **democratization** process (McFarland et al. 1992; Reisinger et al. 1994).

The work on the authoritarian personality spawned other work by political psychologists looking at the relationship between personality and **ideology**. Recent work in this field has conceptualized support for various ideologies and parties as a form of motivated social cognition that is linked to the need to manage uncertainty and insecurity (Jost et al. 2009). Though studies lack direct evidence of whether or not the relationship is causal, authoritarianism has generally been associated with right-wing attitudes and identifications (Hetherington & Weiler 2009; Stenner 2005; Stone & Smith 1993).

Ideology and authoritarianism also stabilize near the outset of adulthood (Sears 1983). This is due to the fact that authoritarians fear taking risks and social instability. They have a strong need for law and order – needs that are associated with supporting right-leaning ideologies that support the traditional power arrangements. Studies that have looked at the psychological traits of individuals that support the extreme right have found that they show relatively stronger psychological and physiological responses to negative or threatening stimuli (Hibbing et al. 2014). Authoritarians are also drawn to parties that focus on the exclusion of out-groups as the solution for all of their social and economic problems (Klusmeyer 1993).

For the most part, authoritarians have been most attracted to radical right-wing populist parties due to their views on socio-cultural policies, not due to their views on socioeconomic policies, such as being tough on immigration and crime, for example (Rydgren 2005). Right-wing parties are not as appealing to authoritarians as radical right-wing populist parties because *laissez-faire* economic policies provide more uncertainty (Houtman 2003). Authoritarians are also more likely to advocate the use of military force over diplomacy (Kam & Kinder 2007; Hetherington & Weiler 2009). Supporters of left-leaning ideologies that promote massive change are also typically more open to experience, have more cognitive complexity and are able to tolerate uncertainty and ambiguity better (Jost et al. 2009; Duckitt & Sibley 2009).

However, researchers have suggested that authoritarians can also be found on the far left as well. The brutal left-wing regimes in Eastern Europe and the Soviet Union led scholars to believe that the left could also attract authoritarians (Shils 1954). For example, authoritarians may support the security that a regulatory state provides, such as housing and employment (Malka et al. 2014). The issue, however, is that the far left in many countries often represents groups that are traditionally not part of the mainstream and do not represent the status quo. Given that authoritarians are less comfortable with pushing for massive social change and destabilizing challenges to the existing order, this would explain why author-

itarians have been less likely to gravitate toward the left (de Regt et al. 2011; Jost et al. 2009; Napier & Jost 2008). That said, when a left-wing party is mainstream and when left-wing politics constitutes the norm, such as in Eastern Europe, authoritarians should face little internal conflict about aligning themselves to the left. Authoritarians who grew up in left-wing despotic regimes have been nostalgic about left-wing panaceas for the issues facing their countries today. Barring the left does not constitute the norm; it is more likely that left-wing authoritarians will disengage from politics. Thus, in countries where left-wing politics is not mainstream, if authoritarians who identify with the left become less politically interested, this lowers the chances that elites will adopt policies to appeal to them (Adams & Ezrow 2009).

That same cycle also can take place on the right. If a radical right-wing populist party emerges that is not mainstream enough, it may not gain support from authoritarians. Authoritarians may be late to join radical right parties – deciding to offer their support once they believe that the party has become mainstream enough. Authoritarians are highly conventional, prone to conform to in-group norms and rules of conduct, and will adjust their attitudes to conform to group norms (Duckitt 1989; Altemeyer 1996; Oyamot et al. 2006; 2012; Stenner 2005).

CLASSIFICATIONS Different constellations of personality traits explain the variation in the authoritarian personality (cf. **psychological profiles**). The only other classification is the distinction between right-wing and left-wing authoritarians.

METHODOLOGICAL ISSUES & MEASUREMENT The authoritarian personality is measured in various ways. However, these measures have been very controversial. The work on the authoritarian personality was one of the first major works in political psychology to combine theoretical claims with social science methods. However, these early studies were heavily criticized on a number of methodological grounds and the literature on the authoritarian personality has differed in terms of how to measure the concept and how an authoritarian personality develops.

One of the issues is that it is problematic to make a psychoanalytic interpretation of personality, and it was difficult to empirically validate a typology that made categorical distinctions between different types of personalities. It also was not clear that the measures being used clearly fit the concept. Milton Rokeach (1954) worked on the concept and renamed it 'dogmatism' to explain the rigid cognitive style that would be attracted to authoritarian movements of either the left or the right. To do so, Rokeach developed a *D-scale* to measure dogmatism, but this was more or less the same as the *F-scale* and shared the same problems. Additionally, neither study used blind ratings or control for socio-demographic and other differences.

There were also issues with Adorno's thesis that the origins of authoritarianism stemmed from Freudian explanations of one's childhood, as later studies demonstrated that there was little empirical support for this. Gordon Allport (1954) argued that these traits were the result of the ego's weakness or personal insecurity and fearfulness. This personal insecurity and fearfulness caused authoritarian personalities to need structure, order, and control of their social environments. It would also cause them to react harshly to social change or unconventional behavior. Allport did not measure his concept, but his simplified explanation influenced later works.

There were also criticisms of the use of a *F-scale* personality test. All of the questions on the test to produce the scale were worded in a way that an agreement indicated an authoritarian personality. As there is a tendency to agree with questions, this produced high scores of authoritarianism. Some people who tended to acquiesce may have been falsely identified as authoritarians. Subsequent research tried to improve the *F-scale* so that there were an equal number of authoritarians and non-authoritarians and so the results would not be so lopsided and influenced by acquiescence.

Another researcher, Glenn Wilson (1973), renamed the concept 'Conservativism' and suggested that some personalities were more susceptible to anxiety when facing uncertainty and would adopt authoritarian social attitudes, which a *C-scale* could measure. The improvement with the *C-scale* is that it required responses of both agreements and disagreements. The *C-scale* was so highly correlated with the *F* and *D-scales* that it suggested that there was little to no difference in what was being measured. Thus, there was a struggle to produce a valid measure of the personality dimension.

Finally, there were criticisms that the measure was biased against right-wing authoritarians. The measure led to the conclusion that authoritarianism would only exist in the right political ideologies, even though so many authoritarianists were living in communist regimes.

Altemeyer (1981) constructed a scale to measure *right-wing authoritarianism* (RWA) but only looked at 'conventionalism,' 'authoritarian submission,' and 'authoritarian aggression.' Limiting the *RWA scale* to attitudinal expressions of these three components led to higher levels of internal consistency. Further studies by Robert Altemeyer disputed Adorno's original psychoanalytic theory that strict child-rearing caused individuals to develop a strong RWA score. Instead, Altemeyer argued that RWA developed through socialization and personal experiences in late adolescence but could decrease when exposed to a liberal education and increase yet again when exposed to a threatening social crisis.

EXAMPLES As mentioned previously, the authoritarian personality (and Adorno's 1950 thesis) had been dismissed on methodological grounds for many years in political science. However, with the rise of Donald Trump, Viktor Orbán, Jair Bolsonaro, Narendra Modi and Rodrigo Duterte, and the rise of right-wing authoritarian populist parties in Europe more generally, there has been an increased fascination with the original authoritarian personality thesis. Hetherington and Weiler predicted the rise of an

authoritarian candidate in US politics due to findings in their 2009 book that authoritarians had been taking over the *Republican Party*. In contrast to the past, where authoritarians may have been drawn to either the Republican or the Democratic Party in the US, over time, this shifted with authoritarians mostly congregating in the *Grand Old Party* – GOP.

Hetherington and Weiler (2009) argued that this process helps us understand the rise of the likes of Trump, a candidate who has drawn support from authoritarians and won two presidential elections. Trump's campaigns tapped into their fears of the unknown, of migrants, and of losing one's identity. Authoritarians long for the good old days, and by using the effective campaign slogan of *'Make America Great Again!'* (MAGA) Trump was able to appeal to this type of voter, subsequently propelling a political novice into the highest elected office in the US in 2016 and winning the popular vote again in 2024. Voters in the Philippines, Hungary, Poland, Brazil, India and France (to name a few) have also been drawn to campaigns that tap into fears of non-conventionalism and immigration, drawing concerns that many countries are taking an authoritarian turn.

IMPACT ON POLICY The prevalence of authoritarianism would pose an issue for democracy. To address this, studies that looked at the rise of **fascism** have pointed to the importance of certain learning and teaching styles and what is taught in the educational system. Research in **education** focused on stressing flexible and non-dogmatic thinking in children during the formative years of their education in order to combat this style of thinking. It is also important within the educational system to teach norms of tolerance and inclusion. However, the educational system has become a battleground in the fight against authoritarianism. Efforts to teach norms of tolerance, inclusion and complex political topics have led to a backlash in some parts of the US, where local governors and politicians have objected to teaching a curriculum that appears to be 'politicized.' Brazil has faced a similar backlash against politics, with the topic being banned from discussion in the classroom while also shunning educators from teaching gender and sexuality education (cf. **gender equality**).

Autocracy

The first thing to be said about non-hereditary dictators is that they have obtained their position by climbing the slippery pole. They are normally highly intelligent, personally brave, because the contest for dictatorships is dangerous, and rather unscrupulous.
– Gordon Tullock (2004)

Today, autocracy is used synonymously with dictatorships (and authoritarianism). The term implies a distinction from other political systems in terms of the role played by force in the acquisition and transfer of power as well as the concentration of power in one person or a small group. (Heslop 2024) For this reason, it differs from regime types where the real power is diffused, or leadership is structurally collegial (feudalism – Box 1.14) or where force is not the main source of power (cf. electoral regimes). Nevertheless, these differences have been poorly delineated and will not counter the contemporary practice of their use. Their nearest equivalent is 'closed regimes.'

In the words of Gill (2021): *"The study of non-democratic politics is bedevilled by a plethora of terms that are used almost interchangeably and without clear definition: 'authoritarianism,' 'autocracy,' 'tyranny,' 'dictatorship' and 'despotism,' to name only the most common. There is no clear and accepted distinction in meaning among these terms, although the last three do seem to have a significantly more pejorative edge to them than the first two. Much of the discussion about the respective merits of these terms amounts to meaningless hair-splitting."* (Gill 2021: 8)

The 'auto-' prefix in autocracy derives from the Greek αὐτός', which means 'by oneself' or 'of oneself.' The term, therefore, implies governing by oneself – or governing without including one's rivals or challengers. (Anderson et al. 2021: 13) This became the Hellenistic/Byzantine Greek word for emperor, *Autokrator* (αὐτοκράτωρ), and spread to various parts of Western Eurasia. The term was used alongside the Latin *Imperator* (emperor) and *Kaiser* (Bavarian and Austrian spelling) or *Kaisar* (Old High German), both from the Latin *Caesar* (a surname of the Julian gens in Rome, elevated to a title after Gaius Julius Caesar (100-44 BCE) became dictator of Rome; it was used as

a title of emperors down to Hadrian (138 CE) (Harper, no date, b).

The term 'autokrator' gained prominence as a formal title for Russian rulers after their emancipation from Mongol rule and their subsequent consolidation of centralized authority in the Russian lands. It became widespread, especially under Ivan IV (Ivan the Terrible) in the sixteenth century, who in 1547 had styled himself as 'Tsar' and 'Autocrat of All Rus' (Всея Руси Самодержец – *Vseya Rusi Samoderžec*) – among other titles. It is a literal transliteration of *Autokrator* with 'samo-' meaning 'auto-' and 'deržec' – 'krator'). By 1721, all Russian tsars were routinely referred to as: 'Emperor and Autocrat of All Russia.' The term 'Tsar' (Царь) was an older title from the first Bulgarian empire (ca. 680-1018) – of course, derived from the Latin 'Caesar' – and was adopted by the Russian princes to stress they were now the overlords after ridding themselves of the 'Mongol yoke.' It was meant to indicate equal rank with the emperor of the Holy Roman Empire as well as being the supreme powerholder in these lands.

So autocracy was fully associated with (Russian, tsarist) monarchy, and this version differed significantly from other monarchies in Eurasia due to its unique blend of religious, patrimonial, and absolutist characteristics, as well as its divergence from the feudal and constitutional traditions seen in Western Europe.

Russian tsars claimed both secular and spiritual authority. This was rooted in the concept of caesaropapism (Box 1.17), where the tsar was seen as God's representative on Earth and held supreme authority over religious matters. This dual role was formalized under Ivan III and later reinforced by Peter the Great's reforms, which subordinated the *Russian Orthodox Church* to state control. Russian tsardom was also characterized by **patrimonialism**, where the tsar owned a much larger proportion of state lands, enterprises, and resources compared to Western monarchs. The state was effectively an extension of the tsar's personal property, as were (in a way) the unfree serfs living and working these lands for their direct superiors.

While **absolutism** became a retroactive label for various forms of centralized rule across Eurasia, Russian tsardom had maintained a rather personalist and extreme form of autocracy that lacked constitutional constraints until very late in its history (e.g., after the 1905 Revolution). Unlike Western European monarchies that transitioned toward constitutional or parliamentary systems (e.g., Britain after the Glorious Revolution), Russian rulers retained unchecked power over legislative, executive, and judicial functions, even though their monarchy had become very bureaucratic. Even after reforms introduced limited representative bodies like the *Duma* in 1906, these institutions remained subordinate to the Tsar's authority.

The English word 'autocracy' appeared in the mid-seventeenth century, with its earliest recorded use in 1655. Initially, it referred to 'independent power' or 'self-government,' but by 1855, it had acquired its modern meaning of 'absolute government' or 'unlimited political power vested in a single individual' (Harper, no date, a). It is fair to say that observers in the nineteenth century had blended the concepts of (Russian) autocracy and absolutism (also in Russia, cf. Belova & Britskaya 2018), but its defining monarchical aspects diluted with the onslaught of republican transitions (**republicanism**). This shift reflects broader historical developments, including the decline of feudal systems and the rise of centralized monarchies and dictatorships (Harper, no date, a).

After WWI, the emergence of the novel totalitarian phenomenon ruffled earlier regime classifications in the 1950s. Only when J.J. Linz (1975) re-interpreted **authoritarianism** to contrast it with **totalitarianism** did both become subsets of the older, general term of autocracy (as shown in Table 1.2), which also still included most monarchies and other forms of traditional rule (Linz's authoritarianism did not).

Note that the typology by **Linz & Stepan** was primarily responsible for this shift in meaning and that interwar scholars had been using autocratic and authoritarian as synonyms before the post-war generations of scholars started dominating the field. (Morgenbesser 2024) For instance, Diana Spearman (1905-1991), a British political thinker, states in her work *Modern Dictatorship* (1939: 10) that: *"Modern autocracy has assumed the extreme form of authoritarian government, that of the centralization of government in the hands of a single man. How far in practice the dictator actually exercises the powers attributed to him it is not possible to say, but in theory he is absolute, and he is retrained by no legal or constitutional rules."* (Cited in Morgenbesser 2024).

In any case, notwithstanding his influence on the field, Linz's distinction did not last, and by the late 1980s, most scholars used the terms dictatorship, autocracy and authoritarianism as synonyms (like the authors in this encyclopedia) unless when juxtaposing authoritarianism and totalitarianism. For example, G. Tullock (1987) – somewhat vaguely – separated autocracies as those regimes that are not feudal nor electoral. He equated the term with dictatorship. In his understanding autocracy could include some hereditary monarchic systems and was defined as a form of government characterized by centralized and absolute power, where authority is concentrated in the hands of one individual or a small group. Tullock's analysis is framed through rational choice theory and centers on the challenges faced by autocrats in maintaining power. He argues that the primary concern of an autocrat is retaining control, which routinely overshadows other policy goals.

So, while historically, the term 'autocracy' implies highly concentrated and unchecked power, its narrow definition applies to those autocracies where all opponents, challengers, or political alternatives outside of the ruling group are excluded from executive decision-making and rule (cf. Anderson et al. 2021: 13). In its broader definition it is applied synonymously with dictatorship and authoritarianism.

Black Knights

For fals Fortune hath pleyd a game;
Atteches with me, allas, the whyle!
The trayteresse fals and ful of gyle,
That al behoteth and nothing halt
– The Black Knight lamenting
G. Chaucer, *Book of the Duchess,* v. 618-621.

'Tis but a scratch.
– The Black Knight, *Monty Python and the Holy Grail*, 1975.

Black knights are a colorful term for spoilers in a democratization process. A label for those actors that hinder or circumvent democracy support.

DEFINITION A black knight is an actor that promotes or strengthens authoritarianism in another state, either by using its leverage to halt or reverse democratic developments and consolidation or by intransigently supporting an authoritarian regime (in crisis) that could democratize otherwise (Van den Bosch 2015).

SEE ALSO The term is often used in combination with the **linkage & leverage** theoretical frame, and a black knight's actions fall under **authoritarian collaboration** and **authoritarian promotion**, sometimes even **regime promotion.**

ORIGIN The term 'black knight' was first used in the context of economic sanctions imposed on the autocracies by the democratic West. From this point of view, black knights are *"counter-hegemonic powers whose economic, military, and/or diplomatic support helps blunt the impact of U.S. or EU democratizing pressure."* (Hufbauer et al. 2007; Levitsky & Way 2010: 41). Originally, the term did not receive much attention: In their works on hybrid regimes and democracy promotion across the globe, S. Levitksy & L. Way focused foremost on Western actions and institutions, and the importance of geographical proximity to the West. As an extension, foremost autocratic regimes like Russia, hindering the West's democratic projections in Eastern Europe and beyond, have received the label (e.g., Del Medico 2014; Lebanidze 2014; Natalizia 2019). Levitsky and Way also brought up that China, Japan, France, and South Africa have played such roles as well in the past (Way & Levitsky 2007).

LITERATURE The term is most commonly applied to describe actors circumventing (Western) economic or human rights **sanctions** (Early 2011; Shyrokykh 2022; Sejersen 2019) or within **linkage & leverage** frames for actors engaged in **authoritarian promotion** and **authoritarian collaboration** (Levitsky & Way 2010; Tolstrup 2015; Chou 2017).

Tolstrup (2015) conceptualized a framework for 'black knight bolstering,' meaning electoral interference by external actors in supporting authoritarian regimes during elections to ensure their continuity in power. This support is typically motivated by geopolitical or economic interests or the fear of undesirable regime changes (in proximate countries or strategic allies). The mechanisms of such interference include signaling invincibility to deter opposition, preventing elite defection, undermining opposition activities, managing popular protests, and counteracting pressures from foreign democracy promoters. Russia's interventions in Ukraine (2004), Belarus (2006), and Moldova (2005 and 2009) serve as examples. In all these cases, Russia provided substantial political, financial, and strategic support to bolster incumbent regimes. This included organizing campaign strategies, providing financial resources for

populist policies or vote-buying, endorsing election results despite irregularities, and using diplomatic channels to discredit opposition forces. While such interference can stabilize authoritarian regimes temporarily, it does not guarantee electoral success, as domestic and international factors can counteract these efforts and influence the final result.

METHODOLOGICAL ISSUES Black knight behavior is intrinsically linked with **democratization**. Without the latter, the former cannot be qualified. Only if a democratization process is hindered by outside intervention may we label that external actor's behavior as that of a black knight. Without the democratization context, the label does not apply, not even with extreme cases like **regime promotion** – e.g., if state A topples an autocratic regime in state B and replaces it with a loyal autocracy for security reasons to gain more influence or for pure imperial motives – this is not black knight behavior, just power politics.

There is some biased assumption that only autocratic states can be 'black' knights – *de facto* rendering all actors promotion democracy 'white' knights – but in essence, it does not matter if a black knight is authoritarian or democratic, solely its actions in international politics determine its label. A welcome exception that exposes this nuance is T. Ambrosio's (2014) treatise on US actions to shore up authoritarian Bahrain in the face of nascent **Arab Spring** protests. Strating (2020) provides a critical analysis of Australia as a black knight when it comes to its anti-refugee foreign policy in its neighborhood.

Bureaucratic Authoritarianism

Democracy is and always will be in some kind of crisis, for it is constantly redirecting its citizens' gaze from a more or less unsatisfactory present toward a future of still unfulfilled possibilities
– Guillermo O'Donnell (2007)

Bureaucratic authoritarianism (BA) is a form of authoritarian regime characterized by a strong bureaucratic organization and technocratic decision-making, often led by the military as an institution rather than through personalist rule. It is associated foremost with Latin America in the 1970s and 1980s and has been very influential in challenging prevailing theories of modernization and democratization of that time.

DEFINITION BA is a form of the authoritarian state characterized by the significant influence of coercive specialists, such as the military and technocrats focused on economic normalization. The concept was developed by Guillermo Alberto O'Donnell Ure (1936-2011) in the 1960s and 1970s to analyze authoritarian regimes in South America. BA regimes are distinct from other authoritarian forms, such as traditional, populist, and fascist **authoritarianism**, and differ from **totalitarianism** in that they do not completely erase the distinction between state and society.

National leadership was primarily composed of individuals who had gained prominence not through

political careers but through bureaucratic roles in large public and private organizations, including international agencies and transnational corporations. Rotation in the presidency among military leaders was a common, though not universal, trait. The decision-making styles of these leaders were typically technocratic (Collier 2001).

Key characteristics of BA states, as identified by O'Donnell, include a class structure dominated by a highly oligopolized and transnationalized bourgeoisie, which serves as the main social base of the BA state. These regimes emphasize coercion and the suppression of political dissent to restore 'order,' often resulting in the political exclusion and deactivation of previously active popular sectors. Decision-making in BA regimes is technocratic, focusing on 'normalizing' the economy through orthodox economic policies aimed at stabilization, implementing deep structural changes, and opening the economy to international capital. Additionally, these regimes typically close democratic channels of access to government.

BA regimes often emerge in the context of severe economic and political crises associated with 'high modernization' in developing countries. While some scholars argue that BA is limited in applicability and overly focused on specific historical circumstances, others, like David Collier, suggest that it may be challenging to falsify generalizations about its social and economic impact because O'Donnell defines BA partially by its consequences (Remmer & Merkx 1982).

Countries identified as approximating BA include Argentina, Brazil, Chile, Uruguay, Spain, Mexico, Greece, South Korea, the Philippines, Poland, Hungary, and Austria (Collier 2001). Further insights into BA can be gained by examining its relationship to concepts such as **bureaucracy** and **patrimonialism**. Max Weber's concept of bureaucracy as a modern form of administration characterized by formal rationality, hierarchy, and impersonality offers insights into the functioning of the BA state. However, some scholars caution that focusing solely on bureaucratic aspects may obscure the power dynamics and resource struggles inherent in these regimes.

The **legitimacy** of BA regimes is inherently fragile due to their reliance on coercion and exclusionary practices, making it difficult for them to secure genuine legitimacy. This fragility underscores the challenges these regimes face in maintaining stability over time (O'Donnell 1973; Remmer & Merkx 1982).

SEE ALSO This entry relates to **bureaucracies** and **military regimes** as well as **modernization theory** and **democratization** and **transitions**. It overlaps with **technocracy** and supplanted earlier Latin American regime types associated with **oligarchy** and **corporatism**.

ORIGIN In the 1970s, militaries ended up creating BA due to several intertwined factors. First, the military possesses a natural advantage in politics because of its superior organization, monopoly on arms, and emotionally charged symbolic status in many societies (Stepan 1988). This inherent power structure allows a military to assert itself in political arenas more effectively than other groups.

Already in 1962 S.E. Finer posited that the professionalization of the military further increases its propensity for political intervention. It tends to make the military more self-centered and focused on its technical tasks, potentially reducing officers' concerns with broader political issues. The military is typically protective of its corporate status and privileges and may intervene to preserve its autonomy or extend its interests and privileges rather than acting in the national interest. Furthermore, the military may perceive itself as the only group capable of establishing or maintaining order within a society, particularly in contexts where political instability or chaos exists (Nordlinger, 1977; Finer 1962).

Military regimes frequently lack legitimacy in the eyes of the public. To address this deficit, they seek to 'regularize' their position by incorporating civilian trappings, including technocratic governments (Finer 1962). Military regimes often embrace modernization as a central goal, aiming to transform their societies through economic development, technological advancement, and social progress. In Latin America, for example, the military often employed BA to advance modernization, particularly in countries like Brazil and Argentina (Perlmutter 1977).

Incorporating technocrats, who are less likely to challenge the military's dominance, provides a stable source of support for the regime while allowing the military to focus on maintaining control. This is illustrated in Nassarist Egypt (1954-1970), where the military sought to secure its position by incorporating technocrats and neutralizing potential opposition from the bureaucracy. (Perlmutter 1977). For example, figures such as Ibrahim Helmi Abdel Rahman, a US-trained economist, were involved in national planning efforts to roll out Arab Socialism (Box 4.9).

KEY SIGNIFICANCE The concept of BA emerged in the 1960s and 1970s as a response to the inadequacies of existing theories of modernization and authoritarianism in explaining the rise of a distinct type of authoritarian regime in South America. Guillermo O'Donnell (1973), who developed the concept, argued that in some cases, high levels of modernization could lead to political authoritarianism rather than democracy, contradicting the expectations of the dominant 'paradigm of affirmative politics,' which assumed a positive correlation between economic development and democratization (**modernization theory**).

O'Donnell's concept was significant for several reasons. First, it challenged the prevailing optimistic assumptions about the relationship between economic development and democracy, demonstrating that modernization could produce authoritarian outcomes instead. Second, it provided a new lens for understanding the political dynamics of developing countries undergoing rapid industrialization and social transformation, particularly in South America. Third, it offered a framework for analyzing the specific characteristics of these regimes, distinguishing them from other forms of authori-

tarianism. (Remmer & Merkx 1982; Everett 2022). The concept also emphasized the role of the state in promoting a particular model of economic development. This model was characterized by the exclusion of the popular sector and a close alliance between state actors and a highly oligopolized and transnationalized bourgeoisie (O'Donnell 1988).

Additionally, O'Donnell highlighted the importance of threat perception in shaping the behavior of bureaucratic-authoritarian regimes. He argued that the level of perceived threat prior to a **coup** significantly influenced both the extent of **repression** and the degree of political and economic 'normalization' pursued by these regimes (Remmer & Merkx 1982).

By focusing on the interplay between social, economic, and political factors, O'Donnell's concept provided a more nuanced and historically grounded understanding of **authoritarianism** in contexts of late development. His work has had a lasting impact on the study of authoritarian regimes, sparking debates about modernization, democracy, and the role of the state in developing countries (Remmer & Merkx 1982).

LITERATURE Guillermo O'Donnell's (1973; 1986; 1988) works in the 1960s and 1970s are the basis for the study of BA, but they absolutely did not constitute a consensus on Latin American politics. A great review of the concept can be found in the collective work edited by Collier (1979). O'Donnell's concept did spark many debates on politics, modernization and democratization, and still does: Brinks et al. 2014.

BA began to disappear as global political dynamics shifted toward democratization in the late twentieth century. This decline is attributed to several factors, including increased international pressure for democratization, economic crises that undermined the legitimacy of authoritarian rulers, and domestic movements advocating for democratic reforms. With mounting challenges both internally and externally, these regimes transitioned toward electoral governments after popular uprisings or negotiated **transitions**.

As with many older concepts (e.g., **prebendalism**), scholars tend to re-engage with them and dust them off to explore alternative viewpoints or critical lenses that have fallen out of disuse. Researchers fall back on the term for the study of bureaucratic legacies (Elías 2017; Graham 2019) or the study of the historical cases of that time: Ma 1999 (on Chile); Bogliaccini et al. 2021 (on Uruguay). There are some examples of its application to other word regions: Everett 2022 (on Russia); Domínguez 2002 (on South Korea); Kressel 2019 (on Spain).

Censorship in a Digital Age

For intellectual life bad conditions are good and good conditions are bad.
– Constantin Noica (1909-1987), Romanian Philosopher and poet

To be for or against censorship as such is to assume a freedom no-one has. Censorship is. One can only discriminate among its more or less repressive effects.
– J. Michael Holquist (1935-2016), Scholar of Slavic language and literature

Censorship has long been a tool of control wielded by regimes to shape thought, suppress dissent, and maintain authority. However, have autocrats moved away from George Orwell's (1949) premise of *1984* with its totalitarian control on reality: *"Who controls the past controls the future: who controls the present controls the past,"* and maybe moved on to Aldous Huxley's (1932) *Brave New World* with its more insidious forms of pacification, where *"truth would be drowned in a sea of irrelevance,"* reflecting a world where distractions and over-saturation replace outright suppression.

In the last hundred years, censorship has evolved between these dystopian ideal types, and the advent of Artificial Intelligence (AI) has the potential to locate a nightmarish equilibrium between these two extremes in technologically advanced, high-capacity autocracies.

SEE ALSO This entry brings together various aspects of regime behavior: **repression**, **disinformation**, **cyber-warfare** and **propaganda**, and links them to the logic of regime survival both domestically (**legitimacy**) and internationally (**external legitimacy** and **soft power**). It shortly introduces the evolution of censorship from pre-modern times, the era of **totalitarianism** to the digital age of today's **digital authoritarianism**.

DEFINITION Censorship, traditionally understood, was defined as an external, coercive, and repressive act, typically carried out by the state or state-like institutions to control thought and expression. This liberal conception of censorship emerged from the Enlightenment's struggle to free intellectuals from the dominance of the church and, later, the state. It views censorship as an authoritative intervention in the free exchange of ideas, characterized by force and repression aimed at prohibiting, silencing, or erasing certain ideas or expressions. However, this classical framework is limited as it overlooks the roles of private actors and structural forces in shaping discourse (Bunn 2015).

'New Censorship Theory' broadens this definition by including not only state repression but also a wide range of social institutions, practices, and actors that influence discourse in subtle and often invisible ways. This perspective draws on critiques of liberal civil society by Marxist thinkers like Jürgen Habermas and is further refined by post-structuralists such as Michel Foucault and Pierre Bourdieu. Structural censorship, a central concept in this theory, highlights how mechanisms like market forces, cultural norms, and self-censorship shape communication. Foucault notably argues that censorship can be productive rather than purely repressive, as it can incite new forms of discourse and delineate the boundaries of acceptable speech (Bunn 2015).

In the digital age, the understanding of censorship has evolved further under the influence of the New Censorship Theory. The Internet has introduced novel opportunities for censorship by both states and private actors. Governments now employ sophisticated technologies to monitor online activity, censor content, and manipulate information flows. At the same time, private platforms like social media companies play a significant role in moderating content, often blurring the lines between state and structural censorship.

CLASSIFICATIONS The digital age has both exacerbated existing challenges and created new ones, as regimes and corporations now have access to unprecedented tools for controlling information and manipulating public opinion. Censorship, as a phenomenon, can thus be understood from three angles, although these intersect.

State Censorship This involves direct suppression by government authorities through measures such as prior restraint (requiring approval before publication), post-publication repression (confiscating texts or punishing authors), economic coercion (financial penalties to deter speech), and Internet filtering (blocking access to specific websites or content) (Perry & Roda 2017; Gerschewski & Dukalskis 2018; Bunn 2015).

Structural Censorship This refers to indirect mechanisms embedded within social structures that shape discourse invisibly. Examples include market forces (economic incentives influencing what gets published), cultural norms (unwritten rules guiding acceptable speech), and self-censorship (internalizing norms to avoid expressing certain ideas) (Bunn 2015; Perry & Roda 2017). Sheen et al. (2024) find that the effects of self-censorship linger even after free speech liberalization because the media can always be punished for their truth-telling ex-post. This has serious implications for information-gathering in dictatorships and underscores the difference between censorship and self-censorship because when deciding whether to censor a report, the regime still learns the information; when the information provider self-censors its report, the regime is not able to learn the information.

Digital Censorship In the digital realm, as shown in the entry for **digital authoritarianism**, technology enables new forms of control over information. This includes social media censorship (removal of content

or suspension of accounts), search engine manipulation (altering search results to promote or suppress viewpoints), surveillance (monitoring online activity – cf. **repression**), **disinformation** and **propaganda** (spreading false information to manipulate public opinion), and cyberattacks (hacking to silence critics or disrupt communication – see also **cyber-warfare**) (Roberts 2022; Dukalskis 2021; Schlumberger 2023).

These types of censorship are not mutually exclusive and often intersect. For instance, state censorship can be reinforced by structural mechanisms when governments pressure social media companies to remove content. (Perry & Roda 2017) To achieve these goals, dictatorships employ a range of censorship techniques, which Dukalskis (2021) groups in the following categories:

Obstructive Censorship (A) focuses on directly suppressing unwanted information and silencing critics through methods such as extraterritorial censorship and domestic censorship, and targeting specific individuals or groups. *(i) Extraterritorial censorship* involves pressuring international companies to censor content, manipulating foreign scholars and journalists, or intimidating dissidents abroad through harassment or violence. *(ii) Domestic media control* of narratives by employing prior restraint, post-publication repression, economic coercion of media outlets, Internet filtering, website blocking, and deploying social media bots to manipulate online discussions. *(iii) Targeting specific critics* who pose direct threats are often targeted through administrative obstacles, reputational attacks, intimidation, or outright **repression** (Gerschewski & Dukalskis 2018; Dukalskis 2021).

Promotional Censorship (B) complements these obstructive measures by actively promoting positive narratives about the regime while downplaying or distracting from negative information. *(a) Public diplomacy campaigns* and *nation branding initiatives* are used to improve the regime's image abroad by showcasing achievements and emphasizing shared values with target audiences. *(b) Diffusion* messaging through **propaganda** and **disinformation** further shapes public opinion by spreading favorable messages about the regime's policies while employing tactics like 'whataboutism' to deflect criticism (Dukalskis 2021).

Despite these advancements in censorship technology, dictatorships face inherent challenges in balancing control with the need for accurate information – a dilemma known as the 'authoritarian data problem.' While censorship helps maintain power by limiting dissenting voices, it can also restrict the flow of valuable information necessary for effective governance. This tension underscores the complexity of modern authoritarian censorship strategies: even as regimes invest in increasingly sophisticated methods of control, they must navigate the risks posed by their efforts to suppress dissenting perspectives (Yang & Roberts 2023; Roberts 2022).

LITERATURE The literature on censorship has undergone significant evolution, reflecting shifts in the understanding of its mechanisms and purposes from pre-modern times to today's authoritarian regimes. In pre-modern and early modern contexts, censorship was predominantly focused on religious texts and enforced by the church and confessionalizing states. The most famous example would be the *Index Librorum Prohibitorum* or 'Index of Forbidden Books' (see also Box 4.4). Before Enlightenment its primary aim was to define and maintain religious orthodoxy, and its implementation was often arbitrary and inconsistent. (Bunn 2015) This period marked an era where censorship was largely seen as a tool for suppressing dissent against dominant religious ideologies (cf. **religions**)

The Enlightenment brought about a significant challenge to these practices as intellectuals sought freedom from the authority of both church and state. Arguments for free speech emerged, emphasizing the distinction between legitimate rule and arbitrary domination. The liberal conception of censorship that developed during this time framed it as a coercive and repressive act carried out by state authorities, aimed at silencing dissent and controlling thought. However, this view remained limited in scope, focusing narrowly on overt state **repression**. (Bunn 2015) Johns (2009) explores the interplay between censorship, printing technology, and the development of knowledge. Darnton (2014) examines how censorship functioned in practice, particularly in the context of the Enlightenment.

In the nineteenth century, Marxist critiques expanded the understanding of censorship by highlighting its role in maintaining ruling class power through ideology. Thinkers like Antonio Gramsci introduced the concept of 'hegemony' to explain how consent was manufactured via control over institutions such as education and the press. This perspective revealed that censorship extended beyond state coercion to include subtler forms of control embedded within societal structures (Bunn 2015).

The totalitarian regimes of the twentieth century, such as Nazi Germany and the Soviet Union, exemplified a more extreme form of censorship – at the level of book burning (Box 4.4) and far-reaching state control over **academic freedom** (Connelly & Grüttner 2005). These regimes used censorship not only to silence dissent but also to shape public opinion and construct totalizing ideologies actively. Traditional methods like prior restraint and post-publication repression were combined with propaganda, mass surveillance, and other innovative techniques to enforce ideological conformity (Dukalskis 2021).

The late twentieth century saw the emergence of 'New Censorship Theory,' which built upon Marxist critiques while incorporating insights from post-structuralist thinkers like Michel Foucault and Pierre Bourdieu. Foucault (1990) challenged the traditional view of censorship as purely repressive, arguing that Victorian-era censorship surrounding sexuality actually stimulated discourse and led to the proliferation of new forms of knowledge and power. Bourdieu (1999) was essential for understanding structural censorship, which operates through social norms, specialized languages, and the dynamics of power within specific domains. He emphasizes how self-censorship and other unreflective modes of con-

trol can be more powerful than overt state repression

The New Censorship Theory shifted attention from overt state repression to the productive and structural dimensions of censorship. It argued that censorship is not merely an external force but a pervasive aspect of communication itself, operating through mechanisms such as market forces, cultural norms, and self-censorship. Foucault emphasized that censorship could be generative, shaping discourse and creating new forms of expression rather than solely repressing them (Bunn 2015; Perry & Roda 2017).

Sue Curry Jansen (1988) provides a comprehensive overview of censorship theory and its evolution. Judith Butler's (1997) work examines the relationship between censorship, language, and power, particularly in the context of hate speech and free speech debates. She critiques the traditional liberal conception of censorship and introduces the concept of 'foreclosure' to describe how certain forms of speech are excluded from public discourse.

In contemporary authoritarian regimes, censorship has adapted to technological advancements. These regimes employ sophisticated digital tools such as Internet filtering, surveillance, **disinformation** campaigns, and social media manipulation to control information flows and shape public opinion. In addition to obstructive tactics like extraterritorial repression of critics abroad, they engage in promotional strategies such as public diplomacy and nation branding to enhance their image globally. Digital censorship often seeks to be less visible than traditional methods; governments use techniques like 'friction' (slowing access to information) and 'flooding' (Box 1.4) to subtly manipulate discourse without drawing attention to their actions (Guriev & Treisman 2015; Gerschewski & Dukalskis 2018; Dukalskis 2021).

KEY SIGNIFICANCE Censorship in dictatorships is primarily motivated by the overarching goal of regime survival and power consolidation. Dukalskis (2021) finds that regimes employ censorship to enhance internal security, promote external security, and shape public opinion and beliefs, using a variety of traditional and digital techniques to achieve these objectives.

Internally, dictatorships use censorship to stifle dissent, maintain social control, and neutralize challenges to their rule. By suppressing information that could incite unrest or undermine their **legitimacy**, they aim to prevent the formation of organized opposition. Controlling the narrative allows regimes to limit access to alternative viewpoints that might empower **opposition** movements or destabilize their authority. This strategy is essential for eliminating both real and perceived threats to their survival.

Externally, censorship serves as a tool for managing the regime's international image (**external legitimacy**) and advancing foreign policy goals. Dictatorships are acutely aware of how they are perceived abroad because negative perceptions can result in **sanctions**, diplomatic isolation, or reduced **foreign aid** or investment. To project an image of stability, legitimacy, and competence to foreign audiences, they suppress information about **human rights** abuses, **systemic corruption**, or other practices that could tarnish their reputation. This external-facing censorship often involves public diplomacy campaigns (**soft power**) and nation branding (e.g., **spectacle politics**) efforts designed to showcase achievements and promote cultural or ideological values.

Censorship also plays a critical role in shaping public opinion and beliefs within the regime's borders. By controlling media narratives and investing in **propaganda**, dictatorships manufacture consent for their rule and promote their **ideology**. Silencing alternative narratives ensures that the public is exposed only to information that reinforces the regime's preferred image of competence and legitimacy.

NEW FRONTIERS Artificial Intelligence (AI) is set to transform censorship, making it more efficient, subtle, and pervasive. By automating censorship processes, AI reduces reliance on human labor and enables rapid filtering or removal of content (Gerschewski & Dukalskis 2018). AI tools can scan text, images, and videos for violations of censorship rules, identify critics through behavioral analysis, and manipulate search results to promote pro-regime content while suppressing dissent. This creates the illusion of a diverse public sphere while subtly controlling narratives (Schlumberger 2023).

AI also enables personalized censorship and propaganda by tailoring content to individuals' beliefs and vulnerabilities. It can deliver targeted propaganda messages that resonate with specific audiences, reinforcing biases and creating 'filter bubbles' or 'echo chambers.' These isolate individuals from alternative perspectives, making it harder to challenge dominant narratives or access diverse viewpoints (Roberts 2022).

Moreover, AI facilitates more invisible forms of censorship. It is apt to apply techniques like 'friction' (slowing user access to certain content) and 'flooding' (burying critical information under irrelevant material) to subtly manipulate information flows. Microtargeting censorship for specific individuals or groups further obscures patterns of manipulation, making systemic efforts harder to detect (Roberts 2022).

While often associated with authoritarian regimes, AI-driven censorship also impacts democratic societies. Corporations may use AI for commercial censorship to protect brands or enforce terms of service, while governments could deploy it to censor content deemed a threat to security or public order. These practices risk stifling free expression and eroding civil liberties (Schlumberger 2023; Perry & Roda 2017; Roberts 2022).

The ethical implications of AI-powered censorship are profound. It threatens freedom of expression by limiting access to diverse viewpoints and creating controlled information environments. Since AI systems train on already-biased data, this perpetuates and even amplifies existing social inequalities. Bias in AI systems can disproportionately target certain groups or viewpoints and exacerbate inequalities. Yang and Roberts (2023: 144) drive the argument

home: Even while *ChatGPT* is trained on a proportionally small amount of non-English-language data, *"when we asked the program to elaborate on the reasons why Mao Zedong was a great leader, it gave more laudatory answers when queried in Chinese than in English."* Additionally, the opaque nature of AI decision-making, combined with the current trend of replacing traditional search engines, raises concerns about transparency and accountability, making it difficult to understand when and why content is censored or to hold responsible parties accountable.

The advent of **digital authoritarianism** combined with AI-driven **disinformation** is resulting in a systemic reassessment of media laws by both democratic and authoritarian states. These are complex and opaque procedures, far removed from the concerns of ordinary citizens, and ill intent can blend technological and legal measures to regulate online content to serve the regime while hiding behind the justifications of protecting individual rights with concerns about national security and the spread of harmful content (Perry & Roda 2017). For the elections in Indonesia, Pakistan and Bangladesh, Mong Palatino (2024) found that: *"existing media laws [are] being weaponized to justify censorship and judicial tyranny. These were clearly designed not to boost democracy and empower citizens, but to deter dissent and punish free speech."*

Conducting experiments with uncensored media access in China, Yuyu Chen and David Y. Yang (2019) find that mere access to uncensored Internet might not be enough; media literacy and a shift in belief systems are needed for citizens in autocracies to demand and use uncensored information: *"so long as the Chinese citizens perceive domestic media to be more informative, more enjoyable, or more reputable when feedback is weak due to the Great Firewall, domestic media outlets are incentivized to maintain their censored news reporting in equilibrium."* (Chen & Yang 2019: 2230). Demand for uncensored information must be actively cultivated and sustained to challenge the censorship apparatus and fundamentally reshape the media landscape.

Charismatic Rule (Weber) – Charisma & Routinization

Idolizing the politician is like believing the stripper likes you
– Anonymous

Max Weber's concept of charismatic rule is one of the most influential contributions to political sociology, offering a framework for understanding extraordinary leadership and its transformation into enduring systems of authority. Charisma, as defined by Weber, refers to a quality attributed to an individual perceived as possessing exceptional or even supernatural abilities, inspiring devotion and obedience among followers. This 'gift of grace,' rooted in Christian theology, emphasizes the leader's extraordinary personal qualities, sense of mission, and ability to effect moral and ideological transformation (Bendix & Roth 1971). Charisma is not an inherent trait but a social phenomenon dependent on the recognition and validation of followers. It often emerges during periods of crisis or upheaval when traditional solutions fail, creating a collective longing for radical change and extraordinary leadership (Allen 2004).

Sources of Charisma – Max Weber did not derive the concept of charisma directly from the early Christian tradition but instead encountered it in *Kirchenrecht* (Canon Law), a seminal work by Rudolph Sohm (1841-1917), a nineteenth-century legal theorist and

expert on Roman law. Sohm explored the role of charisma in the early church, describing it as a 'divine gift' granted to individuals who spoke religious truths through their spiritual authority. This form of authority initially posed a challenge to the emerging hierarchical structure of bishops and church governance. Over time, however, charisma was institutionalized, shifting from untamed spiritual gifts to being associated with the administrative and formal roles of church leaders. Sohm's analysis of how charisma evolved within ecclesiastical structures profoundly influenced Weber's understanding of the concept, particularly its capacity to disrupt established systems while also being subject to routinization and integration into traditional or bureaucratic frameworks (Tuner 2023).

The sources of charisma are multifaceted: They include individual qualities such as exceptional energy, memory, or physical presence; social contexts marked by turbulence or ideological conviction; and the perceptions of followers who attribute extraordinary qualities to the leader and willingly submit to their authority. Charismatic leaders challenge existing norms and inspire new beliefs, uniting followers into a charismatic community through shared devotion.

"The charismatic following of a war leader may be transformed into a state, the charismatic community of a prophet, artist, philosopher, ethical or scientific innovator may become a church, sect, academy or school, and the charismatic group which espouses certain cultural ideals may develop into a party or merely the staff of newspapers and periodicals" (Weber cited in McCulloch 2014)

In addition, McCulloch (2014) highlights the tendency toward cumulative radicalism among the **inner circle** of charismatic rulers, driven by the need to maintain their positions and prove their loyalty. This dynamic can escalate the intensity and scope of the leader's actions, potentially leading to destructive consequences.

An example is Hitler's inner circle, who's members competed with one another to pitch ever-radical policies to the *Führer* in order to improve their standing. (Hitler encouraged such competition by actively pitting his followers against each other.) Although, charismatic subordinates are not tolerated in dictatorships. If not purged for their popularity, they are passed over for promotion (Gueorguie & Schuler 2016).

However, charisma's inherently unstable nature – dependent on the continued belief in the leader's exceptional qualities – makes it a transient phenomenon vulnerable to challenges and crises of legitimacy. In order to survive, charismatic rule thus requires (repeated, cyclical) 'proof of charisma' or the demonstration or validation of a leader's extraordinary qualities, inspiring loyalty and devotion. This proof often involves acts or traits perceived as miraculous, heroic, or otherwise 'not of this world,' affirming the leader's 'gift of grace.' Followers look for concrete signs, such as successes, victories, or personal magnetism, to justify their allegiance. Rituals or symbolic actions, like speeches or public appearances, can also reinforce charisma by creating a shared sense of awe and purpose (Weber 2019). However, sustaining this proof can be difficult. Failures or routine governance may erode the perception of exceptionalism, requiring leaders to continuously validate their charisma through action or capture it into another form of rulership.

Routinization of Charisma – To address this instability and ensure continuity, charismatic movements often undergo processes of routinization. One pathway is 'traditionalization,' where charisma becomes associated with lineage or kinship. Leadership may be passed down through hereditary claims, transforming charisma into traditional rule. This process is exemplified by hereditary monarchies or systems like the caste structure in India (Weber 2019; Allen 2004). A good example is Jawaharlal Nehru (1889-1964) in the wake of Indian independence. He was clearly a disciple and a publicly designated successor. Moreover, in the eyes of his followers at least, Nehru's charisma was indisputably derived from Mahatma Gandhi (Bendix & Roth 1971: 178-181). The **succession** of Kim Jong-Il and later Kim Jong-Un in North Korea are also good examples of such hereditary charisma *(Erbscharisma)* (Dow 1969).

Another pathway is bureaucratization, where charisma is formalized into rules and institutional structures. In this case, the extraordinary qualities of the leader may be transferred to the office itself – what Weber termed the 'charisma of office' *(Ambstcharisma)* (Dow 1969) – allowing for a more stable and predictable system of governance. Historical examples include the Catholic Church's institutionalization and revolutionary movements evolving into bureaucratic states (Allen 2004; Weber 2019).

The need for routinization does not only emanate from charismatic rulers and their personal preferences for **succession**, it is also driven by their administrative staff's critical role in making the new system work (for them). Initially attracted by the leader's magnetism, these individuals begin to prioritize their interests, such as job security, regular income, and career progression. To safeguard their positions and benefits, they work to institutionalize processes and establish enduring organizational structures, thereby transforming the leader's charisma into a stable, bureaucratic system (Allen 2004; McCulloch 2014).

Succession is, of course, the biggest challenge for routinizing charisma because how can a personal 'gift of grace' be transferred? Weber identifies several strategies to address this, each with drawbacks. (a) Revelation or designation relies on oracles or the leader naming a successor but risks gaps in legitimacy. (b) Hereditary charisma ties authority to bloodlines, offering stability but often detaching charisma from personal qualities, transitioning toward traditional rule. (c) The charisma of office uses rituals, like coronations, to imbue positions with sacred legitimacy independent of the leader's traits. While this routinizes charisma, it can create tension between personal and institutional charisma, particularly as systems grow more bureaucratic and less dynamic. (Weber 2019; Allen 2004)

Routinization significantly alters the nature of legitimacy by replacing personal charisma with a version rooted in tradition, formal rules, or institutional processes. This transition often diminishes the emotional fervor and revolutionary spirit that initially defined the movement as authority becomes more structured and predictable. This process is rarely seamless and frequently marked by tensions. Conflicts arise between those committed to preserving the original charismatic vision and those pushing for institutional stability and order. These struggles can result in clashes between the leader's influence and the emerging bureaucratic or traditional structures, potentially undermining the legitimacy of the newly established system (Dow 1969; Allen 2004). Examples are Nicolás Maduro in Venezuela, who, despite being a very adaptable autocrat, does not have the charisma that Hugo Chávez commanded (Box 3.8). Also, Stalin paled in comparison to Lenin's immense charismatic authority.

Charisma as a Transformative Force – As a principle of ruling systems, charisma is often seen as a double-edged sword, capable of both constructive and destructive outcomes. While charisma can inspire social change, innovation, and unity, it also has the potential to destabilize societies, manipulate followers, and lead to catastrophic consequences. From the perspective of legal-rational and traditional rule, charisma is rather seen as a potentially destructive force. Such leaders often emerge in times of crisis and propose radical changes that may bypass or undermine bureaucratic norms or acquire (divine) prerogatives in defiance of established customs or traditions.

The transformative power of charisma is well illustrated by the example of Chinggis Khan, whose leadership reshaped the sociopolitical landscape of the Central Asian steppe while integrating deeply rooted traditions. Chinggis Khan's charisma was pivotal in founding the Mongol Empire, yet his new order did not reject existing structures. Instead, he realigned pre-existing Turko-Mongol traditions, such as hereditary tribal hierarchies and military organization, to consolidate power and establish legitimacy. For instance, he transformed divine order *(t*örü*)* into royal law *(yasa)* to regulate power relations in the ruling coalition and made himself (and his descendants) the ultimate arbiter to interpret it (instead of the Gods, oral tradition, or soothsayers and shamans) His charisma also allowed him to elevate loyal non-aristocratic allies, such as household staff, into key administrative roles, blending innovation with tradition (Van den Bosch 2021: 408-411).

This charismatic foundation endured through routinization. Successors like the Chinggisids ritualized his legacy by blending and institutionalizing his rule, formalizing *quriltai* assemblies and ritualizing ancestral practices (like lifting khans on felt rugs during coronation ceremonies), thus ensuring dynastic continuity for his bloodline for generations (Van den Bosch 2021: 408-411).

Similarly, in modern contexts, revolutionary regimes like North Korea and Cuba institutionalized the charisma of their founders – Kim Il-Sung and Fidel Castro – by embedding their original inner circles – Kim's original brothers-in-arms fighting Japanese occupation (1910-1945) and Castro's fellow veteran revolutionary mountain *guerrilleros*, known as the *generación histórica* of the Cuban revolution (1953-1958), respectively – into enduring political hierarchies (Centeno 2016). These examples demonstrate how charisma, when intense and effectively institutionalized, can leave a transformative legacy that persists across generations.

In modern contexts, charismatic rule can manifest as plebiscitary leadership democracy. Here, leaders derive legitimacy from popular appeal and electoral mandates while relying on personal charisma to mobilize mass support. This is how the concept partly overlaps with **populism** and demagogues (Box 4.6). Although such systems formally adhere to democratic procedures, they often allow leaders to bypass traditional institutions and potentially consolidate power in authoritarian ways. Figures like Napoleon Bonaparte (Box 4.1) exemplify this form of leadership (Weber 2019). Additionally, contemporary scholars have expanded Weber's framework to include 'impersonal charisma,' where charismatic qualities are attributed not to individuals but to ideologies or institutions. This concept has been applied to understand regimes where revolutionary ideologies or political parties hold charismatic appeal rather than a single leader (Breuilly 2011).

Adaptations & Criticisms – Scholars found that charisma is narrowly defined and goes beyond mere personality or charm; it entails the power to effect moral and ideological transformations. Charismatic leaders challenge existing norms, inspire new beliefs, and reshape followers' understanding of the world. A charismatic leader's unwavering commitment to their mission is central to their appeal. This dedication creates a sense of purpose and direction, attracting followers who identify with the leader's vision (McCulloch 2014; Joosse & Willey 2020).

Scholars have expanded Weber's framework in significant ways. E.A. Shils (1965) introduced the concept of 'impersonal charisma,' suggesting that this can attach itself to institutions, roles, and strata that provide a sense of order and meaning, generating 'awe-arousing centrality' in the eyes of the public. W.G. Runciman further argued that bureaucratic structures could exhibit charisma when individuals exceed expectations within formal roles. (Dow 1969, Bendix & Roth 1971) Thorpe & Shapin – studying Oppenheimer – challenged Weber's view that charisma is incompatible with modern rationality and can emerge in modern technical and scientific organizations (McCulloch 2014).

A revised approach by Breuilly (2011) expands Weber's ideal types into a two-dimensional framework, organizing political regimes along two axes. The first axis differentiates rulership between routine (a) vs. extraordinary (b), and the second axis according to personal (c) vs. impersonal rule (d). This simple matrix yields four types: traditional legitimacy (a-c); charismatic legitimacy (b-c); legal-rational legitimacy (a-d); and a fourth (new) type: institutional-charismatic legitimacy (b-d).

Here, a leader in a specific role draws on belief in the institutional order to enhance their power. This hybrid form allows the officeholder to wield significant authority as an arbiter of the system, though their power remains tied to the office they occupy, balancing personal influence with institutional constraints. This fourth type was first identified and worked out by Helen Constas (1961) as 'charismatic bureaucracy' in 1957-1958, before being picked up by others (Van den Bosch 2021: 392-393).

Van den Bosch (2024: 591) has argued this is the difference between Hitler and Stalin: As *Führer* and Supreme Commander-in-Chief, Hitler was the primary ideologue of **Nazism** and enjoyed significant flexibility in reshaping the institutional and ideological structure of his regime, often acting on personal whim rather than adhering to rigid doctrines. This autonomy allowed him to adapt policies and institutions in service of his goals without substantial internal constraints. Also, if one day Hitler would have decided to dismantle existing state institutions and set up new ones, nobody would have been able to stop him. In contrast, Stalin inherited the Communist Party, which was integral to legitimizing his authority within the Soviet system. Despite wielding near-absolute power and modifying aspects of the party's ideology (i.e., reshaping alliances, adjusting the USSR's global socialist strategy, and temporarily accommodating the Orthodox Church during WWII), Stalin could not dismantle or replace the party. It was a cornerstone of the Marxist-Leninist framework underpinning the regime, binding Stalin more tightly to ideological continuity and institutional constraints than Hitler.

Additionally, contemporary scholars have critiqued Weber's (and his followers') male-centric examples: While charisma is not inherently gendered, many critics noticed the Weberian tradition's tendency to focus on male examples: *"Very few of charismatic leaders are female, and if they do exist, they seem to acquire some conventional male characteristics and lose some conventional feminine ones during their period of charismatic transformation. Joan of Arc, for instance, dressed in men's clothes. Nevertheless, the greater number of male charismatic leaders compared to the number of female charismatic leaders should alert us to the significance of structural rather than personal explanations of charismatic leadership."* (McCulloch 2014)

Scholars like Rosalind Gill, Tracey Whalen, and Peter Joosse (2014) critique the predominantly male-centric examples of charisma. They emphasize the need to recognize the charismatic potential of individuals who challenge traditional gender roles and expectations. Examples like Jeanne d'Arc (ca. 1412-1431), Hildegard von Bingen (ca. 1098-1179, the 'Sibyl of the Rhine'), and leaders of new religious movements demonstrate how charisma can manifest through the disruption of gender norms and the embodiment of alternative forms of authority (Joosse & Willey 2020).

The measurement of charisma is almost a study field by itself, deeply immerged in social psychology and psychological profiles of leaders. Derman (2011) untangles how Weber's concept was first enthusiastically embraced in the United States between the late 1930s and the mid-1960s and shaped disciplines on both sides of the Atlantic. Antonakis et al. (2016) provide one of the best overviews of how scholars for decades tried to measure the concept.

Other recent approaches have somewhat given up on exact measurement criteria and used fuzzy proxy variables in attempts to observe its impact. For instance, Roberts and Mueller (2021) try to assess if attractive coup leaders can hold on to power longer. With an experiment, François et al. (2023) found that competent-looking leaders attract more FDI inflows. However, there is no evidence that trustworthy-looking leaders attract more FDI. In any case, much more research is required to untangle the causality between such factors.

Clan Politics

The day we built our nation based on clanism is the day we buried our sovereignty.
– Hanad Warsame (Somali politician)

A united clan is greater than a divided nation.
– Unknown

Clan politics is rooted in the hypothesis that informal structures significantly influence political processes. While Scottish clans are often cited as a quintessential example of clan politics in Europe due to their kin-based relations, the concept extends far beyond this Eurocentric framework. Clan politics can be broadly understood as the interplay of power, relationships, and decision-making processes that are predominantly informal. Within this framework, clans establish their internal structures, rules, and mechanisms for decision-making (Migdal 2001: 54). These dynamics are deeply embedded in the local cultural, historical, and social contexts in which clans operate.

Clans and their associated political practices can exhibit varying degrees of stability. In some cases, they remain relatively static over time, while in others, they experience significant shifts and transformations, particularly during periods of internal change or external pressures.

DEFINITION Clans are often defined through sub-ethnic, kinship, family, and other relational ties. However, this primordial perspective is too narrow and should be reconsidered. In a broader sense, the concept of the clan encompasses diverse forms of social networking that transcend blood relations and operate across various states and cultures, including their involvement in politics. Kathleen Collins (2006: 17) refers to this phenomenon as fictive kinship, which extends beyond biological ties to include individuals integrated into networks through marriage, family alliances, shared schooling, localism, neighborhood connections, or village affiliations. These networks can be highly individualized and interconnected.

Clan politics constitutes an informal regime where clans dominate as key social actors and political players, reshaping the political system. In such systems, clan networks wield substantial power at the expense of formal institutions and elected officials. This dynamic undermines formal regimes, particularly democratic institutions, eroding their stability over time. Both fragile democracies and authoritarian systems are affected as personalist regimes cling to power (Collins 2006: 3). Hill and Gendron (2020: 232-233) expand this view by arguing that clans can also participate in formal politics or even shape it. Depending on the specific context and historical moment, clans may coexist with democratic institutions.

Over time, the very definition of a clan can evolve. Traditional clans based on blood ties now often include broader groups formed around shared regional origins (regional factionalism), professional connections (such as classmates or colleagues), or simple loyalty. These expanded definitions are particularly common in authoritarian systems that increasingly rely on **personalist rule**. The **personalization** of such regimes can erode traditional clan structures, transforming them into networks centered around presidential 'families,' as seen in parts of Central Asia or Chechnya (cf. **family**).

In some societies, religion also plays a significant role in reshaping clans. The introduction of non-traditional religious beliefs – such as the spread of Hanbali Islam into traditionally Sufi communities – can lead to the fragmentation or transformation of clans. This process fosters the creation of new networks based on shared religious ideologies rather than previous clan affiliations, as observed in certain Chechen, Afghan, or Somali groups.

SEE ALSO As the definition of the clan as claimed above is not well-determined, 'clans' and 'clan politics' (as two inseparable issues) are integrated with other informal structures such as 'traditional' family, tribe, tribal confederation or in modern terms, political parties based on personalities and **informality** rather than the ideas and program (e.g., in Kyrgyzstan) or business corporations. Migdal (2001) brings the concept of state-in-society for overlapping the state and social groups. Clan politics in academic discussions often overlaps with such terms as **patrimonialism**, **neo-patrimonialism**, **patronalism** and **personalist rule**, all covered separately in this volume.

KEY SIGNIFICANCE Clan politics can be a valuable analytical framework across various disciplines to study local authoritarian politics and societies.

In *political science*, the study of clan politics focuses on its role in domestic political systems. Unlike analyses centered on formal political structures, such as laws and constitutions, clan politics – when accu-

rately defined – offers insights into the real functionality (or dysfunctionality) of governance in a given state. It complements concepts like **clientelism**, **patronage** politics, and personalism by revealing the informal mechanisms of power, societal interaction with the state, and decision-making processes. Clan politics thus provides a lens to understand how social norms influence political systems and how informal networks operate within or alongside formal institutions.

In *International Relations* (IR), clan politics is particularly relevant in the fields of security and conflict studies. Broadly defined for these purposes, clan politics plays a significant role in both internal and international conflicts. Clan leaders are often perceived (though not always accurately) as **warlords** or as members of alternative informal groups that challenge state authority, such as drug cartels, field commanders, or **terrorist groups** (Anzalone 2013; Šmíd 2015). Giustozzi (2005) offers a nuanced perspective, arguing that while military commanders may claim clan affiliations, these connections are often indirect or even fabricated. Ahmed (2016) similarly highlights the complexity of clan involvement in conflict dynamics, suggesting that such affiliations should not always be taken at face value.

In *ethnography, anthropology*, and *sociology*, clan politics is studied as part of broader social organization within specific cultural, social, or geographical contexts. Research in these fields emphasizes the unique characteristics of each case by examining clans' traditions, stratification, social norms, forms of interaction among members, and relationships with other clans. This approach underscores the importance of fieldwork to understand the internal mechanisms of clans and their role in clan politics. By focusing on localized practices and structures, these disciplines highlight the diversity and adaptability of clans across different societies.

By integrating these perspectives, the study of clan politics provides a comprehensive understanding of its influence on political systems, conflict dynamics, and social organization.

ORIGIN The study of clan politics often traces its origins to the work of Max Weber, who associated clan politics with pre-modern societies, particularly nomadic or semi-nomadic ones (Weber 1968; 1978). According to **Weber**, the emergence of the modern state was expected to render clans and clan politics obsolete. However, this thesis has been widely challenged by subsequent scholars.

Joel Migdal (1988; 2001) notably integrated clan politics and other informal structures – such as families, business networks, and tribes – into his concept of the 'state-in-society.' He argued that these informal groups not only persist within the state but also actively shape it, particularly in contexts where weak state institutions coexist with strong societal structures. Migdal's framework highlights how clan politics thrives in states with fragile formal institutions (Migdal 1988). Similarly, many scholars agree that clan politics endures despite processes of modernization (Collins 2006; Schatz 2012).

In recent years, however, the application of 'clan politics' as a lens for analyzing authoritarian regimes has faced new critiques. Scholars like Ismailbekova (2017; 2021) have questioned the utility of viewing such regimes solely through the prism of clan-based dynamics. Others, such as Norling (2017), have adopted a constructivist approach, even denying the existence of clans as fixed entities.

Despite these critiques, clan politics continues to play a significant role in many modern states. It often reflects enduring forms of pre-modern social control and becomes particularly salient in re-traditionalized societies and political systems. For example, in regions like Chechnya or parts of Africa, understanding local politics frequently requires an appreciation of how clan dynamics influence governance and power structures.

CLASSIFICATIONS The following classification, while not exhaustive, provides a range of examples illustrating the diverse manifestations of clan politics across different authoritarian and democratic regimes. These highlight both traditional and modern forms of clan dynamics, showcasing their adaptability and varied roles in political contexts.

In the traditional sense, clan membership is often relatively static, rooted in familial and geographic ties ('where I was born, there I grew up'). Women's clan affiliation, however, tends to be more flexible, as they typically marry outside the family and join their husband's clan after marriage and thus become integrated into a new community. Modern adaptations of traditional clans have introduced greater permeability, though this remains constrained by the internal norms and politics of each specific clan.

Traditional clans can actively participate in politics. In some cases, political parties are formed based on traditional roots, local identities, or clan affiliations. In authoritarian regimes, victorious traditional clans may consolidate power by marginalizing or incorporating rival informal structures into a new clan-based establishment. For example, in Kyrgyzstan, elites emerging from successive political upheavals (2005, 2010, 2020) often reflect this dynamic. These transitions have sometimes resulted in the arrest or marginalization of key figures from competing factions, while others have been absorbed into **opposition** roles (**co-optation**).

Modern political clans arise from elite formation in contemporary states and societies. These clans are typically informal networks bound by shared ideas or ideological consciousness rather than traditional kinship ties. Such groups may include lobbying organizations, (un-)civil society actors, or political movements that exhibit elements of clan-like behavior. While not formal political parties, these networks often wield significant influence through their informal cohesion and shared objectives.

Workplace or revolutionary clans form through shared experiences in professional environments or participation in politicized events such as **revolutions**. For instance, historical examples include the 'Havel's clan' and 'Masaryk's clan' in the Czech Republic. The staff surrounding Tomáš Garrigue Masaryk (the first Czechoslovak president) and Václav Havel (the first post-communist Czechoslo-

vakian and Czech president) developed a sense of collective identity akin to a clan. After Havel stepped down in 2003, members of his former administration dispersed into state institutions and civil society while maintaining informal support networks. In other cases, such as protest movements during **color revolutions** (e.g., *Khmara* ('Enough') during Georgia's Rose Revolution in 2003), these groups dissolved without developing into enduring clan structures.

Religious clans represent another variation of clan politics. These emerge when traditional clans undergo transformation or fragmentation due to religious influences and adopt identities centered on religious ideologies. External support often plays a role in these processes. Examples include the Arabization or Islamization of Chechnya and the integration of radical Islamist groups into traditional clan societies in Somalia.

This classification underscores the adaptability of clan politics across different contexts – whether rooted in tradition or emerging from modern social and political dynamics – and highlights its enduring relevance in shaping political landscapes worldwide.

METHODOLOGICAL ISSUES Nevertheless, the quantitative study of clan politics offers a complementary approach by analyzing larger datasets to identify patterns, correlations, and broader trends related to clan dynamics. This methodology often involves surveys, statistical modeling, or network analysis to examine the influence of clans on political behavior, governance, or social structures. While quantitative methods can provide generalizable insights, they may struggle to capture the nuanced and context-specific nature of clan politics that qualitative fieldwork often uncovers. Combining both approaches allows for a more comprehensive understanding of clans and their role in various political and social systems (Koch 2013; Yusupova 2019).

EXAMPLES Clan politics has a wide range of varieties worldwide, starting from historical Scottish tribes through the role of tribes and clans in the Arab or African states and societies, the modern political clans within the political parties, communist elites also forming a clan *sui generis* up to the modern politics based on clans that went through a kind of transformation. The selective overview examines only several types of this phenomenon that demonstrate its dynamism derived from the transformation of their respective societies.

Central Asia is often regarded as a symptomatic example of clan politics, where traditional clans coexist with other kinship-based networks, such as tribes, tribal confederations, and local networks. These structures provide fertile ground for discussions on clan-based dynamics. However, the region's clan politics is rooted in a more intricate nexus of overlapping relationships. In her seminal work *Clan Politics* (2006), Kathleen Collins introduces the concept of 'clan networks,' which extends beyond kinship to include local connections – such as neighborhood ties, city quarters *(mahallas)*, villages *(qishloqs)*, workplace relationships, or school contacts. These networks form individualized patterns of relationships and interests that are often leveraged in political contexts. Smith (2021) provides a concise overview of clans in contemporary Central Asia.

Clan politics in Central Asia has undergone significant transformations over the twentieth and twenty-first centuries. The establishment of Soviet republics and Moscow's control over local politics redefined clan dynamics. During this period, clan politics became intertwined with the Communist Party leadership structure. Local party leaders often represented clan interests within the Soviet framework (Кадыров 2001). However, after the dissolution of the USSR, Moscow's centralized control over leadership appointments in Central Asia was lost. This shift allowed former party secretary-generals to transition into positions of power as presidents and leaders of their respective states, reshaping clan politics around their personalities and **families**.

This evolution frequently led to the emergence of personalist regimes in the region, as seen in Turkmenistan and, to varying degrees, Uzbekistan and Tajikistan. While traditional clans did not disappear entirely, they became secondary actors within these new political systems. Frederick Starr (2006) refers to this phenomenon as 'Politics B,' where traditional clan structures were subordinated to the dominant political order centered on individual leaders.

The rise of 'presidential families' became a defining feature of clan politics in post-Soviet Central Asia. Leaders adapted or transformed traditional informal networks into systems centered around their own families. For instance, Kyrgyzstan witnessed its president transition from a democratic leader to one whose power relied heavily on clan and family networks. Similar processes have been observed across the region, where traditional clan politics have been eroded under the influence of **state capture** by local presidents and their families (Berdikeeva 2006). This adaptation underscores how informal structures like clans continue to evolve within modern political frameworks while maintaining their relevance in shaping governance and power dynamics in Central Asia.

Russia presents an intriguing case of clan politics, albeit with distinct characteristics compared to more traditional clan-based societies. Historically, Russian society lacked the typical 'traditional' clans and their associated clan politics. The concept of clan politics in Russia emerged prominently during Boris Yeltsin's presidency in the 1990s. Scholars and journalists introduced the term 'The Family,' which referred not only to Yeltsin's actual family members but also to a network of loyal elite politicians and oligarchs whose careers were closely tied to Yeltsin's leadership (Ламажаа 2007; Бакланов 2023; Gill 2013). This group wielded significant influence during Yeltsin's rule, blending personal loyalty with political and economic power.

Under Vladimir Putin, a new form of clan politics took shape, centered around his trusted circle. This 'clan' primarily consisted of individuals from the *siloviki* (силовики) – members of Russia's power ministries such as the military, security services, and police – and former colleagues from Putin's KGB

background (Taylor 2017). These networks became central to Putin's governance, reflecting a system where loyalty and shared professional backgrounds played a crucial role in consolidating power.

Somali clan politics, in contrast, operate in a more traditional framework. The Somali nation is historically structured around clans based on extensive kinship ties *(tol)*, which are often linked to specific regions due to the nomadic nature of Somali society (Lewis 1961; Press & Torrenzano 1995; Ssereo 2003). Beyond kinship, Mohamed (2007) highlights the importance of *xeer* – a system of mutual agreements or contracts – in shaping Somali clan politics. This dynamic social contract influences both intra- and inter-clan relations. However, in modern Somali conflicts, *xeer* has sometimes been overshadowed by external influences, such as Sharia-based justice systems and Islamist ideologies (Solomon 2014; Ahmed 2020). Groups like *al-Shabaab* exemplify this interplay, as they incorporate clan members into their networks while simultaneously adhering to Islamic principles. Resistance from opposing clans often results in violent confrontations, further entangling clan dynamics with Islamist movements (Taming the Clans, 2018).

Chechnya offers yet another perspective on clan politics, particularly following the collapse of the Soviet Union. Fieldwork in Pankisi reveals a revival of traditional clan structures in Chechen society during periods of *de facto* independence and the Chechen Wars of the 1990s (Souleimanov 2019). Clan identity based on blood ties peaked during this time as a mechanism for wartime survival and post-war reconciliation. However, these traditional structures began to erode with the rise of Ramzan Kadyrov, who transformed his clan into a fictive structure centered on personal loyalty rather than traditional kinship ties. This shift marked a significant deconstruction of traditional Chechen clan politics, particularly among younger generations who rejected the authority of former clan leaders or warlords.

NEW FRONTIERS Clan politics is often seen as a kind of rigid, unchangeable aspect of authoritarian regimes. Nevertheless, even traditional clans transform (and went through it in the past) in which the very understanding of what constitutes a clan evolves: Who is the member of the clan? What are the internal rules of the clan? Who can be co-opted or, on the contrary, expelled from the clan? As Scott Radnitz notes (2011: 127-128): "*Clan and tribe were in fact powerful bases of social and political organization in Central Asia historically, but generations of Russian and then Soviet rule, along with purges, collectivization, and industrialization, have made social life in the region much more complex*."

The complexity and impact of clan politics in authoritarian regimes are shaped by the specific cultural, political, historical, economic, environmental, and personal backgrounds of the clans and their leaders. **Personalization** of power can transform a ruler's political clan into a personal dictatorship, characterized by an exclusive 'inner' clan comprising the dictator and their relatives as a subset of the broader inner circle, as observed in cases such as Central Asia (Horák 2021) and Azerbaijan (Safiyev 2016). Additionally, clan leaders may steer their groups toward merging with or being incorporated into other political entities, as exemplified by Somalia.

Clans often represent groups unified by shared economic interests (Engvall 2016). In some contexts, clan-based societies and their associated politics can evolve into relatively democratic regimes under specific local conditions (Seeberg 2018; Hill & Gendron 2020: 36-39). This suggests that clan politics should be considered when analyzing informal structures, as local settings and the broader transformation of politics and society in each case deeply influence them. Furthermore, elements of clan politics can emerge even in contexts where traditional clan structures are absent, as seen in Russia.

Clientelism

It takes two to tango.
– Song by Al Hoffman & Dick Manning (1952)

If pigs could vote, the man with the slop bucket would be elected swineherd every time, no matter how much slaughtering he did on the side.
– Orson Scott Card

Clientelism is a complex form of political exchange that operates through informal but structured relationships between patrons and clients. It differs from other forms of corruption like nepotism or systemic corruption by its personal, enduring nature and reciprocal obligations. Despite being rooted in traditional practices, it remains a dynamic feature of modern political systems, adapting to varying contexts while shaping governance and state-society relations.

DEFINITION Clientelism is a social and political phenomenon characterized by an informal, dyadic, and asymmetric relationship between a patron and a client. It is often called a 'lop-sided friendship' (Pitt-Rivers 1954) or an 'instrumental friendship.' (Wolf 2001; Stokes 2009).

The 'patron,' typically an individual with greater socioeconomic or political power, provides benefits such as protection, jobs, or access to public goods and services to the 'client.' In return, the client offers loyalty, support, or other forms of assistance (Landé 1977; 1983). This reciprocal exchange is rooted in personal relationships and often persists over time, creating enduring networks of dependency (Scott 1972; Muno 2013).

Clients not only pledge their votes or support in political matters but also commit to exclusively backing the patron from whom they receive goods and credit. Their loyalty is not just an expression; they are obliged to demonstrate this loyalty through their actions. Clients join factions that align with the competitive goals of a faction leader. According to Kenny (1962: 132), crises reveal how loyalty and support demonstrate the alignment of different patronage networks. Rivalry between patrons gives clients leverage, enabling them to gain support and ensure its continuity. The relationship is reciprocal, with each party investing in the other (Wolf 2001: 180).

ORIGIN The term 'clientelism' originates from the Latin *cluere*, meaning 'to listen or obey,' reflecting its historical roots in ancient Rome (Muno 2013). There, patrons provided protection and resources to their clients in exchange for political support, a relationship governed by a sacral code of ethics.

In ancient Rome, a client was an individual represented by a patron *(patronus)* who spoke on their behalf in legal matters, a role still recognized today. The term *clientele* referred to a group of people who were similarly represented by a *patronus*, a powerful figure or aristocrat. This relationship, rooted in a customary code of ethics, was not based on servitude – clients were free individuals, not slaves or bondmen – but it was often inherited. Clients provided political support and labor, while in exchange, patrons offered protection, employment, or land to cultivate. This mutual arrangement formed a key component of Roman social and political life (Finley 1983; Scheidel 2009; Weber 2005). While its historical antecedents were tied to traditional societies, modern clientelism is closely linked to the existence of the state and operates as a contemporary political phenomenon (Erdmann & Engel 2007).

SEE ALSO Clientelism differs from related concepts such as patronage, nepotism, systemic corruption, and informality in several ways. **Patronage** involves the distribution of collective benefits (e.g., roads or schools) to groups rather than individuals, often as part of high-level politics aimed at maintaining political coalitions. In contrast, clientelism focuses on individual benefits and personal networks (Erdmann & Engel 2007). 'Nepotism' (as shown in Box 1.1) refers specifically to favoritism toward family members in appointments or resource allocation, whereas clientelism extends beyond kinship ties and includes broader social networks based on loyalty and reciprocity.

Systemic corruption and clientelism share similarities with informal institutions that deviate from formal rules and involve the misuse of resources for private gain. However, systemic corruption often lacks the personal and enduring nature of clientelistic relationships. While systemic corruption may also involve one-time transactions like bribes between strangers, clientelism is built on trust and long-term exchanges that may even be inherited across generations (Muno 2013). Both phenomena can involve the misuse of public resources, but clientelism often operates within hierarchical networks mediated by brokers who connect patrons with clients (Wolf 2001).

Clientelism also intersects with broader systems of **informality** but is distinguished by its focus on power asymmetry and the exchange of resources for political support. While informal practices such as social networks or cultural norms may not necessarily involve corruption or abuse of power, clientelism inherently entails an imbalance in authority and resources that shape its dynamics (Hicken 2011).

LITERATURE Studies on clientelism have evolved. Early research (the first wave) in the 1960s and 1970s focused on traditional patron-client relationships in agrarian societies, often viewing clientelism as a pre-modern phenomenon destined to decline with economic development in line with **modernization theory**. See Schmidt et al. (1977) for an overview of the main works of the first wave.

The second wave (1980s-1990s) recognized its persistence even in advanced democracies, highlighting its adaptability to different political contexts (Auyero 2000; Hicken 2011). Researchers began to explore how clientelism operated within competitive political systems, focusing on its role in electoral politics and its relationship with democratic accountability. During this period, studies highlighted the hierarchical networks of patrons, brokers, and clients, as well as the mechanisms through which politicians exchanged targeted benefits for electoral support (Kitschelt & Wilkinson 2007; Stokes et al. 2013). Methodologically, scholars have employed both qualitative approaches like ethnographic studies to capture the nuances of clientelistic systems and quantitative methods such as surveys to measure its prevalence across countries. Consult Stokes (2009) for an overview of these first two waves.

The third wave of studies emerged in the early 2000s and continues to shape contemporary research on clientelism. This wave is characterized by a more critical and nuanced approach to defining and analyzing clientelism. Scholars have sought to address questions about why and how clientelism persists in competitive regimes with free and fair elections. The third wave emphasizes the adaptability of clientelism to various social, economic, cultural, and institutional contexts, challenging earlier assumptions about its incompatibility with democratic systems. Methodologically, this wave has seen an expansion from qualitative ethnographic studies to include quantitative approaches such as surveys and experiments, enabling cross-national comparisons (Hicken 2011; Nichter 2018).

Throughout these waves, several key themes have emerged. First is the recognition that clientelism is not merely a relic of traditional societies but a dynamic system that evolves alongside political institutions. Second is the growing emphasis on understanding the mechanisms of clientelistic exchange – such as vote-buying or contingent reciprocity – and their implications for governance and public goods provision. Finally, scholars have increasingly linked the study of clientelism to broader questions about state capacity, **state capture**, **informality**, and **systemic corruption**.

Guerrero-Sierra et al. (2024), utilizing various scientific mapping techniques, reconstruct the evolution of clientelism research, highlighting pivotal contributors and shifting paradigms. They confirm the preeminent role of US-based institutions and scholars and their foundational contributions to clientelism theory.

Box 1.1 Nepotism – Bloodlines & Lifelines

Nepotism is the lowest and least imaginative form of corruption.
– Daniel Alarcón, *At Night We Walk in Circles*, 2013

Blood is thicker than water
– Universal proverb

Nepotism, a prevalent form of corruption, is particularly common in authoritarian regimes. It involves the allocation of jobs, economic opportunities, and favors to family members based on kinship rather than merit – see also meritocracy (Box 1.9). Nepotism is often intertwined with **kleptocracy**, which is typically associated with **personalist rule,** where dictators prioritize personal enrichment over institutional governance.

In many authoritarian systems, key sectors of the economy are dominated by the ruler's family members. For example, in Kazakhstan, former President Nursultan Nazarbayev's relatives controlled vast swathes of the economy. One of his daughters managed the media sector, while another oversaw water, gas, and construction industries. His sons-in-law held significant stakes in sugar production, alcohol distribution, taxation, and parts of the oil industry (Franke et al. 2009). Similarly, in Kyrgyzstan, former (first) President Askar Akayev's wife's clan exerted control over ministries responsible for gold mining and privatization (Ishiyama 2008).

In Indonesia, under Suharto, his family dominated critical sectors such as roads, car manufacturing, and telecommunications (Robertson-Snape 1999). In Uzbekistan, former President Islam Karimov's daughter Gulnara Karimova amassed monopolies in telecommunications and mining, with her fortune reaching $570 million at one point (Ruiz-Ramas & Morales Hernández 2021). The Dominican Republic under Rafael Trujillo (1930-1961) saw his family controlling nearly 80% of the country's industrial production (Acemoglu et al. 2004). In the Philippines, during Ferdinand Marcos' regime, his wife Imelda was a major beneficiary. She received as much as 10% of all ministerial budgets for her projects (Ellison 2005). Family members can directly benefit from laws that undermine competitors. Under Marcos, one of his in-laws, Herminio Disini, benefited from a 1975 Presidential decree that imposed a 100% tax on tobacco filler for all other companies. Diseni's *Philippines Tobacco Corporation*, however, was exempt and only had to contend with a 10% tax (Aquino 1997).

These examples highlight how nepotism not only entrenches **corruption** but also concentrates economic power within ruling families, often to the detriment of broader societal development and institutional integrity. This aspect of nepotism clearly reflects the behavioral reflex of '*Our Turn to Eat'* from **ethnic politics** but is more skewed to personal (family) enrichment than establishing **patronage** with kinship groups.

Moreover, nepotism extends beyond economic (mis) management and infiltrates various spheres of governance. In Kyrgyzstan, for instance, the head of the security forces was appointed solely based on his familial connection to the president despite lacking relevant qualifications. Similarly, in the Dominican Republic under Rafael Trujillo, nepotism reached extraordinary levels. Trujillo assigned key government positions to his family members, including the presidency (held by his brother), two senatorial posts, six major diplomatic

assignments, and high-ranking military roles such as commander-in-chief of the armed forces, undersecretary of defense, and chief-of-staff of the air force. In total, 153 relatives were employed by the government (Acemoglu et al. 2004). Despite many of these appointments leading to embarrassment, Trujillo even made his son a colonel at the age of four and a brigadier general at nine (Hartlyn 1998).

In Iraq, Saddam Hussein also relied heavily on nepotism to consolidate power. His younger son, Qusay, was entrusted with operational control over the armed forces, internal security services, and the *Republican Guard*. Other family members occupied influential positions across the military and intelligence sectors (The Economist 2001). However, this reliance on family connections over merit had significant consequences. Despite Iraq's million-man army and over $50 billion spent on military hardware, a lack of expertise among its leadership resulted in poor battlefield performance (Frontline 1990).

These examples underscore how nepotism can undermine institutional competence and efficiency by prioritizing loyalty and familial ties over qualifications and merit. As with ethnic stacking (**coup-proofing**), putting family members in top positions of the security apparatus provides some level of guarantee of oversight and a form of loyalty that cannot be bought. (Family members know they are likely to share the fate of the ruler in case the regime is ousted.)

Still, there is a costly competence-loyalty tradeoff: nepotism impacts how an economy functions as deserving individuals are slighted, expertise is shunned, and key positions and contracts are gained by familial relationships. This depresses true entrepreneurship and affects everything from policy output and economic growth to battle effectiveness (Cordesman 2004; Okafor et al. 2014).

Corruption

Initiate a proper handshake and the whole world opens up for you.
– James D. Wilson

Derived from the Latin verb *corrumpere* (to mar, bribe, destroy) in philosophy or social and political sciences, the term denotes the decay of the soul or the abuse of trust in public office, respectively. The citation above – used ironically – is meant to highlight the pervasiveness of such reciprocal interactions in all social and political spheres, regardless of location, era, culture or ethnic background.

The moral and spiritual corruption of a ruler and its consequences is deeply entwined with deviation from the behavioral norms of **traditional rule** dictating harmony, honor, and moderation – like, for instance, the 'mandate of heaven' (天命 – *Tiānmìng*) in premodern Chinese polities. In the Western canon, these normative moral definitions trace back to the works of **Plato & Aristotle** and became a core feature of regime types like **tyranny** and **despotism**.

In political and social sciences, the 1960s saw this moral approach replaced by a legally derived approach as the 'corruption of public office' (Williams 1999: 505), thus embracing the Weberian dichotomy between private and public spheres. Alas, this (normative) legal approach was criticized because of the culturally diverging moral and legal standards, implying a cultural bias between the 'West' and 'the rest.' An economic approach followed, branding corruption as **rent-seeking** and thus a betrayal of the principal-agent relation, either as the deviant behavior of one (embezzlement) or two actors (bribery) (Rose-Ackerman 1978; Klitgaard 1988; Lambsdorff 2007; Muno 2013: 35). Corruption is the catch-all term, including fraud, embezzlement,

graft, and pilfering, among other forms. If corruption is limited to the actions of one individual or one organization with the aim of stealing or defrauding for personal gain, and there is no exchange (no 'tit-for-tat') between parties, it does not qualify as **clientelism** or **patronage**.

The mid-1990s brought a conceptual turn with the study of **informality**, treating corruption more neutrally (as an informal institution) by appraising its functional features alongside its dysfunctional effects, cf. **systemic corruption**. While corruption is considered opposed to the ideal of democracy (and its endemic characteristics of transparency and accountability), it is acknowledged that real-life democracies can coexist with various forms of corruption and informality.

Consensus over its exact definition remains elusive. The most common version sees corruption as the "misuse of public power for private gain." (Muno 2013: 35). *Transparency International* defines corruption as "the misuse of entrusted power for private gain." Additionally, they distinguish between 'according to rule' corruption and 'against the rule' corruption. In the former, the recipient is legally authorized to perform certain activities, while in the latter, the recipient is prohibited by law from carrying out the requested tasks. Despite this lack of consensus, there is a joint understanding: *"although corruption comes in many shapes, shades, and sizes, and with different degrees of tolerability, corruption is always defined with one feature – the inappropriate mix of public and private as it is corrupt for officials to profit personally from public office."* (Johnson & Sharma 2004: 3, cited in Zimelis 2020: 3).

It has been noted that "settling on a single definition and measurement strategy is less useful than allowing multiple approaches to thrive," depending on the research goal (Bussel 2015: 34-35). Contemporary research has proposed more elaborate and nuanced definitions to include, for instance, informal practices on the boundaries of 'legit' and 'non-illegal' practices that are socially acceptable, tolerated by state authorities, and thus rendered structural or to include non-monetary schemes, where reputation rather than money is to be gained, or where reciprocity is maintained for a long time (Polese 2023: 337).

Jennifer Bussell's (2015) typology of corruption is useful as a pragmatic framework that categorizes corrupt practices based on the type of state resources involved and the actors who control or influence these resources. She identifies four primary types of state resources subject to corruption: (i) government policies and regulations, (ii) public licenses and contracts, (iii) government jobs, and (iv) public goods and services. For each resource type, Bussell distinguishes between direct control (actors who allocate the resource, such as legislators or bureaucrats) and indirect influence (actors who exert power over those in direct control, like politicians or intermediaries). This typology is particularly useful in decentralized systems, where multiple levels of government may have overlapping authority over resource allocation. By linking corruption to specific resources and actors, Bussell's framework enhances analytical precision and supports targeted anti-corruption strategies, emphasizing the need for tailored typologies to address diverse research goals and policy challenges effectively.

For the study of political regimes, 'systemic corruption,' 'clientelism,' and 'patronage' are the most important analytical frames and are treated as separate entries in this encyclopedia. These three are nested concepts, with **systemic corruption** covering the largest scope of informal behavioral patterns as widespread and structural, from petty corruption to large-scale embezzlement, with **clientelism** focusing on the actors involved, their personal relationships, and their exchange of goods, services or favors, mostly in business and the public sector; and with **patronage** reserved for high-level politics instrumental to regime cohesion and survival.

Conceptual confusion and overlap remain, and most of the time, the terms clientelism, patronage and **neo-patrimonialism** are used interchangeably. Some notable (proposed) nuances exist but are not applied universally: According to Erdmann & Engel (2006: 21), 'patronage' exchanges publicly owned goods while 'clientelism' exchanges individually owned goods. Patronage is thus 'political clientelism' (cf. Stokes 2007). Brinkerhoff and Goldsmith (2002) propose to reserve 'clientelism' for the political sphere and 'neo-patrimonialism' for the administrative sphere.

Consult also Zimelis (2020) and Mungiu-Pippidi & Heywood (2020) for a recent overview of the research field of corruption studies.

Democracy

Democracy is the worst form of Government except for all those other forms that have been tried from time to time.
– Winston S. Churchill

Democracy does not give the people the most skillful government, but it produces what the ablest governments are frequently unable to create: namely, an all-pervading and restless activity, a superabundant force, and an energy which is inseparable from it and which may, however unfavorable circumstances may be, produce wonders.
– Alexis de Tocqueville

The *Encyclopedia Tyrannica* is not about democracy, on which bookshelves have been written. Entries like liberalism, liberal democracy, democratic systems, democratic parties, civil liberties, and electoral systems are auspiciously absent from this book, while others are only touched upon very lightly, like **constitutionalism**.

Of course, we cannot forgo the dichotomy of our contemporary thinking in a world divided by democracies and non-democracies. The state of the free and unfree worlds occupies our thoughts, and various ebbs and flows of several waves (Box 6.3) keep politicians, scholars and the people at large awake at night. No matter how contested democracy is as a concept, the real world requires plans, blueprints and theories for **democratization**, **democracy promotion** and **democratic consolidation**.

Democracy is widely regarded as an *essentially contested concept*, meaning that its definition is inherently subject to ongoing debate and disagreement due to its abstract and evaluative nature (Gallie 1956). This 'contestability' arises from the diverse interpretations and values associated with democracy, as well as the tension between its normative ideals and descriptive realities. Scholars, policymakers, and citizens often use the term democracy to advance specific value claims, either including or excluding certain elements depending on the context and purpose.

One reason democracy is contested is its multifaceted nature. Moreover, its contested nature is amplified by its dual role as both an ideal and a practical system. As an ideal, democracy represents aspirations for equality, participation, and accountability. However, in practice, democratic systems often fall short of these goals due to structural inequalities, institutional limitations, or external challenges such as populism or authoritarianism. Different regional interpretations persist.

The exact nature of democracy becomes even more difficult to grasp when compared to other political systems, which are measured to classify cases and extrapolate trends. However, democracy is considered a 'latent variable,' meaning it cannot be directly observed. To assess it, scholars have come up with various indicators, but there is no agreement on which indicators hold the greatest significance or how they should be integrated. Consequently, different approaches to measuring democracy frequently yield varying outcomes.

This is as true in the field of comparative authoritarianism. Democracy has been defined and debated in various ways, reflecting differing priorities and analytical approaches. A central point of contention lies in whether democracy should be understood in a minimalist, procedural sense or as encompassing broader normative outcomes. Many scholars and citizens associate democracy with desirable characteristics such as civil liberties, the rule of law, and social equality. However, critics argue that 'lumping all good things together' in a definition of democracy itself creates analytical difficulties, as it becomes impossible to study their relationship to democracy empirically. For instance, if social equality or accountability is included in the definition, it becomes challenging to assess whether democracy fosters these outcomes or whether other factors are at play. The section on **classifications & typologies**, especially the sub-sections on **dichotomous categories,** is preoccupied with drawing a sharp line between the democratic and the autocratic.

Joseph **Schumpeter's** (1942) minimalist definition is one of the most influential procedural approaches to defining democracy. He conceptualized democracy as a system in which individuals acquire the power to make decisions through a competitive struggle for the people's vote. This approach focuses solely on the presence of contested elections as the defining feature of democracy, leaving broader characteristics such as civil liberties or equality for separate analysis. Proponents of this view argue that such a narrow focus allows for clearer empiri-

cal study and avoids conflating democracy with its potential outcomes. Critics, however, contend that this definition neglects essential elements that make political competition meaningful, such as the rule of law or freedoms necessary for genuine contestation.

Robert **Dahl** his framework of *polyarchy* (1971) offers an alternative conceptualization that has significantly influenced how scholars analyze democracy. Dahl proposed two core dimensions: *contestation* and *participation*. Contestation refers to the degree to which citizens are free to organize into competing blocs to advocate for their preferred policies, while participation reflects the extent to which citizens can engage in the political process. According to Dahl, both dimensions are necessary components of democracy, though their presence may vary across different regimes. His framework allows for a more nuanced understanding by situating political systems along continua of contestation and participation rather than categorizing them as purely democratic or authoritarian.

With the advent of authoritarian regimes with elections, distinguishing democracy from **hybrid regimes** has demanded an even more nuanced understanding of the defining features of liberal democracy and the ways in which hybrid regimes fall short of these criteria. Democracy, at its core, is defined by free and fair competitive elections, inclusive adult citizenship, the protection of civil liberties and political rights, the genuine governing authority of elected officials, and civilian control over the military. Hybrid regimes, while incorporating some democratic elements such as elections, fail to meet these full criteria and often blend democratic processes with authoritarian practices.

Hybrid regimes occupy what scholars refer to as a 'gray area' between democracy and authoritarianism. They combine features of both systems, creating ambiguity in their classification. This has led to debates about how best to categorize such regimes. While some adopt a dichotomous approach, classifying regimes as either democratic or not, others advocate for **trichotomous categories** that recognize hybrid regimes as a distinct category. In this view, hybrid regimes are often seen as 'diminished subtypes' of democracy, lacking one or more of its essential attributes. For instance, they may hold elections but restrict their competitiveness or curtail civil liberties (Bogaards 2009; Gilbert & Mohseni 2011; Mufti 2018).

Contemporary classifications of **political regimes** are heavily focused on either capturing or measuring this contested concept of democracy or categorizing regimes into broad groups, such as democracies and non-democracies, while also creating categories to understand variations within these groups. Even when democracy is not the explicit focus, these approaches tend to be inherently biased toward democratic principles. Today, democracy systematically serves as the implicit benchmark against which all other regime types are evaluated, reflecting a widespread belief in its superiority. As argued elsewhere in this book, this was not always the case.

This bias is entrenched in Western-centric moral convictions that view liberal democracy as the pinnacle of governance – a belief so deeply rooted that it has become the new normal, the baseline. While liberal democracy has indeed emerged as a dominant model of righteous government, history has seen numerous contenders for the title of 'just rule' cf. **religions of the world & statecraft**. Eventually, all dominant regime types ended up overshadowed by newer models. It remains to be seen when liberal democracy might be replaced by something considered 'more just.'

In any case, despite cold-shouldering democracy so stubbornly in this book, its authors convincingly argue that the non-democratic solutions of the past are unlikely to yield good solutions to our problems of the present.

Despotism

μήτ' ἀνάρχετον βίον μήτε δεσποτούμενον αἰνέσῃς.
παντὶ μέσῳ τὸ κράτος θεὸς ὤπασεν
(neither a life of anarchy nor one beneath a despot should you revere;
To all in-between the god has given superiority)
– Aeschylus, *The Eumenides,* 526-530

Once a royal honorific in Byzantine times, today, despotism is a pejorative term for all sorts of rogue regimes that wield absolute, arbitrary power for their personal gain, disregarding the needs of society. Alongside the more coherent concept of **tyranny**, despotic rule was probably the first regime

'type' regularly used by Europeans to distinguish their own political systems from those of non-Europeans, foremost the Persians, the Turks, and later the Chinese and Indians (Richter 1990: 175).

DEFINITION The most neutral term to capture despotism would be to refer to *"the extreme bias in the control that some individuals exert over limited resources or other individuals,"* as used in its biological setting when studying social stratification among species (Summers 2005). In political thinking, it overlaps with notions of absolute power and the arbitrary rule of a single ruler, aiming to become but never tied to a specific regime type (like tyranny) since it is rather an extreme ideal type on a political spectrum, with democracy as its opposing pole. For this reason, it is as easily linked to **totalitarianism** as to **monarchy** or **populism**. The term is notoriously misapplied and has a long association with orientalist approaches. Most often, it occurs as a value judgment for any type of rule deemed cruel or oppressive.

Despotism, unlike **tyranny**, once did denote legitimate rule (and was even legal in some countries). A despotic rule might have been unchallenged and, at times, arbitrary (like **absolutism**), but it was legal under the laws of men and still restrained by 'natural law' (cf. **traditional rule**), whereas, under a tyrannical regime, neither law nor consensus exists. Therefore, the right of resistance is and remains a right under the condition that it is directed against tyranny and not against despotism – cf. 'tyrannicide' under **assassination** (Turchetti 2008: 159-162).

SEE ALSO In common use, it can be applied indiscriminately to any form of disliked government. In the scholarly literature, it tends to be considered a synonym for **tyranny**, but the former does not share the latter's coherent scholarly canon nor its consistent application through time (see 'origin'). Still, if understood this way, the concept shares many characteristics found in **absolutism**, **sultanism & neo-sultanism** and **personalist rule**.

ORIGIN The classical Greek δεσπότης (*despotēs*) was subjected to a barrage of attempts to Latinize it into *'despotes, despoticus, despotia'* but such endeavors were unsuccessful until the seventeenth century, after which 'despots' and 'despotism' infiltrated mainstream political thought and accrued many of its biased connotations.

Originally, the Greek *despotēs* referred to the power position of a master over his enslaved persons, and throughout the Middle Ages and Renaissance, its Latin equivalent would be *'dominus' or 'pater familias'* – 'master of the household.' In parallel with **tyranny,** it encompassed notions of arbitrary rule, but in contrast to the latter, it was a perfectly legal way, by custom, to run a household (οἰκονομία – '*oikonomia*'). As a political concept, M. Richter (1990: 176) finds it first appeared during the Greco-Persian wars (499-449 BCE) as an adverse term to denigrate the Asian enemy and their way of life. Nevertheless, **Plato & Aristotle** were front-runners to apply it to statesmanship: Plato just to denote its arbitrary decision-making; Aristotle to liken it to tyranny – as 'despotic' rule abandons lawful tradition and thus renders subjects into enslaved people (Koebner 1951: 276-277), albeit by consensus.

Aristotle noted that despotic rule was more accepted and natural in some polities. He also mentioned legal precedence in which subjects submitted themselves to rule by an elected tyrant for reasons of expediency – thus to a 'dictator' in its original meaning (see Box 1.2 on electoral dictatorship). Aristotle hinted that this was an established 'barbaric' (non-Greek) tradition because people in Asia were more servile than those in Europe (Aristotle, *Politics,* 1285a, cited in Koebner 1951: 277). This casual observation planted the seed for later conceptualizations of 'oriental despotism' – see lower – likewise strengthened by Herodotus' coverage of the Greco-Persian wars and Xenophon's (ambiguous) treatise of Cyrus the Younger of Persia, oscillating between exemplary leadership and despotic behavior (Ceglarska 2016; Atack 2023).

In Byzantium, *despotēs* functioned (inconsistently) as an honorary royal title, sometimes for the emperor, sometimes just for his sons and sons-in-law, and at times specifically for the heir apparent. The honorific was never associated with a particular office or function but did include large estates (fiefs or appanages). Spouses mirrored the rank of their husbands as *'despotissa'* (δεσπότισσα). In the twelfth century, the title migrated to Central Europe starting in 1163 with King Béla III of Hungary and Croatia, the son-in-law of the Byzantine emperor. By the mid-fourteenth century, some of these princely polities became known as 'despotates' after they became semi-independent from the Byzantine Empire (Guilland 1959).

This is where the misuse of this term starts and its later conflation with **tyranny**. Most medieval scholars did not have access to the complete Greek canon of classical thinkers, and many either overlooked the nuances between despotism and tyranny or ignored the topic altogether – M. Turchetti (2008) lists a few exceptions – and the Latin translation for Aristotle's 'despot' became *dominus* in the works of the by fifteenth-century humanists, who did not retrieve the term or its derivations in the classical Latin vocabulary of Cicero, Seneca and other authoritative thinkers. In France, the term 'despot' disappeared for three centuries, only to reappear toward the middle of the seventeenth century as *despotisme* (coined by Pierre Bayle in 1704), losing its precise signification in the process. By the eighteenth century, tyranny, despotism (and **absolutism**) were commonly used interchangeably (Koebner 1951; Turchetti 2008).

LITERATURE While **Plato & Aristotle** elevated the concept from the household to the level of the polity, they were the first to do so. Their contemporaries still use **tyranny** and despotism as distinct concepts. For instance, Xenophon highlights some of the trappings that absolute power brings, such as paranoia and sycophancy (cf. Box 6.5). For example, in his dialogue on **rulership** and happiness, Hiero – the 'tyrant' of Syracuse – replies: *"To fear a crowd, and yet fear solitude, to fear to go unguarded, and yet fear the very men who guard you, to recoil from attendants*

unarmed and yet dislike to see them armed – surely that is a cruel predicament!" (Xenophon, *Hiero,* 7, cited in Diken 2021: 11).

With the rediscovery of the classical thinkers during the European Renaissance, the orientalist dichotomies of civilized barbarianism were perpetuated (Ceglarska 2016). As a result, **Machiavelli** also identified despotism as an extreme oriental subtype of tyranny, foreign to European political culture (Giorgini 2004: 5–6), but **Montesquieu** was most influential in pushing this orientalist bias into the mainstream classification of regimes, blending despotism with tyranny as a form of corrupted rule, upheld by fear, heralding an era of decline and eventual collapse of the polity (Koebner 1951; Boesche 1990; Turchetti 2008: 172).

It is important to note that 'despotism' also occurs in social biology and anthropology with the aim of understanding human nature and human development (but not exclusively: cf. Jaeggi et al. (2010), who apply the frame to apes). L.L. Betzig (1986) irrevocably linked despotic privilege (here understood as biased access to resources and coercive leadership) to reproductive success, launching a long research tradition (Summers 2005) and even exploring biological explanations for gender politics (Potts & Campbell 2008). Powers and Lehmann (2014) apply the term to study the dynamics of the so-called 'authoritarian turn' in human development (during the Neolithic) when egalitarian hunter-gatherer groups underwent a transformation of (radical) social stratification in their political organization.

KEY SIGNIFICANCE The dichotomous worldview (free republics vs. despotic monarchies) enshrined in the thinking of Aristotle and confirmed by his contemporaries found fertile soil with medieval thinkers (even Islamic philosophers) concluding that 'some men have to serve others' and that 'barbarians' are meant to be treated as slaves. When Europe entered its 'age of discovery,' neo-Aristotelianism became a potent force, justifying conquest and enslavement of new peoples, thus allowing obscure thinking on despotism to emerge from under the shade of tyranny (Richter 1990: 182-183). (Note that Aristotle's binary view of Greeks vs. barbarians cannot easily be equated with xenophobia or proto-racism, cf. Dietz 2012; Lockwood 2021).

With **Montesquieu** propagating the moral and political corruption of European polities, he had singled out blame on Louis XI (1423-1483) for bringing despotism to France (Boesche 1990: 746). The identification of despotism thus became a justification for contestation, for revolt against, and even for the ouster of such deprived leadership (cf. 'tyrannicide' under **assassination**).

"Montesquieu's reclassification of governments made 'despotism' into the most important category of vitiated one-person rule in the second half of the 18th century. He specifically downgraded 'tyranny,' a related concept, the boundaries of which had long been differentiated from 'despotism.' As used by Montesquieu, 'tyranny' referred to the intention to overthrow the established power, above all in a democracy. This deliberate alteration of the boundaries between 'despotism' and 'tyranny' registered his awareness of the need to reshape both the historical meanings of these two concepts and the previous relationship between them, against which he had to work if he were to succeed in making despotism into the dominant new category of illegitimate one-person rule in his own time." (Richter 2005: 229-230)

R. Koebner (1951: 301-303) and M. Richter (2005: 230) find that it is no exaggeration that the concept of *despotisme* as popularized by Montesquieu, played a part in the intellectual and political unrest which drove the French monarchy down to the Revolution. Note that his contemporary, Voltaire, vehemently opposed Montesquieu's re-interpretation (and Latinization) of despotism as well as its cultural bias (Koebner 1951) and that A. de Tocqueville, Montesquieu's disciple, could not identify the mobilization by fear in despotic Turkey and Russia, but had to acknowledge the role of religion in these polities (Rahe 2009: 167).

CLASSIFICATIONS No scholar has created meaningful subclassifications of despotism, but there exist two standalone terms that were derived from the core concept.

Oriental despotism The German Sinologist and political scientist Karl August Wittfogel (1896-1988) launched the concept of 'oriental despotism' to account for the specific development path of Asian civilizations in his major work: *Oriental Despotism: A Comparative Study of Total Power* (1957). Eager to update Marxist teachings, he finds that the key to 'oriental' civilizations was absolute control over hydraulic projects (for agricultural irrigation) and the creation of elaborate bureaucratic systems to manage these, sprouting a unique type of civilization, differing from Western models, where power was always distributed between contending groups in a more pluralistic fashion. His 'hydraulic despotism' thus locked in characteristics of arbitrary and absolute rule in oriental polities as an ever-present condition. Wittfogel's theory was later criticized both on empirical grounds and for his orientalist bias (Britannica 2016; Eberhard 1958; Mote 1961).

Enlightened despotism The term was invented twice independently: as *despotisme éclairé* by Pierre-Paul Lemercier de La Rivière in 1767 and as *aufgeklärter Absolutismus* by the German historian Wilhelm Georg Friedrich Roscher in 1874. The term was either bestowed upon those absolute monarchs who were receptive to or supported Enlightenment ideas or were self-styled by the same group of rulers to justify their rule. Frederick II of Prussia, Peter I and Catherine II of Russia – all three known as 'the Great' – together with Maria Theresa, Joseph II and Leopold II of the Holy Roman Empire, featured as the most prominent enlightened rulers, although much controversy remains among scholars to the degree their religious tolerance and administrative reforms came from personal convictions or the necessity for authoritarian modernization. In the prevailing narrative, royal power was presented as a social contract, with despots entrusted to use their power for the betterment of their people; in any case, any

reforms touching upon their sovereignty or with the potential to foster dissent were never allowed (Britannica 2019; Black 1990; Behrens 1975).

METHODOLOGICAL ISSUES Until the 1750s, despotism remained firmly in the shadow of the better-theorized concept of **tyranny**. Montesquieu's scholarly revolution not only reversed their relationship but also blurred their distinction. By the end of the eighteenth century, *despotisme "had been used in so many ways, positively and negatively, that it was at once omnipresent and without any single distinctive meaning."* (Richter 2005: 231). Around the same time, despotism and **absolutism** were often used in the same breath, especially by anti-monarchical opposition espousing **republicanism**.

The best overviews of the concept can be found in R. Koebner (1951) and M. Richter (1990, 2005), with Kaiser (2000), Çirakman (2001) and Rubiés (2005) elaborately exposing the orientalist worldviews of the European thinkers toward the Ottoman Empire and other non-Western polities. Read M. Turchetti (2008) for the delineation between despotism and **tyranny**.

NEW FRONTIERS In political philosophy, Bülent Diken (2021) juxtaposes the ancient, early and late modern accounts of despotism to reveal the (dis)continuities and homologies between them. He chases the 'old monster' of despotism, the extreme, rogue phenomenon through its various actualizations in history, always different in its manifestations. Similarly, John Keane (2020) presents an elaborate case to refurbish the concept of despotism to analyze our contemporary counterparts like China and Russia. He investigates their functional aspects at regional and global levels, as well as their ability to cooperate. In line with Montesquieu, he highlights the dangers of complicity by comfortable citizens and how the phenomenon erodes democratic values and institutions.

Box 1.2 Elected Dictatorship & Protection Pacts

Power shows the man
– Pittacus of Mytilene

The principle of 'elected tyranny' referred to a specific form of political authority in ancient Greece, where a ruler was granted autocratic powers through an elective process rather than by hereditary right or force. Aristotle himself did admit that there existed a legal precedence in which subjects submitted themselves to rule by an 'elected tyrant' (τυραννίς αίρετή or αἰσυμνήτης – *aisymnētēs* or '*aesymnetes*') – a 'dictator' in its original meaning (cf. **dictatorship**) – for reasons of expediency.

In essence, these were crisis solutions or the result of protection pacts: Tyrants were elected in ancient Greece during times of significant political or social crises, where existing leadership structures were unable to maintain order or resolve internal conflicts, i.e., stasis (στάσις – civil strife). This form of governance was seen as a pragmatic solution to manage urgent issues such as factionalism, external threats, or civil unrest. For example, Pittacus of Mytilene (ca. 650 – ca. 570 BCE) was elected as 'aesymnetes' around 590 BCE to restore stability in Mytilene (a city on the island of Lesbos). He served in that post for ten years and was later considered one of the seven sages (early philosophers).

These tyrants were granted autocratic powers temporarily, with the expectation that they would step down after resolving the crisis. Despite their autocratic rule, their **legitimacy** was derived from popular consent, which distinguished them from hereditary monarchs or regular (deviant) **tyranny**, where power was seized by force – cf. **Plato & Aristotle**. This popular approval made their rule acceptable, as they were seen as necessary figures who could mediate between rival factions and restore unity to the polis during turbulent times.

In Aristotle's *Politics*, he describes 'aesymnetes' as its non-hereditary nature and temporary or situational character (Romer 1982). Pittacus, for instance, was elected to deal with political exiles and end internal strife in Mytilene. Although he held autocratic power, his rule was legitimized by popular consent, which differentiated this form of tyranny from the more despotic regimes that would later be condemned in Greek political theory. Theophrastus (ca. 372 – ca. 287 BCE, a pupil of Aristotle), in his treatise *On Kingship,* covered the case of Pittacus (they were both born on Lesbos). A copy of this work circulated intact at the time of Augustus and influenced thinking on 'Roman dictatorship' (as 'elective tyranny'). (Romer 1982: 33) Lucius Quinctius Cincinnatus (ca. 519 – ca. 430 BCE) was respected as an elected 'dictator of Rome' when he acted fast and rescued a consular army from defeat by the Aequi (a neighboring tribe). According to legend, when he resigned, he returned to his farm instead of consolidating his political power. (Britannica 2024)

The idea of elected tyranny reflects the fluidity of early Greek political systems, where distinctions between legitimate and illegitimate rule were not always clear-cut. In fact, as Greg Anderson (2005) argues, early Greek *túrannoi* (tyrants) were not necessarily seen as illegitimate usurpers; instead, they often represented dominant figures within oligarchic structures who gained power through conventional means. The negative connotations associated with **tyranny** only solidified later in Greek history, particularly after the classical era.

Thus, the principle of elected tyranny illustrates an early form of autocratic rule that was sanctioned by popular will and aimed at addressing specific political challenges. It underscores the complex nature of leadership in archaic Greece, where rulers like Pittacus could be both tyrants and legitimate leaders depending on the context and the needs of the polis.

Protection pacts, while a classical phenomenon, have been prevalent throughout history, though such regimes often prove short-lived. Scholars like Dan Slater (2010; 2018) and Levitsky & Way (2016) argue that counter-revolutionary regimes succeed by uniting elite interests against shared threats, particularly leftist rebellions aiming to seize capital and dismantle property rights. In response, economic and communal elites form protection pacts, ceding power to strongmen for defense. This often leads to **personalist rule**, as seen in anti-communist dictatorships like in South Vietnam (1955-1963) after the *autogolpe* of Ngo Dinh Diem (Ngô Đình Diệm), ultimately killed in a coup backed by the CIA; Laos (1959-1962) where General Phoumi Nosavan elbowed his way to power; Cambodia (1971-1975) where General Lon Nol colluded with Prince Sisowath Sirik effectively ending the rule of Prince Norodom Sihanouk; and South Korea under Syngman Rhee (1948-1960). Even Malaysia's regime, although not personalist, fits the pattern of elite-driven protection pacts. (Van den Bosch 2021: 265)

Dictatorship

Caesar was the only man who undertook to overthrow the state when sober.
– Marcus Cato the Younger

Dictatorship is an old term that has historically had many meanings, ranging from the concrete to the very general. It is a concept that is burdened with many problems and ambiguities. In general, three basic issues can be identified that are associated with the use of the concept of dictatorship. First is the separation of history from the present. Dictatorship has been understood and perceived differently in the past and differently in the present, or from the twentieth century to the present.

Second, it is the way the concept is used in literature. Many authors use the concept of dictatorship quite loosely and commonly equate it with other terms, such as **authoritarianism** and **totalitarianism**, but also link it with other terms that denote various forms of undemocratic rule.

Third is the question of the definition of dictatorship. How does one define a dictatorship, and can it even be done? Many authors who study non-democratic regimes do not address the question of defining dictatorship at all. Related to this is the question of designing a typology of dictatorship.

In this entry, the focus is on the contemporary concept of dictatorship, not on its ancient historical forms. Assuming that it is a distinct concept that can be defined and that, in turn, therefore it should be differentiated from other terms of non-democratic governance. For example, the concept of dictatorship is not identical and interchangeable with the concept of authoritarianism or totalitarianism, but totalitarian and authoritarian regimes are types of dictatorship.

This more specific definition of dictatorship is required to assess its unique defining features, and hence, this entry takes a different approach compared to the other entries in the *Encyclopedia Tyrannica,* which, following prevailing custom, equates dictatorship with authoritarianism and **autocracy** and freely uses them as synonyms, mostly for stylistic reasons.

DEFINITION The word dictatorship is clear enough. It is simply a general term for any undemocratic regime. Is it possible to define such a generally understood term any more precisely? The simplest and most widely used definitions of dictatorship are minimalist: *"dictatorship is obviously the opposite of democracy"* (Gandhi 2010: 2) or even easier, *"Dictatorships are not democracies"* (Przeworski et al. 2000: 18).

Giovanni Sartori (1971; 1995) stressed that dictatorships are both morally and politically illegitimate because they are always and everywhere based on the usurpation of political power. In other words, in a dictatorship, political power does not come from free elections but is an imposed power. Political power exacts obedience through violence or the threat of its use. In short, anything that contradicts the requirements of democracy is dictatorial; it is *"rule by other means than democracy"* (Brooker 2014: 1).

Dictatorship can thus be defined as a regime in which rulers gain power through means other than competitive elections (Gandhi 2010: 7; Przeworski et al. 2000: 15). It is a negative definition of the concept. Dictatorship is defined not through what it has but through what it does not have. It is not just the lack of competitive elections, because today we have many dictatorships with **elections** of varying degrees of competitiveness (Brownlee 2007: 25), but also the absence of other things: dictatorships do not have the rule of law, political and civil rights, regular changes in power, etc. (Gandhi 2010: 7).

According to Sartori (1995: 72-75), dictatorship is a form of state in which political power is characterized by three basic features: first, it is undemocratic; second, it is unconstitutional; and third, it is coercive or violent. His second defining characteristic of a dictatorship may cause controversy: unconstitutionality. After all, many dictatorships have constitutions (cf. **authoritarian constitutionalism**), and in the past, there were plenty of dictatorships that had overtly undemocratic constitutions (not so much nowadays, as dictatorships have become more camouflaged). For example, the Polish Constitution of 1935 explicitly handed over all state power to the president (Article 4), who was accountable "before God and history" (Article 2, paragraph 2; Konstytucja 1935).

The unconstitutionality of dictatorship in Sartori's conception is based on something else. According to him, a dictatorship is understood primarily in terms of the people who rule it, i.e., in terms of the leaders or dictators, not as an institutional system: *"Traditional doctrine dealt exclusively with the 'dictator-person', not the 'dictatorship-institution'"* (Sartori 1995: 58). This is because its primary and typical characteristic is the strong **personalization** of power that distinguishes it from other political systems.

Leaving aside the rare cases of collectivist dictatorships (the Soviet Union immediately after Stalin's death or South American military **juntas**), the personalization of power is indeed a dominant feature of almost every dictatorial rule. Dictators are individuals endowed with extraordinary powers because of their alleged extraordinary abilities and merits. Their power is not institutionalized and is not subject to legal norms. Dictators rule the state personally from a position of leadership or supreme authority; they are not a state organ or institution. As an example, consider the *Führer* of the Third Reich, Adolf Hitler: *"In what sense was Hitler a state organ subject to his legal principles? (...) Probably only in the sense that he was an organ of himself: that is, in no sense. Hitler was not an organ, but a person whose arbitrary will hovered above and outside the authority"* (Sartori 1995: 78).

SEE ALSO Other primordial terms related to dictatorship are **authoritarianism**, **autocracy**, and **totalitarianism**. Each is presented in its historical and

contemporary understanding. The sections on **classifications & typologies** offer a myriad of conceptual frames used to distinguish democracy from non-democracy and subdivide **political regimes**.

KEY SIGNIFICANCE Dictatorship is the basic and overarching concept of non-democratic rule, from which other concepts, especially authoritarianism and totalitarianism, are derived, which are types of dictatorship. It is universal enough to be used in a variety of contexts and disciplines in the humanities and social sciences. It also has linguistic significance because it represents a word that is commonly used and universally understood. However, all this is on condition that it is understood in a modern, not historical, way as shown below.

ORIGIN The concept of dictatorship has a long tradition of more than 2000 years. The historical prototype of dictatorship was ancient republican Rome. This ancient Latin *dictatura* was a legal institution that was activated in emergencies threatening the state. In such cases, a *dictator* temporarily assumed power but could not change the legal principles of the state (cf. Box 1.2 on elected dictatorship). Over time, this understanding of dictatorship thus 'broke down,' turning into unlimited dictatorial **personalist rule**, as exemplified first by the dictatorship of Lucius Cornelius Sulla and later by Julius Caesar in the first century BCE.

Nevertheless, for centuries dictatorship was still evaluated as a normal albeit personalized power order. Dictatorship has been recommended as a remedy for various problems of the state by Niccolò **Machiavelli**, Jean **Bodin**, Thomas Hobbes and Jean-Jacques Rousseau. Even during the Italian *Risorgimento*, Farini in 1859 (in Emilia) and Garibaldi in 1860 (in Sicily) declared themselves dictators in the 'positive' ancient Roman sense.

It was Louis Auguste Blanqui who broke tradition, speaking of the 'dictatorship of revolutionaries' in the interests of the people (cf. Box 1.3), and thus probably inspiring Marx and Lenin. Soviets later used the term as a positive self-designation in the dictatorship of the proletariat. It was not until after WWI that dictatorship took on an unequivocally negative connotation, and only with the rise of **fascism** and then Nazism that dictatorship came to be understood as a kind of separate type of political system or state. The word dictatorship has proved to be an appropriate label for a degenerate republic that has moved away from the democratic model, just as **tyranny** in the past meant a 'corrupt monarchy' characterized by all-encompassing violence. Dictatorship, as interpreted as such in this entry (see 'definition' above), meaning the negative opposite of democracy, is therefore a twentieth-century affair (Baehr & Richter 2004; Gandhi 2010: 3-7; Przeworski 2019; Sartori 1995: 60-61; 1987: 204-205).

LITERATURE Works purely devoted to the general concept of dictatorship are virtually non-existent today. A few are older and often in languages other than English (see Schmitt [1921] 2015; Cobban 1939; Neumann 1957; Duverger 1961; Sartori 1971: 456-485). Since then, the concept has been part of a broader body of work on non-democratic rule that discusses different types of dictatorship (most often authoritarianism and totalitarianism) or various specific dictatorships around the world including its historical forms (see Baehr & Richter 2004), but not dictatorship as a concept.

Given the fact that dictatorship is a general concept, its occurrence in different regional constellations is vast and varied. Most often, it is some type of **authoritarianism**, but also other types such as – especially in the twentieth century – **totalitarianism**, then **sultanism & neo-sultanism**, various traditional regimes (e.g., **monarchies**), etc. In the twenty-first century, one encounters various strongman leaders, including those who operate within democratic systems using populist strategies but have not yet dismantled democracy (Rachman 2022), as well as proponents of what Brooker (2014) terms 'disguised authoritarianism.' These leadership styles are often linked to **populism**, which many scholars regard as a non-democratic doctrine (Abts & Rummens 2007; Panizza 2005; Pasquino 2008). Since the literature on dictatorship is distributed among its specific subtypes, consult these entries individually.

Table 1.3 – Sartori's Typology of Dictatorships

Criteria	Totalitarian	Authoritarian	Simple
Ideology	strong and totalistic	weaker and non-totalistic	irrelevant or feeble
Penetration, pervasiveness	extensive	modest	none
Coercion, extraction, mobilization	high	medium	medium-low
Subgroup independence	none	limited to non-political groups	permitted with exceptions
Policies vs. outer groups	destructive	exclusionary	absorptive
Arbitrariness	unrestricted	within predicable limits	erratic
Party centrality	essential	useful	minimal or none

Source: Author's own work, based on: Sartori 1993: 15.

METHODOLOGICAL ISSUES In the study of (contemporary) dictatorship, a key methodological question arises: should dictatorship be understood as a distinct general concept encompassing various forms of non-democratic rule, or should it be regarded as synonymous with other types of non-democratic regimes, particularly authoritarianism, as some scholars suggest (e.g., Ezrow & Frantz 2011)? This broad question can be further refined, as exemplified by Hannah Arendt ([1951] 2022), who explored whether dictatorship is merely another term for different forms of authoritarianism, fundamentally distinct from totalitarianism, or whether it represents a broader genus encompassing both authoritarian and totalitarian regimes. While the distinction remains unclear, the first interpretation tends to prevail (Arato 2002: 482-483).

CLASSIFICATIONS Again, since dictatorship is a general concept, there are several typologies based on different criteria. First and foremost, these would be the criteria of 'who rules?' (A) and 'How do they rule?' (B) or a combination of both (Brooker 2014: 13). Typologies based on the classical duality of authoritarianism vs. totalitarianism adhere to criterion B. If we search for classifications using criterion (A) 'who rules?', then we get three basic types of dictatorship: military, one-party and personal (Brooker 2014; Ezrow & Frantz 2011).

An original and highly complex typology of dictatorship was provided by Giovanni Sartori (1971; 1995: 84-86), which combines both criteria (A & B). These are four classifications of dictatorships based on four basic separable criteria, which are: (i) intensity, (ii) goal, (iii) origin, and (iv) ideology. Based on the criterion of *intensity* (i), he distinguished three types of dictatorship: simple, Caesarist and totalitarian. Simple and totalitarian dictatorships overlap with the usually juxtaposed authoritarianism vs. totalitarianism. A Caesarist dictatorship is a regime in which all political power is held by a single charismatic leader who is authentically supported or even enthusiastically admired by the masses (note, 'Caesarism' is described in **term limits**).

According to the criterion of the *goal* (ii), dictatorships are divided into two types: revolutionary dictatorships and dictatorships of order *(dittature d'ordine*). Revolutionary dictatorships seek radical political and social change in the name of reconstruction and progress, while dictatorships of order seek to preserve a threatened *status quo* (conservative dictatorships), to return to the *status quo ante* (reactionary dictatorships) or to implement some grand plan that requires special political guardianship (paternalistic dictatorships). This last kind of dictatorship often takes the form of a kind of 'pedagogical' dictatorship, whose representatives claim that they aim to prepare the nation for democracy, which is not yet possible (and is routinely delayed).

Regarding the criterion of *origin* (iii), i.e., from which environment the ruling circle is derived, Sartori distinguished between political, military and bureaucratic dictatorships. In political dictatorships, the rulers are recruited from the political class; in military dictatorships, they are 'people in uniform,' i.e., soldiers, and in bureaucratic dictatorships, the state apparatus holds political power. The last criterion is the *ideological* (iv) character of the regime. Here, a distinction can be made between non-ideological and ideological dictatorships. Obviously, non-ideological dictatorships will most often take the form of authoritarianism, while ideological dictatorships will be primarily totalitarian or ideocratic.

This typology of dictatorship did not enter the mainstream because it was not translated from its original Italian. Sartori (1993: 15), in one of his later texts in English, presented a simpler typology consisting of three types: totalitarian, authoritarian and simple, as shown in Table 1.3.

Compared to his previous typology of dictatorships, what is new here is that he separated *simple dictatorship* from authoritarian dictatorship and redefined it. It is a non-democratic regime that has two main characteristics. First, it is ruled by one man, and a developed institutional background does not back this personalized political power, nor does a political party back it. Second, the state is relatively moderate, i.e., it minimizes oppression, is non-ideological, and allows for a relatively free public life. It is thus something that would roughly correspond to **hybrid regimes** or new or disguised authoritarianism (cf. **electoral authoritarianism** and **populism**). Authoritarian and totalitarian dictatorships conform to Linz's (2000) 'standard' definitions (cf. **Linz & Stepan**).

Box 1.3 Dictatorship of the Proletariat: A Stretchy Concept

For there are very few so foolish who would not rather govern themselves than be governed by others.
– Thomas Hobbes (1588-1679)

In Marxist philosophy and political theory, the concept of **dictatorship** of the proletariat did not have anti-democratic connotations (Mayer 1993: 255), but this changed over time. Originally, it was a specific stage in the abolishment of class relationships and capitalist modes of production, where the working class becomes the ruling class and assumes power over the state. It is a specific stage in the transition towards a classless society, or communist society, where the processes of the abolishment of private property of the means of production, as the specific expression of class exploitation in the capitalist mode of production, is at the forefront.

Joseph Weydemeyer developed the term, though Karl Marx first used the phrase in the series of articles, that later appeared in the book *The Class Struggles in France 1848-1850*. Marx initially abandoned the concept but later revisited it in his analysis of the Paris Commune and his "Critique of the Gotha Programme."

The Paris Commune was a revolutionary government that briefly ruled Paris from 18 March to 28 May 1871 (see also: **Anarchism**). Its origins lie in the political and social upheaval following the Franco-Prussian War (1870-1871), which saw the defeat of France and the collapse of Emperor Napoleon III's regime. It is well known, that the Commune had very little to do with the contemporary understanding of the notion of dictatorship, since it was the specific conquest of (geographically limited) state power by the working class and the abolishment of class exploitation and class society as such.

The Gotha Programme was a political platform proposed in 1875 during the unification of two major German socialist groups: the *Social Democratic Workers' Party of Germany* (SDAP) and the *General German Workers' Association* (ADAV), founded by Ferdinand Lassalle. The program aimed to establish the ideologies and policies that would guide the newly unified party, which later became the *Social Democratic Party of Germany* (SPD – *Sozialdemokratische Partei Deutschlands*). Marx repeated his concept of the dictatorship of the proletariat in his "Critique of the Gotha Programme," where he emphasized a 'transition' phase between two stages of communist society. The dictatorship of the proletariat marks the first stage, while the second represents true communism, where both classes and the state are abolished. Marx also referred to the dictatorship of the proletariat as a 'state' during this interim period, contrasting it with the dictatorship of the bourgeoisie (Draper 1962; 1987; Johnston 1971).

Georgy Valentinovich Plekhanov (1856-1918), activist, ideologue and 'father of Russian Marxism,' made significant contributions by introducing the Marxist concept of the dictatorship of the proletariat to Russian Social Democracy. Like Marx, Plekhanov argued that the dictatorship of the proletariat was not about minority rule or a mere seizure of power but rather a genuine class project led by the proletariat. Initially, Lenin viewed the dictatorship of the proletariat as a temporary measure, necessary until a free and democratic, classless state could be established. However, he later adopted a more permanent conception of this dictatorship (Mayer 1993; Barany 1997).

The concept of the dictatorship of the proletariat became a major point of contention within the Marxist movement, most notably in the debates between Karl Kautsky and Lenin. Kautsky (1854-1938) was a prominent Marxist theorist, philosopher, and a leading figure in the *German Social Democratic Party* (SPD) as well as the Second International. While Marx originally conceived of the dictatorship of the proletariat as a dictatorship of the majority, meaning the rule of the working class aimed at abolishing private property and class distinctions, this idea evolved significantly after the Bolshevik Revolution. Marx's vision was not one of a dictatorship by a political party but rather a class-based project that would dismantle capitalist structures.

However, under Lenin and the Bolsheviks, the concept was adapted to suit their needs: Lenin argued that in Russia's specific conditions, the proletariat needed a vanguard party to lead and consolidate power during the transition to socialism. This interpretation effectively transformed the dictatorship of the proletariat into a 'dictatorship of the Party,' which claimed to act on behalf of the working class. After Lenin's death, this conception was further radicalized under Stalin, who

used it to justify widespread violence and repression in order to secure and maintain revolutionary gains. In Stalin's revision, violence became central to ensuring the survival of the revolution, marking a stark departure from Marx's original emphasis on majority rule and the goal of creating a stateless society.

Mao Zedong and the Chinese Communists introduced a slightly different version of the concept of the dictatorship of the proletariat. Due to the different material conditions from those in the West, Mao expanded the conception of the revolutionary subject, which also led to the introduction of a novel concept of the *People's Democratic Dictatorship* (人民民主专政 – *Rénmín Mínzhǔ Zhuānzhèng*) (Bose 1995). Mao claimed that it *"is based on the alliance of the working class, the peasantry and the urban petty bourgeoisie, and mainly on the alliance of the workers and the peasants, because these two classes comprise 80 to 90 per cent of China's population"* (Mao 1949) The concept refers to a system where the Chinese Communist Party (CCP) claims to represent and act on behalf of 'the people' (primarily workers, peasants, and other revolutionary classes) while maintaining dictatorial control over those deemed counter-revolutionary or reactionary forces. So, the 'democratic' aspect refers to participation by revolutionary classes in governance under CCP leadership, while the 'dictatorship' aspect justifies the use of force or coercion against those perceived as enemies of socialism or threats to CCP rule.

Digital Authoritarianism

Propaganda is to a democracy what the bludgeon is to a totalitarian state
– Noam Chomsky, *Media Control: The Spectacular Achievements of Propaganda* (1991)

Digital authoritarianism is the use of digital technology by authoritarian regimes to censor, surveil, repress and manipulate domestic and foreign information environments. Digital authoritarianism also comprises the surveillance of individuals and the masses through the use of cameras, facial recognition, drones, GPS tracking, and other digital technologies to support authoritarian governance.

DEFINITION Digital authoritarianism is the efforts by authoritarian regimes to control the information environment. Digital authoritarianism involves *blocking and restricting* information online (**censorship**). This could be blocking or shutting down a communication platform or a deliberate shutdown of mobile networks, Internet access and communications apps, for example, during riots and protests.

Digital authoritarianism encompasses using *restrictive social media laws* to allow critics of the government to be detained under the pretext of spreading 'fake news.' Online users could be persecuted (Reuter & Szakonyi 2015). Digital authoritarianism also includes more blatant forms of censorship. Censorship and instilling fear in those using online platforms (either social or new media) to criticize the government is still a common tactic. Cyber-attacks (cf. **cyber-warfare**) constitute another form of digital authoritarianism.

In addition to more blatant use of censorship, authoritarian regimes can also make it more difficult for information to flow. This strategy is known as 'friction' (see Roberts 2018). Regimes can cause Internet shutdowns and Internet slowdowns. They can remove social media posts. They can make it more difficult to access government information, which is important for publicizing government failures. They can create fees for accessing information that should be free of charge to access. Friction causes delays, but journalists may not even realize that they are being affected. Internet protocol address lists can be used to block foreign online content. Traffic header inspections can monitor online activity. Legal control of Internet service providers can shut down the Internet.

Digital authoritarianism relies on *manipulating content*. Digital authoritarianism is about **disinformation** campaigns, the objectives and modes of which can vary. One of the ways that authoritarian regimes manipulate the public is through flooding (as shown in Box 1.4). Flooding entails the government producing information to distract and confuse from information that the government would rather

citizens did not have access to. Regimes can flood social media with disinformation that is supportive of the regime or demonizes the opposition (Roberts 2018). They can use automated bots to promote government **propaganda** or flood anti-regime protest media. Troll armies are used to harass critics, spread misinformation, and erode trust in independent media outlets.

By doing so, this provides plausible deniability for the use of censorship, propaganda and repression. This also can ultimately confuse people. If there is an onslaught of propaganda to convince the public of something, it makes it even harder for citizens to discern what is false and what is the truth. For example, the Chinese government uses social media to pay government employees to generate about 448 million comments every year (Tucker et al. 2017). Flooding can be used to target a domestic audience or used to target another country's population, as was the case with Russia's electoral interference in the 2016 US Presidential election.

Digital authoritarian involves *surveillance.* Surveillance systems that were supposed to improve public safety are being used to target activists, groups and individuals. GPS can be used to track movements. Email and social media can be surveilled as well (Reuter & Szakonyi 2015). Authoritarian regimes are also using AI, machine learning, facial recognition, malware hacking and satellite infrastructure to control individuals and groups. Any critics of the government or human rights groups are targeted and harassed. The digital tracking power of the Internet has made it easier to identify who is blogging information that the government deems to be offensive, and as a result, thousands of bloggers have been arrested. Additionally, authoritarian regimes are making use of spyware programs that can turn mobile into surveillance tools, giving an attacker full access to the data in these devices. This can be used to target activists, opposition members, journalists and others (Allen & La Lime 2021).

SEE ALSO Digital authoritarianism is an authoritarian practice manifested in the virtual space of the digital age, primarily on social and new media but can be aimed at infrastructure (i.e. **cyber-warfare**). It encompasses new forms of **censorship** fueled by **disinformation** to either boost regime support at home (**propaganda**), identify silent critics (**repression**, **secret services**) or portray regimes in a more favorable light abroad (**soft power**). The term is associated with the concepts of 'fake news,' networked authoritarianism, tech-enabled authoritarianism, and cyber sovereignty.

KEY SIGNIFICANCE Digital authoritarianism has not only impeded individual rights and liberties but has reshaped the power balance between democracies and autocracies. Authoritarian regimes are able to consolidate power and diffuse tools for digital surveillance. With digital authoritarianism, authoritarian regimes are exerting increased and unchecked control over their population through digital technologies and other populations as well.

Digital authoritarianism enables preventive repression and exploitation of **human rights** – the most important first line of defense for authoritarians (Ritter & Conrad 2016). Preventive repression is activities that the government uses to decrease the risk that the opposition would threaten the government, such as enabling them to mobilize and organize public dissent. Preventive repression involves identifying, monitoring and tracking potential regime opponents in order to neutralize them (Dragu & Przeworski 2019). States are less reactive than they were when the Internet was starting to explode. Today, they are proactive in limiting citizens access to information (Morozov 2011).

Digital authoritarianism also allows authoritarian regimes to appear to have a hands-off approach to repression. These strategies have changed the landscape of how information is disseminated and have given a huge advantage to incumbent regimes that can harness social media to control the narratives (Kendall-Taylor et al. 2020). Digital authoritarianism also normalizes constant surveillance and expunges any demands for privacy.

ORIGIN Not until the early 2000s was there any mention of digital authoritarianism. For the most part political science scholarship had very little to say on the matter. The literature that addressed this topic assumed that information and communication technologies would play a democratizing role. Most scholarly work also focused on the role of the Internet in the US and other advanced liberal democracies (Kalathil & Boas 2001). No work countered the popular belief that the Internet would undermine authoritarian regimes.

Early work in the 1990s could not be concluded because Internet access was not spread out. Case studies seemed to demonstrate that contrary to conventional wisdom, authoritarian regimes were finding ways to counter the political impact of Internet use. Singapore was already using legal, technical and social measures to shape the development of the Internet as early as 2000. Ambitious censorship schemes are being implemented in Saudi Arabia and the UAE. More work would follow suit, but the term digital authoritarianism was not used until 2011, and other works focused on networked authoritarianism or more descriptive words to explain authoritarian regimes' use of censorship of the Internet and technology.

China's first regulation of the Internet was the *Provision Directive on the Management of International Connections by Computer Information Networks in the PRC*, which was signed in 1996. At this point, fewer than 20,000 Chinese had access to the Internet – and this was mostly government officials and academics. By the 2010s, there was an uptick in literature on the efforts by authoritarian regimes to stifle social media, particularly after the events of the **Arab Spring**. As the case study in the example below reveals, the pioneer of digital authoritarianism was China.

LITERATURE Various studies have looked at the impact of the Internet and improvements in technology on democracy. With the power of the Inter-

net, authoritarian regimes were initially concerned that the digital revolution would unleash the forces of democratization and lead to authoritarian breakdown. Many authoritarian regimes have been unable to control what their citizens are able to access completely. However, *Freedom on the Net*, a comprehensive study of Internet freedom in 65 countries, has demonstrated that Internet freedom is deteriorating. More countries are following the Chinese model of censorship, surveillance, disinformation campaigns, arrests of government critics and technical breakdowns and attacks. It is not only autocracies like Egypt, Cambodia and Venezuela that are embracing these tactics but also gray zone democracies like Sri Lanka, Nigeria, Kenya and the Philippines. The incorporation of these tactics of digital authoritarianism is an example of how flawed democracies are backsliding.

The literature on digital authoritarianism found that social media did not undermine autocracies. Espen Rød and Nils Weidmann (2015) highlight how authoritarian regimes can use the Internet to their favor. Daehee Bak and colleagues (2018) claim that the Internet is really only helpful in protecting citizens from repression in countries that are already democratic or at least have competitive **elections** and some constraints on the **executive**. For authoritarian regimes, the impact of the Internet on protecting their citizens from repression is very limited (Bak et al. 2018).

Technological systems were initially lauded as being able to spearhead democratic progress, enabling citizens to share information more freely, coordinate activity and hold governments accountable. In Ukraine's Orange Revolution, citizens used networked platforms to access alternative media to communicate and coordinate large groups (Goldstein 2007). Networked platforms were used to help coordinate in Iran in 2009 and Egypt in 2022. This was known as liberation technology, according to Larry Diamond (2010). It was any form of information and communication technology that expanded political, social and economic freedom. Social media was hailed as a technology that would liberate societies and support free speech. Nevertheless, the Internet and social media have also enabled authoritarian regimes to surveil their societies to an unprecedented extent. Authoritarian regimes found ways to limit their citizens' use of networked platforms for free speech or collective action.

CLASSIFICATIONS As the definition already explained there are many different dimensions and practices to digital authoritarianism. These can include surveillance, manipulation, flooding, friction and other restrictions. Thus, there are efforts to censor and restrict, efforts to manipulate and confuse and efforts to surveil and watch over closely. In the category of manipulation and confusion, we find the concept of 'fake news.'

Fake news is a term that authoritarian regimes have used to delegitimize any information that is critical of the regime. Ironically, it is more often that authoritarian regimes or their surrogates use fake news to confuse, distract and polarize. Fake news encompasses many different things, including misleading content that uses misinformation to frame an issue or individual; impostor content where the sources are impersonated; fabricated content where the new content is 100 percent false and designed to deceive and do harm; false connection, where the headlines, visuals or captions do not support the content; false context when genuine content is shared with false contextual information; and finally manipulated content, where genuine information or imagery is manipulated to deceive. Fake news is not satire – which has no intention to cause harm but could have the potential to fool. Fake news has the intention to mislead.

MEASUREMENT Measuring digital authoritarianism requires looking at various actions and restrictions. There are numerous measures of media freedom and censorship offered by **Varieties of Democracy**, **Freedom House**, and the *Economic Index,* among others. However, to more specifically measure digital authoritarianism requires looking at which countries black out the Internet infrastructure and where there is infrastructural isolation such as a firewall. It may also be important to look at the license restrictions to Internet service providers (ISPs), content moderation mandates and to what degree ISPs face prosecution. Studies can also look at whether platforms and websites face prosecution, blocking and denial of services, content filtration and blocklisting. Finally, investigating the environment for Internet users, prosecution, blocking, blocklisting and denial of anonymity.

METHODOLOGICAL ISSUES Measuring digital authoritarianism is complicated by the fact that it is difficult to quantify different forms of digital manipulations. While measuring censorship laws is more straightforward, it is more challenging to ascertain the extent of friction and flooding taking place. Accessing the data on surveillance is also difficult to find as this data may not be readily available. It is also difficult to measure the impact. For example, was public opinion shaped by digital manipulation or other factors?

EXAMPLES China and Russia are notably at the forefront of this phenomenon. Of the two, China has the most experience in digital authoritarianism. China is a trailblazer and one of the leading exporters of regulatory orders for the Internet. A poll of Chinese citizens revealed that 60 percent had a positive image of the government's role in Internet supervision and saw it as a sign of the government's progress. Thus, not only is China using the Internet to prolong authoritarian rule, but it is also doing it in a way that is attractive to its citizens.

Much has been written about Internet governance in China (King et al. 2013; Laskai & Segal 2021; Lu & Zhao 2018; MacKinnon 2011; Roberts 2018; Tkacheva et al. 2013; Yang & Mueller 2019). China has almost a billion Internet users – 830 million representing almost 60 percent of its population. It, therefore, can shape the digital experience of about a fifth of the world's population. China has always advocated

a model of Internet governance that used censorship and surveillance instead of an open model supported by liberal democracies (Sherman 2021). China has essentially provided the world with a blueprint for the establishment of a digital totalitarian state (Qiang 2021).

The Chinese digital governance model has demonstrated how other authoritarian regimes can harness technology to stabilize, strengthen, and legitimize authoritarian governments (MacKinnon 2011: 36). The Chinese government has offered training courses and seminars for 36 countries about information management and restrictive online practices (Qiang 2021; Sherman 2021) – cf. **authoritarian collaboration**.

China is also the supplier of choice for any autocratic regime wanting to improve its surveillance systems, and its techniques are increasingly copied and adopted by other countries. China's *Belt and Road Initiative* (BRI) recipients have passed cyber-security laws that are more restrictive of online content, sometimes mirroring laws already enacted by China (Sherman 2021). For example, Vietnam recently established data localization requirements (Sherman 2021) – cf. **authoritarian learning**.

The Chinese government has also aggressively promoted its 'Digital Silk Road,' a series of fiber optic cables, mobile networks, satellite stations and smart cities built by global Chinese technology companies (Qiang 2021). Through its subsidized Digital Silk Road projects, China has played an important role in increasing the usage of AI surveillance technology, offering $17 billion in loans and investments in telecom networks and other big data initiatives throughout the developing world (Eder et al. 2019). Chinese companies are installing Internet and mobile network equipment and offering high-tech tools to assist governments with surveillance as well. In addition to surveillance, mapping, cloud storage and data analysis are also provided, which may help regimes spy on their domestic political opponents (Parkinson et al. 2019). At least 80 countries in the Global South have adopted *Huawei*'s Safe City solutions or other Chinese surveillance and security technology platforms (Greitens 2020).

In Tanzania and Nigeria, for example, this additional support has helped these countries crack down on Internet content. In response to the **Arab Spring**, some authoritarian leaders began to share information-blocking technology. Protests in Egypt, Iran and Ukraine found that mobile service was disabled (Steinert-Threlkeld et al. 2015). Vietnam, Iran, Saudi Arabia, and the United Arab Emirates, just to name a few, have blocked offensive content to maintain the *status quo*. The Turkish courts banned *YouTube,* which was deemed offensive to Atatürk (the state's founder). Thailand blocked *YouTube* because there was a derogatory message about the king in one of the private messages on the website. Many technology-deprived countries have been persuaded by the efficacy of China's surveillance security models. China not only serves as an inspiration, but many countries may be more likely to support China in international organizations in exchange for China's investment.

In China, the central Internet regulator is the *Cyberspace Administration of China,* which answers to the *Central Cyberspace Affairs Commission*, which is headed by Xi Jinping himself. Censorship on the web is part of a larger surveillance effort, which seeks to process, track and control most networked platforms. In China, political dissent is considered a crime and is closely watched. Additionally, China's cyber-laws target corporations to ensure that there is private dependence on the state.

In China, all website owners have to hold a state license (an Internet Content Provider license or IPC). This makes website owners legally responsible for all published content and requires the self-discipline demanded by Internet services. They are responsible for making sure that unauthorized information remains blocked. There are forbidden words and topics listed and circulated in media and service operators. Off-limit topics are the Hong Kong protests (cf. Box 6.4), the anniversaries of the Tiananmen Square massacre, and the detention of Uyghurs and other ethnic minorities in Xinjiang.

China has one of the most technologically advanced Internet infrastructures for managing Internet traffic. The *Chinese Firewall* (called internally the 'Golden Shield Project' – 金盾工程 – *jīndùn gōngchéng*) is a centralized system of Internet traffic choke points that enables the government to block servers and sites across the country and protect them from international Internet traffic (Ramesh et al. 2020). The firewall blocks platforms like *Twitter, Google, Facebook* and *YouTube,* as well as virtual private networks (VPNs) (Kolton 2017).

With the Great Firewall (which China began working on in 2011), the Chinese state has built a national version of the Internet, in which it holds full power and exercises control at will (Creemers 2016; King et al. 2013; Weber 2019). The firewall is a collection of software and hardware systems that is used to monitor and filter communications. It can block, censor and patrol anything deemed politically unacceptable (King et al. 2013). It blocks mobile apps and forces foreign companies to adapt to domestic regulations. The firewall does not work as a wall but as a management system with many moving parts, exercising flexibility and agility. It does not just censor information but also surveils and manipulates information. The system does routine management of daily flows of information and also works in overdrive during a crisis (MacKinnon 2011). Internet companies are also expected to invest in their technology and personnel to censor information, according to China's Cyberspace Administration. Those who fail to do so face huge fines and can lose their license (Ruan et al. 2020).

Whenever there is a moment of tension, the government shuts down all communications in that location so that citizens cannot use the Internet or their mobile phones. For example, in July 2009, the Internet was completely shut down for ten months in the entire province of Xinjiang after ethnic riots took place.

In its day-to-day activities, flooding is a common

tactic used by the Chinese government. For example, a *New York Times* report indicated that 4600 *Twitter* accounts reposted posts from Chinese diplomatic envoys and official news organizations in the first week of June 2020 to serve as a distraction. Many students are recruited to blog and write favorable posts about their employers and the government. Independent online writers are co-opted and invited to special conferences and press events.

China has also established a system of digital control that can identify potential dissenters in real time. To do so, China has supported and co-opted domestic technology, and Chinese tech companies are legally compelled to offer the government access to data on citizens (Simonite 2019). China also has the largest surveillance network of over 200 million closed-circuit cameras. Using data on each individual, the Chinese government then only allows compliant citizens to participate fully in society and the economy through the social credit system that has been established. With the social credit system, people and companies can be blocklisted for behavior that is considered to be non-compliant, while good behavior is rewarded with preferential treatment in housing, employment, medical care, travel and access to the Internet (Liang et al. 2018). Additionally, big data about citizens' behavior is fed into algorithms to shape economic and social interactions in ways that reproduce the norms of the regime.

The Chinese government also exercises control over devices and networks. Under the guise of protecting children from inappropriate content, software must be installed on all computers sold in China. This software censors political and religious content, logs user activity and sends this information back to a central computer server belonging to a software developer's company. This software also made users more vulnerable to cyber-attacks. Mobile phones are used to track citizens and monitor their movements and communications. They must provide identification when buying a SIM card (Kavanaugh et al. 2011). Only if the battery is entirely removed is tracking no longer possible (Gallagher 2013). It is impossible to evade digital control via cellular data. *Skype* was used in 2006 by the Chinese government to track and log politically sensitive chat sessions inside China. Data leaks in 2019 revealed that 2.6 million people were being closely tracked in real time through a facial recognition company called *SenseNets*. Surveillance enables authorities to warn and harass Internet users through electronic messages.

The Chinese government also has control over domain names, and companies and organizations can only use domains that end in '.cn.' This again was implemented in order to clean up pornography and fraud as a pretext to shut down hundreds of thousands of websites (Taylor 2022).

New users in China must register their websites and blogs with government identification and must agree with conditions to limit their speech. China does not allow any anonymity. Real names must be registered in order to use popular messaging services or to comment on websites and forums (Caragliano 2013). Singapore has followed suit in making sure new users register their blogs and websites as well with the government.

Russia offers lower-cost digital disinformation tools to repress potential opposition and democracies abroad. Russia's digital authoritarianism is less centralized, more reactive and lacks choke points. It has to rely on Internet Service Providers (ISPs) to block or filter content, sites or users based on blocklists that are maintained by the government that must be frequently updated. As a result, in comparison to China, Russia's blocking is also more unevenly implemented. However, Russia is working on improving its use of automated filters and access restrictions.

While most of China's Internet governance laws were introduced in the 1990s and early 2000s, Russia's were established much later, mostly after the 2011 protests, and the *Internet Isolation Law* in Russia was not introduced until 2019. Nevertheless, Russia has more recently been governing its network infrastructure better. This signifies a broader trend toward less visible, more technical digital control mechanisms rather than going after critics of the state via prosecution. Since 2018, regional service blackouts have been executed in both Ingushetia and Moscow.

The visible forms of digital authoritarianism persist. Many countries have passed extremely strict laws for journalists. Russia passed a law in 2014 that required blogs with over 3000 monthly visitors to register. Bloggers are liable for the accuracy of what they write, with anything too critical of the government likely to be deemed false. Egypt, which has the third most journalists in jail, passed legislation that requires social media users with more than 5000 followers to obtain a license from the *Higher Council for Media Regulatio*n. China has also banned social media accounts from posting without a permit since 2017. Similar laws face social media users in Iran who have 5000 followers. Cambodia requires all websites to register with the *Ministry of Information*. Jail sentences are handed out for up to two years for spreading fake news online as a pretext to shut down critical media.

IMPACT ON POLICY There are a series of policy suggestions that have been put forth to tackle digital authoritarianism. The work in this area has crossed over into International Relations (IR), as digital authoritarianism is an issue without borders, particularly in the ease with which technology transfers. Thus, there may need to be tighter export controls on technologies that advance digital authoritarianism. There may be more calls to sanctions regimes that engage in digital authoritarianism and to offer secondary sanctions to the firms that supply them with the technology. There needs to be a greater effort to work with partner countries to build better cyber-security capacity. Furthermore, there needs to be a more concerted public awareness campaign around **disinformation**, including providing funding for educational programs that can build digital critical thinking skills among younger people (i.e., media literacy, news literacy). Democracies will

also need to work to develop a competitive model of digital governance that offers a code of conduct that can counter authoritarian models.

NEW FRONTIERS Digital authoritarianism is a relatively new field of study that will require a better understanding of how technology can be managed. In particular, it will be important to look at the impact of COVID-19 on digital authoritarianism. COVID-19 has allowed countries to engage in much more intrusive levels of cyber-policing and surveillance. In the interest of public safety, many countries, both democratic and non-democratic, have allowed their privacy concerns to be overshadowed in the name of public safety, sometimes in ways that are not necessary or productive.

Box 1.4 Flooding

When the flood comes, fish eat ants; when the water recedes, ants eat fish.
– Lao proverb

Flooding is the process where regimes use social media to inundate citizens with information that is supportive of the regime and/or demonizes, disrupts or drowns out the opposition (Roberts 2018; Tucker et al. 2017). Most often used by autocracies, flooding entails providing so much content, which could be innocuous or entertaining, that citizens are distracted from issues that are politically sensitive to the regime (Tucker et al. 2017; Sanovich et al. 2018; Munger et al. 2019). Because of the onslaught of both government propaganda and possibly truthful apolitical news, flooding also makes it more difficult for citizens to coordinate – as they cannot discern what is false and what is true (Østbø 2017). The goal is to provide citizens with so much misinformation that, at the very least, confuses people or creates apathy. In Venezuela, while anti-Maduro protests raged on, the government flooded Twitter with apolitical posts to distract Venezuelan citizens (Munger 2019). In Saudi Arabia, cyber-armies spammed a trending hashtag to disrupt unwanted conversations, known as 'hashtag poisoning' (Bradshaw & Howard 2017). Authoritarian regimes can also use flooding to amplify ideas that are not relevant or that are divisive. Bahrain coordinated a flooding attack on X (formerly Twitter) filled with sectarian hate speech (Leber & Abrahams 2019).

Flooding can be accomplished in numerous ways – using automated bots or human armies of trolls. Bots have been used in Iran, Azerbaijan, Turkey, Syria and the Philippines (Leber & Abrahams 2019), while in Serbia and Vietnam, dedicated pro-government bloggers are used to spread regime **propaganda**. The Chinese government uses social media to pay government employees to generate about 448 million comments every year (Tucker et al. 2017).

Some authoritarian regimes focus on an external audience. North Korea has used troll armies to undermine democracy in South Korea. Thousands of pieces of propaganda have been posted, but instead of trying to flood South Koreans with *Juche* ideology, the focus is instead on issues that are controversial in South Korean politics (Benedictus 2016). Russia has also notably used flooding on its citizens and its neighbors, providing a wide range of content that is both aggressive and harmless (Cirone & Hobbs, 2023).

Bot armies are useful for hijacking an existing hashtag with pro-regime messaging, generating new conversations that distract, and harassing activists to inflict fear in potential critics. The result is that this overwhelming amount of information dominates and drowns out **opposition** narratives, effectively making flooding a form of **censorship** (Abrahams & Leber 2021).

Dynasties

The rise of a dynasty is like the birth of a star, a dazzling display of light and heat, but its fall is like the dying embers of a fire, fading into darkness.
– Tom Holland

Contemporary dynasticism often blends traditional hereditary rule with modern forms of rulership, sometimes in a true neo-patrimonial fashion. Political families may utilize democratic institutions such as elections to maintain power while undermining democratic norms. These hybrid dynasties challenge conventional understandings of dynasticism by highlighting the adaptability and resilience of family-based power in diverse political contexts.

DEFINITION The concept of a 'dynasty' lacks a single, universally accepted definition, as scholars have formulated various definitions to serve different purposes (Ruud & Nielsen 2018). At its core, a dynasty is generally understood as a family in which power is transferred from one generation to the next. However, the criteria for what constitutes a dynasty can differ significantly. One key element of these definitions is the minimum number of family members who must hold office for a family to be considered a dynasty. In some cases, particularly in well-established democracies like the US, four or more family members are required (Kenawas 2015; Smith 2018). In contrast, other definitions might require only two family members or stipulate that a family must maintain power in a specific geographical area for a certain number of years.

The types of familial relationships included in the definition of a dynasty also vary. While some definitions focus on direct lineage or male politicians, most encompass a broad range of familial ties, including marital and extended family connections. Dynasties can exist at various levels of government, from national to regional and local levels. The timeframe for dynastic succession can also differ, with some definitions specifying that power must be transferred within a particular period, either consecutively or simultaneously (Kenawas 2015).

Another factor complicating the definition of dynasties is the notion of conscious inheritance. Although the term 'dynasty' often suggests a deliberate transfer of power, this is not always the case. Successors may hold different political views from their predecessors, challenging the idea of dynasties as self-aware political projects. Furthermore, internal conflicts and rivalries within a dynasty – such as those between siblings or uncles and nephews – can undermine the perception of dynasties as unified entities (Ruud & Nielsen 2018).

Also, dynasties interact quite differently in various types of political regimes. For this reason, it will be easier to stick to something simple. A good pick is Jeroen Duindam's proposition, which endeavored to clear a path through the myriad definitions of monarchic dynasties in the world. He settles for: *"Any polity governed by a ruler surrounded by relatives and a body of servants qualifies."* (Duindam 2016: 12).

SEE ALSO The concept of dynasties is naturally linked with hereditary **succession** and sometimes to rotational selection or election between a few eminent, eligible families, hence its association with **aristocracy** and **oligarchy**. It thus links ruling to the **family**: historically, kingship to kinship; in dictatorships and democracies, it links offices to political clans (cf. **clan politics**). In dynasties it is impossible to separate the public from the private (**informality** and **neo-patrimonialism**), but there was less tension between these spheres before the emergence of legal-rational **rulership**. For instance, nepotism (Box 1.1) was expected, not deviant.

ORIGINS The term 'dynasty' originates from the ancient Greek word δυναστεία *(dunasteía),* which means 'lordship' and 'sovereignty.' In contemporary usage, it commonly refers to a ruling family or a lineage of kings or princes. Although dynasties are often associated with hereditary succession, this was not universally practiced among all monarchies. The term is used to describe these systems of rule because, even when succession was not strictly hereditary, the ruler's kin often remained close to power.

Aristotle's typology of governments in his work *Politics* categorized **oligarchy** as the (collegial) rule of the rich, but variation existed (e.g., different property rates), and sometimes it was hereditary (like the rule of powerful families or *dunasteía*), which is called the **tyranny** among oligarchies (because it goes against the egalitarian principle among the elites themselves), see also: **Plato & Aristotle**.

KEY SIGNIFICANCE While traditional forms of dynastic rule have declined with the rise of democracy, personalized leadership with semi-dynastic traits persists in politics and business today, particularly in autocratic states, but not exclusively. This suggests that the underlying principles of dynastic power – such as the importance of family connections and the inheritance of privilege – remain relevant in certain contexts.

Dynasticism manifests in various ways across different regime types. In **democracies**, dynasticism presents a paradox as it appears to contradict the principle of equal opportunity. Despite the necessity for electoral endorsement, political families persist, raising concerns about fairness and the quality of representation.

Democratic institutions can either hinder or facilitate dynasticism. For example, electoral systems that favor candidate-centered campaigns, like Japan's single non-transferable vote system before 1994, tend to benefit candidates with name recognition and established networks, often those from political **families** (Smith 2012).

Additionally, decentralized candidate selection

processes within parties can empower local actors who may favor dynastic candidates due to their influence and resources. Dynastic candidates also inherit an incumbency advantage (Box 8.2) from their predecessors, leveraging name recognition, existing networks, and access to resources to secure party nominations and win elections. This is evident in the high proportion of legacy politicians in Japan's cabinet. The persistence of dynasticism in democracies raises normative concerns about the narrowing of the political class and potential bias toward those with inherited privilege (Smith 2018).

In non-democratic regimes, dynastic patterns vary widely and are shaped by the nature of authoritarian power and strategies employed to maintain control. In **personalist regimes** where power is centralized and institutional constraints are weak, dynasticism is a common tendency. Rulers already rely on family members when governing and select successors to consolidate power within the ruling family.

Hybrid regimes also witness dynasticism as these regimes favor the ruling elite and dominant (non-democratic) political ruling **parties**. Political families may manipulate **elections** and suppress **opposition** to maintain dominance, as observed in Indonesia and the Philippines (Kenawas 2015).

In **monarchies**, dynastic rule is inherent as power is vested in a royal family with typically hereditary succession. Dynasties typically emerged in hindsight once a lengthy succession had been established. Since this relied heavily on biological chance, there was a continuous search for ways to regulate it (cf. harems in Box 5.11). When kingship and rule were perceived less as institutional roles and more as personal positions, they became increasingly dependent on individuals. This heightened the temptation to alter circumstances by removing these individuals (Ehlers 2004: 6).

While not all monarchies are absolute, even constitutional monarchies involve some degree of dynasticism since the royal family retains symbolic and sometimes political roles. Thailand's Chakri monarchy exemplifies this persistence despite periods of military rule (Thompson 2012).

LITERATURE While nepotism (Box 1.1) may appear to be a natural human tendency within families, the question of whether dynasticism, too, is inherently human requires a more nuanced exploration. The interplay of cultural norms, institutional structures, and power dynamics across societies and historical periods complicates any straightforward attribution of dynasticism to human nature.

Jallinoja (2017) argues that the tendency for status to become a family matter in elite circles, such as the prevalence of cousin marriages among European royalty, reflects a 'mystical bond' established by kinship. This bond, while varying across contexts, suggests a deep-seated human inclination to favor and elevate one's kin. Similarly, Smith (2012; 2018) observes that even in democracies like Japan and Ireland, where ideals of equal opportunity prevail, political dynasties persist. This phenomenon, often explained by the 'power begets power' dynamic, demonstrates how name recognition, inherited resources, and political connections enable 'favored sons' or 'democratic scions' to leverage family ties for political advantage.

Duindam (2015) further emphasizes the historical intertwining of kinship and kingship, noting that dynastic rule has been a common form of political organization throughout history: *"Remarkably, even the dynastic cycle recurs, in the literary imagining of families as well as in the practice of businesses – self-made men founding their company, first generations of successors consolidating it, and spendthrift youngsters raised in opulence squandering their predecessors' achievements in the third or fourth generation. (…) Do these family cycles correspond to the Chinese dynastic cycle and Ibn Khaldûn's [cf. Box 6.7] model of generations?"* (Duindam 2015: 317)

Ruud and Nielsen (2018) link the prevalence of dynasticism to the human need for trust in uncertain environments. In contexts where institutions are opaque or reliable information is scarce, individuals naturally form networks of trust based on family ties. From this perspective, dynasticism serves as a strategy for navigating uncertain political and economic landscapes by leveraging the trust inherent in familial relationships.

However, viewing dynasticism as purely determined by human nature oversimplifies its complexity. Institutions and political strategies play a significant role in shaping its extent and form. Chandra (2016) highlights how institutional structures influence the character and consequences of dynastic politics. For instance, in India, state control over resources combined with weak party organizations incentivizes dynastic practices. Nevertheless, alternative institutional arrangements with stronger party regulations and meritocratic selection processes could reduce their prevalence. Similarly, Thompson (2012) describes political dynasties in Asia as 'modern hybrids,' blending traditional notions of hereditary **charisma** with strategic political maneuvering. Rather than reverting to age-old practices, elites employ dynasticism as a calculated strategy to consolidate power, manage factionalism, and enhance **legitimacy** within modern systems.

Haldén (2020) underscores the historical integration of kinship into European political orders as a precondition for stability and cohesion. While coercion and violence played roles in maintaining power, collaboration and shared norms among family-based elites were equally critical. This perspective suggests that dynasticism is not inherently human but rather emerges from strategic alliances and power-sharing arrangements among elites. (This echoes sentiments about the local chieftains in Africa, cf. Baldwin 2016).

To recap, while certain human tendencies – such as favoring kin or seeking **trust** in uncertain environments – may contribute to the prevalence of dynasticism, it is not simply an inevitable outcome of human nature. Instead, dynasticism is shaped by the interplay of cultural norms, institutional structures, power dynamics, and calculated political strategies. The question of whether dynasticism is inherently

human remains open to debate; however, it is clear that its persistence reflects both deeply rooted social behaviors and specific contextual factors that enable its reproduction over time.

Ethnic Politics & Comparative Authoritarianism

In a moment of crisis, the wise build bridges and the foolish build dams.
– Nigerian proverb

The intersection of ethnic politics and dictatorship studies is a complex area that is not frequently explored in depth despite the significant role ethnicity can play in authoritarian regimes. Surprisingly little comparative work has been done on systematically explaining why ethnicity becomes politicized (Basedau et al. 2011). Several factors contribute to this relative neglect. The main reason is that ethnic politics are predominantly linked to conflict studies and how such identities intersect with class, religion, and frames of mobilization (e.g., Gisselquist 2013). The second reason is that the literature on ethnic politics is preoccupied with democratic or electoral contexts where ethnic groups have more visible avenues for political expression and mobilization. In **single-party regimes,** politicians often mobilize support along local-level divisions, such as tribe or clan. However, the transition to multi-party systems can incentivize politicians to appeal to broader, national-level identities based on religion, language, or region (Posner 2007).

In **personalist rule**, tyrants actively deepen such schisms as part of their overall strategy of divide and conquer (Van den Bosch 2021). They often rely on balanced ethnic coalitions where power is distributed relatively equally among coalition members. This is because personalist leaders often lack the institutional mechanisms to credibly commit to power-sharing agreements, leading to a mutual commitment problem between the ruling group and potential coalition partners. In contrast, party-based authoritarian regimes can provide institutional arrangements that mitigate these commitment problems and allow for unbalanced ethnic **ruling coalitions** where power is distributed unequally (Beiser-Mcgrath & Metternich 2020).

Regime type thus significantly shapes the salience of different ethnic divisions, but various factors shape ethnic dynamics. A previous generation of scholars investigated the different structures to explain different sets of ethnic relations (Horowitz 1971; Esman 1994). States shape ethnic consciousness and foster political mobilization through policies on resource allocation, education, and language. For example, David Brown's (1994) classification of states in relation to ethnicity still offers an interesting understanding of how different types of states manage ethnic politics. (a) *Ethnocratic states*, such as Burma, are dominated by a single ethnic group and often impose assimilationist policies that marginalize minorities, leading to ethnic tensions and rebellions. (b) *Corporatist states*, like Singapore, manage ethnic interests through controlled participation and strive to integrate ethnic identities into a cohesive national identity, transforming ethnicity into a resource for unity. (c) *Neo-patrimonial states*, exemplified by Indonesia, are marked by elite factionalism and personalist power, which can politicize ethnic communalism and lead to regional rebellions. (d) *Internal colonial states*, such as Thailand, focus on core region development, creating economic disparities that fuel ethnic unrest in peripheral areas. (e) Lastly, states defined by *class relations*, like Malaysia, use ethnic ideology as a tool for maintaining power and managing class dynamics, often employing a 'divide-and-rule' strategy to balance class and ethnic interests.

Basedau et al. (2011) distinguish between structural, institutional, and historical factors to gauge the salience of ethnicity. (i) Structurally, the ethnic demography of a society plays a key role: high ethnic *fractionalization* (many small groups) may hinder politicization due to collective action challenges, while ethnic *polarization* (fewer, larger groups) facilitates mobilization by emphasizing clear differences. (ii) Institutionally, political frameworks like ethnic

party bans and electoral systems influence how ethnicity enters politics. For instance, proportional representation systems can enable ethnic parties by lowering barriers to entry, whereas bans on ethnic parties may redirect political organizations toward other identities like class or ideology. (iii) Historically, **colonial legacies** such as 'divide-and-rule' strategies, land distribution practices, and prior interethnic conflicts leave enduring rivalries that shape the salience of ethnicity in politics. Countries with fewer historical drivers of ethnic division, such as Burkina Faso and Tanzania, often exhibit lower levels of ethnic politicization.

With liberalization and the shift from single-party regimes to multi-party electoral settings, scholars try to isolate the impact of regime type from structural and historical factors. For example, the experiences of Zambia and Kenya, who both transitioned to multi-party systems, saw a shift in the salient ethnic cleavages, from localized tribal identities in the single-party era to broader linguistic (Zambia) or ethno-regional (Kenya) divisions in the multi-party era. (Poser 2007). Basedau et al. (2011) find little evidence that 'ethnicized' party systems harm democracy.

However, this is not the whole picture: The presence of strong local leaders or intermediaries can significantly influence how ethnicity plays out in electoral politics. These chiefs, religious leaders, or ethnic elites, often holding moral authority and control over resources, can act as brokers between politicians and voters, potentially enabling cross-ethnic mobilization and mitigating the formation of rigid ethnic voting blocs (Koter 2013; 2016; Baldwin 2016). The availability of information about candidates and political issues can also impact the role of ethnicity in electoral choices. In information-poor environments, where voters lack access to detailed policy platforms or candidate track records, they may rely more heavily on ethnic cues to make decisions (Conroy-Krutz 2013).

Although it took a while for the field of comparative politics to catch up (Erdmann 2004), today, most research on ethnic politics is concerned either with party politics (e.g., Chandra 2005; Bogaards 2007; Basedau & Stroh 2009) and electoral politics (e.g., Hultquist et al. 2021). In non-electoral regimes, ethnic politics are still under-researched.

Exceptions are some studies on militaries and **coups** (e.g., Roessler 2011; 2016). As a result of colonial legacies and long episodes of personalist rule, in many cases, militaries have been subject to ethnic stacking for **coup-proofing** purposes. While 'ethnic stacking' can provide a degree of stability in the short term, it can also create long-term risks. It can lead to a cycle of coups (coup traps – Box 5.2) as different ethnic factions within the military vie for control of the state. When there is an ethnic mismatch between the civilian leadership and the officer corps, especially if the military is dominated by a group different from the leader's (a default **colonial legacy** in Africa), the risk of instability increases. Leaders may attempt to restructure the military to align it with their ethnic base, but this entails increased coup risks (Harkness 2016).

The size of a leader's ethnic group significantly influences their strategies and the stability of **military regimes**. Leaders from smaller ethnic groups are more inclined to depend on coercive repression and ethnic stacking to retain power. With a limited support base, they face heightened vulnerability to challenges from larger groups, prompting them to ensure military loyalty through ethnic favoritism. In contrast, leaders from larger ethnic groups often have greater flexibility, enabling them to adopt a wider array of strategies, such as forming multi-ethnic coalitions or utilizing institutional tools like political parties to address dissent (Opalo 2011).

Overall, **autocratization** negatively affects ethnic relations by fostering dominance among majority ethnic groups and increasing discrimination against minority groups on average. Furthermore, it often disrupts collaborative inter-ethnic decision-making and power-sharing arrangements, impacting both majority and minority groups (Panzano 2024).

While ethnic politics plays a crucial role in many authoritarian regimes, its study within the context of dictatorship remains underdeveloped due to a preoccupation with electoral and party politics, methodological challenges, and academic tendencies to separate ethnicity from regime studies. This gap presents an opportunity for further research that could provide valuable insights into how dictatorships manage ethnic diversity and conflict. To this day, most works have focused on Africa, although there are odd exceptions (e.g., Kelley 2010).

Gatekeeping (Tolstrup)

'Hodor'
– Hodor, *Game of Thrones* (2011-2019)
(Adaptation by George R.R. Martin's book series: *A Song of Fire and Ice*)

Gatekeeping is a middle-range theory that captures the practice of curating international relations by **political regimes.** This frame plays a crucial role in understanding how authoritarian regimes manage external influences to maintain their power.

The concept of gatekeeping was developed to address and update some limitations of the structural model by S. Levitsky and L. Way, their **linkage & leverage** theory (2006; 2010), which emphasizes the external pressures and connections that can influence **democratization**. While this structural model highlights the importance of external factors for **democracy promotion**, they often overlook the agency of domestic elites in shaping these influences.

Invented by Jakob Tolstrup (2013; 2014), gatekeeping refers to the actions taken by domestic elites – referred to as gatekeeper elites – to control or mediate the flow of external influences into their countries. These elites can be political leaders, economic stakeholders, or civil society figures who can facilitate or constrain ties with external actors. By managing these connections, gatekeeper elites can either enhance or diminish the impact of foreign pressures on their political systems (Tolstrup 2014).

In practice, gatekeeping involves strategic decisions about which external relationships to cultivate and which to restrict. For example, political elites may choose to strengthen ties *(linkages)* with certain international organizations or countries that support their regime's stability while cutting, limiting or surveilling interactions with those advocating for democratic reforms.

A regime can also tackle *leverage*. It can strategically pit a state emanating unwanted influence against another by employing counterbalancing tactics, leveraging its competing interests to its advantage. This is called *counterbalancing*. Simultaneously, regimes can manipulate the intentions and motivations behind foreign actors' pressure – *creating competing interests* – to make them cease or desist from intermingling in a regime's domestic affairs.

A brief example concerning Uzbekistan can effectively illustrate the model of gatekeeping within authoritarian regimes. Central Asia gained increased importance to the US following the rise of the Taliban in Afghanistan in 1996 and even more so after al-Qaeda's terrorist attacks in East Africa in 1998. Despite the earlier US foreign policy focus on promoting **human rights** and **democratization** in Uzbekistan, the US needed the regime's cooperation to efficiently conduct *Operation Enduring Freedom* in Afghanistan following the events of 11 September 2001. Consequently, the *War on Terror* and democracy promotion became competing policy priorities in US-Uzbek relations (Van den Bosch 2018).

In addition, when Russia began to reassert its influence in the region after 2003, Uzbekistan quickly counterbalanced US leverage by enhancing its geopolitical ties with Moscow. This strategic move allowed Uzbekistan to maintain a degree of autonomy despite external pressures. Following US criticism of the Andijan Massacre on 13 May 2005, the Karimov regime ordered the closure of a US military base on its territory. These events exemplify how Tashkent was able to reassert its position in response to US leverage, demonstrating the regime's ability to manage external influences through gatekeeping strategies (Van den Bosch 2018).

In the Ivory Coast (a former French colony with dense ties to France), Laurent Gbagbo's standoff with France exemplifies some of the available gatekeeping strategies employed by authoritarian regimes to maintain power. Gbagbo had come to power in a sudden coup in 2000 after Aimé Henri Konan Bédié had rigged elections. This immediately triggered a civil conflict, with the opposing presidential challenger petering out in a tense standoff between the two camps, divided by French troops (Van den Bosch 2018).

During this Ivorian civil war, he skillfully managed external influences to his advantage; despite

France's significant military presence through *Opération Licorne* and its role as a mediator in the conflict, Gbagbo leveraged nationalist rhetoric to frame French involvement as an imperialist intervention. By promoting a narrative of 'second independence,' he rallied domestic support against perceived foreign domination, thus strengthening his political position (Van den Bosch 2018).

Gbagbo's regime also exploited geopolitical linkages by balancing French influence with support from other African nations and international actors. This strategic counterbalancing allowed him to maintain a degree of autonomy despite external pressures. Furthermore, Gbagbo delayed elections and prolonged the state of emergency, using these tactics to postpone political reforms that could threaten his hold on power. By manipulating both internal and external dynamics, Gbagbo effectively gatekept foreign influence. (Van den Bosch 2018)

In November 2004, Laurent Gbagbo's regime accidentally bombed a French military base near Bouaké, killing nine French soldiers and one American missionary. In retaliation, France destroyed the Ivorian air force and seized the airport. Gbagbo responded by deploying his *Young Patriots* (his **paramilitary**) to incite anti-French violence, targeting foreigners and Western expatriates in Abidjan and other cities. Thousands of Europeans were forced to hide as looters attacked property and harassed individuals. This form of gatekeeping distracted the French from retaliating against Gbagbo's forces, as France was forced to secure and evacuate thousands (Van den Bosch 2018).

This escalation exemplifies Gbagbo's gatekeeping strategy, using nationalist rhetoric and orchestrated unrest to resist French leverage while consolidating his regime's control amidst international tensions. (Gbagbo was eventually defeated by rebel forces in 2010). There are ample ways authoritarian leaders can navigate complex international landscapes to reinforce their domestic authority while minimizing the impact of foreign leverage.

Ideological compatibility, as an aspect of **soft power**, can assist an external government in advancing its policies by fostering a more favorable reception among various groups within the target state or getting international support from allies and like-minded regimes to lessen foreign pressure. This selective engagement or strategic manipulation of ties between countries allows authoritarian regimes to benefit from international cooperation without succumbing to pressures for political liberalization.

Proximity to democratizing centers (e.g., the EU's Eastern neighborhood) or an authoritarian gravity center (cf. Box 6.2) like Georgia and Armenia next to Russia makes it difficult to erode linkages or block leverage. The thinner the linkages, the more control elites have. This is particularly true for personalist regimes with no domestic audience costs (Box 7.1).

Cuba serves as a quintessential example of a personalist gatekeeping state, particularly during the period from 1989 to 2002. In the face of economic challenges following the collapse of the Soviet Bloc, Cuba implemented selective economic reforms that allowed it to maintain control over societal change while presenting an image of liberalization. By selectively opening certain sectors to foreign investment and legalizing limited self-employment, the Cuban government created a *façade* of reform that placated external pressures without fundamentally altering its authoritarian structure (Corrales 2002). This strategy enabled the state to act as a gatekeeper, controlling access to economic opportunities and ensuring that benefits were distributed primarily among loyalists within the ruling party and military. By maintaining tight control over these economic reforms, Cuba effectively managed external influences and preserved regime stability, demonstrating how gatekeeping can be used to balance internal pressures with external demands.

The effectiveness of gatekeeping depends on several factors, including the regime's internal cohesion, its economic dependencies, and the geopolitical context. Cutting off linkages with the outside world, like North Korea or Turkmenistan have done, has insulated these regimes to such a degree that they become almost impervious to outside pressure. Strong central control and a unified elite can enhance a regime's ability to manage external influences effectively. Conversely, divisions within the ruling elite or significant economic vulnerabilities can undermine gatekeeping efforts.

Overall, gatekeeping provides a dynamic framework for understanding how authoritarian regimes interact with external actors. It highlights the agency of domestic elites in shaping international relations and underscores the complexity of external influences on political development. By incorporating gatekeeper elites into analyses of democratization and authoritarian resilience, scholars can better account for variations in how regimes respond to global pressures.

Hybrid Regimes & Democracies with Adjectives

And the Lord came down to see the city and the tower, which the children of men builded. And the Lord said, Behold, the people is one, and they have all one language; and this they begin to do: and now nothing will be restrained from them, which they have imagined to do. Go to, let us go down, and there confound their language, that they may not understand one another's speech.
(Parable of the Tower of Babel)
– Holy Bible, Book of Genesis 11: 5-7.

Hybrid regimes, often situated in the 'gray zone' between 'democracy' and authoritarianism, represent a distinct and enduring category of political systems characterized by a blend of democratic and authoritarian features. These regimes are not merely transitional phases toward full democracy or authoritarianism but are stable in their own right (Lindstaedt 2021). The traditional approach of classifying political systems along a single continuum of 'democraticness' is inadequate, as it fails to capture the complex interactions between democratic and authoritarian elements within hybrid regimes (Wigell 2008).

Levitsky & Way (2010: 3-4) sum it up nicely: *"The study of post-Cold War hybrid regimes was initially marked by a pronounced democratizing bias. Viewed through the lens of democratization, hybrid regimes were frequently categorized as flawed, incomplete, or 'transitional' democracies. For example, Russia was treated as a case of 'protracted' democratic transition during the 1990s, and its subsequent autocratic turn was characterized as a 'failure to consolidate' democracy. Likewise, Cambodia was described as a 'nascent democracy' that was 'on the road to democratic consolidation;' Cameroon, Georgia, and Kazakhstan were labeled 'democratizers;' and the Central African Republic and Congo-Brazzaville were called 'would-be democracies.' Transitions that did not lead to democracy were characterized as 'stalled' or 'flawed.' Thus, Zambia was said to be 'stuck in transition;' Albania was labeled a case of 'permanent transition,' and Haiti was said to be undergoing a 'long,' 'ongoing,' and even 'unending' transition."*

DEFINITION Historically, scholarship on hybrid regimes has been criticized for a 'democratizing bias,' which viewed them as 'diminished' democracies rather than recognizing their unique characteristics. This perspective often led to the misconception that hybrid regimes were simply flawed democracies on a path to democratization – for this reason, they were called 'democracies with adjectives' – cf. 'transitology' – Box 5.3. (Diamond 2002; Levitsky & Way 2002). To counter this bias, some scholars propose viewing hybrid regimes as forms of 'authoritarianism with adjectives,' emphasizing their authoritarian nature and encouraging a nuanced analysis of their specific attributes (Snyder 2006).

Key dimensions that define hybrid regimes include electoral processes, constitutionalism, reserved domains, and state capacity. While **elections** are typically held in hybrid regimes, these often fall short of democratic standards due to manipulation by **incumbents** who may restrict **opposition** parties or violate civil liberties to maintain power. Hybrid regimes also frequently exhibit weaknesses in **constitutionalism** and the rule of law, such as limited judicial independence and arbitrary rule application. Additionally, 'reserved domains' controlled by non-democratic actors like the military can undermine democratic accountability by exerting significant influence over policy (Gagné & Mahé 2020; Lindstaedt 2021; Snyder 2006).

SEE ALSO This encyclopedia has a whole subsection in **classifications & typologies** devoted to various approaches to delineate hybrid regimes (as standalone types). Under **trichotomous categories,** we present the earliest attempts from the 1990s, which used the term 'semi-democracies' (**Gasiorowski** and **Mainwaring, Brinks & Pérez-Liñán**), to the later shift in focus to either 'flawed competitiveness' (**Levitsky & Way**) or **elections** as a tool for regime survival (**Schedler**), and then the latest approaches using several dimensions of **Dahl**'s 'polyarchy' (1971) (i.e. **Regimes of the World** and **Anderson, Brownlee & Clarke**).

The perspective of hybrid regimes emerged as a response to the limitations of traditional regime classifications, particularly in the context of the post-Cold War era. During the 1980s and 1990s, the prevailing 'transition paradigm' (Box 5.3) viewed political regimes as moving linearly toward democracy. This framework, however, proved inadequate for understanding the complexities of regime change, as it failed to account for the possibility of regimes becoming 'stuck' in an intermediate state or regressing toward authoritarianism (Carothers 2002). The increasing prevalence of regimes that exhibited both democratic and authoritarian characteristics – often referred to as 'gray zone' regimes (neither black nor white) or the 'murky middle' – further challenged existing **dichotomous categories**. The rise of these regimes, especially after the third wave of democratization (Box 6.3), highlighted the need for a new conceptual framework that could encompass these hybrid forms of governance (Diamond 2002).

ORIGIN While it is challenging to pinpoint a single originator of the hybrid regimes perspective, since several scholars have played influential roles in its development (see 'literature' below). Although there is rather agreement that Terry Karl introduced the notion of 'hybrid' regime in 1995 to refer to a state that contains both democratic and authoritarian forms of rule. (Gilbert & Mohseni 2011; Colomer et al. 2016)

KEY SIGNIFICANCE The existing literature's initial focus on 'democracy with adjectives,' such as 'illiberal democracy' or 'semi-democracy,' in the

mid-1990s limited understanding by emphasizing democratic aspects while often overlooking, in essence, novel authoritarian adaptations. By 2000, this paradigm still implicitly assumed a (temporarily stalled) trajectory toward full democracy, which did not accurately reflect the political realities in many countries and thus lost any analytical value. The emergence of the hybrid regimes' perspective was crucial in recognizing these regimes as distinct types, allowing scholars to move beyond simplistic classifications and better capture the complexities of global political systems (Levitsky & Way 2002; 2010; Diamond 2002; Snyder 2006).

The significance of the hybrid regimes perspective lies in its ability to provide a more accurate classification of political systems, facilitating nuanced analyses of regime change – although the concept has led to much confusion as well. By acknowledging that **democratization** is not a linear or inevitable process, this perspective allows for the possibility of regimes moving in various directions, including stagnation or regression toward authoritarianism (Schedler 2009). It also enables researchers to explore the unique effects of hybrid regimes on political, economic, and social outcomes, shedding light on issues such as conflict, economic development, and human rights. Furthermore, by offering a more precise picture of political realities, this perspective enhances policy relevance, informing decisions related to democracy promotion, development assistance, and conflict prevention (Diamond 2002).

LITERATURE The study of hybrid regimes has been significantly shaped by several key works that have advanced the understanding of these complex political systems. Guillermo O'Donnell and Philippe Schmitter's seminal work, *Transitions from Authoritarian Rule* (1986), is foundational in this field for making the distinction between 'liberalization' and 'democratization.' They highlighted that those political transitions could result in outcomes other than full democracy, introducing terms like *'dictablandas'* and *'democraduras'* to describe regimes that blend democratic and authoritarian elements. This work laid the groundwork for recognizing the diversity of regimes that can emerge from transitions, including hybrid forms (Bünte 2022).

Juan Linz's (1964; 1975; 2000) contributions, particularly his innovative typology of political regimes (cf. **Linz & Stepan**) of 1975 based on pluralism, mobilization, leadership restraint and ideology, provided a framework for understanding non-democratic regimes beyond simple dichotomies. Linz's work helped conceptualize hybrid regimes as distinct from both democratic and fully authoritarian systems (cf. Gilbert & Mohseni 2011).

Larry Diamond (2002), Andreas Schedler (2002) and Steven Levitsky and Lucan Way's (2002) joint publication in a special issue of *The Journal of Democracy* (Volume 13, Issue 2) was a game changer, not only for bringing attention to hybrid regimes, but for treating them as a subtype of authoritarianism.

Their research highlighted how elections could be used as tools of control while violating democratic principles. Levitsky & Way (2010) and, to a degree, Schedler (2002) brought to the fore **competitive authoritarianism**, highlighting that for autocrats, there was real legitimacy to be drawn for free **elections** skewed in favor of **incumbents** – although with real competition comes outcome uncertainty. Together, these scholars laid the groundwork for understanding hybrid regimes and have been instrumental in developing this perspective into a rich and diverse body of literature. This, however, did not end the terminological 'Tower of Babel' that followed (cf. Armony & Schamis 2005).

METHODOLOGICAL ISSUES This section and the one below continue with the presentation of the relevant literature that has shaped this field but grouped per approach for better oversight. Defining hybrid regimes so far has been an arduous journey. Since democracy itself is an inherently contested concept and its diffuse, heterogeneous counterpart, 'authoritarianism,' is almost always viewed as its negative (non-democracy), then how can one make sense of the observation that there is a separate regime type 'in-between' these two badly delineated reference points (the former narrow but with fuzzy boundaries, the latter residual, internally diverse and diffuse). Also, the tools required to define hybrid regimes are all democracy-biased (either directly, if hybrid regimes are considered a diminished democratic subtype, or indirectly, as they are a corrupted form of 'non-democracy'). This has been a long road indeed. Therefore, this section continues by presenting some of the methodological works that have 'cleared away most of the debris' – so to speak – after the collapse of the proverbial Tower of Babel.

Richard Snyder (2006) nicely articulated the main arguments to abandon the transition paradigm and for the field to move beyond studying politics through the lens of democracy, not only when it comes to **democratization** but also when classifying hybrid regimes: *"Instead of seeing such regimes as democracy 'with adjectives' and calling them, for example, 'illiberal democracies' (Zakaria 1997) or 'semi-democracies' (Case 1996), the contributors to the present volume understand them as authoritarianism with adjectives, calling them electoral authoritarian regimes."* (Snyder 2006).

Matthijs Bogaards (2009) reviews two systematic approaches to studying hybrid regimes: the concepts of 'defective democracy' (cf. Lautz 2004; Merkel (et al.) 2004) and 'electoral authoritarianism' (Schedler 2002; Levitsky & Way 2002). Each approach focuses on one side of the spectrum but fails to cover the middle ground where these regimes overlap comprehensively. To address the limitations of existing approaches, Bogaards proposes a 'double-root strategy' that integrates both defective democracy and electoral authoritarianism into a comprehensive framework: *"The boundary between defective democracy and authoritarianism is crossed when suffrage restrictions are determined arbitrarily, when elections are manipulated to secure the position of those in power, and when a majority or significant number of office holders is not democratically legitimated. The threshold separating competitive and full-scale authoritarianism, following Levitsky and Way, is the possibility for the opposition to participate in elections."* (Bogaards 2009: 412).

Table 1.4 – Classifying Hybrid Regimes & Democracies with Adjectives

Approach	Main argument	Features	Examples	(R)
Transitional situation	Temporary phase that will stabilize as either auth. or dem.	These regimes are in an ambiguous state without clean consolidation. They are unstable and bound to become either dem. or auth. regimes	Linz 1973; 2000 Polity IV – Anocracy (continuous) Early works on this topic (ca. 1975-1995)	B D
Diminished subtype of democracy	An incomplete form of democracy, lacking freedom, equality and control (restraints on powerholders).	These regimes lack one or more prerequisites to be counted as liberal dem.	O'Donnell 1994 (delegative dem.) Diamond et al. 1995 (semi-dem.) Case 1996 (semi-dem.) Zakaria 1997 (illiberal dem.) Merkel 2004 (defective/deficient dem.)	A C E
Diminishd subtype of authoritarianism	A corruption of closed autocracy by allowed flawed elections.	Fundamentally auth. because elections are a tool for control and false legitimacy.	Schedler 2002 (electoral auth.) Levitsky & Way 2002 (competitive auth.) Ottoway 2003 (semi-auth.)	A E
Residual category	Has features from both auth. and dem. Cannot be pigeonholed.	These fluid regimes have unique features from both conceptual roots.	Gasiorowski 1993 (semi-dem.) Freedom House – Partly Free (continuous) Mainwaring et al. 2000 (semi-dem.) Epstein et al. 2006 (partial dem.) Bunce & Wolchik 2008 (mixed)	C
			Bogaards 2009 (two-rooted concepts) Wiggel 2008 (2-dimensional matrix) Gilbert & Mohseni 2011 (3-dimensional matrix) Anderson et al. 2021 (NAND)	E
Independent (sub) type of authoritarianism	Presence of auth. control institutions despite dem. *façade.*	Auth. party and/or tutelary body interferes with electoral process and civil liberties.	Dichotomous approaches	D E
			Geddes 2005 Ezrow & Frantz 2011 Gandhi 2008	D
			Magaloni 2006 (hegemonic party regimes) Hadenius & Teorell 2007 (limited multiparty regimes)	E

Additional (general) **remarks (R)** about this approach:
A – Conceptual stretching and loss of analytical value of original core concept (by adding adjectives)
B – Conflate inherent attributes of the regime type with (temporary) features of the state (capacity) and systemic factors (crisis)
C – Overlook this regime type's complexity if they identify only one inherit (positive) distinctive dimension: flawed competition
D – Downplay the relevance and/or existence of hybrid regimes
E – Foremost use democracy-biased criteria to conceptualize their typology

Source: Author's own work based on: Cassani 2014; Mufti 2018; Bogaards 2009; 2022; Gagné & Mahé 2020; Gilbert & Mohseni 2011.

Carsten Q. Schneider (2010) echoes this approach and argues for treating hybrid regimes on their terms (not merely as a transitional or residual category) but as a distinct regime type with their own operational logic. They combine democratic and authoritarian features, often in dysfunctional ways, making them inherently unstable but unlikely to transition to either end of the democratic-authoritarian spectrum fully. (Later works contested this claim of instability as regimes did prove to be more durable. Morlino (2009) proposes that one decade is enough to conclude regimes have found an equilibrium.)

Mikael Wigell (2008) criticized existing typologies for differentiation regimes solely one dimension (competition); he proposes two instead: 'electoralism' and 'constitutionalism' and creates a two-by-two matrix with four types: democratic, constitutional-oligarchic, electoral-autocratic, and authoritarian.

Leah Gilbert and Payam Mohseni (2011) present an excellent state of affairs after about a decade of booming research on this topic. Inspired by Linz (2000), they embark on a multi-dimensional differentiation between democracy and autocracy. They argue that the shift from classifying regimes as 'democracy with adjectives' to 'authoritarianism with adjectives' has not resolved the issue but rather displaced it: *'The above discussion highlights two important regime dimensions for classification – 'competitiveness' and 'competition' as defined by Sartori. Democracies are competitive regimes with fair competition whereas authoritarian regimes are uncompetitive regimes with unfair competition. Hybrid regimes occupy the conceptual void of competitive regimes with unfair competition."* (Gilbert & Mohseni 2011: 280).

This conceptual untangling is then worked out along three dimensions, which are particularly effective in capturing the complexity of hybrid regimes by integrating (a) competitiveness, (b) tutelary interference, and (c) civil liberties. Each dimension is viewed dichotomously, emphasizing differences in kind rather than degree. This configurative approach allows for the comparison and measurement of hybrid regimes relative to other regime types. Hybrid regimes are not defined solely by flawed competition; they may also be characterized by other factors, such as reserved domains of power, which are areas where certain groups or institutions maintain control regardless of electoral outcomes (Mufti 2018: 115-116).

Their approach yields three specific subtypes: (i) *Illiberal hybrid regimes* are characterized by competitive elections but low civil liberties; (ii) *tutelary illiberal hybrid regimes* feature competitive elections, low civil liberties, and significant tutelary interference; (iii) *tutelary liberal hybrid regimes* combine competitive elections and broad civil liberties with tutelary interference (Gilbert & Mohseni 2011).

Andrea Cassani (2014) eloquently maps the ongoing debate on how to classify hybrid regimes. During the last decade, it has moved in two main directions: analysis of their stability and examination of their predisposition to democratize. Due to their moments of liberalization, they are the most promising candidates for democratization (cf. **Hadenius & Teorell** 2007) but – annoyingly – are not found to move in that direction (cf. Levitsky & Way 2010). If they are seen as finding an equilibrium in the 'in-between,' their inherent instability should not be assumed, and flawed elections actually prolong their reign. Several voices notice that not all shades of gray have a "significant effect on regime breakdown" (Brownlee, 2009: 530, cited in Cassani 2014: 543-544). This article observes that scholars do not agree on the identity of hybrid regimes (see Table 1.4) and, therefore, arrive at contrasting results.

Mariam Mufti (2018) expands upon Cassani (2014) and offers a recent roadmap to understand scholarship on hybrid regimes. Table 1.4 is drawn from their insights and expanded with additional observations and examples.

CLASSIFICATIONS Hybrid regimes present a multifaceted challenge due to their inherent blend of democratic and authoritarian features, which defies straightforward categorization. The literature offers various approaches to classification, each with its strengths and limitations. It would be tedious to list and describe each one, but most of the mainstream approaches are listed under 'examples' in Table 1.4. Consult them directly for their defining criteria and (sometimes) operationalization.

Transitional Situation (I) The earliest classifications of authoritarian regimes and dictatorships lacked the analytical tools necessary to address the role of elections and the phenomenon of rising 'electoralism.' Consequently, when scholars encountered hybrid regimes, they often dismissed them or considered them as temporary phenomena that would eventually align with either democracy or authoritarianism. While this perspective is now considered outdated, it was understandable given that hybrid regimes were still emerging as a distinct category at the time.

Diminished Democratic Subtype (II) In early approaches, hybrid regimes were frequently framed as incomplete or defective democracies. This classification initially prioritized the presence of (albeit flawed) elections while neglecting many of their authoritarian characteristics (suppression of civil liberties). At the start, such frameworks were closely associated with the 'transition paradigm,' which conceptually insinuated only two possible trajectories for these regimes: either evolve into full democracies in time or regime collapse.

A key classification is Wolfgang Merkel's research (2004; 2007) on 'defective democracies' and 'embedded democracies', which added depth by exploring how democracies can exhibit various deficiencies in civil liberties, rule of law, or electoral integrity. This perspective highlighted the need to move beyond a simplistic dichotomy of democracy versus authoritarianism and to recognize the varying degrees and types of democratic deficits that can exist (Merkel 2004; Møller & Skaaning 2010; Bogaards 2022).

Merkel's typology is based on the path-breaking work of Lauth (2004) on democracy and renders his

understanding of the complexities and variations within democratic regimes into an operable typology. His classification identifies three core dimensions that define a democracy: (i) vertical legitimacy, (ii) horizontal accountability with the rule of law, and effective government (iii). Each of these dimensions plays a crucial role in maintaining the integrity and functionality of a democratic system.

Vertical legitimacy (i) refers to the foundational relationship between citizens and their rulers, primarily established through elections and the safeguarding of political rights. This dimension underscores the importance of citizen participation in the electoral process as a means of legitimizing governmental authority. Horizontal accountability (ii), coupled with the rule of law, forms the second dimension. It emphasizes liberal constitutionalism and the mechanisms that ensure government branches hold each other accountable, preventing any one branch from becoming overly dominant. The third dimension, effective government (iii), highlights that only those representatives who are duly elected should have the authority to make binding decisions on behalf of the populace (Merkel 2004).

These dimensions manifest in five 'partial regimes' that collectively constitute what Merkel terms an 'embedded democracy.' These partial regimes include elections, political participation rights, civil rights, horizontal accountability, and effective government. Each regime is assessed using ten criteria operationalized through 34 indicators. When these criteria are violated or compromised, the result is a 'defective democracy,' where the interconnectedness of the partial regimes is disrupted, leading to a degradation in democratic quality.

Merkel's typology is particularly valuable for its theoretical grounding in identifying less-than-fully democratic regimes. It categorizes these regimes based on specific deficiencies: (a) *Exclusive democracy* – This occurs when there are issues with voting rights or when elections are not free, fair, or competitive. It also includes scenarios where political participation rights are restricted. (b) *Illiberal democracy* – In this type of regime, civil rights are inadequately protected, and the judiciary fails to ensure equal access and treatment under the law. (c) *Delegative democracy* – This form arises when mechanisms for horizontal accountability are ineffective, typically due to an excessively powerful executive branch that overrides checks and balances. (d) *Tutelary democracy* – also known as democracy with reserved domains, occurs when non-democratic actors keep some areas of policymaking (trade regulations, public spending, military oversight, etc.) out of the hands of democratically elected representatives.

Diminished Authoritarian Subtype (III) By 2002, however, a significant shift occurred in scholarly thinking. Hybrid regimes began to be conceptualized as diminished subtypes of authoritarianism rather than defective democracies. Despite this shift, these classifications were often prone to 'conceptual stretching,' as it was unclear which defining features of the original autocratic archetype were being diminished. (Most classifications treat authoritarianism as non-democracy; thus, its defining features are negative ('a lack of')). Still, scholars such as Andreas Schedler (2002: 2009), Steven Levitsky & Lucan Way (2002; 2010) made significant contributions by examining how hybrid regimes combine elements of both democratic and authoritarian systems and have appropriated elections for regime survival.

Residual Category (IV) Many hybrid regimes are treated as residual categories – essentially unclassifiable within existing frameworks. Early research on hybrid regimes often did not progress beyond identifying their existence. However, those works who did, inspired valuable methodological studies that sought to build conceptual and analytical bridges between democracy and autocracy: Wigell 2008; Bogaards 2009; Gilbert & Mohseni 2011 (covered above).

Distinct Authoritarian Regime Type (V) Another group treats hybrid regimes as a specific type of authoritarianism in its own right rather than a diminished form of either kind. Here regimes are sometimes denoted as authoritarian subtypes but remain firmly within the broader umbrella of authoritarianism. Such approaches tend to dismiss hybrid regimes as a concept.

Dichotomous approaches to regime classification – those that draw a strict line between democracy and authoritarianism – offer limited analytical flexibility. The precise placement of this dividing line varies depending on the classification system in use, as discussed in detail in the section on **dichotomous categories**, but hybrid regimes tend to fall under authoritarianism (although those with minimalist definitions of democracy muddy those waters again.)

Polychotomous categories, on the other hand, often distinguish more radically between democracy and non-democracy. Unlike earlier frameworks, they do not view the presence of elections in 'hybrid regimes' as a corruption of any authoritarian archetype, which they distinguish along other (non-electoral) criteria anyhow, cf. **Geddes, Wright & Frantz**. Instead, these approaches emphasize how such regimes employ institutions and practices designed to control electoral processes and restrict civil liberties. Within this broader perspective, some scholars classify hybrid regimes as subtypes of authoritarianism while maintaining a clear conceptual distinction from democracies.

To conclude, for comparative authoritarianism, the focus of hybrid regimes on electoral competition can also lead to an under-appreciation of non-electoral regimes that lack even the semblance of democratic institutions. These regimes, which include **totalitarian** systems and **theocracies**, are often grouped into a broad category of 'closed regimes,' which fails to capture their distinct characteristics.

Additionally, hybrid regimes are dynamic entities that can shift toward greater democratization or more pronounced authoritarianism over time. Static classification based on one main attribute (flawed competition) at a single point in time does not necessarily reflect their fluidity and potential for change (in either direction). Tutelary bodies can close the electoral space when things do not go their way, and

state weakness can lead to regime collapse – this is true for hybrid and hegemonic regimes. On the other hand, elections seem to matter for **democratization** and dismissing their importance blinds typologies for **transition** studies.

Finally, the terminological babel is strong in this field. 'Democracy with adjectives' is used for hybrid regimes in almost all approaches despite great epistemological differences regarding the latter's identity. The road goes on.

NEW FRONTIERS Weyland (2024) studies hybrid regimes from a historical perspective during the first wave of democracy. Due to limited modernization and weak societal activism, these hybrid regimes were controlled by entrenched elites who undermined liberalism's formal institutions through informal manipulations and electoral fraud. This entrenched elitism, coupled with pervasive instability, obstructed transitions to democracy. Győrffy & Martin (2023) study their internal dynamics using Hungary as a case study, tracking its downward spiral of corruption and ideological degeneration, manifested with a shift in its electorate. Pérez Sandoval (2023) studies hybridization at the sub-national level across continents, where hybrids have been the norm at the provincial level but still show quite some variation among cases.

Ideocracy

I've got a 3-point plan that's going to fix EVERYTHING
– President Camacho, *Idiocracy* (the movie, 2006)

Ideocracies are distinguished from other autocracies by their all-encompassing ideological ambition to reshape society entirely. While other authoritarian regimes might employ ideology instrumentally or cosmetically, ideocracies place it at the core of their legitimacy and actions. Whether viewed as a broad category or encompassing totalitarianism as a subtype, the concept of ideocracy offers a valuable framework for understanding regimes driven by utopian ideologies and their pursuit of societal transformation.

SEE ALSO The reinvention of ideocracy solves the main issue of **totalitarianism** as a regime type in that the latter has several well-defined criteria, which combination makes it almost impossible to apply to any other cases besides its few original cases. No later cases comfortably fit the totalitarian terms, resulting in conceptual stretching. The conceptualization of ideocracy dismisses requirements like a single vanguard party, centralized leadership and other criteria but keeps the core criterion of a guiding **ideology** intact. With subclassifications, ideocracies can encompass **theocracies,** and thus, various contemporary **Islamic States** and (maybe) discern between their revolutionary and consolidation phases.

ORIGIN The concept of 'ideocracy' emerged in the first half of the nineteenth century in Europe, shaped by the profound political and social transformations that followed the French Revolution and the rise of revolutionary **socialism**. This period was marked by significant upheavals in Europe's political landscape, prompting conservative and liberal thinkers to critically assess the dangers posed by large-scale government and abstract political ideologies. These ideologies, often seen as detached from reality, were perceived as threatening to the established order rooted in tradition and historical knowledge. (Backes & Kailitz 2015)

Conservative and liberal critics feared that such abstract ideologies, with their grand visions of societal transformation, could lead to new forms of fanaticism that would ultimately cause more harm than good. They argued that these ideologies risked denying essential 'facts of nature' and could plunge societies into misery rather than delivering the utopian promises they espoused (Backes & Kailitz 2015).

The term ideocracy itself was coined in 1833 by Heinrich Leo (1799-1878), a German conservative historian. Leo used the term to describe regimes founded on the rule of 'fanaticism,' which he saw as prioritizing abstract ideas over historical realities. He characterized ideocracies as rigidly adhering to these ideas, deeming dissenters 'unworthy of life' and inherently prone to instability, unsustainability, and radicalization (Backes in Backes & Kailitz 2015). Although the term originated in this specific historical context, it has more or less been recycled to recalibrate the analytical potential of **totalitarianism** and improve the comparison of various ideologically driven autocracies throughout history.

DEFINITION Ideocracy is generally defined as a political system where rulers justify their governance through a totalitarian and utopian ideology that demands absolute adherence and seeks to reshape society completely (Piekalkiewicz & Pen 1995). This ideological commitment is the defining characteristic of ideocracies, setting them apart from other political systems.

Like totalitarian regimes, ideocracies differ fundamentally from other regime types in their ambition to permeate and transform every aspect of society based on their utopian ideology. Unlike other autocracies, ideocracies aim not just for the right to rule but also to control and radically transform society. The enforcement of this control is secondary to the ideological ambition itself. (The mission trumps the acquisition of power).

CLASSIFICATIONS Piekalkiewicz & Penn (1995) offer a classification scheme rather than a typology. Their approach uses ideology as the sole criterion for differentiating between regimes. As a result, a regime characterized by a monistic ideology or worldview is termed an ideocracy, one with limited ideological pluralism is labeled an authoritarian regime, and a system where multiple competing ideologies exist is considered a democracy. Later, they expanded this with an additional dimension of coercion and distinguished between 'totalitarian' and 'populist' ideocracies.

In Bernholz's framework (in Backes & Kailitz 2015), totalitarian regimes are considered a subset of ideocracies; they represent ideocracies that have not yet achieved their utopian goals and, therefore, employ repressive measures, such as force and violence, to overcome resistance. *Mature ideocracies*, however, have realized their ideological objectives and no longer require extensive repressive instruments. Historical examples include theocratic regimes like Pharaonic Egypt.

From a rational choice perspective, totalitarian regimes are seen as immature ideocracies that have not yet achieved the supreme values embedded in their ideology. These regimes use their combined secular and spiritual power to pursue these values, which take precedence over all other considerations, potentially leading to repressive measures and violence. Mature ideocracies, having achieved their ideological aims, theoretically do not need repression and violence. Iran's transition from a revolutionary state under Ayatollah Khomeini, marked by significant repression, to a more stable theocracy illustrates this transition, cf. **Islamic States** (Bernholz in Backes & Kailitz 2015).

On another dimension, *religious ideocracies* (**theocracies**) ground their legitimacy in religious doctrines, while secular ones draw on non-religious ideologies like **communism** or **fascism**. A typology of political regimes that includes ideocracies was developed by **Kailitz** (2007; 2024).

KEY SIGNIFICANCE Ideocracies require more than just tacit acceptance from the populace; they demand explicit support for the ideology, distinguishing them from other autocracies that might settle for passive obedience. This stems from their ambitious goal of achieving unanimity and reshaping society based on their utopian vision. While ideocracies strive for complete ideological adherence, they often settle for pragmatic loyalty as the initial revolutionary fervor wanes. Typically, ideocracies develop an ideology-based elite responsible for driving social transformation, controlling key positions, and ensuring loyalty to the regime. The Soviet *nomenklatura* (Box 1.11) serves as an example (Kailitz in Backes & Kailitz 2015).

In contrast to modern pluralistic democracies that rely on consensus-building, debate, and compromise, ideocracies are inherently monistic, prioritizing the implementation of their ideology over individual rights and freedoms. While they might recognize individual rights in principle, overarching ideological goals take precedence. The central distinction between ideocracy and totalitarianism lies in the temporal dimension: totalitarian regimes are immature ideocracies actively striving for utopian goals through coercive means, whereas mature ideocracies have achieved these objectives and theoretically no longer require such **repression**.

I argue that with an elegant elaboration using subtypes, ideocracies could be a viable alternative to capture and isolate ideology-driven and primarily ideology-legitimized autocracies, replacing **totalitarianism**.

Ideology

What seems to take place outside ideology (to be precise, in the street), in reality takes place in ideology. What really takes place in ideology seems therefore to take place outside it. That is why those who are in ideology believe themselves by definition outside ideology: one of the effects of ideology is the practical denegation of the ideological character of ideology by ideology: ideology never says, 'I am ideological.'

– Louis Althusser (2014: 264-265)

Ideology is an inherently elusive concept, eliciting varied interpretations across different contexts and political realities. Its meaning has evolved significantly over its relatively short history of just over two centuries. Initially understood as the 'science of ideas,' it later came to be associated with notions of false consciousness, the misrepresentation of reality, and, more recently, as an assemblage of values, beliefs, and worldviews.

The nineteenth century witnessed the emergence

of liberal ideology, while the twentieth century was defined by the dominance of **socialism**, **fascism**, and later neo-liberalism. Theoretical perspectives also shifted: the first half of the twentieth century saw the rise and consolidation of ideologies, whereas, by the 1960s, the 'end of ideology' thesis gained traction. The Cold War's conclusion and socialism's defeat further popularized the idea that ideology had reached its endpoint, encapsulated in Francis Fukuyama's *The End of History and the Last Man* (1992).

Reflecting this complexity, David McLellan aptly described ideology as *"the most elusive concept in the whole of social science"* (McLellan 1995: 1).

DEFINITION Today, ideology is most commonly used as a specific concept that denotes a set of values, ideas, and beliefs. Different definitions stress different aspects of ideologies. For instance, Michael Freeden considers ideology as a political instrument, a program for action, defined as follows: *"ideologies are the instruments through which members of a society navigate among the many concepts that political life and its processes produce, and then chose, or decontest, a meaning that reduces that unmanageable polysemy. They are held by people and groups who are action-oriented, either in deed or in thought, and who wish to change, reform, uphold or resist political arrangements, be it in a desultory or insistent fashion."* (Freeden 2021: 4)

Roger Eatwell (1993: 10) argues that a political ideology is a belief system: *"a relatively coherent set of empirical and normative beliefs and thought"* that addresses various important questions: historical processes, political and economic systems, etc. Crucially, an ideology can act as either a stabilizing or a radical force, with political ideologies are essentially the product of collective thought. Moreover, it is important to emphasize that ideologies are 'ideal types' that ought *"not to be confused with specific movements, parties or regimes which may bear their name"* (Eatwell 1993: 10).

Malcolm Hamilton (1987) stressed its relational aspects, proposing that an ideology is a specific *"system of collectively held normative and reputedly factual ideas and beliefs and attitudes advocating a particular pattern of social relationships and arrangements, and/or aimed at justifying a particular pattern of conduct, which its proponents seek to promote, realise, pursue or maintain."* (Hamilton 1987: 38).

Michael Freeden's conceptual morphology of ideologies categorizes political concepts into core, adjacent, and peripheral elements to explain their structure and adaptability. *Core concepts* are the essential, enduring ideas that define an ideology and distinguish it from others. *Adjacent concepts* are secondary but crucial for contextualizing and refining core ideas. *Peripheral concepts*, meanwhile, are more marginal and flexible, allowing ideologies to adapt to specific cultural or temporal contexts without altering their fundamental identity.

To illustrate, in liberalism, liberty is the *core concept*, defining the ideology's focus on individual freedom and autonomy. Without liberty, liberalism would lose its fundamental identity. *Adjacent concepts*, such as equality and individual rights, support and refine liberty by ensuring it is fairly distributed and protected from infringement. For example, equality ensures that everyone can exercise their liberty, while rights safeguard freedoms. *Peripheral concepts*, like market efficiency or environmental sustainability, are more context-dependent and adaptable. These allow liberalism to address specific issues in different times or places without altering its core principles, ensuring both coherence and flexibility within the ideology.

Freeden emphasizes the relationships between these concepts – such as their proximity, hierarchy (priority), and permeability – to show how ideologies organize contested meanings into coherent frameworks. This approach allows for understanding both the stability of ideologies over time and their ability to evolve in response to changing circumstances, making them effective cognitive maps for navigating political life: *"Those cores are durable but not essentialist. Nor are they immutably wired into the underpinning of an ideological argument; their position in the ideational structure may flexibly and contingently be subject to temporal and cultural reinscribing. Cores are multiple assemblages that together plot the many paths an ideology can take; their force may combine both rational and emotional commitment."* (Freeden 2021: 10).

SEE ALSO The concept of ideology is always connected to political parties and different political regimes. Liberal, neo-liberal, socialist, social-democratic or extreme right-wing (fascist) political movements, politicians, parties, or regimes always propagate several ideas, presuppositions of the existing order and visions about the future. Ideology is used to legitimize the *status quo* or advocate for changes to the existing order, mobilizing for resistance, revolution, and sometimes even wars and invasions.

Regarding autocracy, ideology is mostly associated with **totalitarianism** and **ideocracies**, in particular **theocracies**. It is considered a tool of their **legitimacy** and a stabilizing factor (cf. **longevity, stability, resilience**).

KEY SIGNIFICANCE The concept of ideology is one of the crucial concepts in explaining the political and to clarify the nature and ideational origins and foundations of political rule. Ideology shapes all political regimes, particularly dictatorships, by providing a framework of beliefs and values that justify and sustain their authority. In dictatorships, ideology often serves as both a legitimizing tool and a mechanism of control, especially in ideocracies.

Under **totalitarianism** or other **ideocracies**, such as Nazi Germany under Adolf Hitler or the Soviet Union under Stalin, ideology was central to the regime's identity and governance. These regimes use a single, official ideology – such as **fascism** or **communism** – to legitimize their rule, unify the population under shared goals, and suppress dissent. The ideology is propagated through **propaganda**, **indoctrination**, **education**, and cultural control, creating a perception of inevitability or naturalness about the regime's dominance. This ideological control extends to all aspects of life, from politics to culture and even private behavior, ensuring conformity and loyalty to the regime.

Authoritarianism may use ideology more flexibly or superficially. While they may adopt certain ideological elements to justify their rule (e.g., **nationalism** or anti-communism), these regimes often rely more on pragmatic governance, **repression**, and **patronage** networks than on comprehensive ideological indoctrination. For example, many postcolonial dictatorships in Africa or Asia used nationalist ideologies to consolidate power but never sought to control every aspect of life in the way totalitarian regimes do.

Ultimately, the relationship between ideology and dictatorship varies depending on the type of regime. Ideocracies rely heavily on ideology. Dominant worldviews also shape the outlook of elites, providing them not only with a justification for their authority but also a framework for envisioning a 'just' political order. Ideologies establish ideals, norms and values for leadership, identify role models to emulate, and define what is seen as the appropriate or moral course of action. Beyond merely legitimizing power, ideologies influence policymaking and act as transformative forces that redefine the relationship between the state and society.

ORIGIN The term ideology was coined in post-revolutionary France. Antoine Louis Claude Destutt de Tracy introduced this term in his lecture at the *Paris Institut National* in 1796. He also used it in his papers and articles that were published in a book entitled *Mémoire sur la faculté de penser (Memoire on the Ability of Thinking)*. He also published *Elements of Ideology*, in which he further elaborated his views on the concept (Vincent 2009; Stråth 2013; Steger 2008). De Tracy *"coined the term for his rationalist method of breaking complex systems of ideas into their basic components. Consciously directed against established religion and its transcendental claims to absolute Truth, the ultimate purpose of Tracy's new 'science of ideas' went far beyond intellectual contemplation."* (Steger 2008: 1).

Issues with 'ideology' emerged as soon as the concept was introduced. Namely, many ideologues, among them de Tracy, were supportive of Napoleon and his regime. However, after he gave concessions to the church, they began criticizing him from liberal and anti-theological positions. Napoleon then began using the term ideology and ideologues in negative terms, claiming that they were daydreaming and were completely detached from reality. By the 1830s, both usages were present in dictionaries – the original meaning of ideology as the theory of ideas and also the Napoleonic usage as ideas that were detached from political reality (Stråth 2013). However, today, the prevalent understanding of ideology and its function within our societies is mostly negative and in line with Napoleon's original critique. However, de Tracy viewed ideology in an opposite way: for him, ideology was *la théorie des théories*. It constituted the queen of the sciences because it necessarily preceded all other sciences, which were all based on 'ideas' (Vincent 2009: 2).

LITERATURE Within the Marxist theoretical tradition, much work has been done to explain the role of ideology in our lives. Marx and Engels' critique of ideology can be found in their unfinished work *On German Ideology* (*Die Deutsche Ideologie*, first published in Moscow in 1926.). However, Marxists of the twentieth century turned exactly to the concept of ideology in order to grasp the variation of social change in different parts of the world and also to explain the success of revolutions or unsuccessful attempts of radical reform. Accordingly, ideology played a crucial role in the failed attempts at **revolution** in the 'Western' world.

Marx and Engels argued in their famous political pamphlet that the ideas of the ruling class – as assembled within an ideology – are always the ruling ideas in every epoch, and these function as the *'camera obscura,'* which shows the real life and existing relations and conditions turned on its head. So, it is something similar to, as Engels would claim, 'false consciousness.'

Antonio Gramsci developed his concept of ideology in close relation to the concept of hegemony, for which he is still renowned today. Often, Gramsci's concept of hegemony is conflated with his theory of ideology, although it is clear that ideology is a tool for establishing hegemony, which is a much broader concept that encompasses class alliance, class leadership, and consensus. *Hegemony* is borne out of the sphere of production, through class alliances and consent, that is built by the true incorporation of different class interests into the emerging or existing historical bloc and is cemented by ideology. Moreover, Gramsci differentiated between organic and arbitrary ideologies: Organic ideologies are those that are "necessary to a given structure," that is, that are necessary for maintaining and cementing a specific mode of production. Arbitrary ideologies are, according to Gramsci, 'willed,' but are not connected to any real class interests in society and are hence "individual movements, polemics." (Gramsci 1971: 376-377).

Most famously, Louis Althusser developed a specific understanding of ideology in his essay *Ideology and Ideological State Apparatuses* (*Idéologie et appareils idéologiques d'État*). Althusser argues that ideology is key in the reproduction of relations of production and conditions of production – that is, capitalist exploitation. In this sense, ideology is exercised through what he calls 'Ideological State Apparatuses' that function predominantly through and by ideology. Althusser finds that "no class can hold state power over a long period without at the same time exercising its hegemony over and in the Ideological State Apparatuses." (Althusser 2014: 245). Althusser's main claim is that ideology interpellates abstract individuals into specific and ideologically-mediated subjects, and that ideology always has a material existence, and it is not something that is purely connected to the level of ideas.

Karl Mannheim developed a very intriguing understanding of ideology. He did not follow Marxist interpretations in full: In his seminal work *Ideology and Utopia* (*Ideologie und Utopie, 1929*), he contrasted these two different notions. He distinguished between *particular* (a) and *total* (b) ideologies. Particular ideologies (a) were, according to Mannheim, based on individual psychology and

interests, while total ideologies (b) were actually comprehensive worldviews and had a developed system and structure of reasoning. Moreover, both ideology and utopia are a specific set of ideas that actually do not correspond to the existing reality and thus differ from scientific knowledge. However, he also argued that utopias are mental frameworks that are aimed at changing the *status quo* and are based on ideas that are beyond the existing reality, while ideologies are used and instrumentalized to defend the *status quo*. In this sense, one has to examine the 'social roots' of specific ideas. This also means that different social classes have different ideologies; while some will function as the defenders of the status quo, others might take the form of a utopia in the sense of aiming to change the current state of affairs (Mannheim 1998; Freeden 2003; Hammersley 2020; Vincent 2009). Mannheim also claimed that this scientific examination of ideas – ideologies and utopias – is possible only when one is aware of their social roots and class position. In this way, one can engage with examining ideas – he called this the sociology of knowledge, which is something very similar to de Tracy's meaning.

During the first two decades of the Cold War, different scholars developed interesting theories, following Mannheim's distinction between particular and total ideologies. The latter argued that the world, at least the Western world, was coming to a point where ideology would become obsolete – grouped together, these scholars are known as the 'end of ideology' movement. Daniel Bell (1988) probably published the most famous book, entitled *The End of Ideology*, while other US scholars also focused on the issue (Lipset 1960; Dittberner 1979). S.M. Lipset famously predicted that within affluent Western societies, "the democratic class struggle will continue, but it will be a fight without ideologies" (Lipset 1960: 408). They all believed that the new, social-democratic consumer society, grounded on strong welfare benefits and full employment, would encompass a reality where few things could be challenged, while the communist ideology (as a total ideology) would become ever less influential among the working classes because their living conditions improved.

At the end of the Cold War, Francis Fukuyama repeated this argument, although in a qualitatively different manner. Namely, for Bell and Lipset, the end of ideology represented a social-democratic vision of the world; for Fukuyama, it was the end not only of ideology but also of history. Liberal democracy and capitalism, arguably, were to dominate the world without any serious ideological competitor.

Since the 1990s, two important contributions have been made to the field of explaining and understanding ideology in relation to politics and society. Michael Freeden introduced the 'morphological' concept of ideology, where he points out the connection of the morphological approach to the linguistic turn and hermeneutics in social sciences. According to Freeden (2013), this approach is based on seven crucial elements: (a) ideologies are permanent for political thinking, disregarding whether they are good or bad; (b) ideologies emerge everywhere, not only among the elites, but "at all levels of social articulation;" (c) ideologies should be analyzed "as particular combinations of political concepts, whose meanings are not always immediately transparent but decipherable through a systematic appreciation of the nature of political language;" (d) this is based on analyzing the micro-foundations of ideologies to grasp the nuances and variations between the different concepts that bring forth various broader systems of ideas and concepts; (e) ideologies are understood as "discursive competitions over the control of public political language – a control that facilitates the crafting of significant political decisions and subsequent actions by and for collectivities;" (f) the morphological study of ideologies is founded not on normative and ethical views, but on the careful analysis, deconstruction and interpretation of different semiotic and extra-semiotic elements; (g) ideologies are understood as something actual and not false, and we can understand political thinking not through but as ideologies (Freeden 2013).

The famous philosopher Slavoj Žižek has been working on conceptualizing ideology at the intersection of Marxism, Hegel's philosophy and Lacanian psychoanalysis. Emphasizing that no one can escape ideology and that ideology is manifested most clearly in the material practices and relations that seem natural to us. So, ideology is actually a set of ideas that have a material impact, and they naturally present the world while at the same time claiming that the world, as we most usually see it, is not ideological (Žižek 1993; 1994; 2009).

The study of ideology and its role in autocratic regimes has been gaining importance due to the empirical fact of witnessing the rise of different authoritarian regimes worldwide. Ideology was deemed a necessary element of totalitarian rule in the 1950s and 1960s by scholars (Arendt 1962; Friedrich & Brzezinski, 1956). However, Linz famously argued that authoritarian regimes are specific *"political systems with limited, not responsible, political pluralism; without elaborate and guiding ideology (but with distinct mentalities); without intensive nor extensive political mobilization (...) and in which a leader (or occasionally a small group) exercises power within formally ill-defined limits, but actually predictable ones."* (Linz 1964: 297). According to Gerschewski (2023), there can be two different approaches taken by authoritarian regimes and rulers. Either to overemphasize the ideological underpinning of their rule or to seek depolitization and legitimation through performance.

One of the most vibrant fields has been the exploration of the failures of the neo-liberal ideology to achieve any sort of cohesion, which has resulted in different democratic backsliding and the spread of different authoritarian regimes based on different ideologies. Some research has been conducted in analyzing levels of Bonapartism (Box 4.1) and Caesarism (covered in **term limits**) for different politicians and political parties regarding their ideologies and means of addressing the 'people' (see: Heino 2020; Meckler 2022).

Kneuer (2017) has argued that contemporary

autocratic regimes do base their authority on ideological legitimation, just as most authoritarian and totalitarian regimes did in the twentieth century. She introduced the concept of mission, which is conceptually different from ideology and a crucial element in the quest for legitimacy in authoritarian regimes: *"When missions are constructed by authoritarian rulers – according to the fundamental premise of this article – a variety of legitimation sources are combined by consciously linking performance objectives (output) with ideational-identitarian narratives ('we-identity')."* (Kneuer 2017).

Escribà-Folch et al. (2020) conducted an empirical study on autocratic regimes since the 1960s, revealing that **personalist rule** (like tyranny) tends to lack a broader, unifying ideology. This absence often necessitates stronger **coup-proofing** measures to maintain stability. In contrast, party-based regimes rely heavily on ideological legitimization to sustain their rule. Holbig (2013) argues that in China, ideological legitimacy has not diminished but has instead undergone continuous transformation and adaptation. These changes reflect the evolving interests of the Chinese Communist Party elite within a rapidly shifting international context.

METHODOLOGICAL ISSUES The basic problem with analyzing political ideologies is the different definitions of the concept: *"The most obvious difficulty with the term 'ideology' is that, as we have seen, it has been given fundamentally different meanings, and social scientists frequently use it without clarifying the sense intended, or apparently without being fully aware of the different meanings it can have."* (Hammersley 2020: 29). We can also point to two other specific problems. First, if ideology is defined as false consciousness or false beliefs – one has to explain why these ideas, beliefs, etc. are false or not true. This results in the basic problem: who can define what is true or false, and who has the competence to do that? It presupposes an extra-ideological position, which is paradoxical if we are all, or almost all, submerged into false consciousness. Second, the problem with defining ideology as an all-encompassing system that completely defines our behavior fails to explain how and why certain changes come about if it is in the interest of those in power to maintain their ruling position and thus spread the current ideology.

NEW FRONTIERS Michael Freeden claims that ideologies *"map the political and social worlds for us. We simply cannot do without them because we cannot act without making sense of the worlds we inhabit."* (Freeden 2003: 9). In this sense, the future exploration of ideologies should denounce the current 'post/non-ideological' formation and stress the importance of studying ideas and practices, that seem sometimes natural but are actually ideologically produced and framed. Moreover, more attention should be given to the interconnection between social structures (ideologies) and the agency of individual and collective actors in changing the social and political reality.

Informality

I love informality the way the soil loves rain.
– Marty Rubin, Canadian writer

Informality belongs among *"the most heterogeneous and conceptually overloaded terms in the social sciences"* (Aliyev 2017: 19). It is a general term denoting a part of social reality that is not formal or official. Frequently, the relation between formality and informality is described using the metaphor of an iceberg, where formality stands for the visible part of the iceberg, while informality corresponds to the much larger part of the iceberg hidden beneath the sea level. While the metaphorical waters of informality are frequently murky, informality should not be confused with illegality. Though some informal practices can be illegal, and some informal networks or organizations can be involved in criminal activities, informality and illegality are not the same thing.

DEFINITION Problems with defining informality begin with an ontological paradox. In primitive societies, there were no formal (officially sanctioned or written) regulations, and in this regard, informality is older than formality (Böröcz 2000: 391). However, the concept of informality as such had been meaningless before the emergence of formality. As Polese & Morris (2015: 3) rightly argue, the concept of informality makes sense only after the emergence of complex societies where the state or another overarching entity tries *"to regulate relationships and interactions between people."* These regulations are written, i.e., officially sanctioned, and those regulations or norms that are not officially sanctioned or written can be considered informal. In this regard, formality and informality have always existed side-by-side (North 1990: 6), and this ontological dichotomy led a number of authors to define informality as merely everything that is not formal (Böröcz 2000; Ledeneva 2012).

However, this simple definition is relatively vague because it says what informality is not (in-formal, un-official, un-written), but it does not specify what informality empirically is. This may confuse because in practice authors typically study several manifestations of informality – informal institutions, networks, organizations, structures, practices, politics, or governance – and some of these terms are frequently used interchangeably. However, in political science, the institutional approach to informality prevails, and most definitions of informality, in fact, define informal institutions.

Most of the definitions of informal institutions in political science build on the conceptualization of Helmke & Levitsky (2004: 727), who define informal political institutions as *"socially shared rules, usually unwritten, that are created, communicated, and enforced outside of officially sanctioned channels."* Although this definition states what informal institutions are, it does so in contrast to formality and implies that formality and informality are two analytically separate categories. This is, however, challenged by several authors, such as Gel'man (2012), Polese & Morris (2015), and Kopeček (2019), who rather perceive formality and informality as closely intertwined.

SEE ALSO Several widely-used concepts such as **neo-patrimonialism**, **sultanism & neo-sultanism**, **state capture**, **rentier states**, etc., are based on the existence of extensive informality in respective states and societies. A number of individual informal institutions or practices have become a frequent topic of political science research, such as **systemic corruption**, nepotism (Box 1.1), **clientelism**, cronyism (Box 1.10), **prebendalism**, **rent-seeking**, etc.

KEY SIGNIFICANCE The metaphor of an iceberg suggests that without studying informality, a number of political phenomena would remain hidden, misperceived, or unexplained. For example, Starr (2006), when studying post-Soviet Central Asia, uses the terms 'politics A' (formality) and 'politics B' (informality), and suggests that politics B dominates over politics A. On the contrary, Hale (2015) (cf. **patronalism**) and Aliyev (2017), who focus on the post-Soviet area, claim that it is the formal arrangements which are more important and that the informal institutions, networks, and practices react to changes to formal arrangements. In the African context, the most common approach is an *"evolutionist perspective arising from the new institutional economics, in which informal institutions are seen as remnants of pre-modern times."* (Meagher 2007: 408).

Although informal institutions also exist in highly formalized democracies (Azari & Smith 2012), the concept of informality in political science has been mostly used in research on **democratization**, democratic consolidation, **hybrid regimes**, and various types of autocracies, and the prevailing perception of informality has been rather negative. Typical research topics thus include **systemic corruption**, **clientelism**, **clan politics** etc. While Helmke & Levitsky (2004) have already shown that informal institutions can also play a positive role, the perception of informality as neither positive nor negative has spread in the academic literature only recently (Aliyev 2017; Isaacs & Polese 2016; Polese & Morris 2015; Polese et al. 2017). In the words of Aliyev (2017: 52-53), it is rather *"some by-products of informal practices – such as clientelism, nepotism, corruption, or patronage networks – [that] can be seen as negative."*

ORIGIN The concept of informality entered social sciences in the 1970s via Hart's (1973) anthropological research on household incomes in Ghana. In his seminal work, he introduced the term informal sector, which was further developed (as informal economy) by a number of scholars (e.g., Castells & Portes 1989; Feige 1990; Portes 1983; Portes & Sassen-Koob 1987). However, it was North (1990; 1991) who began to use informality within the institutionalist approach, and it was mainly through his work that the concept of informal institutions entered political science.

The institutional approach as such can be traced back at least to the Enlightenment, however, a systematic study of institutions dates back to Max Weber. The old institutionalism, which had dominated political science until the 1950s, focused on studying state organs and formal norms (e.g., constitutions) from a comparative perspective. The new institutionalism (or neo-institutionalism) is a reaction to the behavioralist criticism of the old institutionalism and perceives institutions simply as 'norm patterns which shape behavior.' (Lauth 2000: 23). The seminal neo-institutionalist works date back to the late 1970s and early 1980s (e.g., Katzenstein 1978; Evans et al. 1985). The neo-institutional approach began to rise in importance in the 2000s and belongs among the most widespread approaches in contemporary political science. The concept of informal institutions was introduced to political science by O'Donnell (1996), who differentiated between formally and informally institutionalized democracies. Later, the concept of informal institutions was elaborated by Böröcz (2000), Lauth (2000; 2004), and Helmke & Levitsky (2004), who also provided the first typologies of informal institutions.

LITERATURE A general discussion about the concept of informality can be found in Knight (1992) or Misztal (2000). A concise overview of the history of institutionalism is provided by Immergut (1998), Selznick (1996), and Alvesson & Spicer (2019). An overview of institutional approaches is provided by Peters (2019) and by Gandhi & Ruiz-Rufino (2015). A large volume edited by Christiansen & Neuhold (2012) is a collection of seminal works on informality in political science research. Two volumes edited by Ledeneva (2018a/b) explore individual informal political practices and institutions from all over the world.

REGIONAL VARIATION An extensive literature aims at analyzing informality in different geographical contexts. An overview of research on informality in Latin America is provided by Helmke & Levitsky (2006), in Africa by Bratton (2007), and in post-Soviet Eurasia by Morris & Polese (2015). In the Russian context, it is typically informal practices and networks, which are the main subject of research (Ledeneva 2012; 2013). There is also a strong focus on **clan politics** in Central Asia (Collins 2006; Isaacs 2011; Polese et al. 2017). A similar approach is typical for studies on the Caucasus region, such as on Chechen *teips* (tribes) (Galeotti 2002) or Azerbaijani regional groupings (Kopeček 2016; Sidikov 2004). In Africa, a number of studies analyze informality in a developmental context (Meagher 2007), while studies of informality in cities and urban areas are typical for Africa, Latin America, and India (Roy & AlSayyad 2004).

CLASSIFICATIONS There have been only a few attempts to classify informal political institutions, which can be divided into two basic approaches. The first one is based on induction and generalization of empirical reality. This is how Lauth (2000) constructed his five basic types of informal institutions – clientelism, corruption, the threat of the use of force, civil disobedience, and custom law. A similar approach is taken by the editors of the *Global Encyclopedia of Informality* (Ledeneva 2018a/b), who cluster individual examples of informal practices and institutions according to their functional similarities. The result is not a typology *sensu stricto* but rather a comparative overview of functions that informal institutions or practices have.

The second approach is based on the deduction and construction of modes of interaction between formal and informal institutions. This is the way how Helmke & Levitsky (2004) identified four types of informal institutions according to their relationship to the formal ones – complementary, substitutive, accommodating, and competing. A similar typology was developed by Grzymala-Busse (2010), who focused on mechanisms of how informal institutions affect formal institutions – replacement, undermining, support, and competition, and by Azari & Smith (2012), who differentiate between completing, parallel, and coordinating informal institutions.

MEASUREMENT Quantitative measuring of informality is relatively limited. Informal economy can be measured directly in microeconomics using surveys of individual households or indirectly in macroeconomics, comparing aggregated data on declared income, employment, consumption, etc. (Hussmanns 2004; Smith 1987) Informality in political science and other social sciences is mostly analyzed using qualitative methodologies and only a few informal institutions or practices are measured quantitatively, such as **corruption** (e.g. *Corruption Perception Index* or *Global Corruption Barometer*). Indirectly, the level of informality can be abstracted from some of the highly aggravated indices, such as the *Fragile State Index*, the *Rule of Law Index*, or the *Democracy Index*, or large international surveys, e.g. the *World Bank Enterprise Survey*, or the *Business Environment and Enterprise Performance Survey* (BEEPS).

METHODOLOGICAL ISSUES As noted by Aliyev (2017: 29), a crucial decision to be made by any political science scholar when studying informality is to choose the appropriate unit of analysis – e.g., informal institutions, practices, or networks. The selection of the unit then determines whether the researcher focuses on norms, patterns of behavior, or individual actors. A possible solution is also *"to rely on a mixed designed that combines institutional-, networking-, and practices-based methods."* (Aliyev 2017: 32). Aliyev (2017: 26-28) and Helmke & Levitsky (2004: 734) agree that studies on informality are typically based on extensive fieldwork, in which data are collected using interviews or observations. Inevitably, this methodological approach results in case studies or small-n comparisons, although Large-N comparisons also exist (e.g., Bratton 2007; Karlsson 2013).

OTHER LANGUAGES There is a large bulk of non-English literature on informality, and a number of concepts from other languages have found their way into the English language literature. The best example is Russian, from which terms such as *blat*

(a type of reciprocal network), *kompromat* (a form of blackmailing – Box 8.3), *sistema* (non-transparent and non-hierarchical system of governance), or *chornyi piar* (black PR) emerged (Ledeneva 1998; 2006; 2013). However, the analytically most important concept from Russian is 'subversive institutions' (*podryvnye instituty*), which Gel'man (2012: 296-297) described as a bacillus infecting formal institutions in order to cause *"systematic distortion and perversion of [formal] institutions in the wake of institution building and in the course of institutional evolution."* Originating from Spanish, we see terms such as *dedazo* (Box 1.5) – the Mexican informal institution of *"imposition of the next president by the outgoing executive"* (Langston 2006; 144) – or *ronda campesina* (Box 1.6) – self-organized peasant patrols in rural Peru (Degregori et al. 1996; Fumerton 2001). Interesting concepts also originated in smaller languages, such as *trafika* (from Czech) – a system of partisan appointments to managerial posts in the public sector to reward supporters (Hanley 2018; Kopecký 2012; Naxera 2014) or *aqsaqal* (from Turkic languages) – a traditional leader (Tokluoglu 2012).

NEW FRONTIERS Given the regionally focused character of most of the studies on informality, cross-regional comparisons are needed. One of the few examples of cross-regional comparisons of informality in political science is the article by Ledeneva & Efendic (2021) comparing informal networks in Russia (*blat*) and China (*guanxi*). A growing bulk of literature aims at studying informal institutions within consociationalism in countries as different as Iraq, Lebanon, India, or Bosnia and Herzegovina (e.g. Adeney & Swenden 2019; Bogaards 2019; Dodge 2020; Zdeb 2022).

Box 1.5 Dedazo – Handpicking a Successor

Dedazo (big finger in Spanish) is a term that refers to an informal political practice in twentieth-century Mexico under the rule of the *Institutional Revolutionary Party* (PRI), in which the president or a high-ranking official handpicked a person for a particular government position or political office without going through a real and competitive formal selection or electoral process. The most famous *dedazo* practice occurred in the context of selecting a presidential successor by the incumbent president himself. While in most authoritarian regimes, the **succession** of the executive is frequently a source of instability, in Mexico between 1929 and 2000, the institutionalized practice of *dedazo* contributed to the predictability and stability of the political regime based on a hegemonic political party. Major contributions on Mexican *dedazo* have been made by Langston (2006) and Eisenstadt (2003).

A late example of *dedazo* in Mexico was the selection of Carlos Salinas de Gortari as the PRI presidential candidate in 1988. Salinas was chosen by the then-president Miguel de la Madrid as his preferred successor, despite opposition from other party members and without a competitive primary election being held. Salinas went on to win the presidential election, but the results were highly controversial, with accusations of widespread fraud and vote-rigging.

Box 1.6 Vigilante Policing: 'Ronda Campesina'

Self-defense is nature's eldest law.
– John Dryden, English Poet and playwright.

Ronda Campesina (Peasant Round) is a form of community policing that originated in rural areas of Peru in the 1970s and 1980s. It is a self-defense and justice system created by rural communities to protect themselves from crime, violence, and other threats. The *Ronda Campesina* system is based on the traditional practices of communal work and mutual aid that have long been part of rural life in Peru. In addition to their law enforcement role, *Ronda* members (*ronderos*) also serve as mediators and arbitrators in disputes within the community. They often rely on traditional forms of justice, such as restorative justice and community service, rather than relying solely on the formal legal system. The *Ronda Campesina* has been credited with reducing crime and improving public safety in many rural areas of Peru. However, the system has also been criticized for abuses of power and violations of human rights, including the use of excessive force and extrajudicial killings. The importance of the *Rondas* has declined since the 1990s. For more information on *Ronda Campesina*, see, e.g., Fumerton (2001) or Starn (1999).

Junta

A military coup needs a sacrifice and courage that you can't find in an army without morale
– Jalal Talabani (1933-2017), interim president of Iraq (2005-2014)

The Spanish word for *junta* ('council') can refer to the act of an autocratic takeover (a coup d'état) or the group of powerholders in (a more collegial subtype of) **military regimes** after such a takeover. The term originally refers to the various consultative committees of the Spanish monarchy in the sixteenth century (see 'classifications' under **coup** for details).

The term junta indeed carries strong negative connotations, often associated with violent **repression** and **human rights** abuses. In the Cold War era and its immediate aftermath, military juntas were prevalent in regions like Latin America, Southeast Asia, and parts of Africa. Many became synonymous with brutal and undemocratic rule. For instance, juntas in countries like Chile under Pinochet or Argentina during its 'Dirty War' period epitomized these associations, cf. terror (Box 3.13). With the rise of democracy, military rule declined, and along with it, global norms shifted, making the term less desirable.

Many contemporary military regimes have sought to distance themselves from the overtly militaristic image that the term 'junta' evokes. This is evident in processes of 'civilianization,' where military rulers adopt civilian titles, attire, and institutions to mask their control while maintaining *de facto* power. For example, in Thailand or Myanmar, military rulers have used constitutional frameworks or nominally civilian governments to lend an air of legitimacy to their rule. Such strategies make the use of junta less fitting as these regimes attempt to present themselves as more aligned with democratic norms.

Also, scholars have been using the term less. The main reason is that comparative authoritarianism has developed various classifications for military regimes that are more precise or explicitly denote their hybridity when such rulers hide behind a civilian or monarchic component. Previously, there was just one accusatory label for all of them: junta.

Kleptocracy

Pluck the chicken, but don't let it squawk
– Haitian president, Jean Jacques Dessalines (ca. 1758-1806)
Corruption steals from the poor. It steals the promise of a brighter future.
– Jim Yong Kim, president of the World Bank (2012-2019)

The term kleptocracy has its roots in the Greek words κλέπτης – *kléptēs*, 'thief' and κράτος – *krátos*, 'power, rule.' While it is often defined as 'rule by thieves,' the concept is more nuanced than this simplistic definition suggests. The term 'kleptocracy' has become widely used to describe the illegal but systematic functioning of political, economic, and social structures. The basic feature of injustice is when power or mandate are systematically abused, resulting in unfairness and enrichment at the expense of others. It may also include elements of violence, oppression and complex divide-and-rule strategies that rulers may resort to in order to maintain dominance (De Luca et al. 2011: 3).

However, the reality is even more complicated by the fact that the ruling body, which has been accused of kleptocracy, uses a variety of instruments to conceal its operations, manipulate facts, and improve its image for citizens. Often, kleptocracy is associated with grand corruption in a state apparatus that has developed in a largely organized form. The research on the correlation between **corruption** and political regimes is relatively wide, and it includes studies of corruption in democratic and non-democratic regimes. Among others, we can mention these authors: Brooker 2014; Johnston 2014; Rose-Ackerman & Palifka 2016; Yadav & Vineeta 2011.

SEE ALSO Because of its complexity and dependence on the understanding of other terms with better-delineated theoretical frames, such as **systemic corruption**, **rent-seeking**, **prebendalism**, **neo-patrimonialism**, **clientelism**, **patronage**, **hoarding**, etc., the exact meaning of kleptocracy has rather remained elusive.

DEFINITION Kleptocracy is challenging to define precisely, as it overlaps with terms like 'predatory state' (Lundahl 1997), **state capture**, and strategic corruption. These concepts are often viewed as variations of kleptocratic states or as significant features within such systems.

This is primarily related to the era in which kleptocracy is studied and which aspects of corrupt governance are emphasized. In many cases, a kleptocracy is theorized and embodied in a form of "*government which uses coercion as its primary means of gaining power-over the compliance.*" (Haugaard 2023: 1).

For Wedeman (2018: 87), kleptocracy means *"a form of vertically integrated, hierarchically organized corruption in which the main corrupt hierarchies come together at the peak of political power. A kleptocracy is thus not simply a state controlled by thieves; it is a system in which a 'thief-in-chief' or small ruling cabal controls a broader circle of thieves who have captured pieces of the state."* Similarly, Rose-Ackerman (1999) defines kleptocracy as a government that views the civil service as a source of personal gain. As a result, it supports projects that provide corrupt opportunities and personal gains to its members. At the same time, it does not support reforms aimed at making the civil service more efficient in key areas of the economy that benefit the kleptocrats.

However, Rose-Ackerman distinguishes between two types of state systems in which kleptocracy occurs. The roots of kleptocracy may stem from a government's strong or monopolistic position that encourages corruption or, conversely, from a government's weak control over the economy and administration, leading to widespread corruption. In the latter case, corruption becomes a common pathological phenomenon of a weak or failing state, with members of the state's administrative apparatus engaging in mass corruption, sometimes euphemistically labeled 'poor governance.' Rose-Ackerman states that the pattern of kleptocratic behavior varies depending on the type of kleptocracy: *"In short, the strong kleptocrat runs a brutal but efficient state limited only by his own inability to make credible commitments. The weak kleptocrat runs an intrusive and inefficient state organized to extract bribes from the population and the business community*" (Rose-Ackerman 1999: 119). The fact that kleptocracies arise especially in weak states is also confirmed by Acemoglu et al. (2004: 163), stating, that *"kleptocracies emerge in weakly institutionalized polities, where formal institutions neither place significant restrictions on politicians' actions nor make them accountable to citizens."*

To understand kleptocracy as a system, it is necessary to understand its interconnectedness with (grand) corruption, although they are sometimes (incorrectly) used interchangeably. Coates and Quest (2005: 2) claim that *"kleptocracy and corruption are now used interchangeably, with kleptocracy referring to systems of rule and corruption to venal acts and abusive practices. Kleptocracy is only one of a network of vicious circles that obstruct development, although it is one about which correctives can be applied."*

ORIGIN Although the original usage of the term kleptocracy goes back to the early nineteenth century, when Leigh Hunt used it for the description of organized criminals in Spain (Bullough 2018: 25), the contemporary depiction is relatively recent. It was Andreski, concerned with the situation in Latin America and African colonies in the post-war era, who, in his book *The African Predicament,* demonstrated and described a system in postcolonial Africa. In particular, he was interested in the establishment of elitist structures in newly established countries when *"Instead of pursuing egalitarian policies, they begun with prioritizing ties to their tribes or families. As a consequence of the lack of common iden-*

tity and often very artificial substance of the ex-colonial state, including diversity in languages, religions and values, political representatives, civil servant, military officers, and others started to enrich themselves, their relatives, members of their tribe or other groups possessing the power." (Andreski 1968).

Unlike 'normal' autocrats, who could also be corrupt but for which self-enrichment is not their main objective, a kleptocratic regime's single aim is to maximize its own **rents**. In other words, in kleptocracies, corruption *"rather than a weakness or a disorder, it is the effective functioning of systems designed to enrich the powerful*" (Chayes, 2017: 146).

In his 1997 book *Guns, Germs, and Steel: The Fates of Human Societies*, Jared Diamond conceptualizes kleptocracy as a longstanding tool of exploitation used by elites in centrally governed, non-egalitarian societies. These elites typically use tribute or taxation to divert resources from commoners to themselves. Diamond identifies four strategies that kleptocrats have historically employed: (i) disarming the populace while arming the elite, (ii) redistributing a portion of the collected tribute in ways that please the masses, (iii) using monopolized force to maintain public order and reduce violence, and (iv) constructing an ideology or religion that justifies their kleptocratic practices (Diamond 2017).

Andreski (1968) focused on the defective components of governance, particularly the pervasive corruption across state and public institutions. He defines kleptocracy as a system where the functioning of authority is driven by the mechanisms of supply and demand rather than by laws and regulations. According to Andreski, a kleptocratic state operates as a generalized model of laissez-faire economics, even if its economy is nominally socialist. However, he argues that 'pure' kleptocracy, like pure democracy or autocracy, is an ideal type that has never fully materialized, as bonds of solidarity inevitably interfere with the unrestrained workings of supply and demand (Andreski 1968: 109).

KEY SIGNIFICANCE & IMPACT ON POLICY Kleptocracy is commonly associated with authoritarian regimes, especially dictatorships. Here, in particular, there is interconnection and reinforcement, as greater control over economic resources allows for a longer and tighter grip on the political system, widening the circle of supporters and increasing the profits from these activities. However, as Haugaar (2023: 372) noted, even "*the politics of actual democracy are unstable, sometimes tending toward the ideal type, increasing stability, but at other moments moving away from the democratic ideal type, toward authoritarianism and kleptocracy. Today, we are in the latter moment.*" Recently, democratic societies have been experiencing cases that illustrate the full scope, complexity, and diversity of the world's corruption challenges. These cases may indicate potential trajectories toward more or less kleptocratic regimes. On this topic see: Kuhner 2017; Vella 2020; Chayes 2017; Rotberg 2017.

Economic factors play a strong role in this respect. Typologically, a kleptocracy is, or was, a state rich in natural resources (cf. the **resource curse**). Congo-Zaire was a notorious outlier, but Liberia, Sierra Leone and Nigeria are also known African examples. It can also be a state that is able to effectively attract **foreign aid** (Congo-Zaire; Equatorial Guinea), which plays a role in keeping the kleptocracy in power.

The following rulers (all **personalist regimes**) can undoubtedly be counted among the classic examples of kleptocracy in this sense of postcolonial **state capture** at the hands of corrupt, mafia-like and thieving rulers who transformed the state and the local economy into a private company-mafia structure. Zaire under Mobutu Sese Seko (1965-1997) as shown in Box 1.7; Equatorial Guinea under Francisco Macías Nguema (1968-1979) and then his nephew Teodoro Obiang (president since 1979); Nicaragua under the Somoza family (1936-1979); Haiti under François 'Papa Doc' Duvalier (1957-1971) and then his son Jean-Claude 'Baby Doc' Duvalier (1971-1986); and the Philippines under Ferdinand Marcos (1965-1986), (cf. Wedeman 2018: 88).

Of course, some powerful rulers manage to avoid such inefficient policies. They enrich themselves and their **families** (cf. nepotism in Box 1.1) but do not push rent-generating programs so far as seriously to undermine growth. Countries with a high degree of corruption that are politically secure and tightly controlled from the top may suffer from fewer static inefficiencies than those with an uncoordinated struggle for private gain. Their rulers have a long-run viewpoint and hence seek ways to constrain uncoordinated rent-seeking so that long-term gains are maximized (Rose-Ackerman 1999: 120).

The longevity of kleptocratic regimes in weakly institutionalized political environments raises important questions about their ability to function without strong institutions over extended periods. Examples include Mobutu Sese Seko's 32-year rule in Zaire, the Duvalier dynasty's 29 years in Haiti, the Somoza family's 43 years in Nicaragua, and Ferdinand Marcos for 21 years in the Philippines. These regimes effectively contain opposition and insulate security forces from external influence by generating funds through ineffective policies. Acemoglu et al. (2004) argue that kleptocrats maintain power through a divide-and-rule strategy (cf. **hoarding**), which allows them to bribe politically pivotal groups off the equilibrium path, ensuring their continued dominance despite costly societal policies. This strategy enables rulers to remain in power by preventing unified opposition, a point also supported by Coates & Quest (2005).

In the context of kleptocracy, the term's essence is defined by the role of the kleptocrat. There are two types: a kleptocratic dictator who establishes and leads the entire system and one who operates within weak institutions and state instability without centralized power. A strong kleptocrat is often associated with state capture, which Hellman et al. (2000: 2) describe as influencing the formation of laws and regulations through illicit payments to officials. Olson (1993) characterizes such a kleptocrat as a 'stationary bandit' who monopolizes theft through taxes while maintaining order and providing public goods to enhance productivity. This type of kleptocrat acts

like a monopolist, optimizing economic output for profit. However, Rose-Ackerman (1999) argues that this level of control is rare, requiring kleptocrats to develop other power strategies to profit from certain economic sectors.

Andreski (1968: 194) notes that kleptocracy involves selling what the law forbids, such as appointments and government contracts. Lundahl (1997) details methods like foreign trade taxation, smuggling, tax farming, sale of public offices, inflation, confiscation, loan manipulation, aid embezzlement, and misuse of state enterprises. These methods enrich the governing elite and are orchestrated by the state administration, leading to entrenched structures similar to those in predatory states.

The 'new' kleptocracies emerging in contemporary authoritarian regimes differ significantly from the 'old' forms, though the latter have not entirely disappeared. New kleptocratic models are characterized by decentralized and oligopolistic systems of corruption, where powerful oligarchs, supported by networks of bankers, gangsters, and financial operatives, compete for profits by capturing segments of the state (Wedeman 2018: 89). Unlike old kleptocracies, which primarily operated within state borders – depositing assets abroad or borrowing heavily for personal enrichment (Andreski 1968: 176) – new kleptocracies are deeply integrated into global trade. They exploit transnational mechanisms to evade sanctions and generate domestic revenue through oligarchic structures (Bullough 2018).

This internationalization of kleptocracy has transformed it into a powerful foreign policy tool. Kleptocrats establish formal economic, cultural, and political ties while engaging in covert influence operations. They cultivate transnational networks to camouflage financial flows and enhance their reputations (Cooley et al. 2018: 40). Paradoxically, this shift occurred during post-Cold War efforts to increase global transparency. Unable to rely on direct foreign bank transfers or anticommunist credentials, kleptocrats now use sophisticated networks to launder wealth through tax havens or luxury real estate and protect assets under Western or Middle Eastern property laws.

In a second phase, kleptocrats focus on 'reputation laundering,' obscuring evidence of corruption and 'rebranding' themselves as global citizens. This involves acquiring dual citizenship or residency in safe countries (including the EU), engaging in global PR campaigns ('Black PR' a mix of **soft power**, **propaganda** and **disinformation**), sponsoring events like sports clubs, and conducting philanthropy to distract from corrupt practices (Cooley et al. 2018: 45; Heathershaw & Cooley 2017). These strategies allow kleptocrats to maintain power while integrating into the global system.

CLASSIFICATIONS Classifying kleptocracy is challenging due to the unique circumstances and developments in each country and time. However, it can be viewed as a social phenomenon that societies confront, react to, and juxtapose themselves against. Haugaard (2023) explores kleptocracy as a sociologically constructed ideal type of political power alongside authoritarianism and democracy, using Weberian analysis. He identifies four dimensions of **power**: agency, structure, social knowledge, and social ontology (2023: 2). These dimensions allow for the examination of kleptocracy's theoretical functioning and its sociological implications.

In a kleptocracy, agency is characterized by power as domination or oppression, with no separation between political and economic power. Economic domination is intertwined with state and societal capture. Ideally, kleptocratic societies exhibit a binary structural relationship between the powerful and the powerless, leading to instability. This instability often shifts power toward authoritarianism, creating a hybrid form of kleptocracy-cum-authoritarianism. The lack of an ideology to justify this stratification contributes to instability, while subaltern ideologies may emerge to maintain or challenge the power dynamics.

The social ontological dimension in kleptocracy involves accepting the impossibility of change and achieving ontological security through routine structural reproduction. The powerless focus on survival, while the powerful wield control over life and death (Haugaard 2023: 352-356).

Box 1.7 The Mobutu Regime: A Poster Child for Neo-patrimonialism, Sultanism & Personalist Rule

The departed spirit of Mobutu Sese Seko can rest secure in the knowledge that his own contribution to the concept of sultanism has not been neglected.
– Crawford Young (1999: 165)

He built his political longevity on three pillars: violence, cunning and the use of state funds to buy off enemies. His systematic looting of the national treasury and major industries gave birth to the term "kleptocracy."
– *New York Times*, Mobutu's Obituary (1997)

Mobutu Sese Seko's rule over Zaire (now the Democratic Republic of Congo – DRC) stands as one of the most illustrative examples of **personalist rule**, **sultanism**, and **kleptocracy** in modern political science. His nearly 32-year reign (1965-1997) was marked by a unique blend of ruthless political maneuvering, ideological pragmatism, and an extraordinary ability to manipulate both domestic and international actors. Below are some selected aspects of Mobutu's rule that have boosted him to the top in comparative authoritarianism studies.

Mobutu's rise and survival as an authoritarian ruler were deeply intertwined with his ability to manipulate the international system during the Cold War. His regime exemplifies how authoritarian leaders can exploit global geopolitical rivalries to sustain their power.

Mobutu ascended to power with significant Western backing. In the aftermath of Congolese independence in 1960, the country descended into chaos, with the West cold-shouldering the democratically elected prime minister Patrice Lumumba (Box 5.1), and regional secessionist movements in Katanga and Kasai provinces exacerbating instability in concert with rising cold war tensions.

The son of a cook and a hotel maid, Joseph-Désiré Mobutu was born in Lisala, in Equateur province, in 1930. After a stint as a journalist, Mobutu turned soldier. He had become good friends with Lumumba in Léopoldville (Kinshasa) in the run-up to Congolese independence in 1960 and joined his cabinet as a military aide. As the Congo crisis deepened, the anti-colonial Lumumba clashed more openly with unresponsive Western powers and started counterbalancing by asking the Soviets for help. Immediately, he became branded as a communist by panicking cold war warriors. As a rising army officer, Mobutu positioned himself as a trusted ally for all sides, swiftly moving up through the military ranks to the top command. For the West, once it became clear that the Congolese president, Kasavubu, was not the right ally, as the latter did not have the required popular support nor the backing in parliament to take on Lumumba, they started increasingly to rely on the young military commander to 'solve' this protracted crisis in the heart of Africa.

So came the first **coup** in 1960, with tacit Western support, placing Lumumba under house arrest, surrounded from all sides by the Congolese army and protected by another smaller ring of neutral UN forces. Betrayed by a UN vote regarding his political future, Lumumba escaped his arrest but was captured and airlifted to the secessionist province of Katanga, where he was tortured and murdered by his political rival Moise Tschombe (with Belgian backing).

Mobutu stayed in power with US backing and rode out successive crises and insurrections, portraying an almost artistic ability to bribe political rivals back into the fold. When Congo, war-torn and chaotic, was somewhat stabilized, and it was time to hand over power, then came the second coup in 1965, a surprise to the West.

Mobutu's consolidation of power was marked by a ruthless elimination of political rivals through violence, co-optation, and manipulation. One of Mobutu's earliest acts as ruler was to dismantle existing patronage networks and replace them with his own loyalists. This process often involved outright violence. The public execution of former Prime Minister Évariste Kimba and other political figures in 1966 served as a chilling warning to potential dissenters (Nzongola-Ntalaja 2002). Similarly, Pierre Mulele, a rebel leader who had been lured back to Zaire under promises of amnesty, was brutally executed in 1968. These acts were not merely punitive; they were calculated spectacles designed to instill fear across Zaire. In 1969, Tschombe – by then in exile in Spain – was lured on a trip, and his plane was highjacked and diverted to Algeria, where he was put under house arrest and died under suspicious circumstances (a heart attack).

Beyond violence, Mobutu employed co-optation as a tool for neutralizing opposition. Prominent figures were offered lucrative government positions or access to state resources in exchange for their loyalty. This prac-

tice undermined the credibility of opposition movements while expanding Mobutu's patronage network. For example, he strategically appointed officials from diverse ethnic groups to prevent any single faction from consolidating power against him.

Mobutu also manipulated divisions within the opposition to weaken potential challengers further. He encouraged factionalism by creating multiple small political parties that fragmented resistance efforts. This tactic ensured that no cohesive force could emerge to threaten his rule (Schatzberg 1991). Additionally, he maintained tight control over Zaire's security forces (cf. **coup-proofing**) – particularly the *Division Spéciale Présidentielle* (DSP), an elite unit loyal solely to him – thereby insulating himself from coup attempts.

While Mobutu lacked a systematic ideology akin to Marxism or Négritude, he developed a distinctive set of practices aimed at consolidating his authority and fostering national unity under his leadership. Central to this effort was his 'Authenticity' campaign. Launched in the early 1970s, *Authenticité* sought to reject Western cultural influences and promote a uniquely Zairian identity. This initiative included renaming Congo as Zaire, requiring his citizens to adopt African names, banning Western attire (in particular neckties), and emphasizing traditional customs (Young & Turner 1985). While some scholars dismiss *Authenticité* as a 'light' ideology primarily designed for **propaganda** purposes, it resonated with many Zairians by fostering national pride after decades of colonial domination.

The campaign also served as a vehicle for Mobutu's **personality cult**. He styled himself as Mobutu Sese Seko Kuku Ngbendu wa Za Banga ('the all-powerful warrior who goes from conquest to conquest'), portraying himself as both a traditional African chief and a modern statesman. He was referred to as *Mokonzi* 'Big Man' in Lingala. Events like the 'Rumble in the Jungle' – a boxing match between Muhammad Ali and George Foreman in Kinshasa in 1974 broadcasted live on television – further reinforced this image on an international stage (**spectacle politics**).

During his rule, Mobutu masterfully exploited Cold War dynamics to secure ongoing support from Western powers (**gatekeeping**). He presented himself as an indispensable ally against communism in Africa, often framing his regime as the only alternative to chaos – a narrative encapsulated in his 'Mobutu or chaos' foreign policy logic. This argument resonated particularly well with US administrations during the Cold War, which prioritized stability over human rights concerns. For example, during George H.W. Bush's presidency in the late 1980s and early 1990s, Mobutu successfully leveraged this narrative to stave off calls for democratic reforms despite mounting domestic and international criticism (Young & Turner 1985).

Mobutu's ability to manipulate international actors extended beyond the United States. He cultivated close ties with France under President Valéry Giscard d'Estaing, securing additional military and financial support by aligning himself with French interests in Africa. Mobutu also played regional conflicts to his advantage; for instance, his support for French interventions in Rwanda during operations *Noroît* (1990-1993) and *Turquoise* (1994) reinforced his value as a regional power broker (Schatzberg 1991). However, this strategy of external reliance ultimately proved unsustainable. With the end of the Cold War and the diminishing threat of communism, Western tolerance for Mobutu's corruption and repression waned. By the mid-1990s, Mobutu found himself increasingly isolated on the international stage.

Mobutu's regime is perhaps most infamous for its kleptocratic practices. He treated Zaire's state resources as his personal property, siphoning off billions of dollars into overseas bank accounts while presiding over one of Africa's most impoverished nations. **Corruption** under Mobutu was not merely tolerated; it was institutionalized as part of his governance strategy. He famously advised officials to "steal just a little," signaling that corruption would be overlooked so long as it did not threaten his rule (Schatzberg 1991). This system allowed him to maintain loyalty among elites while ensuring that no rival could accumulate sufficient resources to challenge him.

The scale of Mobutu's personal enrichment was staggering. He regularly chartered a Concord jet to service his personal Versailles (the Gbadolite Palace), which he constructed in the middle of the rainforest. By some estimates, he amassed a fortune exceeding $5 billion – an amount equivalent to Zaire's total national debt at the time of his ouster (Nzongola-Ntalaja 2002). However, this kleptocracy logically also contributed to Zaire's economic collapse in the 1990s, undermining Mobutu's ability to sustain his patronage networks.

Despite widespread discontent among both elites and ordinary citizens, Mobutu managed to avoid successful coups throughout his reign. The same with the (cyclical) rebellions, where he always managed to convince allies to provide essential support on his behalf – a remarkable feat for an authoritarian ruler presiding over such continuous instability.

Mobutu's regime, which had endured for over three decades, collapsed in 1997 due to a confluence of internal decay, external abandonment, and regional upheaval. The end of the Cold War marked a turning point as Western powers, particularly the US, withdrew their support. No longer needed as a bulwark against **communism**, Mobutu faced mounting criticism for his **systemic corruption** and **human rights** abuses. France, his last major patron, also distanced itself due to its own tarnished reputation following controversial interventions in Rwanda. Internally, decades of **kleptocracy** had hollowed out the Zairian state. The economy was in shambles, infrastructure crumbled, and the army was demoralized and ineffective. Mobutu's superficial democratic reforms in the early 1990s failed to quell public frustration, further eroding what was left of his **legitimacy**.

Meanwhile, the Rwandan genocide and refugee crisis destabilized Zaire. Mobutu's support for Hutu militias angered Rwanda, which allied with Uganda and Angola to back Laurent Kabila's rebellion. Kabila's *Alliance of Democratic Forces for the Liberation of Congo* (AFDL), supported by regional powers and fueled by popular discontent, swiftly overran Mobutu's weakened forces. Isolated internationally and unable to counter the rebellion, Mobutu fled to Morocco into exile, marking the rapid collapse of his fragile personalist regime. He

died one year later of prostate cancer on 7 September 1997 in Rabat. He was buried in the European cemetery in Rabat. His grave is marked only with the initials "MSS" and remains there to this day. Discussions about repatriating his body back to Congo have only been met with disagreement – cf. Box 5.6 on dictators' bodies.

Mobutu is almost the ideal type of **personalist ruler** because he ticks *all* the boxes. Lemarchand (2003: 31) called his regime the purest illustration of a thoroughly patrimonialized system. Young and Turner (1985: 165) noted that Mobutu's "predatory" rule involved the permeation of the state by a level of corruption so pervasive as to have become its most visible and defining property. (Bach 2011: 279) He was a master of manipulation and ambidextrous when it came to the dictatorial toolkit. As a staunch ally of the West, but with good working relations with some communist powers, his penchant for spectacle and diversion, combined with his long tenure, his Zaire acquired an infamous reputation as the decades proceeded.

Legitimacy & Legitimation

The worst form of injustice is pretended justice
– Plato

Legitimacy refers to the belief or perception that a rule, institution, or leader has the right to govern. It is a judgment about the rightfulness of **rulership** and is often shared by individuals within a society, leading to collective social effects such as more efficient and consensual governance (Hurd, no date). Legitimacy is thus an essential component for the stability and acceptance of any political system or authority figure.

External legitimacy is when actors outside the polity (other states, international organizations, audiences or international regimes) signal a normative evaluation of a political regime. This contrasts with *domestic legitimacy,* which refers to the acceptance of political rule by the ruled (citizens and other residents) governed by the regime. In this entry and throughout the encyclopedia, we equate domestic legitimacy with legitimacy covered here. **External legitimacy** is covered in the section on **international relations**.

Legitimation (also spelled legitimization or legitimisation) is the process by which legitimacy is established or enhanced. It involves actions taken by actors or institutions to justify the power and authority of a regime in terms of societal norms and values. This can include normative appeals or material incentives aimed at gaining acceptance from subordinates (Hurd, no date). Legitimation is inherently a social and political process that seeks to align the actions of a political regime with accepted norms to gain acknowledgment as legitimate.

Self-legitimation (or *regime legitimation*) is when the regime itself undertakes this process and resorts to various strategies to create and disseminate narratives using multiple media and platforms at different levels. This has been defined as: *"the capacity of a political system to engender and maintain the belief that existing political institutions are the most appropriate or proper ones for the society"* (Lipset cited in Grauvogel & von Soest 2024).

SEE ALSO The distinction between *legitimacy* and *legitimation* is well-established, yet the lines between these concepts and related ideas, such as trust, support, and loyalty, can sometimes be unclear. While

political or institutional trust is often used as an indicator of a regime's legitimacy, they are not synonymous. (Political) **trust** refers specifically to confidence in particular institutions, whereas legitimacy encompasses the broader acceptance of the regime as a whole. Similarly, support and loyalty differ from legitimacy. *Support* includes citizens' behaviors that may appear compliant but do not necessarily indicate a perception of the regime as legitimate. *Loyalty* often pertains to elites' actions, which might be driven by genuine affection or calculated cost-benefit analyses (Grauvogel & Soest 2024; Gerschewski 2018).

ORIGIN The concept of political legitimacy has its roots in ancient Rome, where it evolved over centuries. The term 'legitimate' is derived from classical Latin, signifying 'what is legal' or 'what conforms to the law.' Cicero employed phrases such as *legitimum imperium* and *potestas legitima* to denote legally established power and magistrates. He also used the term to differentiate a legitimate enemy *(legitimus hostis)* from a thief or pirate, based on the existence of signed treaties that validated their status, thus bestowing **external legitimacy** on Rome's enemies (as sovereign actors) (Coicaud 2002).

The notion of legitimacy gained significant prominence during the French Revolution (1789-1799) and the subsequent Bourbon Restoration (1815-1830). This era marked a pivotal shift in political discourse, with legitimacy becoming central to debates about the right to govern. Royalists utilized the concept of 'legitimacy' to contrast their preferred form of government with the negatively perceived concept of 'democracy,' which initially lacked a widely accepted name. The use of 'legitimate' inherently suggested its opposite, 'illegitimate,' and these terms were further defined through their relationships with other political concepts (Richter 1982).

DEFINITION The concept of legitimacy has undergone significant evolution, reflecting the shifting dynamics of political systems, philosophical thought, and governance structures throughout history. In its earliest form, legitimacy in ancient Rome was closely tied to the idea of conformity to the law. During the Middle Ages, the term 'legitimacy' itself came into use, retaining its association with legality while expanding to include political considerations such as the justification of delegated power. At this time, legitimacy became linked to the quality of a title to govern and was understood as a legally validated political activity (Coicaud 2002).

In the modern era, the concept gained prominence when the old political order was shaken after the French Revolution and with the rise of **republicanism**. Democracy had no political-moral monopoly yet. Royalists employed it against **democracy** (seen as a negative). In the post-revolutionary reactionary movement, legitimacy became foremost anchored on historical precedents and traditions (cf. **traditional rule**).

In the nineteenth century, liberal thinkers like François Guizot (1787-1874) redefined legitimacy by shifting its focus from mere legality to moral notions such as justice, right, and reason. Guizot argued that legitimacy was incompatible with absolute power, regardless of its origin, and he painted Napoleon Bonaparte, a military usurper, as an example of democratic illegitimacy (Coicaud 2002; Richter 1982).

He emphasized the historical origins of legitimacy. Guizot argued that although all power partly originates from force, no authority desires to be perceived as a product of violence. Legitimate governments strive to dissociate themselves from it. He linked legitimacy to **constitutionalism**, asserting that absolute power is illegitimate (Richter 1982).

Alexis de Tocqueville, directly drawing from Guizot, expanded on existing liberal theories of legitimacy by exploring checks and balances in modern democracies (the danger of emerging **tyranny** and total domination by one individual) and how they align with the values of the governed. He posited that liberal democracy (the US model at the time) was the only legitimate alternative to Bonapartist dictatorship (Box 4.1), thus reinforcing the evolving discourse on political legitimacy (Coicaud 2002; Richter 1982).

In contemporary understandings, Max **Weber** contributed significantly by introducing an empirical framework for analyzing various forms of legitimacy. Moving away from purely normative ideals, Weber focused on how political rule functioned in practice. He identified three ideal types of legitimate authority: rational-legal rule (based on laws and procedures), **charismatic rule** (rooted in the personal qualities of a leader), and **traditional rule** (derived from longstanding customs). This approach allowed for the study of legitimacy across both democratic and autocratic regimes (Tannenberg et al. 2021). Consult the entry on **rulership** for a full overview of his typology and its subtypes; many are treated separately in this encyclopedia.

Modern definitions recognize legitimacy as a multifaceted and dynamic concept. It encompasses belief in the rightness of a political system, acceptance of rulers' authority, perceived obligations to obey laws, willingness to comply with regulations, normative justifications for support, procedural fairness, and government performance. Contemporary scholars emphasize that legitimacy is not static but involves ongoing interactions between those in power and those being governed. Measuring legitimacy empirically remains challenging because it requires examining not only formal institutions and procedures but also citizens' beliefs, attitudes, and behaviors (Diamond 2004; Tannenberg et al. 2021; Gerschewski 2018; Grauvogel & von Soest 2024; Levi et al. 2009; Sadurski et al. 2019; Weatherford 1992; Whiting 2017).

This complexity underscores the evolving nature of legitimacy as both a theoretical construct and a practical reality. In practical terms, Nicole Roughan (in Sadurski et al. 2019) proposes a concept of 'micro-legitimacy,' which focuses on the legitimacy of individual actors within the state rather than solely evaluating the legitimacy of the state as a whole. (See also Box 1.8 on Kakistocracy & Ochlocracy).

KEY SIGNIFICANCE Legitimacy is a fundamental component for the stability and effectiveness of any political system, whether democratic or authoritarian. When a political regime is perceived as legitimate, its citizens are more inclined to obey its laws, cooperate with its policies, and participate in its institutions. This willing compliance reduces the need for coercion (**repression**), thereby making governance more efficient and the supreme powerholders more secure from popular insurrection (Tannenberg et al. 2021; Coicaud 2002; von Haldenwang 2016).

Legitimacy plays a crucial role in promoting stability by reducing conflict and violence. When citizens believe in the regime's right to govern, they are less likely to resort to violence or upheaval to achieve their political objectives. It fosters cooperation and compliance as citizens are more willing to support government initiatives, even if they do not directly benefit from them, because they view the broader system as just and deserving of support. Moreover, legitimacy strengthens regime **longevity, stability & resilience**, enabling a government to endure crises and challenges, both domestic and international. A reservoir of legitimacy built over time through effective performance can sustain a regime during difficult periods (Coicaud 2002; Levi et al. 2009; Grauvogel & von Soest 2024; von Haldenwang 2016).

In terms of enhancing effectiveness, legitimacy facilitates policy implementation by reducing resistance and ensuring citizen buy-in. It mobilizes resources by making it easier for governments to raise taxes, recruit soldiers, and gather support for public projects. Citizens are more willing to contribute to a system they believe in. Furthermore, legitimacy reduces the costs of governance as voluntary compliance with laws and regulations allows the government to allocate resources more efficiently (Tannenberg et al. 2021; Jones 2019; Levi et al. 2009).

Legitimacy also supports justice by reinforcing the rule of law. It ensures that everyone is subject to the same rules applied fairly and impartially, contributing to a sense of justice and fairness in society. A legitimate government is more likely to respect individual rights as it derives its authority from the consent of the governed and recognizes its responsibility to serve its interests. Additionally, legitimacy promotes political equality by ensuring all citizens have a voice and stake in the political system (Coicaud 2002; Krygier & Roughan in Sadurski et al. 2019).

Of course, we are interested in the role of legitimacy in authoritarian regimes. Even without democratic elections, rulers seek legitimacy through various means such as appealing to tradition, cultivating charismatic leadership, demonstrating economic competence, providing essential services, maintaining order and security, manipulating **elections** or controlled participation forms, promoting resonant **ideologies** among segments of the population, and seeking international recognition (i.e., **spectacle politics**) to bolster domestic standing. Authoritarian regimes often face greater challenges in establishing and maintaining legitimacy due to the lack of inherent accountability mechanisms found in democratic systems. Nonetheless, achieving a degree of perceived legitimacy is crucial for reducing reliance on repression and promoting order and stability (Dukalskis 2021; Gerschewski 2018; Tannenberg et al. 2021; Diamond 2004; Grauvogel & von Soest 2024).

LITERATURE The study of legitimacy and legitimation in authoritarian regimes has been significantly influenced by several key works that explore how these regimes establish and maintain their rule. The foundational contribution comes from Max Weber, whose analytical framework (**rulership**) for understanding legitimacy does not discriminate between regime types.

Building on Weber's insights, Juan Linz's (1975; 2000) work on totalitarian and authoritarian regimes provided a comprehensive analysis of how these systems maintain control through **ideology**, **propaganda**, and **repression,** as well as older sources of **traditional rule**. Linz's exploration of the dynamics of non-democratic rule remains highly influential in understanding the mechanisms of authoritarian governance.

Johannes Gerschewski (2018; 2023) has been pivotal in advancing the study of legitimacy in autocracies. He argues that legitimacy is a crucial feature of autocratic rule, contributing to regime stability. In his 2013 article, Gerschewski outlines three pillars of autocratic stability: legitimation, repression, and co-optation. His subsequent work delves deeper into the concept of legitimacy in autocracies, examining its meaning, rival concepts, and measurement challenges (Gerschewski 2018; 2023).

Christian von Soest and Julia Grauvogel (2015; 2018) have conducted extensive research on the legitimation strategies of authoritarian regimes. Their work emphasizes the multidimensionality of legitimacy claims, exploring how autocracies draw upon various sources, such as performance, ideology, and identity, to bolster their rule. They highlight how these legitimacy claims influence a regime's resilience, particularly when facing international **sanctions** (Grauvogel & von Soest, 2014; 2017).

B. Hoffmann (2009; 2015) investigated the importance of external legitimacy for authoritarian regime legitimation using the case of Cuba. S.H. Whiting (2017) focuses on China, examining how the state uses law and legal institutions to bolster regime legitimacy. Not only does their interpretation and construct of 'the rule of law' powerfully shape the legal consciousness of ordinary rural citizens; moreover, this state-constructed legal consciousness enhances regime legitimacy.

Alexander Dukalskis (2021) examines how authoritarian regimes use **propaganda** and public discourse to construct legitimacy. His analysis of the authoritarian public sphere reveals how countries like China and North Korea shape narratives to justify their rule and suppress dissent (**disinformation**).

METHODOLOGICAL ISSUES Defining and measuring legitimacy has caused many headaches. Weber's influential typology provided a foundational framework but has been criticized for oversimplifying

the complexity of legitimacy by collapsing different dimensions into one.

David Beetham (1991a/b) advocates for a more nuanced approach that separates legality, justifiability, and consent as distinct criteria for assessing legitimacy. Beetham emphasizes that legitimacy is not just about subjective belief but also the extent to which authority meets objective criteria, such as adherence to rules and normative justifications. In his view, power is legitimate to the extent that (a) it is legal, that is, acquired and performed according to the existing rules and procedures; (b) these rules are compatible with norms prevailing in the society; (c) the subjects express their support for the system through political participation and symbolic acts (Beetham 1991: 15-20).

For the study of dictatorship, Potz sides with Weber: *"while the ruled certainly take into account the first two criteria, that is, whether the rulers abide by the rules and whether these rules are congruent with a broader axiological/moral/ideological consensus, it is their subjective disposition, not the objective facts, which, in the last analysis, influences their political attitudes and behaviour."* (Potz 2020: 65).

Meanwhile, John Rawls's (1993) normative view, with its emphasis on public reason, justice and fairness as a basis for legitimacy in liberal democracies, raises questions about its applicability to non-democratic settings, where public discourse is often constrained (**censorship**) (Gerschewski 2018; Sadurksi et al. 2019).

Legitimacy is thus seen as a latent property that is difficult to observe directly. It is inferred from observable phenomena such as stability, compliance, and support; however, these indicators can be influenced by factors beyond legitimacy itself. Critics argue that legitimacy becomes readily observable primarily when it is in decline or absent, which poses challenges for measuring it in stable systems, whether democratic or authoritarian. Przeworski (1991) suggests that understanding legitimacy individualistically offers limited explanatory power for macro-phenomena like stability because organized interests rather than isolated individuals drive collective action. This perspective raises questions about the appropriate level of analysis for studying legitimacy (Gerschewski 2018).

The subjectivity and context-dependence of legitimacy further complicate its measurement. Legitimacy relies on the perceptions and beliefs of individuals and groups, which vary significantly across societies and change over time. Contextual factors such as cultural norms, historical experiences, and economic conditions play crucial roles in shaping legitimacy beliefs, making it challenging to develop universal measures applicable across diverse political systems. Weatherford (1992) emphasizes the need for more valid measures of legitimacy orientations for comparative analysis and proposes attributes like accountability, efficiency, procedural fairness, and distributive fairness. However, these criteria can be difficult to operationalize consistently (Weatherford 1992; Gerschewski 2018).

The relationship between *legitimacy* and *legitimation* is crucial for understanding how regimes seek to build and maintain legitimacy. Legitimacy refers to the belief in the right to rule, while legitimation involves the process of justifying that rule. The methodological challenges in defining legitimacy have direct implications for studying legitimation strategies; if measuring legitimacy itself is difficult, assessing the effectiveness of different (self-)legitimation efforts becomes even more challenging. Scholars have employed various methods to study legitimation, including analyzing official discourse, media content, public opinion surveys, and expert assessments. Each method has limitations, necessitating triangulation to gain a comprehensive understanding of legitimation processes (Grauvogel & von Soest 2024).

Applying the concept of legitimacy to authoritarian regimes presents additional challenges due to its strong normative association with democracy. This raises questions about whether dictatorships can be considered legitimate in any meaningful sense. Authoritarian regimes often rely on different sources of legitimacy than democracies (see 'measurement' below), and this requires adapting conceptual frameworks and measurement tools to account for the specificities of non-democratic contexts (see 'classifications' below). The repressive nature of authoritarian regimes complicates gauging public perceptions of legitimacy since citizens may engage in preference falsification by expressing support out of fear of reprisal. This limits the usefulness of surveys and other methods that rely on public expression of opinions, cf. Robinson & Tannenberg 2019.

CLASSIFICATIONS Steffen Kailitz (2013; 2024) revisits the classification of **political regimes** with a focus on legitimacy and durability. He argues that different types of autocracies employ distinct legitimation strategies that contribute to their longevity. Kailitz further explores how regime legitimation influences elite cohesion and strengthens authoritarian regimes. His typology is discussed in the relevant section under **Kailitz**.

Grauvogel & von Soest (2024) provide an excellent overview of several classifications used to distinguish between various *legitimation strategies*. (Note that while these scholars refer to 'legitimation' strategies, they are actually 'self-legitimating' actions as most are initiated and cultivated by the regime itself.) Typologies covered include their own six-fold frame: (i) foundational myth, (ii) ideology, (iii) personalism, (iv) procedures, (v) performance, (vi) international engagement. Further they cover: Omelicheva 2016; Maerz 2020; Tannenberg et al 2021 (see below) and Williamson 2021. There is also the simplified model by Du Boulay & Isaacs (2019), who bundled such categories together back into the three original Weberian types: charismatic, traditional and legal-rational.

MEASUREMENT Marcus Tannenberg et al. developed expert-coded measures of *regime legitimation strategies* (RLS) across 183 countries from 1900 to 2019, based on the dataset by **Varieties of Democracy** (V-Dem). As sources (following Weber), they distin-

guish between legitimacy from performance, the person of the leader, rational-legal procedures, and ideology; and they measure the legitimation claims by regimes themselves (self-legitimation).

Democracies are performance-based and rely less on ideological claims than closed regimes, but **hybrid regimes** tilt toward the latter. Regarding charisma, Israel pivoted around the authority of dominant prime ministers (e.g., Ariel Sharon and Benjamin Netanyahu) and South Africa was swept away by the mythic status of Nelson Mandela. Hybrid regimes are interesting in that they combine all four claims in large measure.

Party-based regimes, particularly those with a **single-party**, often rely heavily on ideological claims to legitimacy. This is especially true and logical for regimes with roots in Marxist-Leninist ideologies. These regimes emphasize the party's role in leading societal transformation and maintaining ideological purity as a justification for their authority. They are person-centered during their revolutionary phase.

Military regimes typically justify their rule through performance-based claims, emphasizing their ability to maintain order and security. They often argue that their intervention is necessary to restore stability or protect national interests, thus framing their governance as a temporary necessity rather than a permanent solution.

Monarchic regimes followed by **personalist regimes** most often make person-centered claims and rely much less on performance claims than expected. Personalist rules, of course, dole out **patronage** and use **co-optation** to stay in power.

Populism intersects with these regime types by emphasizing leader-based legitimation claims. Populist leaders often portray themselves as direct representatives of the people's will, bypassing traditional institutions and emphasizing personal connections with the populace. This approach can lead to an increase in personalist legitimacy claims within populist movements (Tannenberg et al. 2021).

NEW FRONTIERS The study of legitimacy and legitimation, particularly in authoritarian regimes, has been evolving rapidly in the last few years. Authoritarian regimes often rely on **propaganda** and **censorship** to shape public discourse and bolster legitimacy. Investigating how these regimes adapt their messaging to different audiences, both domestically and internationally, offers valuable insights. For instance, Boussalis et al. (2023) emphasize the importance of analyzing rulers' speeches and government propaganda to uncover legitimation processes during periods of transition or challenge. Rosenfeld and Wallace (2014) highlight the need to examine the impact of technological advancements on propaganda's future as AI becomes increasingly sophisticated.

A little gem is Martin Sabrow's article *Time and Legitimacy,* which explores the role of time (symbolic periodization) as a cultural and political factor in the legitimacy of the Nazi regime and the German Democratic Republic (DDR). Sabrow (2005) examines how both dictatorships utilized temporal concepts to establish and maintain legitimacy despite lacking democratic mandates. The study conceptually bridges similar self-legitimation strategies undertaken by **dynasties** in pre-modern **monarchies**. Sajó (2021) also presents various comprehensive strategies by hybrid regimes on how to stay in power.

Box 1.8 Kakistocracy & Ochlocracy: Preludes to Authoritarianism?

The absence of legal hierarchies facilitates the rise of the less scrupulous.
– Nicolás Gómez Dávila (1913-1994)

Linguistically derived from Greek, kakistocracy literally means 'rule by the worst.' The word, which was reportedly first coined in mid-seventeenth-century England, was revived in the wake of the rise of different forms of **populism** and of the poly-crisis that struck Europe and other parts of the world during the last fifteen years. Not surprisingly, and also because a general standard definition is lacking, it is most often used randomly and in a highly judgmental matter. One notion to which kakistocracy is closely connected, however, is that of institutionalized incompetence – a situation in which incompetence is only rampant and, under certain conditions, rewarded.

'Institutionalized incompetence' mostly comes into being in two sets of political-societal circumstances and environments. The first is authoritarian and semi-authoritarian systems with high degrees of cronyism (Box 1.10) and **corruption**. In these, access to positions in government and the various state organs is primarily determined by other factors (personal connections and **patronage**, regional and genealogical ties, sycophancy (Box 6.5), abiding by the correct social codes and jargon, etc.) than by competence, experience and qualifications.

The second soil for some forms of kakistocracy are democratic systems with governance structures and decision-making processes, which, over time, have become so hyper-complex that inertia looms around the corner. Confronted with sacrosanct austerity, huge tangles of rules, regulations and procedures, stifling managerialism and juridification, endless consultations, and pressure to accommodate all sorts of interests and sensitivities, officials and rank-and-file staff – though themselves often competent and qualified – face situations where hands-on work and tangible results become increasingly difficult.

'Ochlocracy,' for its part, is better known as mob rule. Jasmin Hasanović (2015: 60), thereby quoting Esad Zgodić, defines it as *"the direct rule of the mob or mass, or, perhaps, its effective ability to indirectly – but crucially – influence governments. In the absence of democracy and the engagement of its actors, ochlocracy mimics itself in a willingness to appear as a democracy."* Ochlocracies surf on the intimidating effect of large, aggressive crowds yet differ from nihilistic outbreaks of unrest in the sense that the street agitators, demagogues (Box 4.6) and, more recently, online activists and influencers who take the lead in them usually have some, be it often incoherent, political-societal demands.

Historical episodes characterized by frequent ochlocratic mob rule were the long crises of the late Roman Republic (133-44 BCE) and the French Revolution and its aftermath (1789-1795). These two particular examples show that an authoritarian restoration of authority often follows ochlocracies. More recent historical examples include the reckonings with real and alleged collaborators in several European countries during the weeks or months between the departure of the Nazi German occupation forces and the restoration of sovereign state rule (1944-1945). In some areas, intertwined as they were with older local feuds, clannism, personal politics and factionalism among resistance fighters, these sometimes took the form of micro-civil wars.

The civil unrest and anarchy after the financial meltdown in Albania in the spring of 1997 can also qualify as one. Some commentators consider the movement of the *Gilets Jaunes* (Yellow Vests) in France (2018-2020) to be an ochlocracy, but that is highly disputable. Rather, it was a social protest movement that was mobilized outside of the traditional channels of social protest, like trade unions and opposition parties. Mob rule does not exclusively occur in a state of absence of effective state power. As happened during the Jacobin terror in post-revolutionary France (1793-1794), in Russia during the Red Terror (1918-1922) and in China during the 'Great Proletarian Cultural Revolution' (1966-1976), for example, regimes and their affiliates instrumentalized or incited mob rule to eliminate political opponents and 'harmful' social classes.

'Flash-in-the-pan politics' driven by the mediatic craze of the day and fear of politicians not to antagonize potential voters, 'trials by social media' and online call-out culture and 'doxing' (the act of publicly revealing someone's private or personally identifiable information without consent) can be considered contemporary forms of ochlocracy. Finally, ochlocratic mob rule can come into being if and where the legitimate state authorities, law enforcement agencies and the judiciary are no longer able or willing – or at least perceived to be unable or unwilling – to fulfill their core task of protecting the population, thus resulting in mob justice, vigilantism and attacks against institution buildings in reaction. So, in that respect, ochlocracy can be an outcome of, or a reaction against, kakistocracy.

Linkage & Leverage Theory (Levitsky & Way)

Waarabu hujuana kwa vilemba
(Arabs know each other by their turbans)
– Swahili proverb

The theory of 'linkage & leverage' (2006; 2007; 2010), developed by Steven Levitsky and Lucan Way, provides a framework for understanding how external influences can affect **democratization** processes in **hybrid regimes**, in particular **competitive authoritarianism** (a narrower subset of A. Schedler's **electoral authoritarianism**). Levitsky & Way's model focuses on two main concepts, linkage and leverage, but has been updated to include 'gatekeeping' (covered separately, see below).

Linkage refers to the density of economic, political, social, and organizational ties between countries. The original theory focused on the links between Western democracies and other non-democracies. These linkages encompass several dimensions, including (i) economic linkage (trade and investment, FDI, foreign aid), (ii) geopolitical linkage (diplomatic ties, membership in international organizations, alliances), (iii) social linkage (migration and tourism, visa regimes, but also elite education abroad), (iv) communication linkage (media penetration, cross-border telecommunications, Internet connections), and (v) transnational civil society linkage (i.e. connections with international NGOs, churches or other transnational networks and international regimes).

High levels of linkage with democratic countries increase the costs of authoritarian behavior for regimes because they heighten international attention to abuses and raise the likelihood of external intervention or sanctions (Levitsky & Way 2010).

Leverage, on the other hand, is defined as the degree to which governments are vulnerable to external pressure for democratization. This vulnerability is influenced by factors such as the state's economic size and strength, the presence of competing foreign policy issues that might distract external actors, and the availability of alternative regional powers that can provide support to the regime. High leverage allows external actors to exert significant influence over domestic political developments by threatening or applying sanctions or by offering incentives for democratic reforms (Tolstrup 2010).

Jakob Tolstrup (2013; 2014) later expanded on Levitsky and Way's model by addressing its limitations. He argued that while Levitsky & Way primarily focused on Western influences and democracy promotion, these linkages are essentially neutral and can also be used to exert negative influences that counter democratization processes (cf. **black knights**). Tolstrup also criticized the original model for overlooking the agency of political elites in target countries, suggesting that these elites can actively shape the impact of external influences through their own strategic actions (Tolstrup 2010) – that addition is detailed in the entry **gatekeeping**.

Van den Bosch (2018; 2021) argued that while leverage was traditionally understood in terms of hard

power – such as military and economic strength – it lacked an ideological dimension. He proposed that **soft power,** defined by Joseph Nye (2011: 20-21) as *"the ability to affect others through co-optive means of framing the agenda, persuading, and eliciting positive attraction to achieve preferred outcomes,"* is an indispensable element of leverage.

By incorporating soft power into the model, Van den Bosch emphasized that states could use ideational and cultural tools to connect through transnational ideological networks and influence both foreign and domestic behavior without relying solely on coercive capabilities: Either by mobilizing the population (even at regional level) to support the regime's foreign policy goals – like the recent wave of anti-French protests in West Africa rallied with anti-neocolonial sentiments to push out French diplomatic and military presence from the region (Châtelot & Bensimon 2023), or by mustering an international coalition and diplomatic pressure.

The combination of high linkage and high leverage tends to promote **democratization** because it increases both the incentives for authoritarian rulers to liberalize and the capacity of domestic opposition movements to challenge incumbents. Conversely, in regions with low linkage and leverage, authoritarian regimes are more likely to persist due to weaker external pressures for reform.

Levitsky & Way's framework has been influential in explaining why some competitive authoritarian regimes transition toward democracy while others remain stable or become more authoritarian. The additions by other authors have primed the model to study **authoritarian collaboration** and **authoritarian learning**. The dimension 'transnational civil society linkage' (v) is also a great match for Owen IV (2010) his framework of **regime promotion** and his concept of *transnational ideological networks* (TINs) that promote specific political ideologies across borders. This model thus highlights the significant role that international factors can play in shaping domestic political outcomes, particularly in a globalized world where cross-border interactions are increasingly common.

This framework has been widely applied in other regions, although the coding criteria to operationalize **competitive authoritarianism** and separate it from hegemonic authoritarian regimes have been problematic (Guliyev 2012), as shown in the overview of their regime classification (**Levitksy & Way**) in the subsection on **trichotomous categories**.

Military Regimes

Se dice que de cuando en cuando la democracia debe bañarse sangre para que pueda seguir siendo una democracia
(It is said that from time-to-time democracy must bathe in blood so that it can remain a democracy)
– Augusto Pinochet, Dictator of Chile

Military regimes are basically defined as systems of "managing government by the military" (Perlmutter 1980: 96). They are a relatively new phenomenon that started only after the modernization and professionalization of armed forces, a process that began in Europe in the seventeenth century, first with the rise of 'standing armies' (instead of feudal armies and **mercenaries**) and took off after Napoleon's (organizational, tactical and ideological) reforms in the nineteenth century. For more on this evolution, consult, for instance, Mears (1969; 1988); and specifically on the professionalization of armed forces in Latin America, see J. Gandhi (2008). Note that standing armies were a long-established tradition in India and China, and Spartans, Romans and Ottoman Janissaries were front-runners in Europe, while the Songhai (West Africa) and Majahapit (Java, Indonesia) empires were noteworthy outliers.

DEFINITION Although military regimes are most often established through violence or coups, this is not what distinguishes them from other forms of nondemocratic rule, but rather the fact that armed forces are the sole ruling institution (Gandhi 2008: 25). Yet military coups may give rise to a form of government in which *"military officers are major or predominant political actors by virtue of their actual or threatened use of force"* (Nordlinger 1977: 2). Here, the military have a monopoly on the use of force and may exercise political power either directly, or indirectly by controlling civilians; parties may be allowed, and elections may be carried out (multi-party, no-party, one-party), or not at all, but regimes, where persons of military background are chosen in open elections, are not to be considered as military (Hadenius & Teorell 2006: 6-8; Kailitz 2013: 47-48).

The degree of authoritarianism varies across different military regimes, as they may also include civilian bureaucrats and politicians and combine their military nature with **technocracy**, **corporatism** and **bureaucratic authoritarianism** in a 'military-civilian regime' (Perlmutter 1980). The military generally retains (full) control over policy and security forces, and leadership comes from a current or former military officer or a group of them – a **junta** (Ezrow & Frantz 2011: 166).

SEE ALSO Military regimes (often called **juntas**) are one of several **political regime** archetypes and a key component of civil-military relations and their corresponding literature. Their distinct military organizational nexus (**armed forces**) translates into their distinct behavior, resilience and modes of **transition**.

KEY SIGNIFICANCE Military regimes are one of the main regime types. As pointed out by Barbara Geddes et al. (2014a: 149), military regimes constitute a distinct subset of authoritarian rule because the military officers leading them display a significantly different behavior than non-military authoritarian leaders. Accordingly, military rule's general features and governing ways include a cohesive and disciplined internal organization and respect for a clearly defined military hierarchy; the concentration of power over the security apparatus by a centralized command structure; the use and threat of force; maintaining order, obedience, coercion; deterring opposition and shared socialization among regime members via **indoctrination** during training (Ezrow & Frantz 2011: 171; Geddes et al. 2014a: 148; Remmer 1989).

As explained by S. Kailitz (2013: 44-48), military regimes possess an exceptional character in that the military is not supposed to rule the country in 'normal times;' they thus tend to find justification for a more permanent rule with an internal or external threat to the country. This is oftentimes sustained by the argument that only the military is able to save the nation from social conflict or civil war in times of crisis, including the argument for the protection of the civilian government from threats such as communism, Islamism, terrorism, separatism, and even acting in situations politicians fail to manage such as human-caused and natural disasters (Kailitz 2013; Farooq 2012) – see also **bureaucratic authoritarianism**.

ORIGIN Military regimes are a modern phenomenon; their study began in the 1960s at a time when newly independent governments following decolonization fell to military intervention (Geddes et al. 2014: 149). They are thus generally restricted to developing countries but are not limited to any region of the world. In fact, in the 1970s and 1980s, military regimes were the most common type of authoritarian rule, along with one-party states. Since the early 1990s, however, regimes of this type have receded sharply (Hadenius & Teorell 2006: 9).

LITERATURE Early studies in the 1960s and 1970s primarily focused on the causes of military intervention, the factors influencing the occurrence of military **coups**, the military's governance features, and the effects of military rule in economic development, giving rise to models of interpretation drawing on **bureaucratic authoritarianism**, neo-conservatism, or anti-Keynesianism, for example (Fossum 1967; Geddes et al. 2014a: 149; O'Donnell 1973; Schamis 1991). Both initially and subsequently, empirical case studies, especially from Latin America and Africa, were the major drive of this literature's advancements. The most prominent aspects found in the literature concerning military regimes, in general, have otherwise been related to their internal organization

and stability, durability, correlation with violence and repression, conflict propensity, and their very ending.

Internal organization In spite of their key attributes of internal hierarchy, discipline, muscled leadership and fairly casual use of force, military regimes appear to lack the needed stability to maintain power long. Leadership, for instance, may change frequently in this type of regime, which reflects the internal tensions occurring in military ranks, either between different branches, different command levels, or different generations (Hadenius & Teorell 2006: 15). As a consequence, leader overthrow, and disobedience are frequent, and officers often rebel and may resort to mutiny (Frantz & Ezrow 2011), see also **protests & uprisings**. Other reasons for military rule's vulnerability include poor economic governance and unsatisfactory performance in terms of internal and external security (Fossum 1967; Kailitz 2013: 44).

Durability There is a consensus that military regimes are the most short-lived of autocratic regimes (Geddes 1999; Hadenius & Teorell 2007; Kailitz 2013). Their lesser durability and proneness to breakdowns are due to several reasons, such as the preferences of military elites toward their own unity and survival over permanence in political power, the destabilizing effects of factionalism resulting from exposure to politicization, commitment to temporary rule defined by specific objectives, and sensitivity to pressure for democratization (Ezrow & Frantz 2011: 171-174). Accordingly, when threats to the military institution arise, the military may take drastic measures, ranging from staging a coup and ousting a civilian government to voluntary withdrawal from power (Ezrow & Frantz 2011: 186).

Furthermore, what may be determinant for the regime's longevity are its relationships and political alliances with civilians under some degree of power-sharing (Clapham & Philip 1985). In cases like Congo, though, K. Emizet (2000) connects the fall of General Mobutu Sese Seko's regime to his efforts to legitimize his rule by 'civilianizing' the system, while the military was becoming more professionalized and more politicized, which ultimately created internal contradictions and military inefficiencies.

Repression The correlation between military rule and violent **repression** is not linear, despite the widespread perception that the use of force is rather easily banalized in military regimes. During the initial phase after the seizure of power, in which domestic resistance may occur, higher rates of civilian killings may be registered, although a more humane treatment of prisoners and reluctance to carry out domestic repression may also transpire in cases where commanding officers intend to enforce preexisting democratic legal norms (Geddes et al. 2014a: 155-156).

Poe et al. (1999) find military-led autocracies to generally display a higher rate of **human rights** violations when compared to civilian governments, though regular officers and soldiers do not necessarily carry these out, but internal security officers and national police. Now, when comparing dominant party regimes and military regimes to **personalist rule**, the former are found to be less likely to repress civil liberties and violate personal integrity (Davenport 2007). In this context, it is interesting to note that in some cases, the correlation may be reversed or ambivalent, for military officers have overthrown civilian dictators after being ordered to repress opposition demonstrations with violent means. Some examples are the first military interventions in some African countries after decolonization (Decalo 1976; Englebert 1998).

Conflict propensity Military dictatorships are found to be more likely than civilian autocracies to resort to military force and initiate war, especially those governed by military strongmen in comparison to those led by a military institution (Debs & Goemans 2010; Lai & Slater 2006; Weeks 2012). For instance, Honig and Reichard (2015) model why some dictators go to war again right after a military defeat (to offset the costs of a post-defeat legitimacy crisis). However, Nam Kyu Kim (2018) deconstructs the idea that military regimes initiate conflicts because of an inherently aggressive nature. The main driver of increased conflict propensity, the author finds, is the presence of territorial threats from neighboring countries that make their security environment more hostile and generate militaristic behavior.

N.K. Kim (2019) actually delves more deeply into this matter to develop a reverse causality argument; it is the persisting presence of threats to homeland territory that create the conditions for the rise of military regimes, in particular juntas, that is, a country is more likely to experience collegial military rule when it engages in territorial disputes. Siverson & Johnson (2018) find that military regimes need less time to decide if and when to go to war than their non-military counterparts.

Transition According to Geddes et al. (2014a: 158), between 1946 and 2010, only 43 percent of military regimes fell to insurgency, popular uprising, or invasion. The outcome of nonviolent breakdowns has been democratization in the majority of cases, especially that of military regimes (62 percent), but less in the case of dominant party regimes (45 percent) and personalist dictatorships (36 percent). The conditions and consequences of military regimes ending can be manifold. There are thus varying degrees of problems, obstacles and challenges posed by the demise of military rule, which have been assessed on an empirical basis. C. Danopoulos (1988) compiles a large set of case studies including Argentina, Benin, Brazil, South Korea, Poland, Panama, and Turkey, among others, to reflect on those issues in the light of factors such as democratization, disengagement, new political parties, and changing civil-military relations.

Moreover, the impact of an outgoing authoritarian regime on a new democracy is held as fairly important. T. Demirel (2005) namely looks into how the perception of military rule as success or failure may impact the stability of a later democratic regime

and shows that because the three military interventions in Turkey (1960, 1971, 1980) were not perceived as overly repressive by political actors, nor as total failures in economic, political and military terms, the indispensability of a democratic regime has been demeaned. This lack of negative evaluation of military rule has led civilians and soldiers to consider a military coup as good a viable option as any other (Demirel 2005: 264). Of course, the possibility that those perceptions are carefully constructed is to be taken into consideration.

CLASSIFICATIONS Typologies of military regimes abound and vary significantly depending on the author's methodological approach. The most widespread and cited classification is Barbara Geddes' (1999; 2003) differentiation between party-based regimes (**single-party regimes**), military regimes, one-man rule – which she labels '**personalist rule**' – and mixed authoritarian regimes – see also: **Geddes, Wright & Frantz**. In fact, she does not endorse military-led personalist regimes as conceptually distinct; to her, these are just personalist, either from a military officer's standpoint or a civilian's. That is why the term 'military-led autocracy' is preferred by Geddes et al. (2014b) to cover both forms of rule, that is, both the prevailing decision-making by a group of officers representing the military institution – which the authors label 'military regime' – and the military strongman rule. However, this classification is not that straightforward and has encountered a few refining categorizations and nuancing (Cheibub et al. 2013; Hadenius & Teorell 2007; Kailitz 2013), especially because some regimes combine two or more of these classifications and because the distribution of power, type of leadership and influence on policy are not always clearly separated (Lidén 2014: 54).

Among the subtypes of military regimes, the five listed below are most common in the literature, but older classifications exist, dating from times when electoral autocracy was still rare.

Pure military regime A military dictatorship defined by military, executive power and a nonexistent or ineffective legislature (Hadenius & Teorell 2007). Such regimes rule overtly and directly without civilian partners and do not hide in the shadows. This subset has the largest number of cases; for a thorough listing of examples, see Hadenius & Teorell (2006).

Junta This label, most commonly used synonymously for military rule (Geddes et al. 2014a: 152), is, in fact, an authoritarian military subtype with elite-constrained leaders, making decisions and exercising power in a collegial manner (O'Donnell 1973; Remmer 1989; Weeks 2012). '**Junta**' is a Spanish word for 'meeting,' used to describe a reunion of people belonging to an institution, collective, or community in order to deal with matters directly affecting them as members of that group (Real Academia Española). The application of this idiomatic stance to this type of regime comes from a substantial representation of empirical cases located in Latin America. Accordingly, a junta refers to a group of high-ranking military officers exercising military rule in which decision-making power is concentrated, and civilian bureaucrats may have a secondary role or not (Gandhi 2008: 26; Kailitz 2013; Weeks 2012). Additionally, a junta can be a transitional form of military rule that precedes the establishment of a strongman rule (Geddes et al. 2014a: 153). Here, security forces follow a regular military chain of command, and the leading highest-rank military officer ruling the regime is expected to retire from power and make place for another, as observed by K. Remmer (1989) regarding military regimes in Latin America.

Strongman rule This designates a military regime with a personalist leader, that is, a one-man rule by an officer. One key feature is the concentration of power defined by the **personalist rule** of the security forces (Remmer 1989). Another specificity of military strongmen includes, for instance, a higher likeliness to belligerence and citizen abuse than juntas or civilian personalist rulers (Geddes et al. 2014: 149). Examples include Chile under Pinochet, Egypt under Nasser, Indonesia under Suharto, Spain under Franco, and Uganda under Idi Amin (Weeks 2012).

Hybrid military regimes This amalgam combines military rule with other forms of government such as a **single-party** (e.g., Algeria 1977-1991; Iraq 1980-2002; Mali 1982-1990) or multi-party regimes (e.g., Algeria 1997-2003; Brazil 1974-1984; Indonesia 1971-1996). These hybrids remain understudied.

Rebel regimes These come to power as a result of insurgency; in this case, a rebel movement distinct from the regular armed forces takes over power by military means and remains unsubstituted by another regime; **rebel regimes** are usually very short-lived, possibly due to their excessive turbulence and unruliness (Hadenius & Teorell 2006: 6, 16). Examples include Angola 1975-1979; Cambodia 1975; Mozambique 1975-1976; Uganda 1986-1988.

Some well-known, older typologies, for instance, were proposed by E. Nordlinger (1977) based on the military's goals: (a) *praetorian moderators*, making a 'displacement coup' to replace one civilian regime to install another; (b) *praetorian guardians*, that are more willing to take over government for several years, and (c) *praetorian rulers*, which are unwilling to relent power, are more repressive and institutionalize – see also **presidential guards & praetorians**.

A. Perlmutter (1980) focuses on the composition and types of elites involved: *corporative, market-bureaucratic, socialist-oligarchic, army-party, and tyrannical* military regimes. Clapham & Philip (1985) enhance the degree of repression, role and goals of the military: *veto regimes, breakthrough regimes, moderator regimes, and factional regimes*.

METHODOLOGICAL ISSUES As argued above under 'classifications,' measurement is made fairly difficult by the existing diversity and sometimes overlapping typologies. Interestingly, to cite G. Lidén (2014: 50), *"scrutinising the typologies of dictatorships and their variants provided by previous research reveals some loosely connected or almost arbitrary alternatives."* Each

depends, in fact, on different *foci* when measuring indicators such as the composition, role and goals of the military; the degree of professionalization of the military; the degree of civilian involvement in the regime; the level of repression exercised; the architecture of governing power; among others.

Military rule has been defined in several different ways by different scholars, which makes it more difficult to apply evenly to empirical case studies and draw stable conclusions (Geddes et al. 2014: 149). Generalizable conceptualizations are difficult to establish since there is a cross-variability of many key factors and qualitative differences across regime subtypes and empirical cases.

MEASUREMENT Many datasets include military rule, but their coding criteria differ. For instance, **Geddes, Wright & Franz** have coding criteria that look at the military background of the incumbent, the inner circle and (denoted) successors, if the military hierarchy is still intactand if the powerholders are actually restrained by the rules and norms of the military apparatus through which they wield power. (Geddes 2003: 226) For **Hadenius & Teorell** (2007: 146), military regimes are defined more simply as states in which military officers are major or predominant political actors by virtue of their actual or threatened use of force.

There is also a growing disparity between the quantitative and qualitative findings: while coups and the number of military regimes have been on the decline, this does not mean that military influence on politics has diminished over time. Coup databases (cf. 'measurement' under the entry **coup**) are unable to account for this important nuance, and therefore, Croissant et al. (2007) created the *Political Roles of the Military* (PRM) dataset with information on 120 democratic and autocratic regimes and a total of 138 regime spells for the period 1999-2012.

NEW FRONTIERS More recent literature has attempted to both deepen and specify the understanding of military regimes by researching little explored subjects in specific case studies and time frames.

Reny (2022) proposes a typology of military regimes that sheds light on variation in military control in executive, legislative and bureaucratic powers, distinguishing between the level of military control (high, middle, low) with the aim to track their trajectories over time.

A few examples are the study of spatial regional correlation and diffusion of military regimes in Sub Saharan Africa between 1978 and 2014 (Caruso et al. 2019); the focus on the agenda dynamics and policy processes in the military regime of Kenan Evren in Turkey between 1980 and 1983 (Yldirim et al. 2020); the analysis of the liberalization process in Myanmar since 2008 as a survival strategy by the Burmese military to persist in their long-term military rule (Croissant & Kamerling 2013).

REGIONAL VARIATION (by Jeroen J.J. Van den Bosch) – Below are listed some (once) known comparative works for different world regions. Only Eurasia has received very few regional analyses since the collapse of the USSR (mostly because party rule dominated this region).

Latin America Studies of military regimes in Latin America examine their political, economic, and social dimensions. Biglaiser (2020) discusses the role of economists and generals in economic reforms under military rule, highlighting technocracy's intersection with authoritarianism. Dix (1994) analyzes military coups and governance during the Cold War. Klein & Luna (2017) focus on Brazil's military regime, while Loveman (1994) examines 'protected democracies' and transitions to civilian rule. Pérez-Liñán & Polga-Hecimovich (2018) explore coups as mechanisms of regime change. Richards (1986) links economic crises to the breakdown of military authoritarianism.

Sub Saharan Africa The study of military regimes in Africa reflects the continent's complex political history. Gutteridge ([1975] 2023) examined African military regimes' achievements and challenges, while Howe (2001) explored militaries' roles in security and governance. Luckham (1994) highlighted the interplay between militarization and democratization. Markakis & Waller (2013) analyzed Marxist military regimes, while McGowan (2003) provided data on African coups from 1956 to 2001.

MENA Studies of military regimes in the MENA region highlight diverse dynamics shaping military roles. Droz-Vincent (2011) examines Arab armies during the 2011 uprisings, Pollack (2019) analyzes Arab military ineffectiveness, Cronin (2013) focuses on Saudi Arabia's military, and Barany (2021) discusses Gulf militaries' roles in regime protection – on this topic, see also **monarchies in the Arab world**.

Indo-Pacific Studies of military regimes in the Indo-Pacific highlight diverse responses to political structures. Lee (2015) examines military responses to protests in authoritarian Asia, McCarthy (2015) explores civil society limitations under militarized regimes, and Slater (2020) investigates rebellions' influence on authoritarian regimes in Southeast Asia.

Eurasia Consult Reese (2002) for an overview of the Soviet army and Lehrke (2013) and Marat (2009) for the post-independence transitions.

Monarchy

Immediately from God derives the office of His ecclesiastical Vicar
– Otto Gierke, *Political Theories of the Middle Ages*, 1900

Man will never be free until the last king is strangled with the entrails of the last priest
– Attributed to Denis Diderot (1713-1784)

Currently, hereditary rulers constitute 22 percent of the world's heads of state. However, the majority of these monarchs serve in ceremonial roles within democratic systems. The historical trajectory of such monarchies often involves transitions from absolutist rule to constitutional arrangements. For instance, the English monarchy provided a model for democratization over centuries, beginning with the *Magna Carta* in 1215 and culminating in the *Glorious Revolution* of 1688, which limited monarchical power and established parliamentary authority. (Lawrence 2023). This pathway has been emulated by states such as Sweden (1809-1974), Japan (1889-1947) or Bhutan (in 2008), although under (at times radically) different circumstances, including foreign pressure.

ORIGIN The word 'monarchy' came from Latin *monarchia* and originated from the ancient Greek term μονάρχης – *monárkhēs*, and suggests *mónos* (alone) as the single ruler or leader *(árkhēs)*, denoting a ruler with supreme power over their territory. This entry distinguishes monarchies as dynastic institutions and as political regimes.

DEFINITION This entry harbors neutral conceptualizations of monarchies, building on the comparative understanding of their common elements like dynasties, their households, courts and armies, as well as their usual features (ritual and display). Nonetheless, defining a monarchy is a complex task that requires moving beyond simplistic notions of a single ruler holding power for life. Any comprehensive definition must consider cultural and historical contexts, as well as the diverse forms and functions monarchies have assumed over time.

A central feature of monarchies today is hereditary rule, which distinguishes them from other forms of governance. Succession in monarchies is and has often been based on hereditary principles, where power is passed down within a family lineage. This characteristic is absolutely fundamental to modern monarchies (Anderson 1991; Lawrence 2023) and sets them apart from earlier (more varied) systems where succession might have been determined through election, conquest, or other means.

Whether the ruler is a basileus/basilissa, caliph, chieftain, despotes/despotissa, emir, emperor/empress, inca (coya), kaiser/kaiserin, khan/khatun, king/queen, malik/malika, maharaja/maharani, negus (and negusa nagast – 'king of kings'), oba, pharaoh, prince/princess, raj/rani, shah/shahbanu, sultan/sultana, tlatoani/cihuacoatl, tsar/tsarina, tennō/kōgō, wáng/wángfēi – the hereditary principle remains a dominant element in almost all monarchies. However, one should not consider this form of **succession** as its core defining feature. Whatever succession 'rules' there were, they were always bent to accommodate context or interests, and therefore their shared feature of 'dynasticism' is a better match (cf. **dynasties**).

The relationship between the monarch and the state is another critical aspect of defining monarchy. Monarchs are frequently seen as embodying the state itself, representing its will and personality. In constitutional systems like Westminster-style democracies, monarchs often serve as 'parliamentary heads of state,' where their role in governance is symbolic but integrated into the legislative process. Laws are enacted when both parliamentary houses and the head of state agree, demonstrating the monarch's ceremonial yet significant role within the state apparatus (Monod 1999; Kumarasingham 2020).

Religious and symbolic dimensions further complicate the definition of monarchy. Many monarchies have historically been associated with 'sacred kingship,' where rulers are perceived as divinely appointed or having a mystical connection to higher powers (cf. **religions**). The intensity of their sacral characters ranged from a living deity, demigod, divine representative on Earth, protector of the Faith, to 'mere' sovereign of an earthly realm. Even in modern constitutional monarchies, remnants of this sacral authority persist as they may occupy a special position in church hierarchies.

Monarchies are not static entities; they have evolved in line with their polities and adapted to changing political and social conditions for millennia. The transition from ruling monarchies to 'parliamentary monarchies' is only one (small) part of this evolution, marked by challenges, failures, and pragmatic adjustments. While monarchy might appear anachronistic in contemporary democracies, it has persisted by adapting its role within modern political systems. However, many had to give up sovereign power to survive under colonialism, imperialism or the shocks from global conflicts like WWI.

Monarchy is a belief system curated and cultivated by dynasties. Dynastic successions have served as a fundamental way of retroactively structuring historical narratives and time (linear, cyclical or circular). Monarchies are a story of continuity: An individual monarch's reign may be seen as part of a larger historical timeline, stretching across centuries, creating a narrative of permanence. Monarchs pass down artifacts, documents, or traditions, solidifying the passage of time through family legacies. Symbols like regalia (crowns, thrones), royal titles, and coats of arms are ways to mark time. These symbols represent the eternal and unchanging nature of royal authority, with time becoming synonymous with the stability the monarchy provides.

This resonates with human beings and their deep need for stability. The presence of monarchy as a

continuous institution offers a psychological anchor in the face of existential anxieties about change and mortality. Their entwinements with religion, sacred ritual and notions of 'just rule' are no coincidence but meant to solidify their images. Monarchies structure national and communal time through ceremonial practices that create collective memory. Dynasties were not afraid to switch **religions** (competing branches) or even extend patronage to additional belief systems if this allowed them to modernize a stale narrative. (Mistakes were made, often with detrimental consequences.) By witnessing or participating in royal events (like national holidays, cyclical rituals or commemoration of royal anniversaries), people align themselves with larger historical narratives, reinforcing their identity as part of a nation or cultural heritage.

Such views are partly embedded in Weber's routinization of **charismatic rule** and **traditional rule** as a belief system, and this is indeed where contemporary monarchies are running out of steam. While highly adaptable, once the spell is broken, a monarchy cannot be 'created' from scratch in the current political setting. So, without the continuity, they cannot draw **legitimacy** from it. In this regard, international law and the nation-state model (with fixed borders) have made it almost impossible for monarchies to replicate as a regime type. Before, new dynasties split off from former imperial nexuses once they had cut off the control of a weakened center and acquired sovereignty. Contemporary monarchies seem very unlikely to multiply their current numbers through conquest.

Lawrence (2023) takes the position that monarchies are distinct from regime types, as they can exist within autocratic, democratic, or hybrid systems. Unlike single-party regimes, military dictatorships, or personalist autocracies, which are inherently undemocratic, monarchies possess a unique compatibility with both autocracy and democracy. For example, Saudi Arabia operates as an authoritarian monarchy under the al-Saud family, while Denmark functions as a parliamentary democracy led by Queen Margrethe II. This adaptability highlights that monarchy itself is not a regime type but rather a form of governance that can coexist with varying political systems (Lawrence 2023).

When confronted with a standard definition of **political regimes,** however, such an approach is brought to a screeching halt. Monarchy as a political institution or as a political regime is not the same. As a tutelary body with merely symbolic power, a constitutional monarchy is just a democracy if it meets all requirements for the latter regime type. Not every state with a military is automatically equated with a military regime if the armed forces are not the powerholders.

In monarchies (as a regime type), a 'royal' tutelary body run by a dynastic network must hold supreme power (cf. absolute monarchy) or share power (either with a military institution or civilian party) to be considered a political regime. Once the institution gives up power, the other defining characteristics of the political system and the **ruling coalition** determine the nature of the political regime.

So, monarchies (as institutions) are dynastic political networks, often characterized by hereditary succession, self-legitimizing their rule on an image of continuity and governing line with established custom and tradition, often religious. The ruling network is a dynasty that constantly reinvents and cultivates its image and continuously renegotiates its position as *primus inter pares* by curating the ruling coalition.

For survival as an institution, they sometimes hand over supreme power like today's constitutional monarchies in democracies (e.g., Western European examples) or accept subnational autonomy in federative systems (e.g., Malaysia, India, Indonesia), or they shield military powerholders who play first violin in military-monarchic hybrids and co-opt their legitimacy to facilitate *de facto* military rule (e.g., Thailand). In these cases, they cease to be regimes. Depending on the resulting nature of their regime constellation, dynasties have specific **exit options & leader fates**.

SEE ALSO This entry is thus very closely entwined with **dynasties** and monarchic **legitimacy**, often prescribed by **religions**. Most have procedural forms of **succession** and hence are noted for their **longevity, stability & resilience**. Related concepts of feudalism (Box 1.14) and **absolutism** have been questioned and nuanced. In the last two decades, building on solid quantitative data, monarchies have been studied through the lens of **assassinations**, even **purges**. The position of women in such regimes (**female rulers**) has become a central feature in the last two decades, beyond the study of harems (Box 5.11). Still, the study of monarchies has historically been shaped by various biases, which can still distort our understanding of these political systems today.

METHODOLOGICAL ISSUES For too long, oriental, gender, absolutist and imperialist biases – both in primary sources and scholarly treatises – have stubbornly impeded (more) objective and holistic studies of monarchy. Furthermore, while these and other misconceptions persist, recent works have made enormous strides forward to address them.

Orientalist bias Notably is the bias between the 'East' and 'West' that is also latent in concepts like **despotism**, **tyranny** and **sultanism**. In the words of Jeroen Duindam:

"States in early modern Europe have traditionally been understood by historians as bureaucracies and representative bodies gradually acquiring autonomous status and finally emancipating themselves from dynastic leadership. In the same tradition, Asian empires have been seen as 'palace polities' governed by the quirks of individual despots and liable to abrupt regime change, yet without the capability to generate profound and lasting reform." (van Berkel & Duindam 2018: 3).

The orientalist bias reflects the tendency to view Eastern societies and cultures through a Western lens, often leading to distorted and prejudiced interpretations. This bias has historically framed Asian rulers as despotic figures who lacked concern for

their subjects' welfare, treated as mere enslaved people, unlike European subjects, perpetuating the notion of 'oriental despotism' up until **Montesquieu** (cf. **despotism**) and later **Weber** labeling the Ottoman Empire as **sultanism** (cf. Box 1.13 on *Kadi* justice). Such perspectives fail to account for the complexities and nuances of monarchies of the Indo-Pacific, imposing age-old Western frameworks and assumptions that obscure the realities of governance in these regions (Said 1978). By reducing Asian (especially Ottoman, Indian and Chinese) monarchies to simplistic stereotypes, orientalist bias reinforces a dichotomy between 'civilized' Western governance and 'backward' Eastern rule (Flüchter & Richter 2012: 113-115).

Besides stereotypes, Eurocentric perspectives also prioritized European frames and interpretations of monarchy while marginalizing non-European systems. Throughout time, Western scholars have often sought to understand non-European monarchies through European analogies, such as applying 'housefather literature' to interpret rulership in China or Mughal India. A good example is Max **Weber's** labeling of such regimes as modern forms of **patrimonialism**. This approach imposes European cultural frameworks on distinct contexts, resulting in misinterpretations and generalizations that fail to recognize the unique characteristics and developments of non-European monarchies (cf. **religions**). A more balanced approach would involve examining knowledge transfers both within Asia and Europe and between these regions to avoid privileging European perspectives (Subrahmanyam 1997).

Gender bias Gender bias in the study of monarchies manifests in the marginalization or misrepresentation of women's roles and influence. Historically, scholarship has focused predominantly on male rulers, associating leadership with masculine qualities while neglecting the significant contributions of women as queen mothers, regents, or queens-regnant, as shown in the entry on **female rulers**. Female power has often been portrayed as illegitimate or degenerative, linked to meddling and conspiracy rather than strategic political acumen. Box 5.11 on harems also illustrates the important position of women in **succession** and securing **dynasties**. This perspective ignores the substantial influence women wielded within monarchical structures, thereby perpetuating a narrow and androcentric view of monarchy (Sharpe 1991).

Absolutist bias Rulers were once attributed with absolute power by their historiographers. The bad or good rule thus coincided with weak or strong rulers, thus assuming that rulers should – and could – attain complete central authority over their followers, preferably in a harmonious fashion. Absolutist bias assumes that monarchs wielded absolute power, overlooking the constraints they faced from advisers, councils, and other institutional structures. It is true that even in constitutionally 'symbolic' monarchies, some sovereigns retained or regained a powerful presence due to experience and networking (with some similarities to incumbency advantage – Box 8.2). Still, even under **absolutism**, their power was often limited by checks and balances imposed by local elites or institutional frameworks. Historical representations of royal grandeur frequently obscure these limitations, creating an exaggerated image of monarchical authority that fails to reflect the realities of governance (Henshall 1992). This bias simplifies complex power dynamics and neglects the collaborative or contested nature of rule within many monarchies. Since the 1970s, more attention has been given to the role of local levels and middlemen in the study of monarchy (van Berkel & Duindam 2018: 4; Aldrich & McCreery 2016).

Imperialist bias Imperialist bias reflects the disproportionate amount of scholarship on empires, cold-shouldering the intricate insights from small polities, much more varied in form with their tailor-made solutions to local contexts in the absence of powerful bureaucracies. This is, of course, quite normal; empires arguably left more important, durable legacies (cf. **imperial legacies** and **colonial legacies**), transferred more practices and served as models for one another. This bias does not only affect monarchies; comparative authoritarianism is also biased to such 'authoritarian gravity centers' (Box 6.2). It is the combination of available primary sources, relevance and imperial fascination that have skewed scholarship in this regard. Overall, contemporary scholars are aware of this and make efforts to balance the comparative scales.

LITERATURE Up until fairly recent times, the study of monarchy was equated with the study of recorded human history (which in itself is also a bias, of course), but for its treatise in comparative authoritarianism, one can find monarchies quite neglected up until recently. Here, one may point the finger at the decision of **Linz & Stepan** (following Weber's theory of **rulership**) who placed monarchies outside the universe of authoritarian regimes (under traditional rule, cf. Huntington 1966). Due to their influence in framing classifications, dictatorships were thus routinely delineated as those non-democratic, non-monarchic types. Even the game-changing typology of **Geddes, Wright & Frantz** (1999) initially did not cover monarchies, even if B. Geddes had abandoned the Linzean categorical segregation and welcomed totalitarian regimes back under the label of authoritarianism (as single-party regimes).

To my knowledge, it is (in part) the study of **personalist rule** (and their tendency for hereditary succession, cf. Brownlee 2007) that initiated more comparisons with monarchies in comparative politics, while their resilience in the Middle East and Northern Africa (cf. Arab exceptionalism – Box 6.1) led to a reappraisal of monarchy as a (surprisingly) stable regime. The **Arab Spring** also brought to attention their patterns of **authoritarian collaboration** and **authoritarian learning**.

Still, contemporary monarchies are mostly covered in (splendid) individual case studies, with few comparative works bridging world regions. Larger comparisons are usually descriptive and do not apply theories of comparative authoritarianism or

are focused on monarchic institutions in democracies, e.g., Anckar 2021.

In any case, an overview of the main works on pre-modern monarchies is beyond the scope of this entry (the bibliography below is not a bad starting point), but for dictatorship studies, the next three entries cover the Arab world, the Indo-Pacific and Sub Saharan Africa and present some specific features of these monarchies, the regional context of their emergence and decline, and some modest case studies as examples.

NEW FRONTIERS There is an uptick in scholarly interest with many works mixing Large-N data with case studies to gain new insights: Gerring et al. 2021 (on the rise of mass communication and monarchic decline); Guillén 2018 (on their ability to protect property rights); Jugl 2020 (on the influence of their country size); Ottinger & Voigtländer 2021 (on the political impact of individual monarchs). Deserving attention are also those studies tracing the authoritarian origins of Western democratic systems and the role of monarchies in that long process of democratization: Ginsburg 2020; Hazell & Morris 2020.

Monarchies in the Arab World

A crown, a throne could not be based on the not too very solid foundation of blood.
– Mohammed Reza Pahlavi, Shah of Iran (1941-1979)

The emergence and persistence of Arab monarchies reflect a complex interplay of historical accidents, deliberate policy choices, economic resources, and international support. These regimes were not merely products of cultural traditions but were shaped by broader political, economic, and geopolitical forces that defined their trajectories throughout the twentieth century.

Today, MENA is home to the largest remaining cluster of monarchies in the world, with four absolute monarchies and four formally constitutional monarchies where monarchs are somewhat restrained but still hold supreme power. Usually, observers distinguish between the six Gulf monarchies and only add Morocco and Jordan when they widen their scope. (From 1979 onwards when the Pahlavi dynasty fell to the theocratic regime of Ayatollah Khomeini, all monarchies in MENA have been exclusively Arabic).

Arab monarchies have varied titles. For example, four Arab monarchies are considered kingdoms. These are the Kingdom of Saudi Arabia, the Kingdom of Bahrain, the Hashemite Kingdom of Jordan, and the Kingdom of Morocco. Three Arab monarchies are considered emirates: The Emirate of Kuwait, the Emirate of Qatar and the United Arab Emirates (UAE). Interestingly, the title of the head of the UAE

is not just emir or prince, but 'president' as per its constitution. The last one, the oldest dynasty in the region, is the Omani Sultanate established in 1744.

Arab monarchies are unique in their blend of traditional tribal governance, Islamic legitimacy, and modern statecraft, often functioning as **rentier states** that use wealth from natural resources, particularly oil, to sustain both their ruling authority and extensive **patronage** networks.

CONTEXT The emergence of Arab monarchies in the Middle East is primarily a phenomenon of the twentieth century, with only the Moroccan and Omani dynasties predating the 1900s (Anderson 1991). Their creation was shaped by a combination of historical contingencies and deliberate policies, particularly those implemented by the British Empire. These monarchies arose from the interplay of internal dynamics and external influences, reflecting broader processes of state formation, nation-building, and geopolitical strategy intrinsically linked to **colonial legacies**.

A significant factor in the establishment of Arab monarchies was British imperial policy. Britain, seeking to secure its strategic interests – most notably access to India – favored monarchy as a form of governance in the region. Unlike the French preference for republican structures, British policymakers viewed monarchy as a traditional and manageable system that could ensure stability. This approach led to the establishment of monarchies in territories such as Iraq, Jordan, and the Trucial States (now the United Arab Emirates). Monarchs were seen as figures capable of consolidating power and fostering national unity, particularly in newly independent states where tribal and regional divisions posed challenges to cohesion (Cleveland 2018; Mansfield 2019).

The process of state formation and nation-building was closely tied to the establishment of monarchies. Monarchs served as unifying symbols, centralizing authority in a way that transcended local divisions. The adoption of European models of hereditary **succession** further transformed traditional forms of rule in the Arab world. Even in regions with established dynasties, this shift enhanced the power of monarchs, moving from more consensual governance structures to systems where rulers exercised greater absolute authority. The introduction of hereditary succession expanded monarchs' arbitrary authority, replacing traditional practices like the Moroccan *bay'ah* – 'the pledge of allegiance' (cf. 'Islam' in **religions**), which implied mutual responsibility between ruler and people – with a constitutional framework that separated sovereign representation from election, in fact consolidating monarchical rule and making it less accountable before, during and after successions. (Cleveland 2018; Mansfield 2019).

A notable development during this period was the adoption of the title 'king' (*malik*) by several Arab rulers, replacing traditional titles such as 'sultan' or 'amir/emir.' This change reflected an effort to modernize the monarchy's image, aligning it with Western notions of kingship and projecting a sense of modernity (Anderson 1991).

The durability of Arab monarchies can be attributed to several factors. Strategic use of resources, particularly oil wealth, has been instrumental in maintaining stability. Monarchies have distributed oil rents to foster political loyalty and mitigate dissent while creating pseudo-representative institutions that provide a semblance of participation. External support has also played a crucial role; Western powers like Britain and the United States have provided diplomatic, economic, and military assistance that bolstered these regimes against internal and external threats (Bank et al. 2014; Yom & Gause III 2012).

Additionally, Arab monarchs have cultivated tribal – *'asabiyyah* (عصبيّة – *'aṣabiyya*), kinship as social cohesion – together with religious legitimacy to strengthen their rule. While cultural determinism alone cannot explain their persistence (cf. Arab exceptionalism – Box 6.1), relationships with tribal leaders and religious authorities have been strategically leveraged to legitimize monarchical authority (Yom & Gause III 2012). Women have been notoriously excluded from power, although they still play important roles within dynasties, different from the Harem system of pre-modern times (Box 5.11). Maktabi (2021) investigates the appointment of women as adjudicators in court in the Gulf monarchies between 2005 and 2020.

FEATURES While the creation of monarchies was significantly shaped by British imperial policy, the military also played a pivotal role in nation-building within monarchies: In the mid-twentieth century, the politicization of officer corps and military coups led to the fall of monarchies in Egypt, Iraq, Yemen, and Libya, establishing military-dominated republics (which then turned personalist).

After WWI and the implosion of the Ottoman empire, surviving monarchies like Jordan and Morocco adapted by embedding the military into their regimes as stabilizing forces. Monarchies forged close ties with tribal and rural elites, incorporating them into security forces like Jordan's *Arab Legion* and Morocco's *Forces Armées Royales*, fostering loyalty and national identity (but headed by Western officers or Berbers, respectively). Jordan's Arabization of the army came in 1956. These militaries were thus 'tamed' under monarchic state- and nation-building and did not politicize (Droz-Vincent 2020).

Gulf monarchies took a different path, as their state-building took place in the 1930s and uncontested territories under British protection. Therefore, they maintained small, family-dominated armies supplemented by foreign contractors to avoid empowering local militaries that could threaten their rule. These armies were heavily reliant on external patrons like the United States for security guarantees after independence (oil and military bases were the bargaining chips). Over time, monarchies converged with republics in establishing full authoritarian control (**coup-proofing**) but retained unique features such as tribal integration and dynastic leadership within armed forces (Droz-Vincent 2020).

The military's role evolved from regime shield-

ing to power projection, particularly in Gulf states like Saudi Arabia and the UAE, which expanded their capabilities post-2011 amid regional instability (Barany 2021; Droz-Vincent 2020).

Tribalism remains influential, often overshadowing institutional ties in military and political appointments. Furthermore, oil wealth underpins many Arab monarchies through 'rentierism,' enabling resource distribution to maintain stability and fund social programs. (Hanieh 2018; Herb 2005) Basedau and Lay (2009) find that oil-rich countries can achieve political stability through a combination of extensive wealth distribution, substantial investment in security apparatuses, and external protection. In contrast to oil-poor nations and challenging the assumptions of **rentier state** theory, the institutions of oil-rich countries do not seem to be predominantly defined by **patronage** and **clientelism**.

While some federalist systems rotate the crown between royal tribes, many operate as dynastic monarchies and rely on male hereditary succession (although not primogeniture – Box 5.10), where ruling families dominate political decision-making and control key state apparatuses. Here, monarchs are constrained by internal family dynamics, resource availability, and personal attributes.

In contemporary times, Arab monarchies have remained quite absolutist with limited institutional checks, especially in the Gulf. For this reason, the label **sultanism** has been applied to them as well (cf. Davidson 2021). Arab monarchies are classified based on their structure, sources of legitimacy, and governance styles. In the Arab world, monarchies are often divided into 'dynastic' and 'linchpin' types.

Dynastic monarchies, such as those in the Gulf (e.g., Saudi Arabia, Qatar), rely on extensive family rule and oil rents (**rentier states**), where the royal family dominates political decision-making.

Linchpin monarchies, like Jordan and Morocco, revolve around a single monarch who balances elite groups such as tribes or the military: the Sultanate of Oman is a hybrid, non-dynastic but with oil wealth. While monarchies differ in their structures and strategies, they converge in authoritarian practices, blending tradition, external support, and rent distribution to maintain stability (Bank et al. 2014; Herb 1999).

External patronage, however, has been critical to their survival (e.g., **black knights**). Western powers like the United States have provided diplomatic and military support (like Britain and others before them), ensuring these regimes' stability amidst regional upheavals. Notably, Arab monarchies demonstrated remarkable resilience during the **Arab Spring** uprisings, avoiding collapse through **authoritarian collaboration** and lessons drawn from the failures of neighboring republics (**authoritarian learning**).

The Arab Spring spurred significant inter-monarchical collaboration through financial, diplomatic, and even military support. Additionally, it has driven a remarkable surge in state expenditures. Furthermore, the Arab Spring triggered constitutional reforms in certain cases. However, not all monarchies have participated equally in these developments. While all oil-rentier states expanded state spending, constitutional reforms were primarily observed in Jordan, Morocco, and, to a lesser extent, Oman (Banks et al. 2014; Korotayev & Khokhlova 2021; Elkahlout & Hadid 2021).

These historical and contemporary features underscore the adaptability and enduring relevance of Arab monarchies in a region marked by political volatility. While these regimes have undergone a significant transformation from more traditional, consensual forms of rule to more centralized and absolute systems, these ruling dynasties have managed to stay in control in the face of all the modernizing demands of **political Islam** and retained former colonial states as allies while gradually asserting their emancipation and (in some cases) regional dominance, unlike the de-colonial projects in Iran, Afghanistan or the Islamic Caliphate (cf. **Islamic States**) (Kostiner 2000).

REGIONAL VARIATION Six out of the eight Arab monarchies are located in the sub-region of the Arabian Peninsula. What separates the *Gulf Cooperation Council* (GCC) monarchies from Jordan and Morocco is their resource-based economy. In addition, both Jordan and Morocco are less dynastic than the GCC monarchies.

Jordan does border Saudi Arabia, so only Morocco is geographically outside the monarchic cluster. This was not always the case of course: In Algeria, the monarchy was abolished during the French colonial conquest in the nineteenth century, as the Ottoman-affiliated Dey of Algiers was overthrown in 1830.

Egypt and Libya lost their monarchies through military-led coups driven by nationalist and revolutionary ideologies. In Egypt, the monarchy was installed under British influence in 1922. In Libya, the monarchy was established in 1951 under King Idris I with significant support from Britain and the UN (following Libya's independence from Italian colonial rule). The Free Officers' coup in 1952, led by Gamal Abdel Nasser and Muhammad Naguib, and the 1969 Libyan revolution spearheaded by Muammar Qaddafi ended these monarchic experiments, respectively.

In Tunisia, the monarchy ended in 1957 when Habib Bourguiba, leader of the nationalist *Neo Destour* party, declared the Republic of Tunisia and deposed King Muhammad VIII al-Amin Bey (tainted by French collaboration).

Saudi Arabia is a unique political regime due to its combination of absolute monarchy, religious legitimacy, economic power, and assertive leadership. As an absolute monarchy, the al-Saud family wields near-total authority, with the King directly shaping domestic and foreign policies. This dynastic structure is reinforced by Wahhabism, a conservative interpretation of Sunni Islam, which legitimizes the regime through a historical alliance with the religious establishment. Saudi Arabia's custodianship of Islam's holiest sites, Mecca and Medina, further enhances its religious and symbolic authority within the Muslim world (Hanieh 2018; Ottaway & Ottaway 2019).

The al-Saud family itself is vast, with an estimated 10,000 members. Various factions and family lines compete within the dynasty, influencing internal politics. Mohammed bin Salman (MBS) currently serves as the crown prince and Prime Minister of Saudi Arabia, effectively acting as the kingdom's *de facto* ruler (his father is 88 years old). Since he was appointed crown prince in 2017, MBS has personalized power by sidelining traditional power-sharing mechanisms within the royal family. He has centralized decision-making by diminishing the influence of other senior princes and key institutions, such as the *Council of Ministers* and the religious establishment.

MBS has also restructured Saudi Arabia's military and security apparatus, removing potential rivals and placing loyalists in key positions. For example, he merged the Ministry of Defense and the National Guard under his control (This '**presidential' guard** previously was a power base for other royal factions). Additionally, he launched anti-corruption campaigns, most notably in 2017 when dozens of princes, officials, and businessmen were detained in Riyadh's Ritz-Carlton hotel. While framed as a reform initiative, this move was widely interpreted as a means to neutralize rivals and consolidate his grip on power (Hanieh 2018; Ottaway & Ottaway 2019).

Through these measures, MBS has shifted Saudi Arabia from a more consensus-based dynastic monarchy to a highly centralized system centered on his leadership.

Economically, Saudi Arabia exemplifies a **rentier state**, leveraging its vast oil wealth to maintain stability through resource distribution and funding development projects. This wealth underpins its regional influence and strategic alliances, particularly with the US. Recently, under Crown Prince MBS' *Vision 2030* initiative, Saudi Arabia has embarked on significant economic diversification and social reforms while consolidating political power through far-reaching repression (Ottaway & Ottaway 2019).

Unlike other monarchies, Saudi Arabia's fusion of **theocracy**, oil wealth, and custodianship of sacred Islamic sites grants it unparalleled authority in both domestic governance and regional politics, although when it comes to **regime promotion**, its radical variety of Islam is not a good match for its neighbors.

The UAE is a unique political regime among Arab monarchies due to its federal structure, hierarchical power dynamics, and assertive military and economic policies. Unlike the unitary systems of other Arab monarchies, the UAE is a federation of seven emirates, each governed by hereditary rulers who retain significant autonomy, particularly in economic matters. Abu Dhabi dominates the federation due to its vast oil wealth and political influence, with its ruler traditionally serving as the UAE's president. Dubai complements this by acting as a global financial and trade hub, with its emir serving as PM (Hanieh 2018; Ottaway & Ottaway 2019).

The UAE's federal system creates a distinctive balance of power between the central government and individual emirates, while its military unification in 1996 fostered national identity and strengthened federal cohesion. Under Crown Prince Mohammed bin Zayed (MBZ), the UAE has pursued an assertive foreign policy, projecting power regionally through interventions in Yemen and Libya, earning it the nickname 'Little Sparta.' Its military modernization and strategic use of oil wealth have enabled it to play an outsized role in regional politics (Droz-Vincent 2020).

Jordan and Morocco, classified as 'linchpin monarchies,' rely on religious legitimacy, historical narratives, and strategic alliances for stability. Both monarchies have engaged in constitutional reforms to enhance procedural legitimacy while maintaining ultimate royal authority.

In contrast, Bahrain operates as a 'dynastic monarchy,' heavily reliant on oil rents and family-based rule. Its political landscape is marked by repression of its Shia majority and dependence on Saudi-led GCC support for regime survival.

Yemen, Oman, Qatar, and Kuwait each represent unique political settings within the Arab world, shaped by their historical trajectories, governance structures, and economic contexts. Yemen stands apart as a fragile state plagued by conflict and poverty. Unlike its Gulf neighbors, Yemen lacks significant oil wealth and has endured chronic instability, tribal divisions, and weak governance. Its current state of collapse highlights the challenges of state-building in the context of internal fragmentation and external intervention (**state fragility & failure**).

Oman is distinguished by its 'hybrid' monarchy, blending elements of traditional rule with modern state structures. Sultan Qaboos' long reign (1970-2020) brought stability through modernization and limited reforms while maintaining centralized control. Oman's moderate oil wealth and strategic location necessitated external support, such as British military assistance during the Dhofar Rebellion (1962-1975). Its political system balances tribal dynamics with symbolic participatory mechanisms like the Majlis al-Shura, a lower house consultative assembly (Barany 2021; Bank et al. 2015).

Qatar exemplifies a rentier state with vast natural gas wealth fueling its economic prosperity and independent foreign policy. Governed as a dynastic monarchy, Qatar's al-Thani family dominates decision-making while leveraging its wealth to project influence regionally through diplomacy, media (e.g., Al Jazeera), and hosting global events. Despite tensions with neighbors, such as the 2017 Saudi-led blockade, Qatar's financial resources have bolstered its resilience (Lambert & Elayah 2023; Barany 2021).

Kuwait combines oil wealth with a relatively vibrant parliamentary system, one that furnishes enduring loyalty from below while constraining abuses of state power from above, making it unique among Gulf monarchies. While the ruling al-Sabah family retains ultimate authority, Kuwait's parliament provides a platform for political participation and debate. However, societal tensions persist, particularly concerning the stateless Bidoon population. Kuwait's balancing act between authoritarian governance and limited political liberalization

underscores its distinctiveness (Abu Sulaib 2020; Yom 2011).

These regimes illustrate varying approaches to legitimacy, governance, and external relations within the broader framework of Arab monarchies. Yemen's fragility contrasts sharply with Oman's stability, Qatar's assertiveness, and Kuwait's hybrid political model.

Monarchies in the Indo-Pacific

Be always sure to please the Gods
– Japanese saying

The Indo-Pacific was most likely the home of the largest number of historical monarchies before and during the common era. In many Asian countries, the monarchs were often respected political, national or spiritual figures. There are about 30 extant monarchies around the world now, and six Asian monarchies are in the Indo-Pacific, namely Bhutan in South Asia; Brunei, Cambodia, Malaysia and Thailand in Southeast Asia; and Japan in East Asia, next to other smaller monarchies in Oceania. Historic accounts of ancient Asian monarchies go back before 3000 BCE, and were mythologized.

Note that the Indo-Pacific has never been a reference frame to study historical monarchies in South, Southeast or East Asia but was used in this encyclopedia as a neutral geographical delineation in juxtaposition to other world regions (this means it does not carry geopolitical connotations in its application here).

CONTEXT Asian history is rich with monarchies, many of which have played key roles in shaping the cultures, economies, and politics of their respective realms. Historical Asian monarchies represented a vast and wide web of regional modes and networks of hierarchical and horizontal relationships around powerful monarchs, of which, within the Indo-Pacific, perhaps the most famous and powerful dynasties were in China, Thailand (Siam) and India. Historical Asian monarchical regimes exploited feudalistic structures, used **religions** for legitimacy and order, built cities and armies, and organized trade. Larger empires collected tributes from neighboring subordinate kingdoms (often protectorates), which received 'protection' and 'trade' from the major empire.

There were myriads of monarchies in the Middle Ages. Many of these became interwoven with Islamic culture over time and reinvented themselves as absolutist rulers with sultans, shahs or rajahs at the helm. Rulers in smaller, lesser institutionalized monarchies could also have titles like *Rajah* or *Sultan*, but exchangeable and/or alongside lower indigenous titles like 'paramount chief' like *Lakan* (in the Philippines) and *Datu* (around the Malay peninsula). As everywhere, many other titles like *Shri* and *Pra-*

bhu were once royal titles that were devalued over time but originally derived from Sanskrit under the previously dominant Indian cultural influence since ancient times.

Some of those local monarchies are preserved until today in India, Indonesia, and Malaysia but differ significantly from (semi-)constitutional to absolutist ones (Brunei) in that they no longer wield sovereign power. Some are purely symbolic, others have been integrated into federal systems and implement policies at sub-national level, with the dynastic monarch equaling the position of a governor. Most do retain their prestige, sometimes even wealth and political influence.

The pathways to constitutional monarchy in (Southeast) Asia blend pre-colonial traditions with modern governance. Thailand transitioned from absolute monarchy to constitutional rule under reform pressures, while Malaysia integrated its traditional rulers into a federal system, rotating the kingship. In former indirectly-governed colonies, Cambodia's monarchy adapted through nationalist leadership and did re-emerge in constitutional form after the revolution. A semi-constitutional monarchic regime appeared in Laos with independence in 1953, but its monarchy was overthrown in the 1975 Laotian Civil War and subsequent communist revolution. The (only surviving) Vietnamese monarchy had ended earlier with the forced abdication of Emperor Bảo Đại on 25 August 1945, during the Việt Minh-led August Revolution, and ended again by referendum despite its short revival in the south (1949-1955) (Anckar 2021; Vatikiotis 2015).

FEATURES Historical Asian monarchies had some unique features that set them apart from monarchies in other parts of the world, such as dynastic succession and the influence of religious doctrines. A first feature was the rather common occurrence of **female rulers**. Amirell (2015) identifies 277 women rulers in the Indian Ocean World between the fourteenth and nineteenth centuries, representing a minimum estimate. These rulers often governed small, loosely organized political entities such as tribes, chiefdoms, or port cities, engaged in local trade (not long-distance). To compare, Queen Victoria of the United Kingdom ruled over hundreds of millions, while Jumbe Fatimah of Mohéli in the Comoro Islands governed merely 5000 people on a small island. South Sulawesi in Southeast Asia had the highest number of female rulers (105 recorded) due to Bugis traditions that allowed noble women to lead even when male candidates were available. Timor also had a significant number of female rulers (63), largely due to recent historical research. In contrast, coastal India had only one identified queen regnant, and mainland Southeast Asia had two: Shinsawbu of Pegu (1453-1472) and Ang Mei of Cambodia (1834-1840), although the latter was a puppet queen (Amirell 2015).

Many Asian monarchies deployed the concept of the 'divine right to rule' in which the monarch was seen as having been chosen by the gods to rule. This belief helped to reinforce the power and authority of the monarch. The (universal) concept of the 'mandate of heaven' (天命 – *Tiānmìng* in Chinese) was a central belief in many Chinese, Korean, Japanese and Turko-Mongol dynasties, in which the ruler was believed to have been granted the right to rule by the gods based on their moral virtue. If a ruler was believed to have lost the mandate of heaven (meaning the gods had taken it away) the ruler could be legitimately overthrown. (Of course, assessing the loss of heaven was often a *post-factum* activity by historians of the next dynasty).

The Hindu god-king concept (*Devarāja*) declared that the ruler was a reincarnation of a Hindu god from a vast pantheon (commonly *Shiva, Vishnu*, and sometimes *Buddha*). This idea allowed the ruler to demand obedience and respect from their subjects. The idea of a universal monarch *cakravartin* (चक्रवर्तिन् – 'wheel-turning monarch') referred to a vast territorial hegemony, while the *Devarāja* cult referred to local centers where the imagined spiritual powers were accumulated rather than extended (Cribb 2018: 18). The influence of Hinduism, Buddhism and later Islam is notable throughout the Indo-Pacific, mostly in Southeast Asia where they blended most. Note that the spread of Islam had an ambiguous impact on female rule. While Islam is often seen as opposing female leadership, this bias has pre-Islamic roots in the Middle East. No woman exercised sovereign power in the Muslim Middle East during this period. However, in the Indian Ocean World, roughly half of the identified queens were Muslim and ruled over predominantly Muslim populations (Amirell 2015).

Some Southeast Asian monarchies, such as those in Thailand, Cambodia, and Laos, have a tradition of divine kingship, in which the monarch is considered to be semi-divine and to have a close connection to the gods. With such legitimacy, many of them became absolute monarchies, in which the monarch had complete control over the government and the country. Asian monarchies have been characterized by a highly centralized and bureaucratic system of government, in which the monarch's power was maintained and reinforced through a complex system of government officials and advisers. Ruling dynasties have played crucial roles in shaping the cultures and religions of their respective countries, often serving as patrons of the arts and literature and playing key roles in the development and spread of religion. For instance, in Theravada monarchies such as Cambodia and Thailand, the monarchies took on the role of protector of Buddhism; the Thai concept of *pāramī* refers to a royal virtue and potency, connecting the monarch with a *bodhisattva* (Guillou 2017: 424). Descended traditions of Asian monarchies have spread elements of identity, normative and hermeneutic functions (Fisher Onar 2013: 421).

In the early modern era, Asian monarchies were integrated into the international system as part of a broader 'royal cosmopolitanism' (Fitzpatrick 2021: 210), fostering relationships among monarchs both within the Indo-Pacific region and beyond, including with monarchs from Western colonial metropoles. This dynamic evolved during the colonial period, as imperial powers encroached on their kingdoms but

acknowledged the status of monarchs in colonized territories and accorded them honors and some levels of autonomy to facilitate indirect rule over distant regions. This arrangement endured as long as Asian-Pacific monarchs accepted their precarious position and cooperated with colonial authorities, as seen in cases such as Samoa, Tonga, and Brunei. (Those who resisted usually disappeared).

Historical Asian monarchies may be categorized based on historical-geographical, political and other criteria, but are usually not studied through the lens of 'dictatorships' or 'regimes' (nor are pre-modern monarchies in Europe). Despite their vast differences, sorting criteria would encompass factors such as longevity of rule and dynastic continuity, territorial extent and stability, prosperity and cultural influence. Territorial studies apply qualitative and quantitative research methods that combine linguistics with area historical-geographical empirical data.

REGIONAL VARIATION Monarchies in the Indo-Pacific varied greatly, with powerful centralized empires like the Khmer Empire or Burma's Pagan and Taungoo Dynasties, while Vietnam's Nguyen Dynasty was the last to rule before French colonial influence. In contrast, the Philippines was divided among kingdoms and sultanates until Spanish rule, and the region saw the emergence of city-states like Melaka and Johor, each with distinct political and cultural dynamics shaped by imperial interactions. Below, are some of the most notable monarchies from all over this part of the world with their defining characteristics and some details of their unique pathways into modern times.

In Chinese, 黃帝 *(Huángdì)* was the title held by the mythical 'Yellow Emperor' (or Yellow 'Thearch' since he was considered a deity) in the third millennium BCE. China has a long history of monarchies, starting with the Xia dynasty (2070-1600 BCE) and ending with the Qing Dynasty (1644-1912). The monarchs in China ruled their empires, wielding absolute power over their subjects. There had been monarchs who were harsh and tyrannical as well as benevolent and enlightened. In the case of the former, the Qin Dynasty (221-206 BCE) (see **legalism**) and the Qing Dynasty (1644-1912) are referred to as dictatorial regimes due to their centralized control and suppression of dissent.

Based on the Mandate of Heaven, the Middle Kingdom's imperial regimes constituted complex hierarchies based on virtues, duties and Confucianism (see: **religions**). For instance, the mighty Tang Dynasty (618-907) used ritual rectification orders that delegated influence in social life. Another example is the Hongwu Emperor (Taizu) of the Ming Dynasty (1368-1644), who led a revolt against the Mongol Yuan dynasty. He invoked the Mandate of Heaven to delegitimize Mongol rule and consolidate his authority (Han & Yan 2021: 29). This celestial mandate also served to obscure his humble origins, providing a divine justification for his rule.

'All-under-Heaven' (天下 – *tiānxià*) referred to a geographical region based on concentric circles of tributary relations with surrounding and more distant kingdoms. The subsequent *'Pax Sinica'* based on hegemonic stability accompanied Chinese historical monarchies until nineteenth century (Fisher Onar 2013: 414). Territorially, the area between the Yellow and Yangzi rivers constituted the regional core of the ruling centers in dynastic Chinese states. The meritocratic Chinese system (Box 1.9) of hiring skilled and educated gentry employed in the complex state administration enabled the emperor to connect in the imperial capital with common subjects. Confucian ideology, knowledge and etiquette had been another source of legitimacy; it was in the emperor's interest to win the support of scholars skilled in the administrative and organizational matters of the empires.

Another significant chapter in the history of Asian and Chinese monarchies involves Mongolia and the rulers of the Mongol Empire (1206-1368), led by Genghis Khan (also Chinggis Khan, born Temüjin) and his descendants. The Mongol heirs governed China under the Yuan dynasty, adopting Chinese ruling traditions while maintaining an identity that encompassed both Mongolians and Han Chinese. The subsequent Ming dynasty marked a return to Chinese classicism.

Historically, Mongolia was governed by hereditary nobles known as *Zasags*, who administered territories organized into leagues composed of numerous banners (хошуу – *khoshuu*). These banners represented the authority and jurisdiction of the ruling nobles across Mongolian lands. By the Qing Dynasty, the scope of Mongolia was perceived either as 'Entourage' – 外藩 – *Wàifān* (outer tribes, indirectly ruled), or 'Directly Ruled' – 内属 – *Nèishǔ* (for Inner Mongolia) (Tachibana 2014: 71). Mongolia was the only region from Qing China that declared and received recognition of independence with the 1911 revolution and abdication of last Chinese Emperor Pu-Yi.

In Tibet, Dharma kings ruled within later absolutist elective monarchies, heavily influenced by Lamaism. The first major centralized monarchy emerged under the Yarlung Dynasty (seventh-ninth centuries), which introduced Buddhism. This Buddhism merged with local shamanistic traditions to form Lamaism or Tibetan Buddhism. The Tibetan Empire (618-877 CE) under Trisong Detsen is considered the most powerful era in the region's history.

Subsequent dynasties, such as the Sakya Dynasty (1260-1354) and the Phagmodrupa Dynasty (1354-1618), further developed Buddhist doctrines. The last secular ruling house, the Gtsang Dynasty (1565-1652), allied with the influential *Karma-pa* (the Red Hat) sect. In contrast, the Yellow Hat sect, supported by Altan Khan, established itself in Lhasa and began conferring the title of Dalai Lama. The Ganden Phodrang rulers, led by the Dalai Lamas, governed a feudalistic and theocratic protectorate under the Qing Dynasty. This **theocracy** ended after the communist invasion of Tibet in 1950 (Aldrich 2020).

The Japanese monarchy dates back to the seventh century BCE, with the first mythical emperor, Emperor Jimmu, who, according to the Chinese-written *Kojiki* chronicles, is said to have descended from the Sun Goddess *Amaterasu*, the highest deity in

Shinto. Following the establishment of the *Yamato Confederation* in the seventh century, the emperor's power and role in society diminished in favor of powerful shoguns. These authoritarian rulers suppressed dissent and maintained strict social order. The monarchy continued until the Meiji Restoration in 1868 when the emperor's role became largely symbolic within a new constitutional monarchy in 1889. During the Shōwa period (see Box 4.2), the infamous Kyoto School of Geopolitics co-developed ideological works that were employed in state propaganda. This included the concept of *Hakkō Ichiu* – literally translated as 'the eight corners of the world united under the imperial household' – as well as the utilization of Pan-Asianism and Tennōism, which positioned the emperor as the central figure dominating the 'eight corners of the world' (Laš & Baar 2014).

In the post-war period after 1945, Japanese emperors played a significant role in shaping Japan's identity during its transition to democracy. Since 2019, Emperor Naruhito, the 126th monarch in Japan's traditional line, has ascended the throne following the abdication of his father, Emperor Akihito. Japan remains the only modern monarchy that uses the title 'Emperor.'

Korea, still divided today on the peninsula in East Asia, has a long history of monarchies. The first mention of a Korean kingdom dates back to the mythical *Gojoseon* Dynasty (2333-108 BCE). Under Chinese influences, the prosperous 'Three Kingdoms Period' (57 BCE – 668 CE) is well-known, characterized by the three ruling centers of *Baekje*, *Goguryeo*, and *Silla*, the latter of which eventually unified the region. Another period of significant development occurred under the *Goryeo (Koryŏ)* Dynasty (918-1392). However, the most influential period was the *Joseon (Chosŏn)* Dynasty, which ruled from 1392 to 1897 until Korea became a Japanese protectorate and was annexed in 1910. Due to its strict social hierarchy and suppression of dissent, the *Joseon* Dynasty is considered rather dictatorial.

Within the three earliest documented Indo-European languages, in Sanskrit, a ruler was labeled as 'Raja', and a great ruler was denoted as 'Maharaja.' India has a long and complex history of monarchies, with plenty of different kingdoms and empires emerging over the centuries (Strnad 2003). Hindu culture and religion reflected in the caste system had effects. Indian monarchies were characterized by centralized power and administration, such as the largest Mauryan Empire (321-185 BCE, with powerful ruler Chandragupta Maurya and his grandson Emperor Ashoka, who instituted strict laws and regulations.

Most powerful monarchs united the territorial belt of the great Indian rivers, and their empires stretched from the western to the eastern shores of Northern India, such as the Gupta Empire in the fifth century and the Harsha Empire in the seventh century CE. The Mughal Empire (1526-1857) and the British Raj (1858-1947) under the rule of the British Crown were two of the recent significant ones. The British set up the institution of the Emperor or Empress of India with a reigning British monarch. The smaller regional monarchies were labeled 'princely states,' with 500-700 Indian regional monarchical rulers not directly under the control of London but hierarchically under the British monarch.

The British rulers in India deployed the *Doctrine of Lapse* to restrict inheritance in the case of the rajas and maharajas, who did not have a male heir, which resulted in the annexation of the heirless state after its ruler's death. This policy was abolished with Queen Victoria's installment as the Empress of India in 1877, while the political resistance and parties slowly stood up against the monarchy, which turned to constitutional changes since India's independence in 1947. Most princely states were integrated successfully into the Indian Union, but a few territories, such as Kashmir, remained disputed in the postcolonial era.

In Sikkim and Nepal, monarchies have engaged in varying degrees of **absolutism**, and monarchs possessed significant power over their polities. The most famous monarchy in Nepal was the Shah dynasty that ruled from Kathmandu from 1768 until 2008 when it was abolished and the country transited to federal democracy. Previously, the dynasty had had full control over the military and judiciary, and was unpopular for its suppression of opposition and strict censorship. **Democratization** began with King Tribhuvan's efforts in the 1950s to reclaim power from the autocratic Rana regime, followed by King Mahendra's establishment of a partyless system in 1961. The process culminated in 2008, after a series of popular movements, a Maoist insurgency, and mass protests, leading to the abolition of the monarchy and the declaration of Nepal as a federal democratic republic.

Bhutan had been a hereditary monarchy under the Wangchuck Dynasty since 1907, which lasted by transforming into a constitutional form in 2008 (Anckar 2021). Here, democratic reforms were initiated by the king himself (saving the dynasty as an institution by surrendering the regime). Before, it was known for its strong Buddhist indoctrination and religious etiquette, exhibiting features of a **theocracy**. With modernity, the Bhutanese monarchy co-implemented a traditional code of social etiquette, *Driglam Namzha*, that recognized the cultural position of the monarch in the transition period ahead since the 1970s (Kikkenborg Christensen 2021).

The sultanate of Brunei Darussalam traces its origins back to the 1360s when its monarch converted to Islam as the Sultan Humammad Syah (Lindsey & Steiner 2016: 554). After its colonization, it stayed in the British orbit as a protectorate for a long time, weary of aggression from neighbors. The current Sultan of Brunei is Sultan Hassanal Bolkiah, who has ruled since 1967 and remains one of the longest-reigning monarchs in the world. With its oil revenues, it is one of the Islamic **rentier states**, but unlike the **monarchies in the Arab world,** its socioeconomic outlook is less optimistic.

The Thai monarchy dates back to the thirteenth century, with the current monarchy belonging to the Chakri Dynasty, established in 1782. The monarchy's tradition has its roots in Sukhothai culture,

Box 1.9 Defining Worth – Meritocracy & Loyalty in Dictatorships

Терпи, казак – атаманом станешь!
(Endure, cossack, and you'll be chief)
– Russian saying

The scope and limits of meritocracy under authoritarian rule are gravely understudied and are an emerging field. Most party-based regimes yield evidence that informal connections matter for (male) elite promotions in the *nomenklatura* (Box 1.11). (cf. Garifulina 2024) Often, these informal mechanisms are hidden behind seemingly meritocratic choices. Pang et al. (2018) observed that Chinese communist officials who have held a series of key positions briefly are more likely to rise higher in their careers than other officials, a pattern that is sometimes referred to as 'sprinting with small steps.' In interviews with local cadres, they reveal there is a dual-track system of cadre management: some cadres are preferred, cultivated, and promoted through a fast track that breaks party regulations, while others have to earn their promotions through the regular track.

So, even where an authoritarian system sometimes tries to hide it, the pervasive view is that loyalty trumps competence. However, shared loyalty to the regime does not diminish competition among peers. (Chen & Hong 2021) In contrast, Lee and Schuler (2020) nuance the view that competencies are completely dismissed, and they find that there are no barriers to promoting competent staff (in China) as long as candidates possess technical but not political competencies. Likewise, Gueorguiev and Schuler (2016) find that Chinese officials with a personal following (i.e., popular politicians) are often sidelined for promotion in single-party regimes.

Still, more individual studies are finding cracks in these prevailing theses. Mirić and Pechenkina (2023) find that useful competencies (like preventing or effectively dealing with (labor) protests) are smiled upon by the Politburo (Box 8.4) when deciding promotions. Moreover, Aaskoven and Nyrup (2021) found that in Nazi Germany, performance mattered for (local) elite advancement, but later, competence was supplanted by loyalty once the Nazi regime started WWII. This means that under certain conditions (i.e., when the threat environment is favorable and ruling elites have the resources to monitor and evaluate the performance of cadres), meritocracy matters. Future research will have to untangle these dynamics and account for differences among regime types.

which laid the foundation for the Siamese empire. The position of the monarch was particularly strong until 1932, when a **coup** set the stage for reforms. However, the monarch's place and power have remained integral to the state through an elaborate **patronage** network, ensuring the monarchy's continued influence in political affairs. Some scholars have described Thailand's model as a 'network monarchy,' with the monarch's power often exerted behind the scenes (Anckar 2021), alongside its traditional ceremonial role linked to Buddhist epistemology. Within this system, acceptable leaders are integrated into the royal network, while self-serving individuals are allegedly politically excluded (Nishizaki 2013: 70).

The Thai King Bhumibol Adulyadej, or Rama IX, is considered one of the longest-reigning monarchs in the Indo-Pacific region, having reigned for more than 70 years from 1932 to 2016 (aged 88 years) during a period of profound historical changes and transitions, from the broader national historical context to postcolonial modernism. After his death, his son, King Maha Vajiralongkorn (Rama X), ascended the throne.

Monarchies in Sub Saharan Africa

When a king has good counselors, his reign is peaceful
– Ashanti proverb

Although formal monarchies have disappeared in many parts of Sub Saharan Africa, their legacy persists in cultural practices and modern political systems. The adaptability and enduring influence of these institutions highlight their significance in shaping the region's historical trajectory. Monarchies were dynamic entities that evolved and continue to leave an imprint on contemporary African societies.

CONTEXT Monarchies in Sub Saharan Africa took diverse forms, reflecting the complexity and adaptability of political systems across the region. A common organizational structure in many kingdoms featured a king supported by a council, as seen in the Asante, Temne, Mende, and Mossi states. These monarchies often exhibited hierarchical systems extending beyond village levels, with layers of authority that included village chiefs, paramount chiefs, and kings. Larger kingdoms were divided into provinces governed by princes with their own councils and assemblies. While this royal council structure was widespread, some kingdoms deviated from the norm. (Ayittey 2006).

For example, the Kingdom of Dahomey (ca. 1600-1904), now in Benin, shared similarities with the Asante kingdom in terms of its founding and expansion but ended up significantly different: Dahomey was marked by a highly centralized and rigid government, emphasizing military efficiency and royal **absolutism** with strict discipline and a clear chain of command. In contrast, the Asante (also Ashanti) empire (1701-1901), now modern-day Ghana, was more decentralized, comprising Metropolitan Asante, Provincial Asante, and vassal states, each with some autonomy in internal affairs. Historians debate whether the Asante kingdom functioned more as a confederacy than a centralized state (Ayittey 2006).

The selection of kings was typically restricted to specific lineages, often those of original settlers or their descendants. However, kingship as a rule was not absolute; rulers were expected to meet specific duties and standards. Failure to bring prosperity, govern according to customary law, or heed counsel could result in deposition (Ayittey 2006).

External forces largely drove the decline and transformation of monarchies in Sub Saharan Africa. Colonialism played a central role by dismantling traditional political structures through the installation of puppet rulers, the exile of kings, and attempts to seize symbols of power such as the Golden Stool of the Asante. Resisting rulers were often defeated militarily, leading to the collapse of many kingdoms.

Despite these disruptions, some monarchies survived or adapted to new realities. Lesotho and Eswatini (formerly Swaziland) became British protectorates to halt Afrikaner encroachment. This way, they endured colonialism fairly unscathed: Eswatini remains Africa's last absolute monarchy today (Par-

ket 2023; Ayittey 2006).

In other cases, monarchies transformed under colonial rule and sacrificed sovereignty for survival; for example, the Mossi kingdom of Ouagadougou continued with its king serving as a representative under French administration. In Dahomey, members of the royal family became canton chiefs as part of a modified monarchical structure (Parket 2023; Ayittey 2006).

In the postcolonial era, independence movements aimed at building their political platforms on popular support or elections, so **charisma** or legal-rational **legitimacy**. The vestiges of traditional rule and traditional chiefs, diminished by decades-long collaboration or integrated into colonial systems, were routinely sidelined in the decolonization process and after. (Traditional kinship ties had often been watered down already by (forced) relocations, migration, urbanization and modernization). If traditional rule was not harnessed during liberation struggles, it was often perceived as a backward and rival institution in the eyes of the **single-party regimes** that emerged after independence (Nugent 2012; Dlamini 2019).

In many cases, chiefs were perceived as collaborators of the colonial regime, further fueling tensions with nationalist movements. For example, in Tanganyika, TANU actively campaigned against chiefs, equating them with 'tribalism' and seeking to replace them with party-controlled structures. In Ghana, Nkrumah viewed the Ashanti monarchy as a potential threat to his pan-African vision and his party's political dominance. While some voices sought to abolish chieftaincy outright, others opted for a strategy of **co-option** and control. The introduction of electoral politics in the 1990s has made chieftaincy more salient again in some countries.

Usually, a middle way prevailed: In Nigeria, chiefs were integrated into the modern administrative system, but their powers were severely curtailed, and they were made accountable to political leaders. There were exceptions: South Africa, under the Apartheid regime (Box 4.7), pursued a unique strategy of reinventing chieftaincy as a cornerstone of its segregationist policies. Guinea, under Sékou Touré's socialism, on the other hand, abolished chieftaincy altogether as incompatible with revolutionary ideals.

FEATURES The diversity among Sub Saharan African monarchies is notable. Some were highly centralized and authoritarian, while others were decentralized, with significant power vested in councils and local authorities. Ritual authority played a crucial role in legitimizing royal power; kings were not only political leaders but also spiritual figures responsible for their people's wellbeing. External influences such as the trans-Saharan trade, Atlantic slave trade, and European colonialism significantly shaped both the development and decline of these monarchies.

Africa's history of **female rulers** reflects a nuanced and complex interplay of cultural, political, and social factors that allowed women to access significant positions of power in various contexts. Queen mothers, such as the *Ndlovukati* in Eswatini and those of the Ashanti Kingdom, exemplify this phenomenon. These women held substantial authority as equal co-rulers, participating in governance, presiding over courts, influencing family and women's affairs, and playing key roles in selecting and advising kings. Their positions within royal lineages provided them with institutionalized avenues to wield influence and shape policy (Parket 2023; Nugent 2012). They often influenced decision-making processes and sometimes acted as regents. Notably, the western Indian Ocean region, particularly the Swahili coast and islands of present-day Kenya and Tanzania, had a high concentration of female rulers, with 25 queens regnant, followed by 19 in the Comoro Islands and 16 in Madagascar (Amirell 2015: 449). Additionally, women wielded influence through economic activities, such as market associations in West Africa, although the extent to which this translated into political authority varied across different societies and time periods (Woodacre 2018).

As everywhere, female rule was not without challenges. Cultural norms and societal expectations often blocked women's access to formal positions of power or opposed their claims when they assumed leadership roles. In addition to formal leadership roles, women in African societies often exerted power through economic and social channels.

The incorporation of monarchies into colonial networks in Sub Saharan Africa was a complex process shaped by the differing strategies of European colonial powers, particularly the British and French. The British favored a system of indirect rule, which sought to govern through existing indigenous institutions. This approach involved recognizing and working with traditional rulers, such as chiefs, as intermediaries between the colonial administration and local populations. While this strategy preserved some monarchical structures, it also entailed significant adaptation and manipulation. The British often intervened in matters of **succession**, appointed chiefs where none existed, and redefined their roles to align with colonial administrative needs.

For instance, in northern Nigeria, the British preserved the emirate system, allowing emirs to retain considerable control over their territories while ensuring their compliance with colonial interests. Similarly, in the Gold Coast (modern-day Ghana), the British collaborated with the Asantehene and other chiefs but simultaneously sought to control them, leading to resistance and a gradual decline in their authority. In Uganda, the *Buganda Agreement* of 1900 granted significant autonomy to the *Kabaka* (king) and the *Lukiiko* (parliament), reflecting a pragmatic strategy of leveraging powerful monarchies for administrative efficiency (Nugent 2012; Lemarchand 2024).

Despite its apparent preservation of traditional structures, British indirect rule often led to the erosion of monarchical authority. As colonial powers increasingly intervened in local affairs and introduced new administrative structures, traditional rulers found their influence diminished. Chiefs became intermediaries whose legitimacy was undermined

both by colonial manipulation and by their communities' perception of them as agents of foreign rule.

In contrast, the French colonial administration generally favored direct rule, emphasizing centralization and control. Chiefs were treated primarily as instruments of colonial governance rather than partners. They were granted limited autonomy and subjected to strict oversight; they could be appointed, dismissed, or punished for failing to comply with colonial directives. Chiefs served as low-level administrators tasked with collecting taxes, recruiting labor, and enforcing policies, roles that often made them unpopular among their people. In Senegal, for example, the French appointed chiefs to implement policies and maintain order within a centralized administrative framework (Nugent 2012).

Both the British and French approaches reflected pragmatic adaptations to local contexts but, in both cases, fundamentally transformed the roles of traditional rulers. Colonial intervention thus undermined indigenous political systems by manipulating succession processes, imposing new administrative roles on rulers (while taking away older royal prerogatives), and introducing foreign governance structures that disrupted pre-existing balances of power.

African kingship blended spiritual authority, ritual power, and political responsibility, with kings seen as mediators between the earthly and supernatural realms. Their legitimacy was often derived from divine or ancestral connections, and their role was to maintain cosmic balance and ensure their people's wellbeing. Rituals such as royal installations and rainmaking ceremonies reinforced their authority, while symbols like lions, leopards or hippopotamuses emphasized their unique and powerful status as figures both revered and set apart (Parket 2023; Ayittey 2006).

Despite their significant authority, African kings were not absolute rulers in the European sense. Their power was constrained by customary law, councils of elders, and societal expectations. Governance required consultation with advisers and adherence to tradition, and failure to fulfill these obligations could result in deposition or even regicide. Mechanisms such as councils of elders, queen mothers, and institutionalized checks on royal power ensured accountability and limited the potential for tyranny. Administrative systems were often decentralized, with kings delegating authority to provincial governors or chiefs who managed local affairs. However, exceptions existed in highly centralized kingdoms like Dahomey and Kongo (Parket 2023; Ayittey 2006).

The features of African kingship were diverse and evolved over time. Some kingdoms were centralized and hierarchical, while others embraced more decentralized governance with shared power structures. External influences such as Islam, long-distance trade networks, and European colonialism introduced new ideas and practices that reshaped kingship in various ways. Ultimately, African kingship was a dynamic institution rooted in spiritual significance, ritual symbolism, and mechanisms of accountability while remaining adaptable to local traditions and external pressures.

REGIONAL VARIATION Most monarchies (as institutions), weakened by colonial rule, never recovered and remained mere shells of their former glory. Others failed in their attempts to reassert themselves after independence. Still, after decolonization, there were several sovereign monarchies: Ethiopia (never colonized), the former British protectorates of Lesotho and Swaziland, and Burundi (Rwanda's monarchy had fallen right after independence). There were also some federal constellations like in the Emirates in northern Nigeria or the autonomous Buganda kingdom in Uganda.

The Ethiopian monarchy was unique for its unbroken Solomonic dynasty, which ruled from 1270 to 1974, claiming descent from the biblical King Solomon and Queen of Sheba. This lineage provided legitimacy and fostered national unity among Ethiopia's diverse ethnic groups. Its ruling ideology, often termed 'African Zionism,' positioned Ethiopia as God's chosen nation, with its monarchs as heirs to the Ark of the Covenant. This ideology, rooted in the *Kebra Nagast* (ክብረ ነገሥት – *kəbrä nägäśt* – the national epic: *The Glory of the Kings*), reinforced divine authority and helped Ethiopia resist external pressures, including Islam and European colonialism. The monarchy also stood out for its centralized administration, detailed in the *Ser'ata Mangest* (a ceremonial constitution of royal rituals), and its close relationship with the Ethiopian Orthodox Church, which shaped national identity and provided stability (Tafla & Scholler 1976). Unlike many African kingdoms with mobile courts, Ethiopia established permanent capitals, such as Aksum and Gondar, reflecting a settled governance structure (Parket 2023).

Despite these strengths, internal challenges weakened the monarchy. Succession disputes due to the lack of primogeniture destabilized transitions, while regional fragmentation and the rise of powerful nobles eroded centralized control. Sectarian divisions within the church further undermined unity. Externally, conflicts with Islamic sultanates and Italian occupation during 1935-1941 exposed vulnerabilities. Emperor Haile Selassie's modernization efforts in the twentieth century alienated traditional power bases and fueled discontent. These pressures culminated in the 1974 Ethiopian Revolution, driven by economic disparities and political repression. The revolution deposed Haile Selassie and ended one of Africa's longest-lasting monarchies (Parket 2023).

The Rwandan and Burundian monarchies shared common pre-colonial origins and were significantly shaped by German and later Belgian colonial policies, which centralized power and exploited existing social hierarchies (rendering them into ethnic identities). Both monarchies were also influenced by the 'Hamitic myth,' a pseudo-scientific (racist) colonial ideology that attributed societal development to supposed migrations of 'Caucasian' peoples, privileging Tutsi elites over Hutu populations. (Nugent 2012; Lemarchand 2024)

Despite these similarities, the two monarchies followed distinct trajectories due to differences in internal dynamics, ethnic relations, and colonial support. In Rwanda, the monarchy became closely

associated with the Tutsi minority, intensifying ethnic divisions and fueling resentment among the Hutu majority. This culminated in the Hutu revolution of 1959-1961, during which the monarchy was overthrown following the electoral victory of the *Parmehutu* party. By contrast, the Burundian monarchy incorporated Hutus into its power structures to a greater extent and leveraged internal rivalries within the Tutsi elite, particularly between the Bezi and Batare lineages. This strategy helped maintain its legitimacy across ethnic lines for a longer period (Lemarchand 2024; Nugent 2012).

Belgian colonial administrators also played differing roles in each case. While Belgian support for Rwanda's monarchy waned as Hutu unrest grew, they continued to back Burundi's monarchy as a stabilizing force amid ethnic tensions. However, this support could not prevent its eventual demise. The Burundian monarchy was abolished in 1966 following a military coup led by Michel Micombero (1940-1983).

The Swazi monarchy is distinguished by its unique dual structure, in which power is shared between the king, or *Ngwenyama* (the lion), and the queen mother, or *Ndlovukati* (the she-elephant). This dual monarchy provided a balance of power and added complexity to Swazi governance, earning admiration from European observers. The monarchy also stood out for its integration of traditional and modern governance. King Sobhuza II, educated in Western systems, played a pivotal role in blending Swazi traditions with modern political frameworks during the decolonization process. His strategic alliances with white settlers and patrimonial control over land allocation (Nugent 2012) allowed the monarchy to consolidate power, unlike many African monarchies that were sidelined or abolished after independence. (Dlamini 2019)

Cultural legitimacy was central to the Swazi monarchy's resilience. By emphasizing its role as the true representative of Swazi people and traditions, it resisted the imposition of Western-style democracy while selectively adopting modern governance elements. Still, with independence King Sobhuza II inherited a constitutional system limiting royal power. In the early 1970s, Sobhuza executed a significant power grab that transformed the political landscape of the country. Dissatisfied with the limitations imposed by the *1968 Independence Constitution*, in a true royal *autogolpe* (self-coup), he unilaterally repealed the constitution, dissolved parliament, and banned all political parties. Declaring that the constitution had failed to ensure good governance and peace, Sobhuza assumed absolute power, ruling by decree and centralizing executive, legislative, and judicial authority in himself. This move marked the end of Swaziland's brief experiment with liberal democracy and ushered in a period of monarchical absolutism. He replaced democratic mechanisms with the *tinkhundla* system in 1978, a structure based on traditional administrative units that allowed limited local participation while ensuring the monarchy's dominance. Under this system, elections were conducted without political parties, further entrenching royal control (Dlamini 2019).

The Lesotho monarchy is unique for its role as a symbol of unity and resistance, shaped by the kingdom's status as an enclave surrounded by South Africa. This geographical position fostered a strong national identity, with the monarchy serving as a safeguard against incorporation into South Africa, particularly after the formation of the *Union of South Africa* in 1909. The monarchy operated within a decentralized chieftaincy system, or 'parallel rule,' where the paramount chief (*Morena e Moholo* – 'Great King') shared power with local chiefs responsible for governance and land allocation. This structure ensured administrative coherence but also created internal competition for power. The early influence of European missionaries, particularly from the *Paris Evangelical Mission Society*, introduced an educated Basotho middle class that shaped political discourse and influenced the monarchy's evolving role in development and independence (Aerni-Flessner 2018).

Historically, the monarchy maintained strong transnational connections due to its proximity to South Africa and the experiences of Basotho migrant laborers. These connections extended to participation in South African political movements like the *African National Congress* (ANC). During the transition to independence, King Moshoeshoe II associated the monarchy with national unity and development, actively seeking international aid and promoting modernization (Aerni-Flessner 2018).

The monarchy's transformation began with Moshoeshoe I's unification of various groups under his rule in the early nineteenth century. Facing Afrikaner expansion, Moshoeshoe I petitioned Britain for protection, leading to Basutoland's annexation as a British colony in 1868. Colonial rule maintained monarchical authority with the *Moholo* as broker and nexus for connecting local chiefs through 'parallel rule,' allowing the British to administer their protectorate 'on the cheap.' After independence in 1966, the monarchy assumed a symbolic role within a parliamentary democracy (Aerni-Flessner 2018).

However, the 1970 coup led by PM Leabua Jonathan and the *Basotho National Party* (BNP) was detrimental to the monarchy. The coup was triggered by the electoral defeat of Jonathan's ruling BNP by the opposition *Basutoland Congress Party* (BCP) in the general election. In response, Jonathan annulled the election results, declared a state of emergency, dissolved parliament, and suspended the constitution. King Moshoeshoe II, who had expressed disapproval of these actions, was stripped of political authority and sent into exile. This self-coup effectively sidelined the monarchy, reducing it to a ceremonial role under Jonathan's increasingly authoritarian regime. The king returned from exile in 1971 but remained largely symbolic, with real power concentrated in Jonathan's hands. The monarchy's diminished role persisted until Jonathan himself was overthrown in a military coup in 1986. Although the monarchy experienced a limited resurgence following Lesotho's return to multi-party democracy in 1993, it remains largely symbolic today, representing cultural heritage and national identity while operating within democratic constraints.

Neo-Patrimonialism

You can't go around arresting the Thieves' Guild. I mean, we'd be at it all day!
– Sir Terry Pratchett, *Guards! Guards!* (Discworld Series, 1989)

Neo-patrimonial states are a blend of modern bureaucratic-legal (Western model) state systems with some pre-modern, traditionalist forms of rulership. The concept was conceived in the late 1960s as an effort to apply Weberian ideal types to study modern polities and get a conceptual grip on multiple modernities existent in postcolonial and other developing states. The concept emerged in response to **modernization theory** casting socioeconomic development as the only uniform evolutionary route that all societies supposedly follow from traditional societies to modern forms (Ynalvez & Shrum 2015: 150-155). Scholars derived the concept from Max **Weber's** concept of **patrimonialism,** one of the subtypes of traditional **rulership** (domination – *Herrschaft*), but its definitions, delineation, and operationalization have been problematic since its inception. The 'neo-' prefix served to indicate a clear boundary between Weber's pre-modern states and the new modern states in Latin America and those that had emerged with decolonization (1945-1962) in the Middle East, Asia and Africa.

Adapted to modern realities, the concept is characterized by its conflicting norms and defined primarily by the hybridity between two logics of rulership (traditional/patrimonial and legal-rational). It is based on the close interaction between patrimonialism (all power relationships are personal relationships) and legal-rational bureaucratic domination. The distinction between the public and the private formally exists and is accepted, even if it is not respected (Bach 2011; Bratton & van de Walle 1994; Erdmann & Engel 2007; Laruelle 2012: 303).

Today, neo-patrimonialism is a heavily criticized concept because of its application to different (overlapping) sociopolitical contexts, its conflation with phenomena like **patronage**, **clientelism,** feudalism (Box 1.14) and **prebendalism**, its theoretical confusion as a system of **legitimacy**, a type of (failed) state, a sociopolitical structure, or distinct regime type.

DEFINITION Gero Erdmann and Ulf Engel (2007: 105) provide a comprehensive definition of the concept as a legitimacy system, thereby adhering closer to Weber's original use of patrimonialism: Neo-patrimonialism is a mixture of two co-existing, partly interwoven, types of rulership: namely, patrimonial (a subtype of traditional rulership) and legal-rational bureaucratic domination.

In the original concept (**patrimonialism**), all power relations between the ruler and the ruled are personal relations. The state is the personal property *(Patrimonium)* of the ruler. This 'patron' bestows gifts from public and private resources on followers to secure their loyalty. Patrimonial bureaucratic staff, in the form of enslaved people or bondsmen *(Ministeriale)*, are granted some rights to govern parts of the *Patrimonium* on behalf of the ruler. This necessary exchange limits a ruler's discretion in selecting administrators from among the appropriate classes and staff, thus tend to belong to the group of 'traditional associates' (*Genossen*) like in traditional **rulership** (Erdmann & Engel 2007; von Soest et al. 2011; Van den Bosch 2021a). In neo-patrimonialism, this same personal relationship between ruler and staff persists to a high degree but follows a clientelistic logic of higher complexity involving many brokers (intermediary patrons), linking the political center with the countryside. By mimicking the logic of authoritarian **patronage** politics, neo-patrimonial states are considered to overlap with autocracies, while its extreme (predatory) forms are often equated with personalist rule. (The original Weberian ideal types of rulership do *not* equate with any regime type).

Under neo-patrimonialism, the distinction between the private and the public, at least formally, exists and is accepted, and public reference can be made to this distinction. Here, patrimonial power structures penetrate the legal-rational system of 'modern' stateness, twisting its logic, functions, and output but not taking exclusive control over the legal-rational logic. So, informal politics invade for-

mal institutions. Both are intimately linked to each other in various ways and by varying degrees, and this mix becomes institutionalized informality.

Erdmann & Engel and J.-P. Olivier de Sardan stress the aspect of *insecurity* that characterizes this type of rulership. *"A client needs a patron for protection either to avoid something or to be assisted in gaining something which otherwise would not be obtainable. In short, developing a clientelist network is a means to gain protection and to achieve goals in a situation of societal uncertainty created by public institutions which may behave in ways that are not calculable."* (Erdmann & Engel 2007: 108). In their strive to overcome such insecurity, by operating both on formal and informal levels, state actors actually reproduce the inherent insecurity of their sociopolitical system. Both logics within neo-patrimonialism are considered to be mutually reinforcing (Erdmann & Engel 2007: 105-106).

In neo-patrimonial systems of rulership, elites, bureaucrats, and residents can hypothetically choose to which of the two logics (patrimonial or legal-rational) they want to adhere to achieve their objectives, but in practice the uneven patron-client power relations preclude this, rendering the clientelistic logic pervasive and systematic; even turning it into a distinct political culture, and an effective 'social trap' for residents (Arellano-Gault 2016). Findings on **systemic corruption** have shown that formal state institutions in such systems reduce growth, are unable to provide universal welfare, and actually increase income inequality and poverty. The resulting inequality, in turn, then increases the level of corruption since the *"wealthy have both greater motivation and more opportunity to engage in corruption, whereas the poor are more vulnerable to extortion and less able to monitor and hold the rich and powerful accountable as inequality increases."* (Jong-sung & Khagram 2005: 103; Van den Bosch 2021b: 219-220). In theory, the interests of political and economic elites may sometimes be served better with official legal-rational rules, resulting in their advancement rather than their circumvention (Erdmann & Engel 2007: 105-106).

As a theoretical conception intended to capture a particular system of rulership, neo-patrimonialism has also been stretched to qualify the nature of statehood of various sociopolitical systems of informality or to denote a particular political regime type. These conceptual derivations have been defined in confusing and contradictory ways and operationalized even more poorly. The only aspect shared by these spin-off conceptual applications is their focus on the rent-seeking behavior of political elites and the pervasive clientelism in societies classified as neo-patrimonial. (See 'measurement' and 'methodological issues' for a comprehensive critique of the basic concept and its derivations).

SEE ALSO Derived from Weber's original conceptualization of **patrimonialism** with the aim to classify systems of **rulership** and **legitimacy**, this concept encompasses elements of **patronage**, **systemic corruption**, **kleptocracy**, **clientelism**, **prebendalism**, nepotism (Box 1.1), and is often applied to other world regions under synonyms like cronyism and bossism (both covered in Box 1.10). It has often been (erroneously) equated with **personalist rule**. The same trend has befallen Weber's (related) concept of **sultanism**, which has been rebranded as neo-sultanism. Due to heavy criticism, some scholars have come up with alternative frameworks to analyze the confluence of formal and informal spheres in the exercise of power, like Henry Hale's **patronalism**.

KEY SIGNIFICANCE The scholarly community is divided about the fate of neo-patrimonialism as an analytical concept – a debate mostly held in African studies – but most of these disagreements boil down to two lines of argumentation: Neo-patrimonialism is obsolete since it has turned into a blunt, harmful, racist paradigm to one-sidedly explain the dysfunction of African states (in particular). Alternatively – more sympathetically – the concept still has analytical value if scholars stick to a clear definition, apply it solely as a system of rulership (and not as a regime type), and find (new) ways to operationalize it by empirically benchmarking different degrees of neo-patrimonialism, thus enabling comparison. The former group thus scolds its tainted track record as an 'overstretched' Eurocentric concept; the latter acknowledges its universal, heuristic value (when applied correctly), admitting it has fostered both good and bad research but provided the theoretical impetus for pushing the frontiers for the study of informal-formal spheres in relation to political power (Erdmann & Engel 2007: 114; deGrassi 2008; Isaacs 2014; Wai 2012: 41; Bach 2011).

ORIGIN Daniel C. Bach (2011: 276-277, 282-289; 2012), Hinnerk Bruhns (2012), and Erdmann & Engel (2007: 97-100) provide detailed overviews of the introduction and evolution of the concept. Theories of patrimonialism had already been applied to Latin America to cover the legacy of Spanish and Portuguese colonialism, tracing contemporary government models (**corporatism**) back to imperial policies (Morse 1964; Sarfatti 1966; Florescano & Gil Sánchez 1976; Uricoechea 1980; Roett 1984; Osiel 1986).

By the late 1960s, Guenther (Günther) Roth (1968), a scholar and translator of Weber, was the first to introduce the latter's concept of patrimonialism to African politics, attempting to replace earlier attempts to capture African nationalist leaders' rule with the Weberian concept of **charismatic rule**. (Once the charisma of the nationalist leaders was routinized after independence, the focus fell on **patronage** distribution, according to G. Hyden (2006: 24)). However, using a pre-modern concept for modern states provoked resistance. Aristide Zolberg (1966) suggested distinguishing between 'traditional' and 'neo-traditional' regimes, and consequently, Shmuel N. Eisenstadt (1973: 15) coined the concept of neo-patrimonialism: The 'neo-' prefix served to indicate a clear boundary between Weber's pre-modern states and the 'post-traditional' societies of Latin America, South Asia and the Middle East.

LITERATURE Jean-François Médard (1979) borrowed the concept to explain Cameroon's underdevelopment and lack of institutionalization. Since

then, the concept has become prominent in African studies, popularized with Jean-François Bayart's (1989) work on *'politique du ventre' (politics of the belly)* and other French scholars working with the *Centre d'étude d'Afrique noire* in Bordeaux or by the journal '*Politique africaine*' (created in 1981).

Highly influential were the works of Michael Bratton & Nicholas van de Walle (1994; 1997), who started exploring the link between (shades of) neo-patrimonial rule and the prospects for democratic transition. Patrick Chabal & Jean-Pascal Daloz's book *Africa Works: Disorder as Political Instrument* (1999) summarized two decades of blurring the concept with African underdevelopment (or rather anti-development) and authoritarian (personalist) rule, illustrating how neo-patrimonialism by then had become not merely a paradigm, but an essentialist African paradigm (Bach 2011: 276-282; deGrassi 2008: 108, 112). A critical reappraisal of the concept emerged together with a reevaluation of the African state.

Besides these Africanists, there is an enormous amount of literature out there on neo-patrimonialism, but some of the scholars who contributed most significantly to its theoretical refinement are S.N. Eisenstadt (1973; 1978), S.N Eisenstadt & L. Roniger (1980), R. Theobald (1982), O. Therkildsen (2005), G. Erdmann & U. Engel (2007), A. deGrassi (2008) A. Pitcher et al. (2009), O. Fisun (2012), Z. Wai (2012), D.C. Bach (2011), F. Guliyev (2011), D.C. Bach & M. Gazebo (2012), C. von Soest (2022), G. Erdmann (2013) and T. Mkandawire (2015). A (non-exhaustive) list of important applications to other regions is provided below. Many of these works have stumbled into one or several methodological pitfalls (listed lower) but continue to be valuable by presenting inquisitive case study findings on hybrid formal-informal structures (in states or their societies).

REGIONAL VARIATION Oscar Oszlak (1986) was the first to introduce neo-patrimonialism to Latin America, soon followed by Karen Remmer (1989). Both authors used 'neo' to indicate the presence of a professional military, technocratic administrative staff, and all the other elements of a comparatively modernized and industrialized society (Remmer 1989: 165; Bach 2011: 283). Before, (neo)-patrimonial tendencies were captured by concepts like *caudillismo* and *caciquismo* in Box 1.10, or their Brazilian counterparts *coronelismo* and *mandonismo*, all referring to local strongmen, their system of (traditional) rulership and their clientelistic networks.

Karsten Bechle (2010) offers a recent evaluation of the concept for this region. Important other works are R. Snyder (1992) on transitions, J. Hartlyn (1994) and Remmer (1999) on the Caribbean, and G. Scherlis (2009) on Argentina.

In the study of East and Southeast Asia, scholars applied such frameworks under the guise of cronyism (also in Box 1.10) to explain viable capitalist development in combination with authoritarian (often even personalist rule), like in Indonesia (Crouch 1979; Liddle 1991), the Philippines (Hutchcroft 1998), Malaysia (Yoshihara 1988; White 2004). The financial crisis of 1997-1998 led to a reevaluation of this 'balanced' co-existence (Bach 2011: 284-286). The rise of China and its economic soft power have also attracted such analysis (Wu 2015) or the reevaluation of colonial legacies in Asia (Goh 2015).

Neo-patrimonial studies of the Middle East and North Africa were almost non-existent and only emerged after the **Arab Spring**. The German scholar Peter Pawelka was one of the few and only to apply the model in the 1980s, first in the form of an elaborate analysis of Egypt's political system (1985) and later to explain autocratic stability in Middle Eastern regimes (Pawelka 2002; Brownlee 2002). R. Brynen (1995) applied it to Palestine.

One hypothesis is that 'Arab exceptionalism' (Box 6.1) is responsible for this scholarly void. André Bank and Thomas Richter (2010: 8) note: "*It is neither sufficiently explored what empirical similarities and differences of neopatrimonialism have emerged in a post-colonial period across Arab regimes, nor does any systematic research exist which points to the changing nature of neopatrimonial rule given the external shocks and internal challenges Arab regimes have been undergoing.*" This would all change with the 'Arab Spring:' Qasemi (2012), Ugur-Cinar (2017), Gray (2018), de Elivara et al. (2018), Demmelhuber et al. (2020), Boucekkine et al. (2020), Bohn & Vollmann (2021).

For communist countries, Weber's earlier works on patrimonial Tsarist Russia were initially extrapolated to Stalinist times and Soviet *nomenklatura* systems (see also Box 1.11). Later, Yoram Gorlizki (2002: 701-702) brought back the focus on the inherent formal-informal duality in Soviet Russia. Ronald Linden (1986) applied the original patrimonial frame to N. Ceaușescu's Romania. The fall of the Berlin Wall, the collapse of the USSR and especially the ensuing murky privatization processes of national assets in the 1990s kick-started a fresh interest in neo-patrimonial theory in the Former Soviet Union (Fisun 2012), focusing on: Yeltsin's Russia (Slinko et al. 2005), Putin's Russia (Yakovlev & Zhuravskaya 2006; Robinson 2012, Gel'man 2016; Skigin 2020), Ukraine (Fisun 2003; Malygina 2010), Belarus (Hervouet 2013; Frear 2018), Azerbaijan (Lussac 2011), and Transnistria (Owen 2009).

Central Asia with its **clan politics** has received some attention (Ishiyama 2004; Gawrich & Melnykovska 2010; Laruelle 2012; Lewis 2012, Isaacs 2014; Izquierdo-Brichs 2021) with valuable case studies: Kazakhstan (Isaacs 2009; Peyrouse 2012), Kyrgyzstan (Marat 2012), Uzbekistan (Ilkhamov 2007; Markovitz 2012), Turkmenistan (Kunysz 2012), and even post-war (but pre-Taliban) Afghanistan (Hess 2010). Rico Isaacs (2014) finds that initially, scholars focused too much on the informal elements in Central Asian polities and that future research should explore real neo-patrimonial hybridity. Isaacs (2014) provides a critical overview of the earlier use of the concept for Former Soviet Central Asia.

METHODOLOGICAL ISSUES Despite its belated introduction to African politics, this region is where the concept would be applied most and in time evolve into a harmful paradigm where self-explanatory elite rent-seeking behavior, clientelism and super-presidentialism (sometimes mislabeled 'presidentialism' and too often conflated with **personalist**

rule) would become the routine *explanans* (premise) for an increasingly synonymous *explanandum* (research object): the African 'anti-developmental' state. Aaron deGrassi notes that it became a functionalist explanation, where neo-patrimonialism as an institution or cultural characteristic is explained by the function it fulfills rather than based on its historical development. This leaves no room for considering why no alternative arrangements yielding the same effect were adopted (deGrassi 2008: 115-116).

In the 1970s, critiques against 'developmental' and 'dependency' paradigms nudged more scholars to embrace neo-patrimonialism to explain the 'crisis' of the African postcolonial state. Thandika Mkandawire claims that the economic crises of the 1970-1980s (the 'lost decades') and with them, the rise of Afro-pessimism contributed to the diffusion and conflation of the concept: Before, *"in the 1960s when Africa was doing well economically – 5.7% growth rates – and when credible nation-building policies were being pursued, little was said about the cultural barriers to development."* (Hoffman 2018: 434). Because the concept was vague and often ill-defined, scholars often uncritically labeled a whole range of political arrangements as neo-patrimonial state capture. Lacking precise measurement criteria, by the early 1990s, some 40 African states had been branded as such (Bach 2011: 280-281).

Zubairu Wai (2012) provides some of the most scathing criticisms of the concept for African studies: He exposes the problematic logical circularity when scholars posit or infer the cause and effect of state weakness and failure from the same source (rent-seeking behavior of the African political elites). Therkildsen (2005: 12) exposes the blind spot behind that error: *"The neopatrimonialism paradigm mis-specifies or ignores important motivations of political and bureaucratic elites such as nationalism, professional integrity, gaining political following through service provision, public demand for accountability, etc. It also downplays some of the key structural features of poor African countries, for example the deep fiscal stress facing public organisations; distortive tax systems; dependency on a few primary commodities on volatile and distorted export markets; donor influence; etc."*

Pitcher et al. (2009) and Wai (2012) expose the fallacy of applying Weberian ideal types as categorizing explanatory regime types. As a derivative, neo-patrimonialism cannot be used for this purpose: *"ideal-types (…) are not real; and (…) do not correspond to any historical or actually existing or empirically grounded reality."* (Wai 2012: 38). Wai continues to tackle two current approaches of Afro-pessimism, the society-centric approach, highlighting African cultural barriers to development, and the state-centric approach, locating the problem not in society, but in the predatory African state itself (Wai 2012: 32).

Wai's final critical concerns are epistemological, referring to Max Weber's deep Eurocentric, unilinear, teleological way of thinking, where "*African phenomena can only really be understood as mirroring an earlier European history*." (Wai 2012: 33). In contrast, scholars of Latin American neo-patrimonialism (or other regions) never assumed that the state was eroding or would dissolve into **informality** (Bach 2011: 283).

A significant group of scholars thus torpedo the concept's claims of universalism while sympathizers continue to improve and refine it for comparative research. In any case, there is a growing consensus that the concept has some heuristic but no predictive value and that neo-patrimonialism has too many complex, interrelated causal links to other dysfunctional factors for it to be able to predict the development or prospects of **democratization**.

MEASUREMENT The main problems with neo-patrimonialism are all down to its vague definitions (being derived from an ideal type), resulting in difficulties regarding its delineation (analytically separating it from other related concepts) and resulting in trouble with empirically selecting cases (scope of sample cases) (Van den Bosch 2021b). The informal and illegal nature of the research object by itself brings forth many issues for the concept's operationalization.

Delineation Despite its long track record of vague definitions, recurring key defining characteristics of neo-patrimonialism are its hybrid logic of formal and informal encompassing elements of clientelism (patron-client power relations) and patronage politics (the use of public goods for rents and enabling clientelistic relations) (Erdmann & Engel 2007). Too often, neo-patrimonialism has been equated to **personalist rule**, thereby skewing the scale of its conceptual hybridity back toward its patrimonial pole. Its analytical separation from systemic corruption, corporatism, clientelism, patronage, prebendalism, etc., remains blurry in the existing literature. However, even without these pitfalls, the 'neo-' question begs: Where do pre-modern states end and modern states begin? Moreover, can one draw a clear border between the bureaucratic-legal and the patrimonial (traditional) rulership? How does one qualify the nature of neo-patrimonial bureaucracy within the spectrum of these intersecting ideal types?

Scope How do we choose our research object? Does the concept apply only to regime or state structures and institutions? Or to a wider set of social relations in society? (vertical scope). Does the concept overlap solely with authoritarian regimes, or can democracies likewise be neo-patrimonial? (horizontal scope). Weber's original ideal types were neutral in this regard, and legal-bureaucratic rule can equally be applied to some authoritarian systems (Pitcher et al. 2009). While patrimonialism was a 'legitimate' system of rule, can the same be said about neo-patrimonialism? (Hale 2015: 25).

Operationalization This last issue spills over into the question if the concept can be used as a separate regime type (or a merely conflicted mode of legitimacy). Anne Pitcher et al. (2009: 126-127) have pointed out that Weber's ideal types explain legitimacy and thus cannot correspond with regime types, but almost all literature squarely puts neo-patrimonial rule in the realm of authoritarianism, even

if this is a very heterogeneous group. By equating the concept with personalist rule, however, scholars create a mismatch with earlier identified case studies, like the regime of J.E. dos Santos in Angola or R. Mugabe's Zimbabwe (that fit neo-patrimonialism but had more collegial power structures).

With imprecise delineation and a 'catch-all' scope, there is no surprise that a viable operation of the concept has been the most daunting task, especially since the defining aspect of clientelism is difficult to measure and observe. Weber's original characteristics of legal-bureaucratic rule can provide a negative set of benchmarks – to determine how neo-patrimonial bureaucracies fail to meet such criteria (Erdmann & Engel 2007: 108, 110). A rare exception to successful operationalization is C. von Soest et al. (2011) comparing regional variation in tax administrations, establishing clear(er) benchmark indicators. Their article shows that not all indicators matter equally for different world regions. This raises interesting questions on the concept's universalist claim (or maybe just its operationalization) and indicates that actor agency significantly influences outcomes.

CLASSIFICATIONS Sub-classifications of the concept often fail to bring more clarity since they were derived from defining criteria riddled with the methodological issues listed higher.

M. Bratton and N. van de Walle (1994) created a classification of African political regimes and found that four of them can be regarded as varieties of neo-patrimonialism: personal dictatorship, military **oligarchy**, and plebiscitary and competitive one-party systems. They differ on two axes: participation (exclusion or broad mobilization) and pluralism (low or medium competition).

D.C. Bach (2011) elaborates on J.-P. Médard's (2000) proposition to distinguish between 'regulated' and 'predatory' forms of neo-patrimonialism (as two ideal types). The former, based on co-optation and redistribution according to an ethnic-regional logic, is able to promote the expansion of the state to peripheries and foster a (non-violent) culture of mutual accommodation. Jomo Kenyatta (1964-1978) in Kenya and Félix Houphouët-Boigny (1960-1993) in the Ivory Coast are both heralded as good examples. The predatory type corresponds to **sultanism,** indicating a harmful form of extreme **kleptocracy**, with a narrow distribution base, *"where personal rule and resource control reach a paroxysmic level, with a consequent 'failure of institutionalisation (…) and thus of the state.'"* (Médard 1991: 139, cited in Bach 2011: 279). It is important to note that the regulated examples listed by the Médard are actually *not* considered personalist regimes according to B. Geddes et al. (2012), while all the predatory forms fall in this category. These differences can also be explained by existing regime typologies that operate with clear coding criteria.

Post-communist regimes have also been subjected to neo-patrimonial classifications (Kitschelt 2021; Fisun 2012) in order to distinguish which Soviet legacies live on (in modified form) in current realities. They are also distinguished along conceptual axes based on various levels of personalism, institutionalization, and inclusiveness. Oleksandr Fisun (2012: 94) even identifies a type labeled 'neopatrimonial democracy.'

NEW FRONTIERS If neo-patrimonialism is to survive as an analytical concept, it should be applied solely to study the hybrid tension between formal and informal spheres in political regimes. It is not a regime type, one type of state, and certainly not a *'deus ex machina'* explanation to subscribe underdevelopment only to cultural factors. Regarding its potential as a predictive tool, those painful lessons should have been learned by now.

Its different application in the study of various world regions and the fact that no convincing universal insights have been put forth so far should maybe temper the universalist aspirations of such proponents. Maybe it is more helpful to study how neo-patrimonialism emerged and evolved in different states and regions. As a middle-range analytical tool, it can retain its heuristic value by guiding new research, balancing equal attention for the formal and informal.

With their methodological rigidity, von Soest et al. (2011) have illustrated new ways for a successful operationalization of the concept. Also, new concepts have emerged: Henry Hale's (2015) **patronal politics** has made quite a splash in Eurasian studies and has the potential to be applied beyond the post-communist world.

Box 1.10 Caudillismo, Caciquismo, Cronyism & Bossism

It's not what you know but who you know
– American saying

These four concepts have created methodological havoc as in the past, they have been used synonymously with regime types such as **personalist rule**, **neo-patrimonialism** or practices like **state capture**, **clientelism** and **systemic corruption**. *Caudillismo* and *Caciquismo* came out from the situation in Latin America during the nineteenth century and, therefore, have a weak empirical connection to the present situation (Brooker 2000; Lidén 2011: 5). Similarly, bossism traces back to local US politics from the nineteenth and early twentieth century.

All four go back to specific culturally and historically-bound phenomena, have evolved with time, and have been applied beyond their place of origin before scholars attempted to turn them into distinct political concepts. Table 1.4 provides a comparison of their most common defining features, but keep in mind that all of these terms have been conceptually stretched (sometimes beyond recognition) and ambiguously applied.

CAUDILLISMO The Spanish word *caudillo* (from the Latin *capitellum* (small head) was used to describe the head of irregular forces who ruled a politically distinct territory in Latin America. (De Riz 2015) In the nineteenth century, *caudillismo* refers to the rise of *caudillos*, who originally were powerful landowners who assumed regional governance after the collapse of colonial political institutions. These figures often commanded private militias and competed for control over national power. By the twentieth century, the term *caudillo* included military officers and aspiring politicians, particularly in countries like Mexico. These leaders first built independent power bases at the regional level and, bolstered by large followings, sometimes moved on to grab power in the political center. (Bethell 1994: 383)

Caudillismo here refers to a pre-modern form of personal rule where the ruling elite usually has its background or some connection to military rule: *"The caudillo is now generally thought of as one who used violence or the threat of violence for political ends – whether as a professional officer commanding regular army units, or as a militia officer or civilian-on-horseback leading militia or irregular forces into political battle, or (more broadly) as an essentially civilian leader who engaged in violent repression"* (Bethel 1985: 371) For authoritative treatises of the historical phenomenon, consult: Haigh 1964; Wolf 1956; Chevalier 1962; Wolf & Hansen 1967; De la Peña 1986.

Personal charisma was the transformative feature that propelled them to power in the first place, after which they cemented their position by establishing patron-client relationships. However, this form of charismatic personalist rule remained an unstable form of dictatorship where challengers cyclically competed for power. As theorized in **patronalism** (cf. H. Hale), one should imagine these caudillistic patron-client networks as elaborate pyramids – in which local *caciques* (see below), with their followings, pledged loyalty to regional chieftains, who in turn gave at least temporary and conditional support to *caudillos*, or other political leaders operating at the national level. (Bethel 1985: 373)

The ideological orientation of most *caudillos* can be characterized as pragmatic and largely indifferent

Table 1.5 – Mapping *Caudillismo, Caciquismo,* Cronyism & Bossism

Features	**Caudillismo**	**Caciquismo**	**Cronyism**	**Bossism**
Typical background	Military, landowner, merchant	Local strongman, peasent leader	Politicians, business leaders	Politicians, political parties, state bureaucracy
Scope of rule	National or regional	Local	All levels	Regional or local
Urban vs. Rural	Rural origins	Rural	Urban	Urban
Level of formalization	Weakly institutionalized	Informal	Informal	Institutionalized
Direction or shape of network	Centralizing force	Federalist	Vertical and horizontal	Centralized
Sources of Power	Military, patronage, charisma	Patronage, traditional legitimacy, brokerage	Patronage, clientelism	Patronage, prebendalism, legal-rational legitimacy
Main function	State-formation Patronage	Electoral Fraud Interest formulation	Systemic corruption	Electoral Fraud Patronage
Conceptual core	Regime type	System	Practice	Regime type
Most conceptual resemblance with	(Military) personalist rule	Patron and client (broker) Electoral authoritarianism Ethnic politics	Clientelism Systemic Corruption	Personalist rule Competitive authoritarianism Ethnic politics

to formal political ideologies or constitutional principles. Unlike the Latin American political intelligentsia, who were concerned with the ideas embodied in laws and constitutions – seeking political respectability both domestically and in the eyes of Europe – *caudillos* were more focused on maintaining their power bases and satisfying the interests of key local constituencies, such as landed oligarchies and merchants. For military officers and regional *caudillos*, politics was often driven by personal reputation, protecting the military as an institution, or representing broader social interests. The concerns of large landowners and merchants were more practical, revolving around land tenure disputes and favorable or predictable commercial regulations, respectively. Therefore, *caudillos* were primarily concerned with maintaining local power structures and securing material advantages for their supporters rather than adhering to any particular political ideology, although there are examples of revolutionary leaders. (Bethell 1985: 369)

CACIQUISMO Caciquismo does not have any military connection but is instead based on a traditional hierarchy where local leaders interlock with each other to create the ruling elite (Linz 2000). The term *cacique* originates from indigenous languages (Arawak) but was adopted by the Spanish *conquistadores* to refer to the leaders of native tribes or, in more stratified Indigenous states, district governors. The Spaniards maintained *caciques* as hereditary chiefs within Indigenous communities, assigning them roles such as minor judges, labor organizers, and tribute collectors. In colonial Mexico, the heads of forced labor gangs were also called *caciques*, while in Peru, they were referred to as *curacas*. Over time, the term was adopted in Spain, where it came to carry an even stronger association with political bossism. (Kern & Dolkart 1973; Britannica 2016)

Caciquismo describes the influence of such local power brokers, who typically emerged from the rural masses or lower middle classes. *Caciques* held local authority in their villages or towns and acted as intermediaries in both political and cultural matters. Unlike *caudillos*, they rarely maintained permanent armed forces but could still mobilize violent uprisings, known as *'jacqueries'* (a peasant revolt against the nobility). During the first half of the twentieth century, *caciques* played a key role in recruiting rural populations for factional disputes between *caudillos*. They also led peasant resistance against taxes, land expropriation, and disruptions to traditional life. Their ability to act as brokers allowed grassroots movements to influence broader political struggles. (Bethell 1994: 383)

In later times, these local strongmen were associated with rallying votes for their patron in the regions they controlled and handling the vote rigging (Lehoucq 2003: 240). It is this function that Matsuzato (2001) aims to capture by applying the term to local powerholders in Tatarstan (in the Russian Federation). Here, local (rural) bosses act as intermediary brokers, bridging the gap between central authorities and local communities. They position themselves within a hierarchical structure spanning the central, regional, and local levels through political exchanges, receiving **patronage** from higher authorities while mobilizing votes during elections at the grassroots.

Mandonismo, from the Portuguese *mandão* (strongman or boss), is closely related to *caciquismo* although it is rather a descriptor, not a political term. It describes the dominance of local leaders who control resources and political power in rural areas through personal authority and patron-client relationships. Scholars like Jose Murilo de Carvalho (1997) argue that mandonismo is Brazil's equivalent of *caciquismo* in Hispano-American contexts.

As defined by Victor Nunes Leal (1948; 1977), *Coronelismo* was specific to Brazil during its First Republic (1889-1930). The term refers both to this time period and to any political system where rural oligarchs (*coronéis*) control local politics through vote manipulation, patronage, and coercion. However, it represents a more institutionalized form of domination compared to *mandonismo* and was integral to Brazil's national state-building process during this period. It represents a strengthening of state power rather than the predominance of the military strongmen, and its bureaucratic drive and increased dependency on state structures actually increased the decline of local mandãos.

CRONYISM Crony capitalism refers to a (capitalist) economic system in which individuals with close ties to political power – often referred to as 'cronies' – secure positions of undue influence over economic policies, allowing them to reap significant personal benefits. Cronyism is defined by the Oxford English Dictionary as *"appointment of friends and associates to positions of authority, without proper regard to their qualifications."* (Zudenkova 2015) This system distorts market mechanisms by prioritizing personal relationships over competition and merit. It is the antithesis of merit-based capitalism. (Klein et al. 2022)

One way to look at cronyism is from the perspective of **neo-patrimonialism** and **state capture**. Here, cronyism is equated with a state of **systemic corruption**. For instance, a notable example of 'crony capitalism' in Russia is seen in the privatization process, where insider dealings allowed major state assets, such as oil companies, to be transferred into private hands at drastically undervalued prices. Another instance is the establishment of 'authorized banks,' a select group of commercial banks granted exclusive rights to manage government accounts. These privileges were often exploited; for example, payments could be deliberately delayed, reducing their real value under conditions of high inflation. Additionally, there have been serious allegations of insider trading involving cronies in the Russian government securities market. In the context of Russia, cronyism highlights the informal arrangement that developed between the president and the country's business elite, commonly known as oligarchs. Their tacit agreement implied that if the oligarchs used their economic clout to provide political and financial backing to the president, they would, in turn, be granted the ability to shape laws and regulations in ways that served their own interests. (Hedlund, no date)

Cronyism is mostly studied as an informal practice (cf. **informality**), and its pervasiveness, function and impact correlate differently with definitions of illegality depending on cultural and legal contexts (Khatri et al. 2006; Khatri & Tsang 2016; Pearce 2015). In more modern times, the term 'crony capitalism' was first widely used in the 1980s to describe the economic system under Ferdinand Marcos' dictatorship in the Philippines; later, the term bossism was used as well for that regime.

Coyne & Hall (2019) offer a different perspective and argue that cronyism is a feature and not a bug in all political systems: *"There are two reasons, however, why real*

government can never be limited to a role of referee that stands entirely outside of the game it is tasked with overseeing. First, even the minimal protective state requires resources in order to operate. This requirement means that the government must intervene in private economic life to extract resources. In doing so, it shapes and manipulates economic life and creates an environment conducive to cronyism by relying on political power to determine resource transfers and allocations. Second, the minimal protective state must also have discretion to deal with circumstances that are unforeseen at the time it is granted its initial powers." (Coyne & Hall 2019: 400).

BOSSISM Immortalized in two Martin Scorsese movies, *Gangs of New York* (2002) and *The Irishman* (2019), bossism is portrayed as systemically corrupt urban machine politics at the local and state levels in a flawed, pre-WWII US democracy. As a term, 'bossism' refers to an institutionalized political system where a single leader (obviously 'the boss') exercises control over the selection of political party candidates and the distribution of **patronage**, often without regard for the public interest. The power of the boss derives from their ability to unilaterally choose candidates who will win elections, thereby ensuring that elected representatives remain indebted to them. These representatives, in turn, allow the boss to make key policy decisions and distribute government jobs and resources to party loyalists.

Outsiders and rivals inflate their imagined level of personal power. Stave et al. (1988: 294), quoting Lord James Bryce, described a boss as *"dominant among his fellows (…) He dispenses places, rewards the loyal, punishes the mutinous, concocts schemes, negotiates treaties. He generally avoids publicity, preferring the substance to the pomp of power, and is all the more dangerous because he sits, like a spider, hidden in the midst of his web."*

Bosses often wielded significant influence at the local level by combining their role as political party leaders with elected office, but they were never unchallenged. The source of their **legitimacy** is thus partly legal-rational as it is derived from the office they occupy. However, their ascent might not have been democratic (i.e., election rigging); they reinforced their position through control over a local or private security apparatus (local police or thugs). (Geller 1968) Their ability to dole out positions in the civil service resonates with the concept of **prebendalism**, albeit at a lower (local) level.

In the US, the phenomenon is most commonly associated with big cities but has also been prevalent at state and local levels in suburban and rural areas. For instance, Harry Flood Byrd dominated Virginia's *Democratic Party* from the 1920s to the 1940s. Bosses have even played roles in national politics, such as influencing presidential nominations and elections, notably Harry Truman's vice-presidential nomination in 1944 and John F. Kennedy's election in 1960. (DoAH, no date)

The conditions for bossism were particularly ripe between the 1860s and WWII, driven by waves of immigration. Political machines led by bosses provided jobs, favors, and ethnic solidarity to immigrants in exchange for their electoral support. However, Progressive reformers at the turn of the twentieth century attacked these systems for their inefficiency and **corruption**, leading to civil service reforms that weakened bossism. The decline of bossism after WWII is attributed to changes in immigration patterns, demographic shifts in cities, the expansion of federal social welfare programs, and a decrease in voter loyalty to party organizations. The rise of mass media like television and radio also allowed candidates to bypass political machines and communicate directly with voters.

Outside the US, the concept has often been applied to the Philippines. This marks an interesting break with previous frames, which is intentional: *"The use of the term 'boss' reflects both a rejection of accounts stressing the putative sociocultural legacies of Spanish colonial rule (caciquism) and the supposed salience of patron-client relations (clientelism) in the Philippines (…) [emphasizing] the distinctly American colonial-era institutional structures inherited by the postwar Philippine state and stresses the often underestimated and poorly understood role of violence and coercive pressure in shaping economic accumulation, political competition, and social relations in the archipelago."* (Sidel 1999) Before, *caciquismo* was used in the amalgam of 'cacique democracy' (Anderson 1988), although this term has attracted *opprobrium* from (native) scholars.

As presented in Table 1.4, a comparative overview of these four concepts might provide the most clarity as several key distinctions emerge across dimensions, such as their scope, level of formalization, power bases, and relationship to electoral politics. Even with some similarities – such as their informal nature and reliance on **patronage** – they also diverge significantly in terms of their structure and historical context.

Both *caudillismo* and bossism can be easily classified as distinct (historical) regime types, originating at the local level but showing a tendency to expand beyond that. (Note that Linz (2000: 155-157) also classifies *caciquismo* as a traditional regime type.) *Caudillismo* often grows from the regional to capture the national level, whereas bossism tends to remain more localized or regional in its influence but has been applied to political regimes at the state level.

Caudillismo is characterized by military power and personal charisma, often associated with a single leader who consolidates authority through force and personal loyalty. It always involves the establishment of a hierarchical patronal network, where a single 'pyramid' of power dominates the political landscape. The *caudillo's* authority is thus rooted in his ability to command military forces and inspire personal loyalty among followers. In contrast, bossism is more institutionalized due to its reliance on party machines. A boss's power is derived not from military influence *per se* but from holding high office and engaging in forms of political manipulation such as election rigging or patronage. Bossism operates within a vertical patron-client structure, often mediating between different ethnic constituencies in an urban setting. Unlike *caudillismo's* reliance on personal charisma and military might, bossism's strength lies in its ability to control political institutions and manipulate electoral processes.

Caciquismo is a more localized practice rather than a full-fledged regime type. It is deeply rooted in rural settings and involves local strongmen (*caciques*) who act as intermediaries (brokers) between the government and local populations. These leaders represent the interests of specific ethnic or social groups within a federal system composed of similar units. *Caciquismo* has historically been tied to electoral politics, particularly in authoritarian regimes where elections serve more as a performance than a genuine democratic process. The *cacique* acts as a personalist patron within his local domain, exercising significant influence over both local governance and the distribution of resources.

Cronyism, by contrast, is not tied to any specific geographic level – local, regional, or national – and is, in all aspects, more of a practice than a regime type. It refers to the favoritism shown by those in power toward friends or associates, particularly in business or politics. Unlike *caciquismo*, cronyism is not associated with elections but instead connects elites through transactional politics that typically exclude societal non-elite actors and their interests.

There is a clear distinction between the rural and urban origins of these concepts. *Caudillismo* and *caciquismo* both have rural roots, and bossism and cronyism are more closely associated with urban centers and businesses. Bossism thrives in large cities where political machines can manipulate large populations through patronage systems, using the system of urban civil service and resources at their disposal to control voters. Cronyism tends to flourish in environments where elites engage in mutually beneficial transactions that are often centered around urban business or political networks.

All four concepts are forms of informal politics that rely on personal relationships rather than formal institutions. In these systems, power is exercised through networks of loyalty and transactional relationships rather than through established political structures. Bossism merely stands out for its predefined degree of institutionalization (a political **party**). Only *caciquismo* and bossism are linked to **elections** and **ethnic politics**. *Caudillismo* has little connection to electoral politics due to its focus on military leadership rather than democratic processes. Cronyism is similarly (conceptually) disconnected from elections; it operates primarily through elite transactions once a ruler has come to power and does not involve brokering public participation or competition for office through voting mechanisms (although raising campaign money is another matter).

Box 1.11 Nomenklatura: The Red Bureaucracy

A ruling class that monopolized power and privilege under the guise of serving the people.
– Michael Voslensky, Soviet dissident, *Nomenklatura: The Soviet Ruling Class* (1970)

In socialist-type regimes, *nomenklatura* refers to a system of appointing individuals to key administrative positions within the government, economy, and other sectors of society based on their loyalty to the Communist Party or equivalent. In other words, it thus is an institutionalized system of **patronage**. Confusingly, the term also refers to the group of people who occupy these positions, thus as a group label for the political elite that controls significant aspects of governance and decision-making.

The term *nomenklatura* is the Russian term (номенклатура) for nomenclature (a naming system). It has a specific meaning and refers to lists of key positions that needed to be filled by politically reliable individuals in the communist system. Over time, it came to denote both the process of staffing these positions and the group of officials who held them. The original term, nomenclature, is general and absolutely neutral. It just refers to a labeling system or set of rules for naming things in various fields, particularly in science and arts. It is derived from the Latin *nomen* (name) and *calare* (to call), and it deals with sorting objects or concepts according to specific conventions. In biology, for example, nomenclature governs how species are named and classified based on agreed international rules.

The *nomenklatura* system was designed to ensure that power remained centralized within the Communist Party, with appointments made based on political reliability rather than merit or expertise. This system played a crucial role in maintaining the party's control over the state and society by filling important roles with individuals who were politically trustworthy and aligned with party ideology. These officials 'on the list' were part of a privileged class with access to special benefits, such as better housing, healthcare, and education for their families.

What are the exact dynamics of how appointments were distributed? Which positions were up for grabs by what authorities, and how did the system evolve? (i.e., under **personalization** or during Perestroika) While these aspects have acquired some attention in the last decade of the Cold War and right after (Harasymiw 1969; Moses 1981; Miller 1983; Weeks 1987; Rigby 1988; Hill & Löwenhardt 1991; Kryshtanovskaya & White 1996) – many of these questions remain answered in part and are still subject of historical inquiry (Lewin 2003). In addition, scholars aim to gauge its long-term impact from the point of view of **authoritarian legacies** (Snegovaya & Petrov 2022).

The *nomenklatura* system was not limited to the Soviet Union but was also used in other Eastern Bloc and non-European countries under communist rule; for China, consult Burns 1987; 1989; Chan 2004. For comparative works, see: Eyal & Townsley 1995; Dogan & Higly 1998. For individual cases, consult these works: for Poland (Podgorecki 1994; Wasilewski 1995), Romania (Grosescu 2004), Hungary (Szakolczaia & Horváth 1991; Huszár 2005), and Yugoslavia (Obradović 2013; Dyker 2014; Miller 2022). Today, the term has traveled over the world to (non-communist) party-based regimes as well and is used universally to denote the inner sanctum or ruling elites (**ruling coalition**).

Oligarchy

The tyranny of a prince in an oligarchy is not so dangerous to the public welfare as the apathy of a citizen in a democracy
– Montesquieu (1748)

This is oligarchy: a government of the billionaires, by the billionaires, and for the billionaires
– US Senator Bernie Sanders

The concept of oligarchy as a political regime type has evolved significantly over time, both in its meaning and its constitution. Historically, oligarchy refers to a form of governance where power is concentrated in the hands of a few individuals or families, often distinguished by wealth, social status, or political influence. This contrasts with more democratic forms of governance where power is distributed more broadly among the population.

ORIGIN In ancient Greece, oligarchies were prevalent in city-states such as Sparta and Athens. These regimes were typically characterized by the rule of a small group of wealthy individuals who held significant power and influence. The term oligarchy itself originates from the Greek ὀλιγαρχία with *olígos* (few) and *árkhein* (to rule) and was used by Aristotle to describe a perverted form of aristocracy, where the rule was by the rich for corrupt and unjust purposes (Gottfried 2019; Ramos 2017; Badie et al. 2011).

Ancient Greek oligarchies actually developed as a response to democracy, not the other way around (cf. Simonton 2017), and were typically characterized by a property requirement for holding office, with institutions malignantly designed to exclude people with low incomes from power.

In the medieval period, oligarchies were often linked to the rise of merchant classes and city-states, where wealthy families or guilds dominated political and economic life. During the colonial era, oligarchies were prevalent in societies where a small group of European settlers or local elites exercised control over the Indigenous population. In the post-communist context, oligarchies emerged following the collapse of the Soviet Union, as former state assets were acquired by a small group of individuals who leveraged their newfound wealth to gain political influence (Badie et al. 2011).

SEE ALSO This is one of the oldest regime types since the time of Plato and Aristotle. In contemporary times it can equate with a collegial form of exclusive **electoral authoritarianism**. It is often too exclusive and repressive to be considered competitive authoritarianism, but some **hybrid regimes** have identified some forms of defective democracy as oligarchic. Its older forms are sometimes considered proto-party-based forms of **single-party regimes**. Currently, the term also stands for **state capture** by wealthy elites.

DEFINITION Classical thinkers considered oligarchy as a form of government in which a small minority of people, typically the wealthy, hold and maintain power, often at the expense of the common good. In the archetypal six-fold category this regime type thus was the **corruption** of the 'few.'

Socrates describes oligarchy as a political system where the rich hold power while poorer people are excluded, leading to a society where everyone outside the ruling class lives in poverty. In contrast, democracy is portrayed as a system based on equality and freedom. (For their full classification, see **Plato & Aristotle**).

Aristotle, following Plato's classification in the *Statesman*, categorizes political regimes into six types: kingship, **aristocracy**, and **timocracy** (or *politeia*) are considered good, whereas **tyranny**, oligarchy, and **democracy** are seen as bad, with democracy being the least objectionable among the bad ones. Aristotle notes that the primary distinction between oligarchy and democracy is not the number of rulers but rather that the rule of the rich characterizes oligarchy, while in democracy, power is held by all free citizens (Saxonhouse 2015; Miller 2009).

Aristocracy is ideally governed by the virtuous, but in some instances, wealth or merit determines leadership, as seen in Carthage or Sparta. Oligarchy involves rule by the wealthy and can vary depending on property qualifications; some forms may be hereditary, such as dynastic rule, which is considered a form of tyranny among oligarchies because it upends the collegial features of elite rule. *Politeia* represents a blend of oligarchy and democracy, combining wealth and freedom; if virtue is also present, it resembles aristocracy as governance by the best (Saxonhouse 2015; Miller 2009).

Abu Nasir al-Farabi (*al-Fārābī* – 872-950 CE, 'Alpharabius' in Latin) followed this model in his work *Al-Madina al-Fadila* (*The Virtuous City* or *Ideal State*). In his five types of 'city,' he identifies 'the ignorant city' as characterized by its inhabitants' lack of understanding of true felicity and ignorant rulers pursuing wealth equating to oligarchy (see also: 'Islam' under **religions of the world & statecraft**). Other medieval thinkers, like Engelbert of Admont, also borrowed and adjusted the Aristotelian mode (Blythe 1992), cf. **medieval classifications**.

Throughout history, oligarchies have often been perceived as coercive systems that rely on public obedience or oppression to maintain control. This perception is rooted in the idea that oligarchies prioritize the interests of the ruling few over those of the general populace. Some contemporary scholars have retained this approach, as shown in 'classifications' below, but overall, the interpretation of oligarchy has changed. However, in the literature, the term remained 'underspecified' in the scholarly literature (Leach 2005) and remains one of the most

frequently used but insufficiently theorized terms in the social sciences (Winters 2011: 1).

The modern understanding of oligarchy has been influenced by sociological theories such as Robert Michels (1878-1936), who came up with his 'Iron Law of Oligarchy' (cf. Box 5.4), suggesting that all organizations inevitably become oligarchic as they grow, concentrating power in the hands of a few (Maloy 2023). This theory suggests that true democracy within organizations is unattainable because of the need for efficient leadership and decision-making.

Most observers have been 'off topic' when it comes to treating oligarchy as a regime type: *"Despite the abundance of contemporary writing on the concentration of wealth and power, studies have been mainly concerned with either the (somewhat derivative) problems of inequality and inadequate regulation, or with the implications of the power of the oligarchy to democracy, competition, and national political autonomy. while these issues are pivotal for a comprehensive analysis of oligarchy, they are largely of a secondary nature to the underlying mechanisms of the oligarchy's power basis, the causality of its evolution, and its relationship with other institutions and processes in capitalism."* (Gottfried 2019: 6).

In more recent times, the concept of oligarchy has been applied to various political and economic contexts. For example, after the fall of the Soviet Union, Russia was often described as an oligarchy due to the concentration of wealth and power among a small group of business magnates. (Its plutocratic (civilian) elites are still called олигархи *(oligarkhi),* but elites from the security forces, law enforcement and military are collectively referred to as силовики – *siloviki*). Similarly, some political scientists argue that certain features of contemporary democracies, like the US, exhibit oligarchic tendencies due to significant economic inequalities that allow elites to influence public policy disproportionately.

In contemporary discussions, oligarchy refers to the exertion of influence and the strategies used to accumulate and maintain wealth and power, even without direct involvement in formal governance structures. This interpretation, of course, thus no long treats oligarchy as a political regime. It merely underscores the systemic ways in which political processes and the broader political economy may cater to the interests of a wealthy minority. This dynamic is often attributed to structural weaknesses in capitalism, challenges inherent to (democratic) systems, and other related factors, even if this wealthy elite does not officially govern. Jeffrey A. Winters (2011), a prominent scholar of oligarchy, defines it as the 'politics of wealth defense' by materially endowed actors.

If regimes can thus become 'oligarchic' (an adjective, not a noun), then one must be able to label this process 'oligarchization,' and its end goal should be the achievement of some pure type of oligarchy. Such an approach thus allows for hybridization. While historically at opposing sides in the typology, democracies can become oligarchic without breaking down and thus function as some sort of defective democracies, for instance, constitutional-oligarchic **hybrid regimes** (Wigell 2008) or becoming a 'domain democracy' (Merkel 2004).

Some scholars argue that oligarchy should be understood not simply as the rule of a specific group of individuals but as an 'informal institution' with its own set of rules, strategies, and dynamics. According to game theory, the mission of this institution is to shield itself from competition while preventing a political backlash that can result in a confiscation of its wealth. In other words, oligarchs influence and manipulate political regimes and protect their power from competitive threats. Second, they help avoid a 'legitimacy crisis,' which could arise from excessive exploitation or short-sighted actions, such as those seen in the US financial sector prior to the 2008 crisis. Thus, while these rules may limit the predatory tendencies of oligarchs, they simultaneously facilitate the preservation and augmentation of their wealth and power (Gottfried 2019).

Interesting is that this 'oligarchization' is not expanded upon for non-democratic politics. In contrast, 'de-oligarchization' exists and is defined as *"eliminating the excessive influence of vested interests in economic, political, and public life"* (cf. Zurabashvili 2022: 1; Minakov 2023). Still, the oligarchization in political regimes could denote two processes on two axes. The increase of 'reserved domains' by vested elites (politically influential but outside the formal power structure) with the aim of co-opting these wealthy elites, granting them favors and positions in exchange for their support, could solidify the regime's control and further entrench oligarchic interests.

Alternatively, oligarchization could be the opposite of **personalization**, a shift from 'one ruler' to 'the few' and thus could denote a move toward collegial rule, either as 'de-personalization' with the specific aim to defend wealth, privileges, and assets from **tyranny** and arbitrary confiscation (protecting property rights); or a move away from **absolutism** in **monarchies**, although property rights are better protected under the latter (Guillén 2018).

From a contemporary perspective, the 'few' who constitute the core of oligarchy can encompass a wide range of groups, including enslavers, landlords, nobility, the wealthy elite, high-ranking officials, or party bureaucrats. Thus, rule by the superrich or *plutocracy* represents just one interpretation of oligarchy, with wealth as the defining factor for influence and decision-making. In contrast, oligarchy can derive power from various sources such as military strength, family ties, or expertise, not just wealth.

Plutocracy is thus a subset of oligarchy, specifically focused on economic elites controlling governance. Currently, the world's richest man (with a net worth of around 439.4 billion USD in early December 2024), Elon Musk has used his financial resources to support political candidates, notably contributing vast sums to Donald Trump's re-election campaign and playing a pivotal role in his electoral success by his ownership of *Twitter/X* to spread **disinformation** and **propaganda**. Musk's actions initially demonstrated how wealth could translate into political power and influence at a regional scale (i.e., his *Starlink* satel-

lites that were used in the Ukrainian war), but it was his purchase of *Twitter*, completed in October 2022, that enabled him to become a global political player.

After Trump was reelected in 2024 for a second term, Musk's wealth shortly peaked to half a trillion (500 billion) USD in late December 2024, well superseding the GDP of over 140 nations. Musk his crucial role and support of Trump has also bought him direct influence in the White House when the latter took office in early 2025. Currently, Musk is a 'special government employee' and direct advisor to president Trump, and he has been tasked by leading the newly formed *Department of Government Efficiency* (DOGE), which has broad authority to reshape federal agencies, despite ongoing concerns about conflicts of interests (as he is still the CEO of several companies) combined with violations of congressional authority and federal laws. His enormous, blunt funding cuts, mass firings of federal employees (**purges**) and active rollback of regulations (by disabling regulatory agencies) are a form of **state capture** and seem to be paving the path for a self-coup by the Trump **ruling coalition**.

In economic terms, oligarchy finds its closest parallel in *oligopoly*, where a small number of dominant players control the market, operating independently and effectively sidelining competitors who cannot challenge them on equal terms. (Badie et al. 2011) While oligarchs are a type of elite, they are distinguished by their vast material wealth and the unique political challenges and capacities that come with it. Elites can hold power based on various resources, such as social status, expertise, or political connections, but oligarchs are defined primarily by their economic dominance (Ramos 2017; Gottfried 2019).

Overall, while the fundamental idea of oligarchy as ruled by a few remains consistent, its conceptualization as a regime type has shifted over time. From ancient city-states to modern nation-states, oligarchies have adapted to different sociopolitical environments, often intertwining with other forms of governance, such as democracy and communism. This evolution reflects broader changes in societal structures and ideologies, where democracy has become a global force, highlighting the persistent tension between concentrated power espousing elite interests and democratic ideals aimed at the common good.

KEY SIGNIFICANCE Oligarchy has been a persistent feature of human societies, appearing in various forms throughout history, from ancient Greece to the modern era. Analyzing oligarchy allows us to comprehend this enduring pattern of minority rule and its profound impact on societies over time.

Oligarchic tendencies pose significant threats to democracy and equality, even within ostensibly democratic systems. When a small group of wealthy individuals wields disproportionate power, they can manipulate policies and regulations to serve their own interests, often at the expense of the majority. This dynamic can exacerbate economic inequality as oligarchs skew systems to benefit themselves, resulting in widening gaps between the rich and the poor (Cameron 2020). Furthermore, public trust in democratic institutions may erode as citizens perceive these systems as rigged in favor of the wealthy, undermining faith in democratic processes (Foweraker 2021). Such conditions can also lead to political instability, as social unrest emerges from those excluded from power who seek to challenge the *status quo*.

Oligarchy has proven highly adaptable and takes on different forms depending on the context. Additionally, oligarchy is deeply intertwined with globalization and contemporary capitalism. The rise of globalized capitalism has created new avenues for wealth accumulation, enabling the emergence of powerful transnational oligarchs who operate across borders (Glassman 2021; Cameron 2020; Ramos 2017).

By uncovering the mechanisms through which oligarchic power operates, the study of oligarchy highlights potential threats to democratic values and offers insights into promoting greater political and economic equality. It remains an essential area of inquiry for those invested in safeguarding the health and future of democratic societies.

LITERATURE Several recent overviews of oligarchy have been published in the last decade: Simonton 2017 (for the classical Greek model); Gottfried 2019 (on oligarchization in democracies); Foweraker 2020 (on a comparison of the US and Latin America). Winters (2011) remains a foundational work. Older regional studies are Ramseyer & Rosenbluth 1995 (on Japan), Winters 2012 (on Southeast Asia), and Johnson 1970 (on medieval China). Besides these comparative works, interesting case studies abound: Mendoza et al. (2022) comparing two snapshots of the Philippines in the 1970s and 2020s; Zhu (2022) on contemporary China.

CLASSIFICATIONS Even when seldom defined specifically, oligarchy has never gone out of fashion as an analytical concept. Subclassifications are useful, and below, one finds a selection of the most relevant approaches from the mainstream literature.

Jeffrey A. Winters categorizes oligarchies into four distinct types based on the methods oligarchs use to defend their wealth, particularly their level of personal involvement in coercion and the extent to which their rule is fragmented or collective (Winters 2011).

The first category, (i) *warring oligarchies*, is characterized by oligarchs who are directly armed and personally engaged in violence to protect their wealth. Their rule is highly fragmented and personalist, with examples including Appalachian feuding families and the 'Wild West' cattle barons. In contrast, (ii) *ruling oligarchies* involve oligarchs who still play an active role in defending their wealth and governing but do so collectively rather than individually. This type of oligarchy often operates through institutions controlled by the oligarchs themselves, as seen in the Roman Republic before the rise of emperors, medieval Italian city-states dominated by merchant oligarchs, and Apartheid-era South Africa (Winters 2011). *Sultanistic oligarchies* (iii) represent a system where a single oligarch monopolizes coercive power,

often disarming other oligarchs and relying on personalist rule and patronage networks. The ruler's authority is tied to protecting the collective wealth of the oligarchic class. Historical examples include Roman emperors after the fall of the Republic, as well as modern cases like Haiti and Afghanistan. Finally, *civil oligarchies* (iv) are defined by disarmed oligarchs who do not directly govern but instead defend their wealth through influence over impersonal state institutions. Their focus lies on income defense mechanisms, such as shaping tax policies or regulations. Winters argues that many contemporary democracies, particularly the US, exhibit features of civil oligarchy (Winters 2011).

Moreover, Winters (2011) exotically discerns between 'wild' and 'tamed' oligarchies. Wild oligarchies are marked by instability, violence, and frequent power struggles among oligarchs, often lacking institutionalized mechanisms to resolve conflicts or maintain order. In contrast, tamed oligarchies are more stable and institutionalized, with systems in place to manage conflicts among oligarchs and preserve their collective power. This stability can result from internal self-regulation within the oligarchic group or external pressures exerted by a stronger state or international actors.

Some contemporary scholars identify oligarchic authoritarianism as distinct regime types where a small, wealthy elite is in control. Bratton and van de Walle (1994) developed a typology of African political regimes, in which he identified two oligarchic types: Settler oligarchy (a) and military oligarchy (b).

A *settler oligarchy* (a) is a political system that resembles an exclusionary democracy, emerging in regions where European settlers gained autonomous control of the state, such as parts of Latin America and Africa. These regimes are characterized by the dominant settler group using legal frameworks to exclude ethnic majorities from political participation, typically through restrictive voting rights and emergency legislation. Despite this exclusion, settler oligarchies allow significant political competition within the settler population, making them both exclusionary and internally competitive. South Africa is a prominent example, alongside several other countries in eastern and southern Africa, with a settler colonial legacy (Bratton & van de Walle 1994),

Military oligarchy (b) is one of four variants of **neo-patrimonialism** (personal dictatorship, military oligarchy, plebiscitary one-party systems, and competitive one-party systems). It is a form of exclusionary regime in which elections are suspended, and power is concentrated in a ruling elite, typically a junta or committee, rather than a single leader. While decision-making is collective and may involve civilian advisers, political participation is severely restricted, with bans on parties and civic organizations. These regimes rely on force to maintain control, facing crises of legitimacy due to unmet economic promises and limited public support. Transitions to civilian rule are often managed from above, with weak opposition unable to challenge the regime's timetable. Examples include Ghana under Rawlings and Nigeria under Babangida (Bratton & van de Walle 1994).

Geddes (2003) treats oligarchies as a subtype of **single-party regimes** in their typology and corresponding dataset (**Geddes, Wright & Frantz**). She defines oligarchy as a political system characterized by extremely restricted suffrage and, in some cases, less institutionalized systems where executive power is often seized by force, although elections may still occur following these power seizures. In her framework, the defining feature of oligarchies is not necessarily the method of selecting executives but rather the presence of public and organized elite political competition structured into somewhat stable blocs. This distinguishes oligarchies from despotic regimes, where political competition occurs solely within the ruler's inner circle. Thus, periods are considered oligarchic if elite competition is visible and organized into stable factions rather than being entirely hidden within the ruler's entourage (Geddes 2003).

Kailitz (2024) similarly treats 'electoral oligarchy' as a more exclusive form of 'semidemocracy' (a type of rule without universal (male and female) suffrage) that was designed by elites to capture regimes such as Apartheid-era South Africa, where entire racial groups were excluded from the electoral process.

Patrimonialism

Uneasy lies the head that wears a crown
– Shakespeare, Henry IV

In Max **Weber's** understanding, patrimonialism is (like its more extreme form, **sultanism**) a type of **traditional rule**, more complex in scope than kin-based patriarchal systems, manifested as a personalist political system where a polity is ruled as the personal property of the incumbent, using these to dominate power relations.

This system of rule is characterized by the presence of administrative staff, in contrast to less complex familial systems (without staff) like *primary patriarchalism* (households characterized by (male) hereditary rule) or *gerontocracy* (characterized by rule by elders) and foremost by a leader's dominant power relation *vis-à-vis* this group. (Note that *gerontocracy* can also emerge in non-familial contexts – Box 1.12).

SEE ALSO This subtype of **traditional rule** in Weber's typology of **rulership**, together with its more extreme form (**sultanism**), constitutes the basis for later concepts like **neo-patrimonialism** and **neo-sultanism** and for the study of modern dictatorships. Many of its defining characteristics, like **prebendalism** and personalism, were also operationalized as analytical concepts and played a role in shaping terms like **personalist rule**, **kleptocracy**, and **clientelism**.

DEFINITION In the patrimonial ideal type, all power relations between ruler and ruled are personal relations. The polity is the personal property *(Patrimonium)* of the ruler. This 'patron' bestows gifts from public and private resources on followers to secure their loyalty. The administrative costs of governance are thus either covered directly by the leader from the central treasury or indirectly by granting 'benefices' (e.g., endowments or land estates with support staff as income) or offices (yielding revenues by managing taxation – cf. **prebendalism**) to followers in exchange for their service.

Patrimonial rule is characterized by: (A) the method of selection and background of the inner circle; (B) its patrimonial bureaucracy; and (C) its civil-military relations.

Inner Circle (A) – In Weber's understanding, patrimonialism develops from a patriarchal structure through an extension of the chief's family household (οἶκος – *oikos* – from Old Greek: 'house' 'family' and 'familial property'). This *patriarchalism* retains its traditional source of **legitimacy** ('the natural right to rule'), but the ruler's relation to the staff and the latter's nature are different (Guliyev 2011: 577). Personal relations with the ruler determine which followers are included in the **inner circle**. Unlike other traditional forms of rule, a ruler's discretion is very pronounced in patrimonial regimes and unbridled under sultanism. In the former, the ruler has to take into account traditions, customs or previous arrangements and adhere to the prevalent hierarchy (class, caste, etc.) among his subjects when selecting candidates to assist him in ruling. Under its extreme form, **sultanism**, the leader has full discretion and is no longer bound by tradition when selecting staff.

Patrimonial Bureaucracy (B) – Regarding the nature of the administrative staff in patrimonial systems (b) this group is no longer made up solely of traditional associates (kinsmen, (freed) enslaved people, domestic officials, clients) from the ruler's household, but they are also recruited 'non-patrimonially' from among personal favorites, vassals (owing fealty), and from (specialized) officials that have entered the ruler's service voluntarily (cf. **bureaucracy**). So even when staff may be placed in a seemingly orderly bureaucratic format, they are either unfree officials (enslaved people or dependents) or bondsmen, i.e., the holders of 'benefices' – offices with attached revenues or endowments – which the ruler transfers at his own discretion (Weber 2016: 349, 359).

Note that Weber distinguishes more forms of rents and that granting 'fiefs' (*Lehen* – land estates

that include delegating governing powers, like in feudal systems, may, in time, actually diminish true patrimonial power. Once military lords are given economic governing power over a ruler's estates in reward for their service, their obedience to the ruler can only be contractually enforced, reducing the traditional supremacy of the ruler when fiefs become hereditary and their personal bond *(Verband)* more hierarchical (Poggi 1988: 215-224).

The relationship between patrimonialism and feudalism (Box 1.14) is difficult to assess since Weber revised this topic in later versions (Zabludovski 1989b; Sell 2017). For more on Weber's interpretation of 'feudalism,' see Murvar 1964; Poggi 1988. Note that the applicability of the concept of feudalism to (Western) history itself remains disputed (Reynolds 2012).

A ruler's monopoly on political power, judicial supremacy, and discretion in bestowing (and removing) economic privileges determines the degree of the patrimonial system of rule. *"With full patrimonialism there is a complete separation of the administrator from the means of administration."* (Weber 2016: 364).

While Weber stresses the unequal power relation between a ruler and his staff and the economic logic that flows from this, he does not particularly highlight the patrimonial ruler's incentives to foster division and competition among the staff – a key dynamic that can also be found in **personalist rule** and the study of **coup-proofing**.

"Whenever possible the ruler tried to avoid monopolization of offices by groups that had status by appointing people dependent on him. (…) Administrative functions might be split among officials to prevent any from becoming too powerful. New or special tasks were given to favorites. Officials were appointed only for short terms. The office of military commander was separated from that of the tax collector or tax farmer. Officials were excluded from areas where they had relatives or where they owned land or were natives, and they were continually transferred. Spies and controllers (…) supervised them. Competition was encouraged between provinces and among officials. Competing offices might be created in the same district." (Curtis 2009: 276-277).

Often, members of the 'patrimonial bureaucracy' are granted some rights to govern parts of the *Patrimonium* on behalf of the ruler. In patrimonial systems, such a necessary exchange limits a ruler's discretion in selecting administrators from among the appropriate classes, and thus, the staff tends to belong more to the group of 'traditional associates' *(Genossen)* like in other forms of traditional domination. In its more extreme form, sultanism, the ruler has almost complete discretion in selecting, promoting and firing staff; here, the latter is fully reduced to the level of subjects *(Untertanen)*. Like in other pure types of traditional rulership, a patrimonial administrative staff does not have specifically delineated competencies, a fixed rational hierarchy, a system of regular appointments (and promotions based on merit) or specialist training (as the norm). Also (often) a fixed salary or even payment in money is missing.

Civil-Military Relations (C) – The power relations between ruler and followers also characterize patrimonial rule. In other (simpler) systems like *patriarchalism* or *gerontocracy,* rulers remain dependent on the wish of the members of the extended household to obey them by virtue of tradition. Rulers have no other way to enforce this. In contrast, patrimonial rulers possess their own repressive capacities: Besides some real traditional legitimacy, authority is enforced by administrative staff and military elements (**mercenary** bodyguards and patrimonial (slave) armies, cf. **presidential guards**) tied to the regime by personal ties and rents. Such a personal army was equipped and maintained out of the supplies and revenues belonging to the ruler (Curtis 2009: 281). This monopoly on repression allowed rulers to enforce obedience on other subjects. As this pillar of power is personally linked to the ruler, a separate community of interests coalesces around the ruler, which is opposed to that of its other subjects: *"Through these powers, the ruler extends the scope of grace and favor – of arbitrary rule free of tradition – at the cost of the traditional dependence associated with patriarchy and gerontocracy."* (Weber 2016: 306-361).

In order to keep control over his staff, a ruler needs to ensure the loyalty of his private army and to avoid that, benefices become hereditary, resulting in feudalism and a decentralization of supreme power. Weber still considers feudalism as a traditional form of rulership, but by nature, more oligarchic: *"Feudalism is domination by the few who are skilled in war; patrimonialism is domination by one who requires officials for the exercise of his authority."* (Bendix 1960: 364; Allen 2004: 104). Also, the more this traditional system of rulership tilts toward hierarchical rule, the more personalist power becomes restrained. The formation of a clear hierarchy of administrative staff – in other words, a shift toward legal-bureaucratic rule – restricts a ruler's discretion to select staff, appropriate posts, or retain the monopoly of power since power diffuses when individual staff members can secure the material means of administration in respect to the office they hold, as well as the related power of command to execute their function.

When it comes to survival, patrimonial regimes are thus vulnerable to military defeat or the sudden death (incapacitation) of the leader, which can jeopardize the personal connection between the supreme power holder and its armed forces. The inability to pay (to provide rent and pay his army) could force a patrimonial ruler to grant military commanders offices with taxation privileges, undercutting his power to act as a broker. Preventing staff from building up their power bases is thus a paramount concern in patrimonial polities, but the issue also has a geographical component: Territories near the center of power could be directly administered by the patrimonial bureaucracy. However, outlying provinces were often administered by (carefully) selected governors, who ruled in a patrimonial fashion themselves, exercising strong powers of their own. When servants became too numerous and more organized, they could limit the authority of the ruler by demanding contractual arrangements (Cur-

tis 2009: 274-275).

CLASSIFICATIONS There are two ways of sub-classifying patrimonialism: (A) Along its dimension of legitimacy, where the pure type can be found alongside the subtype of **sultanism** with a diluted traditional legitimacy and more personal discretion for the ruler – cf. Box 1.13 on Kadi Justice. (B) Moreover, according to its organizational dimension, where Weber distinguishes between (a) *patrimonial prebendalism* and (b) *patrimonial feudalism*.

The former (a) is the pure, traditional form, where rulers enlist staff by offering them 'prebends' for their upkeep (cf. **prebendalism**). Prebends are non-hereditary offices providing revenues and can be reassigned according to the ruler's whim or grace. Often, rulers and their retinue travel the *Patrimonium* as an itinerant court to exert better control. The second system (b) creates a stationary order *(ständische Gewaltenteilung)* of fief holders (estates), rendering bondsmen into a landed elite as their fiefs become hereditary, resulting thus in more centrifugal power relations with a capital city (Sells 2017: 321-326; Bevir 2007; Poggi 1988: 215).

Weber revised his classification of patrimonial subtypes in later editions, leading to much confusion. Some scholars follow Weber's early writings, where feudalism equals estate-type patrimonialism. Others base their interpretations on his later versions, where (full) feudalism is considered a different (non-patrimonial) form of traditional rulership. Until today, there is much confusion about how to separate the concepts precisely, but G. Zabludovsky (1989b) and C.E. Sell (2017) expose these inconsistencies.

KEY SIGNIFICANCE It is difficult to overstate Weber's influence on comparative politics. (Anter & Bruhns 2020) His ideal types have influenced scholarly thought and almost all academic writing on the nature of political regimes and legitimacy. Weber's concept of patrimonialism is most significant for the later study of informal dimensions of statehood: **neo-patrimonialism**, based on his study of 'patrimonial bureaucracy' while its aspects of personal power relations have influenced later interpretations of **neo-sultanism** and **personalist rule**.

ORIGIN Weber credits the self-taught Swiss jurist and statesman Karl Ludwig von Haller (1768-1854), who's influential work *Restauration der Staats-Wissenschaft* (published in six volumes in 1816-1834) elaborates on patrimonialism. This major work by Haller (1834), titled in full as: *'Restoration of Political Science: Theory of the state of natural sociability opposed to the chimera of an artificial civil state'* even lent its name to the 'Restoration' period (a reactionary phase against the French Revolution starting at the end of Napoleon's rule in 1815, lasting until the revolutions of 1830). Haller's motive is to refute the idea of the French Revolution being a liberation from illegitimate oppression. He criticizes the ideas behind the **revolution** and especially Jean-Jacques Rousseau's anti-monarchical treatise: *The Social Contract* (*du contrat social* – 1762), which Haller holds responsible for instigating the chaos and anarchy in Europe after 1789 (Kapossy 2017; Kruska 2021).

Haller derives the concept of patrimonialism from the *patrimonium populi* (public or state domains), the so-called princely domains of individual lords in ancient Roman times. Like with other judicial concepts from Roman law, Haller argues, these legal terms were applied erroneously to different circumstances by later scholars, leading to confusion about the natural (legal) order of monarchic rule. Haller thus tackles the legitimacy aspects (as does Weber) and was the first to identify that patrimonialism was a natural extension of the household ruled by a patriarch, thereby giving natural precedence to such private law (over public law). For a nuanced analysis of Haller's writings and the criticism he received, consult Kapossy 2017.

LITERATURE Among the many works covering Max Weber's writing, Iván Szelenyi (2016) provides a useful summary of Weber's defining characteristics of traditional rule (but confuses Weber's stance regarding sultanism). Vatro Murvar (1964) expands on the nature of Weber's 'ideal' or 'pure' type classification, covering traditional rulership in quite some depth. Michael Curtis (2009) is a must-read for a thorough review and critique of patrimonialism. Kieran Allen's (2004) short introduction to Weber provides valuable insights into traditional rulership in general. Carlos Eduardo Sell (2017) is most comprehensive in addressing how the concept evolved during Weber's various redactions of his (own) works.

MEASUREMENT In Weber's words: *"An absolutely ideal typical purely patrimonial state has never existed"* (Weber 2016: 368), and the defining aspects of patrimonialism remain difficult to benchmark: (a) The ruler has traditional claims to power and is largely supported by a traditional elite hierarchy. (b) His relations with his followers are patriarchial personal relations. (c) The regime must possess a 'patrimonial bureaucracy' and a 'patrimonial army', and therefore the ruler must have control over public and private resources to sustain such organizations and uphold his uneven power relation to them.

EXAMPLES Weber himself presents several examples of patrimonialism (stretching back to ancient Egypt, Rome and Byzantium) but compares them in a rather anecdotal and unsystematic way. His examples of pre-modern India, China and Japan as patrimonial systems have attracted much criticism. Many later scholars have undertaken various attempts to reevaluate Weber's original examples empirically. Just to mention a few: For South Asia, N. Abbot (2018) studied the patrimonial-bureaucratic state in the Mughal Empire (1526-1720), tracing the institution of *'Sarkār'* (an elite household with military and administrative appendages). For East Asia, G. Hamilton (1984; 1990), A. Eisenberg (1998), and Junnan Lai (2015) reappraised his take on Qing China (1644-1911); N. Jacobs (1964) covered pre-modern Japan. N. Naderi (1990) criticizes Weber's orientalist approach to Islam and Islamic societies in the pre-modern Middle East. Almost all these reviews point to Weber's

misrepresentation of non-Western cultures, i.e., his understanding of *Kadi* justice – Box 1.13.

METHODOLOGICAL ISSUES In his treatise of patrimonialism Weber has received various counts of criticism for his Orientalism. He alluded to the racial superiority of the West (with its modern **bureaucracy**) and compared the Occident and Orient on their achieved level of capitalist development (rational vs. irrational). Weber admitted being deeply motivated to find explanations for the cultural disparity he witnessed in the East, where the lack of a feudal aristocracy, independent clergy or entrepreneurial middle class never brought forth modern legal-rational states, like in the West (Murvar 1964: 378). Defenders of Weber argue that he never posited an 'essentialist' position in his writings: While he did consider religion to be a significant factor in explaining legal irrationality, absence of a free market, or lack of autonomous cities in different societies, Weber never considered it the only cause, instead pointing to patrimonialism (Curtis 2009: 297).

Kieran Allen (2004: 104-106) exposes Weber's ruler-centric vision on two accounts: (a) His sexist perspective: In all traditional systems, the patriarchal household is the archetypal center of authority for all (political) relations, and Weber completely blindsides the role and function of women in familial systems of governance, instead accepting patriarchal dominance as natural, primordial and static (existing from time immemorial). (b) His elitist perspective: The peasantry is completely ignored, and his focus is kept firmly on the 'apex of the feudal pyramid.' *"There is no discussion on why the mass of the population obeys the knights and kings. It is assumed that they accept feudal society as legitimate because their landlords do."* (Allen 2004: 106).

REGIONAL VARIATION Latin America is the only continent where patrimonialism has been consistently used as an analytical frame to study regime types. Gina Zabludovsky (1989a) provides an excellent literature overview on the use of the concept in Latin America, where scholars have applied it to *Nueva España* (the Viceroyalty of Spain) and other successor states of Iberian colonialism. She covers the approaches of important English works like Morse 1964; Malloy 1976; and influential works in Spanish by: Semo 1973; Florescano & Gil Sánchez 1976; Paz 1982; Pietschmann 1982. Furthermore, she exposes their weaknesses (the transplantation of 'oriental' concepts for Latin American realities, lack of conceptual clarity and wrong use of ideal types; the absence of clearly demarcated historical periods) resulting from older translations of Weber's *Economy and Society* and unequal access to his other writings (Zabludovsky 1989a: 60-64) Other authors applying the concept are: Sarfatti 1966; Osiel 1986; Oszlak 1986; and specifically, to Brazil: Uricoechea 1980; Roett 1984.

OTHER LANGUAGES Brazil hosts the only academic community where patrimonialism has become a permanent conceptual feature in sociology. Carlos Eduardo Sell (2017) provides a short overview on this Brazilian debate. More can be found in Portuguese: J.M.D. Carvalho (1997) elaborates on the confusion of terms in Latin America. R.G. Campante (2003) tackles the misinterpretation of some of Weber's terms by the renowned Brazilian scholar Raymundo Faoro (1925-2003) in his magnum opus *Os Donos do Poder: Formação do patronato político brasileiro (The Owners of Power: The Formation of Brazilian Political Patronage)* from 1968.

In Russian, historian N.A. Omel'chenko analyzes the 'modernizing' reforms of Russia's court administration by Tsar Peter the Great (1672-1725) using patrimonialism to capture this new bureaucratic system based on personal loyalty, which shifted Russia away from legal-rational rule, rendering its patrimonial bureaucracy ineffective and dependent on political power. (Омельченко 2021)

NEW FRONTIERS Some studies reappraise the concept by applying it solely to monarchies, thus acknowledging its traditional legitimacy roots. D. Woods (2012) criticizes the neo-patrimonial derivative by going back to Weber's original and applying it to study elite relations and royal legitimacy in Swaziland. E. McDonagh (2015) applies patrimonialism to study the monarchical origins of the (Western) welfare state, positing that these emerged from earlier forms of *familial government* and that the family-state perspective is an understudied dimension in state formation studies.

A rare innovative approach is William P. Murphy's (2003) anthropological work on child soldiers (Box 8.5) in western Africa. He applies patrimonialism to analyze the client-patron system of military commanders and child soldiers in Liberia and Sierra Leone. This new approach goes beyond earlier frames that look at child soldiers solely as revolutionary rebels, coerced victims or delinquent opportunists and considers them as 'patrimonial staff' providing both military and administrative services in rebel-captured areas in exchange for protection and prebends, bound by patriarchal personal relations to their 'big man' commanders.

A recent appraisal of patrimonialism regarding the legacies of empires can be found in the special issue (2011) and book (2015) edited by M.M. Charrad & J.P. Adams. In both works, various authors try to untangle patrimonialism, bureaucracy and modernity. These two works offer chapters with a wide geographical coverage of world empires and cases, ranging from Sub Saharan taxation systems to studies of sub-national networks like gangs, mafias and crime rings – applying its analytical lenses of kinship ties, 'local patriarchalism' in institutions, and imperial legacies.

Box 1.12 Gerontocracy: Old Guards, Feeble Fists

Clearly, ours is an age of gerontocracy. If advancing years meant growing wisdom, today's generation would be more wisely ruled than any of our ancestors.
– Dankwart A. Rustow (1964)

Gerontocracy, at its essence, reflects a system of governance where older individuals hold disproportionate political power. It has been a recurring phenomenon across different historical and political contexts. (The Roman institution 'senate' is related to the Latin word *senex*, meaning 'old man.')

Gerontocracy was definitely the buzzword of the first part of the 2024 US election as an octogenarian, and a septuagenarian dueled it out over who was the most vigorous. Both Joe Biden, at 81, and Donald Trump, at 78, were among the oldest individuals to ever run for and hold the US presidency. This has sparked widespread debate about whether they are too old to continue serving in one of the most demanding jobs in the world. (Ng & Indran 2023) As the election proceeded, and every 'senior moment' was magnified in the press and on social media, pressure mounted on President Biden to drop out of the race (for his second term), which he reluctantly did in favor of his vice president, Kamala Harris.

His initial refusal to withdraw is blamed as one of the main causes why Harris did not win the electoral race (i.e., her campaign was too short, and since there was little time before the elections, her candidature was more imposed by the top leadership than elected by the Democratic Party, etc.). Also, Harris faced significant challenges in her campaign, unable to criticize to the unpopular incumbent President Biden. She struggled to articulate a distinct political vision, instead focusing on arguments against Trump's fitness for office. This strategy backfired as voters grappled with perceptions of rising inflation and economic concerns, which they attributed to the Biden administration – of which Harris remained a part. Trump, benefiting from a incumbency advantage (Box 8.2) and new support from tech billionaires, ultimately secured the electoral victory.

One of the narrower definitions refers to a system where political power is explicitly reserved for older individuals. This form of direct rule by elders is seen in historical examples like ancient Sparta's *Gerousia* (γερουσία – the council of elders), where men over the age of 60 held legislative and judicial authority. (Ng & Indran 2023) Similarly, pre-colonial African age-set societies often conferred leadership roles to elders, reinforcing formalized gerontocratic structures. (Magni-Berton & Panel 2021; 2022)

While the system has been very biased in favor of male elders, there are some counter-examples: In the Haudenosaunee Confederacy (or Iroquois Confederacy), *Clan Mothers*, as part of the matrilineal society, were responsible for selecting male leaders, known as *sachems* or chiefs, to represent their clans in the *Grand Council*. If a chief failed in his duties or acted against the clan's interests, the *Clan Mothers* had the power to 'de-horn' him, effectively removing him from leadership after issuing three warnings. This system ensured that female elders played a central role in maintaining political accountability. (Atkins & Grant 2024)

A broader definition encompasses systems where older individuals exert disproportionate influence over political processes without necessarily holding all leadership positions. This influence can stem from higher voter turnout among older citizens or their stronger engagement in political organizations. In this context, gerontocracy may not be codified but manifests through the over-representation of older individuals in decision-making roles due to their perceived wisdom and experience. This is related to the economic policy preferences of older voters in democracies. As populations age, older voters become a larger proportion of the electorate, prompting governments to prioritize policies that cater to their interests – such as pensions or low inflation – at the expense of policies that might benefit younger generations or foster long-term economic growth. This form of gerontocracy highlights the impact of demographic shifts on policy-making rather than formal political structures. (Berry 2012.; Atella & Carbonari 2017; Atkins & Grant 2024)

The term was first coined in 1828 by French pamphleteer Jean-Jacques Fazy as a critique of the aging French parliament. Since then, it has carried a negative connotation, often used to criticize the over-representation of older politicians who are perceived as resistant to change or disconnected from younger generations' needs.

Historically, gerontocratic systems have appeared across diverse cultures and periods. Besides Sparta's *Gerousia*, in Renaissance Venice, although there were no explicit age-based rules for political office, power was concentrated within older elite families, demonstrating how gerontocratic tendencies can emerge even without formal mechanisms. (Magni-Berton & Panel 2021; 2022).

Pre-colonial African societies also provide examples of gerontocracy through their age-set systems. Members of an age set typically undergo initiation ceremonies together and progress through different stages of life as a cohesive group. The system often dictates specific roles, duties, and privileges that correspond to the group's stage in the life cycle. Among communities like the Samburu in Kenya, elders held considerable authority in decision-making processes. Similarly, Indigenous Amazonian tribes practiced gerontocracy by giving elders central roles in governance. These examples highlight how gerontocracy has been intertwined with social structures and traditions across different regions. (Adebayo 2018)

In kinship-based societies and agrarian societies with lower life expectancies, elderhood was often associated with high status due to the perceived wisdom that comes with age. In these contexts, gerontocracy likely emerged as a natural consequence of societal reverence for experience and knowledge accumulated over time.

For contemporary regimes, gerontocracy differs significantly between democratic and non-democratic polities due to variations in political processes and power

dynamics.

In democracies, scholars examine why voters might prefer older candidates. One common explanation is that older politicians are perceived as more experienced and competent than their younger counterparts. This preference for experience is particularly pronounced during times of crisis when stability is prioritized over innovation. Additionally, older voters tend to participate more actively in elections than younger citizens, leading to an over-representation of their interests in policy-making processes. Additionally, retirees tend to have more homogeneous policy preferences compared with working-age populations whose interests may vary depending on factors like employment status or family responsibilities. (Berry 2012.; Atella & Carbonari 2017; Atkins & Grant 2024).

In contrast, research on autocracies focuses on elite politics rather than voter behavior since elections either do not exist or are heavily manipulated. Scholars investigate how leader **age** affects regime stability and **succession** planning within **ruling coalitions**. In many autocratic regimes (without **term limits**), selecting an older leader can be a strategic move designed to manage succession risks by limiting potential power struggles among elites. By choosing an aging leader with a shorter life expectancy, ruling coalitions can maintain control over succession processes while reducing uncertainty about future leadership transitions. (Magni-Berton & Panel 2017)

The connection between gerontocracy and peace, particularly in autocratic regimes, posits that older leaders may promote stability by naturally limiting their time in power. This concept, known as 'alternation through death,' suggests that the shorter life expectancy of elderly leaders creates incentives for **opposition** groups to wait for a leadership change rather than resort to violence. Drawing on the minimalist theory of democracy – which argues that elections reduce civil conflict by offering peaceful transitions – gerontocracy is seen as a functional equivalent in autocracies where elections are absent or manipulated. Historical examples support this theory: Venice under elderly Doges was an exceptionally stable polity, where a Doge entered office at age 68 on average, compared with 33 for European kings during the same period (Eisner 2011). Also notable are the reduced elite struggles in the USSR after Stalin when a series of seniors took the highest office: Khrushchev at 59 years, Brezhnev at 58, Andropov at 68, and Chernenko at 73 (all heavy smokers). Empirical evidence further indicates that non-democratic regimes led by older dictators experience fewer violent rebellions than their counterparts run by young autocrats. However, this effect is contingent on factors like the type of rebellion and the institutionalization of succession. While gerontocracy can reduce external conflicts, it may also provoke internal power struggles among potential successors and hinder long-term policy planning. (Magni-Berton & Panel 2018)

Box 1.13 Kadi Justice: A Weberian Prejudice

Max Weber's misrepresentation of 'Kadi justice' has often been borrowed without due reflection. **Weber** argued that a combination of rigidity, arbitrary decision-making, and traditionalism characterized Islamic law. He identified several sources of Islamic law, including the Quran, legal specialists *(faqih)* in Islamic jurisprudence who formed the four major schools of legal jurisprudence (the Hanafi, Maliki, Shafi'i, and Hanbali schools), and what he termed 'Kadi justice,' (a *Kadi* (*Qadi* or *Kazi*) was a judge who adjudicated these forms of law and offered his interpretation if there was no or little legal precedent to fall back on).

Weber borrowed the term 'Kadi justice' from the German scholar Richard Schmidt to describe what he saw as informal, subjective judgments made by judges (kadis) based on ethical or practical valuations rather than formal legal rules. In Weber's view, when individual cases could not be decided by tradition or revelation, Kadi justice came into play. He argued that this form of justice lacked rational rules for decision-making and was marked by arbitrariness and unpredictability. As a result, Weber claimed that in societies where religious courts had jurisdiction over land disputes, economic development – particularly capitalist development – was hindered due to the uncertainty surrounding legal decisions.

However, this interpretation of Kadi justice has been critiqued for oversimplifying and misrepresenting the nature of Islamic legal practices. While Weber emphasized the unpredictability and arbitrariness of Kadi justice, many scholars argue that Islamic jurisprudence was far more nuanced and structured than Weber acknowledged. In reality, Islamic judges often relied on well-established legal principles derived from both the *Quran* and *hadith* and their decisions were shaped by centuries of legal thought developed within the various schools of Islamic law. Moreover, Weber's comparison between Islamic law and Western legal traditions – including his portrayal of canonic law as a model for secular law – can be seen as part of a broader Eurocentric narrative that contrasts 'rational' Western legal systems with 'irrational' non-Western ones. This binary overlooks the sophisticated legal mechanisms present in Islamic societies and fails to account for how Islamic law adapted to local contexts and social needs over time.

Patronalism (Henry Hale)

The corruption of the best things gives rise to the worst.
– David Hume

God provides, but he needs a nudge.
– Persian proverb

Patronal politics place the **informality** of dictatorships' power politics at the center stage of analysis. Henry Hale developed this theoretical frame based on earlier conceptions of **patronage**, **clientelism** and **neo-patrimonialism**. It mostly concerns the power struggle within regimes, a dictatorship's grip over the state and its resources, the **personalization** of power and the transition when an **incumbent** becomes a lame duck (see Box 3.14).

DEFINITION Patronal politics can be defined as a network of political actors with a pyramidal hierarchy of chiefs (patrons) and subordinates (clients). This network provides the exchanges of goods, services and, in the case of politics, political functions and protection (cf. **patronage**). Higher-positioned patrons dole out rewards in exchange for their clients' loyalty but can dismiss them as a punishment depending on the actual situation in power politics. This setting often creates sub-patronal systems of high-positioned officers (in the state), economic oligarchs, tycoons or social authorities (sub-patrons). They create their own power pyramids that can compete with each other for access to the supreme leader (president, dictator, director) or, generally, any higher-positioned patron. Henry Hale (2015: 10) calls this a *competing-pyramid system*.

Patronal politics are highly informal and personalized; the patron-client networks are usually acquainted with each other or, at least, connected

through the mediators within the network (Hale 2015: 9). Patronal politics emerge in both democratic and authoritarian regimes. In the latter case, the institutions and formal political systems are weakened by a high level of informality that opens the way for patronal politics. The patron-client network implicates hierarchical relations and is usually performed from 'behind-the-curtain' politics. A patron can influence a group of people, such as classmates, family, clans, tribes, or oligarchs or through informal relations within political parties or others using their power and available resources.

SEE ALSO This theoretical framework differs from categorical ways of **classifying political regimes and rulers** because it does not aim to subdivide political regimes into certain types but rather identifies the baseline (reciprocal) dynamics for all political regimes, even democracies. As shown below, the concept shares similarities with **patrimonialism**, **neo-patrimonialism**, **systemic corruption, informality, nepotism** and **clientelism**. It is mostly applied to Eurasia and has been used to untangle various elite dynamics behind **color revolutions**.

ORIGIN Patronal politics is derived from different disciplines and concepts of informality. The research on informal politics (Helmke & Levitsky 2006), patronage or patrimonialism usually refers to Max Weber's *Herrschaft* (**rulership**) and the concept of the state's **traditional rule** and authority of the state, i.e., **patrimonialism** (Weber 2019). In the 1970s to the 1980s the concept of **neo-patrimonialism** developed from Weber's patrimonial state (Eisenstadt 1973). The concept became crucial to interpreting African postcolonial politics in the 1980s and 1990s (Bratton & van de Walle 1997) and was also adapted to the post-Soviet states after the fall of the Soviet Union (Laruelle 2012). In parallel, the concept of 'corporatism' in politics was discussed in Latin America (Camp 1998). The concept of **clientelism** became one of the crucial 'brotherhood' approaches to patronal politics studied by many authors and applied to different regions and states (Przeworski 1991; Kitschelt & Wilkinson 2007; Bueno de Mesquita et al. 2003; Stokes 2011). Finally, Henry Hale widened the term clientelism to include top-level politics, integrated its basic premises and laid the foundation for patronal politics theory (Hale 2015).

KEY SIGNIFICANCE The more hierarchical a structure and the tighter the relations remain in the power pyramid, the more such a political entity requires vertical informal relations based on patron-client networks. The closed authoritarian systems are often based on centralized **personalist rule** that creates one top pyramid encompassing all spheres of the particular country's political and/or economic system. The lower *pyramids* are limited in their scale and power, as demonstrated in the cases of Russia after 2022, Turkmenistan, North Korea, and others. However, in many societies, including democratic ones, horizontal patronal relations (i.e., between different patrons and their groups) are relatively common.

In dictatorships, it is the head of the regime posing and imagining himself or herself as the principal patron, while most of the other elites are merely clients who can create their own (sub-)patronal systems. However, their dismissal by the top level of patronal politics can lead to the collapse of the whole 'little' patronal pyramid. Such 'divide-and-rule' politics in dictatorships create the necessity for loyalty to secure the position of the highest 'patron' (Van den Bosch 2021a: 10-12, Acemoglu 2004). The dismissal of the top patrons (presidents, dictators, monarchs) usually takes place through unrest from below the patron-client pyramid (if repressive organs fail to contain it), from outside actors (external intervention, a clash of several groups) or from within the narrow circle of leader's entourage (**coups**). Henry Hale defines patronal politics as *"a social equilibrium in which individuals organise their political and economic pursuits primarily around the personalised exchange of concrete rewards and punishment through chains of actual acquaintance, and not primarily around abstract, impersonal principles such as ideological belief or categorisations."* (Hale 2015: 10).

After creating the patron-client network of mutual benefits, the group, the patron or the leader is highly interested in conserving their positions. Such networked societal groups are vitally concerned with maintaining the status quo they created. In this way, the patron (politician, informal leader, chief) receives support from their clients in exchange for providing the expected services and goods to their clients (Acemoglu et al. 2014: 361). The benefits may include jobs, opportunities to gain personal income, bribes, help with local problems, assistance to relatives, etc. On the other hand, the patron should also be able to control eventual disobedient or dissatisfied clients through explicit or implicit threats (Kitschelt & Wilkinson 2007: 281). The strength and efficiency of patronalistic networks thus depend on the self-fulfilling prophecy of group expectations, by which members *believe* that (i) patrons continue to have access to valuable *resources* for rewarding loyal members; (ii) patrons have the power to *enforce* punishment selectively on disloyal members, and (iii) patrons can *monitor* clients and sub-patrons (Hale 2015: 20-22, 31).

CLASSIFICATION The complex research of post-communist political systems pursued by Magyar & Madlovics (2020: 628) divides such authoritarian regimes into three principal categories based on the character of its decision-making process and (a) informal patronal, (b) bureaucratic patronal, and (c) non-patronal. They also distinguish between 'hard' and 'soft' patronal autocracies, providing Russia and Hungary, respectively, as examples of both types. In addition, they also introduce the term 'patronal democracy' conceptually located in between liberal democracy and patronal autocracy (Magyar & Madlovics 2020: 21, 64-67).

METHODOLOGICAL ISSUES Patronalism shows that societies need not be treated as static, and those networks excluded from patron-client relations might set up competitive groups to challenge the existing

order. A clash between existing networks and such challengers depends on the existing patrons' ability to keep their dominant position (often using connections within state authorities or repressive organs or by entering a coalition with other patron-client networks with aligning interests) to retain power.

Henry Hale (2015: 19-20) also points to the vicious circle of **systemic corruption** and nepotism (1.1) that encompasses the whole society *("if you are corrupted, I also have the right to be corrupted"*). It creates a mutually dependent nexus of relations within the society for which the inclusiveness into more robust patronal politics is more important and profitable, although members of the network can realize the ineffectiveness of such mutual dependency and bribe systems. System breakdown is a long-term process (Hale 2017: 31) in which several factors should be fulfilled, including the political reform-oriented will (legal as well as informal), societal changes (widespread support to reduce corruption), and eventually outside pressure or inducements (e.g., the perspective to enter attractive organizations – EU, NATO, etc.).

Patronalism thus lends itself to studying the internal dynamics of authoritarian regimes and focuses on their commonalities (their patronage politics), whereas other categorical ways of **classifying political regimes & rulers** usually aim to contrast cases and expose their differences. Politics in any regime is often complex and multifaceted, combining a mix of institutions and formal and informal practices that do not neatly fit together under a single or clearly delineated regime type (Junisbai & Junisbai 2019: 4). Regime classifications are static, gain empirical validity only after regimes have entered their consolidation phase, and are applied to study regime behavior at the top **executive** level, either domestically (*vis-à-vis* other societal actors) or internationally (*vis-à-vis* other states) (Van den Bosch 2021b). Patronalism has a broader scope and captures processes: Patronal networks go beyond the executive unit in states and can cross country lines. Still, the theory foremost serves to explain domestic power struggles within polities and renders this framework exceptionally well suited to analyze the process of regime emergence, consolidation or collapse.

IMPACT ON POLICY Patronal politics in autocracies where elections still play some role emerge via the election process and keep going by mustering the resources between election cycles to be re-elected again. These practices include the involvement of administrative resources (Афанасьев 1997) and financial and social capital in the form of incentives and other benefits to satisfy clients that are counted on to keep the system together (Kitschelt & Wilkinson 2007). Patronal politics in harsh and informal authoritarian regimes are also significantly determined by the composition of the **selectorate** and the leader's selection process. The mutual dependence of the leader and their supporters, clients or entourage in collegial authoritarian regimes or the one-sided dependency of these selectorate groups on the leader's decisions and caprices in **personalist rule** can be observed as a cornerstone of a regime's patronal politics.

LITERATURE & REGIONAL VARIATION The recent literature on patronalism is mostly based on several important books that were mostly focused on patronalism in the Eurasian (post-Soviet, ex-Soviet) area. Hale (2015) provided the fundamental definition and patronal politics based on the former Soviet Union countries. Bálint Magyar and Bálint Madlovics (2020) expand the analysis of patronalism and ambiguous transformation from **totalitarianism** on the whole post-communist bloc from Central Europe to China. The concept has been picked up in the Russian language (e.g., Рогов 2017; Уяма 2021), but the critical assessment of the post-Soviet area (and particularly Russia) encountered a sometimes-exaggerated critical response in Russian academia (Летняков 2020; Расторгуев 2023).

Personalist Rule

Cuncta ferit, dum cuncta timet
(He strikes everything, for he fears everything)
– Claudius Claudianus (ca. 370 CE – ca. 410 CE)

Oderint, dum metuant
(Let them hate me, so long as they fear me)
– Lucius Accius (170 BCE – ca. 86 BCE), *Atreus.*
(Often wrongly attributed to the tyrant Caligula, who liked the motto)

A personalist regime, or one-man rule, is a particularly vindictive form of autocracy where power is concentrated in the hands of one person or a small elite. These dictators hold such a dominant position that they are often seen as the embodiment of their regimes.

In 1988, personalist dictatorships accounted for 28 percent of the world's authoritarian regimes. By 2010, this figure had risen to 52 percent, establishing personalist dictatorship as the most prevalent form of authoritarianism. Similarly, the average level of personalism in dictatorships increased from 0.39 between 1946 and 1989 to 0.47 from 1990 to 2010. These significant increases demonstrate that personalist dictatorship is becoming more widespread, regardless of the measurement criteria used (Frantz 2024).

SEE ALSO Personalism has many faces: Not only is it the dictatorship type we identify most with tyrants, despots and strongmen – often notorious faces we recognize – but in the last thirty years, personalism, as a phenomenon, has been tackled from a myriad of angles (grouped here into four categories: I–V). This entry accounts for two of such approaches (I & II); others (III & IV) can be found under other entries.

Regime type (I) As early as **Plato & Aristotle**, personalist rule or its equivalent has been identified and delineated as a specific type of rule. Initially considered a **corruption** of righteous government, earlier concepts of **tyranny** and **despotism** do capture many (but not all) of personalism's defining features. However, the term personalism is a contemporary invention of the post-monarchical world, while tyrants and despots of pre-modern times were either rogue monarchs or usurpers aiming to install their own dynasties. This shift in defining personalist-tyrannical rule in non-monarchical **authoritarianism** started with J.J. Linz and his original conceptualization of **neo-sultanism**.

Dimension (II) A 'characteristic' or 'regime trait' that can be present in all **political regime** types, that can 'ebb and flow' within regimes as leaders attain absolute power, consolidate their regime and manage crises and **successions**.

Practice (III) An informal way of governing based on loyalty and personal ties, 'personalism' can be equated with Max **Weber**'s **patrimonialism** (or **sultanism)** and its contemporary, non-monarchical counterpart **neo-patrimonialism** as a governing style. Such systems of political **informality** are studied through different frameworks: **patronage**, **clientelism**, and **systemic corruption**.

Process (IV) The set of actions required to obtain personalist power within a regime – to capture this approach, a separate entry has been devoted to **personalization**. Scholarship on this exact process is relatively new and has coalesced around two focus points: (i) the personalization within political parties in democratic and electoral settings, a process often coinciding with **populism**, and (ii) the personalization of (already fully) authoritarian regimes (incumbent takeovers, either incremental or through *autogolpes* or self-**coups**). Both are forms of **autocratization**. The former (i) plays out the realm of 'executive aggrandizement' and is associated with democratic erosion; the latter (ii) is a specific process taking place in the **ruling coalition** of dictatorships in parallel to the larger trend of 'sultanization.'

Note that this four-fold approach is not the only way to map personalism. For instance, Guliyev (2011) interprets personalism through three levels: (a) ruler-level, (b) statist, and (c) as an institution-less polity, ordering these from 'thin' to 'thick' definitions (or from those with a few characteristics to

multi-faceted definitions).

Often, the concepts 'personalist rule,' 'personalism,' and 'personalization' are used interchangeably. As a purist, one can propose to clean up the technical nomenclature by reserving 'personalist rule' for the *regime type* (I) and for cases where the *practice* (III) is prevalent at the polity level. 'Personalist regimes' can denote those cases close enough to the ideal type or meet the categorical criteria, thus behaving as a distinct *regime type* (I). 'Personalism' then denotes the change in ruler-elite relations as an ongoing *practice* (III) within various political systems that drives the *process* (IV) of 'personalization.'

The **personalization** *process* (IV) itself has different stages, depending on the starting point of a (future) political leader. These correspond to three levels of analysis: (a) *within* political parties (still in democratic settings) and (b) in an autocratic but still collegial regime. Note that both 'a' and 'b' fall under **autocratization** but are located in different stages. Finally, (c) as a personalist regime taking over a whole polity (infesting non-regime institutions with systemic corruption, a process, for lack of a better word, that can be labeled 'sultanization').

These dictators are invariably called despots, tyrants and strongmen, although 'strongman' is often associated with a ruler's military background. Autocrat is also often reserved for those more unconstrained rulers. Monocrat also exists, but it is an older term (Gilissen 1970) that is occasionally dug up (e.g. Musella 2022). 'Big man rule' is an oriental moniker reserved for Africa. For *caudillismo* and *caciquismo*, see Box 1.10.

As a cherry on the cake for purists, Lioy (2023: 826) offers some more distinctions: The adjective *personal* refers to something 'related to an individual,' thus a 'personal (political) party' refers to a political organization associated with a specific individual. Likewise, the suffix '-ist' in 'personalist' denotes the 'state of being personal,' whereas the suffix '-ize' in 'personalized' signifies the act of making something personal, suggesting that the leader adapts or transforms the party (similar to how something is customized).

ORIGIN While it is unclear who first invented the term, the origin of personalism is obviously a logical continuation by those scholars familiar with definitions of **neo-patrimonialism**, developed by Guenther (Günther) Roth (1968), Aristide Zolberg (1966) and Shmuel N. Eisenstadt (1973), who coaxed the study of **patronage** and **clientelism** into the mainstream. They went beyond the question '*Who* rules?' and asked '*How* do they rule?' to capture its different nature. Later, R.H. Jackson and C.G. Rosberg (1982) – familiar with, but departing from Weber's original nomenclature – likely popularized the term with their seminal work *Personal Rule in Black Africa*. Because it was consistently adopted by S. Huntington, P. Brooker and B. Geddes, the term elbowed many older concepts out of the mainstream after 2000.

DEFINITION As stated above, this entry focuses on personalist rule as a *regime type* (I) and as a *dimension* of regimes (II). The third approach, as a *practice* (III), is covered by various other entries. The *process* of power acquisition itself (IV) is discussed separately under the entry: **personalization**.

While **neo-patrimonialism** was either a practice or a form of rulership, personalism was foremost considered a *regime type* (I): Samuel P. Huntington (1991: 111) categorizes 'personal dictatorships' as a type of nondemocratic regime distinct from one-party systems and military regimes. He describes personal dictatorships as a 'diverse group' where *"the individual leader is the source of authority and power depends on access to, closeness to, dependence on, and support from the leader."* His definition highlights the importance of personal loyalty and access to the leader, rather than institutions, as the basis for power.

Brooker (1995) examines the transformation of political regimes from organizational rule by parties or the military to personal rule by individual leaders. He uses the framework of the principal-agent relationship, a concept from the new institutionalism in economics and political science, to analyze this shift. In this context, the regime's leadership initially acts as an agent for the ruling organization, such as a **party** or **junta**. However, over time, this relationship often reverses. The agent – originally serving the organization – becomes a personal ruler, turning the organization into an agent serving their interests. This shift signifies not just a breakdown but a reversal of the original hierarchical relationship between the organization and its leader (Brooker 1995: 9-10). This analysis reflects the influence of new institutionalism, which emphasizes the role of institutions and structures in shaping political behavior and outcomes (Brooker 2014: 31). The principal-agent model is particularly relevant here as it highlights issues of control and authority within political organizations.

Following Huntington (but abandoning **Linz's** classification), Barbara Geddes and her colleagues Joseph Wright and Erica Frantz (GWF) define personalist regimes as a subtype of **authoritarianism** where the leader has concentrated power at the expense of their closest supporters. They emphasize that the dictator has personal discretion and control over key levers of power. They identify personalist regimes as a residual category, differentiated from other dictatorships based on their low degree of institutionalization. Personalist regimes are those without strong military-based or party-based leadership (and they are not monarchies). Their institutions are weak and offer little constraint on the ruler's power (Geddes 1999; Geddes et al. 2014; 2018). Note that amalgams are possible, as presented lower in 'classifications' and also in the discussion of the typology by **Geddes, Wright & Frantz** (GWF).

After 2010, an important shift came to the understanding of personalism. Paul Brooker (2000: 37) was among the first to propose that the existence of personal rule is *"not confined to any particular variety, whether party or military, totalitarian or authoritarian, rightist or leftist. The presence of personal rule is usually viewed as being only a secondary or supplementary feature of a regime."* **Hadenius & Teorell** (2007) built upon this when deciding to construct a typology that omitted personalism altogether. Instrumental were

M. **Svolik**'s insights to extrapolate personalism as an abstract scale in his continuous classification of autocracies (Svolik 2009; 2012). This was soon reintegrated into the GWF dataset (Geddes et al. 2018) as the '*latent measure of personalism*' (LMP). Since then, personalism has been considered to be a *dimension* (II) of political regimes (Gandhi et al. 2014; Van den Bosch 2015; Gandhi & Sumner 2020).

Van den Bosch (2015; 2021) explains how personalism can simultaneously be a characteristic and a regime type. He argues that the characteristic is present in (almost) all regime types, but once leader dominance reaches a particular threshold (see below), this alters regime structure and behavior to such a degree that it allows us to study these various forms of one-man rule as a distinct type.

For Van den Bosch (2021), an established personalist regime is characterized by rule from a small group closely tied to the dictator through personal connections. The **inner circle** extends this network via **patronage** and **clientelism**, drawing from kin, co-ethnic groups, interest groups, and loyal followers (cf. **selectorate theory**). Depending on the need for support and its origins (rebel group, ruling party, or military), the 'selectorate' size can vary and be adjusted by the dictator. This network operates under informal rules with a *façade* of formal norms. Power is concentrated in the executive, supported by subjugated government branches, with minimal checks and balances. The dictator controls **repression** tools and **patronage**, which is crucial for regime stability. **Succession** is uncertain but informally regulated by the winning coalition dominated by the dictator. **Elections**, if held, are neither free nor fair, with political power not derived from an electorate. The regime is exclusive, with a narrow support base closed to most of the population (Van den Bosch 2021: 19). This definition captures both the essence and the variety of personalist regimes. Of course, personalist subtypes matter too and are distinct, as shown in 'classifications' below.

Alexander Baturo (et al. 2024) take a different approach to tackle (and map) the heterogeneity of personalist cases. Reaching back to the original literature (**Weber**), he argues that personalist regimes are defined by (a) 'personalism' and (b) 'patrimonialism' as two (partly overlapping) characteristics: He views 'personalism' (a) as a one-man rule, where the leader has a high concentration of power and makes decisions unopposed. **Patrimonialism** (b), on the other hand, encompasses weak institutions, the prevalence of **clientelism** in governance, and the state increasingly resembling the ruler's patrimony. Baturo suggests that personalist regimes can be distinguished from other dictatorships by this combination of personalism and patrimonialism. Both personalism and patrimonialism are scales, with the former (a) the level of power concentration and personalist micro-management dependent on leader characteristics (work ethic, **age & health**, personal **background,** prior career, education and **psychological profile**) and the latter (b) the level of de-institutionalization as a result of dysfunction and **corruption** (Baturo et al. 2024: 45-49).

Baturo's two-pronged approach neatly captures the essence of personalist regimes and separates two realms that have caused the most confusion for this concept (as they did as well for **neo-patrimonialism** and **neo-sultanism**): Personalism (a) is the manifestation of the intra-regime process of personalization, confined to the internal power dynamics of the inner circle. Patrimonialism (b), as a process, is the encroachment of such a regime on 'the public,' rendering it personal. This is the process of expanding **systemic corruption** through patronal networks, weakening and subverting state institutions and establishing a sole dominant pyramid or so-called *vertikal'* (cf. H. Hale's **patronalism**). For lack of a better word, this second process could be called the 'sultanization' of the polity (cf. **sultanism & neo-sultanism**). In a novel approach, Van den Bosch (2024b) also conceptually separates the processes of 'personalization' and 'neo-sultanization' but devises a new 'measure of tyranny' to capture salient thresholds of these interrelated processes.

Most authors acknowledge the significant diversity among personalist regimes, which stems partly from their origins and partly from the individual leader's characteristics and psychological profile. Others have focused on their shared features with monarchic rule: Brooker (2000) argues that 'presidential monarchies' share many similarities with 'traditional monarchies' and merges them both under personal systems. Lidén (2013) and Gill (2021) propose a similar approach. Both forms of governance revolve around a single leader who wields power independently of ruling parties, much like traditional monarchs. The similarities extend to the use of rituals, symbols, and the leader's perception of ruling the country for life. Even **succession** patterns look similar at first glance and have created quite some confusion (Brooker 2000).

For this reason, I believe this entry would benefit from a short but in-depth comparison between personalist rule and **monarchies,** as presented in Table 1.6. The first main key distinction between monarchies and personalist regimes lies in the role of institutions. Monarchies typically operate within a framework of established rules and institutions that legitimize their authority and provide for stable succession. Personalist regimes, as explained in this entry, are established by a weakening of institutions and de-institutionalization. Monarchies use legal-rational institutions to harness and cultivate traditional authority. While during the creation of a dynasty, a ruler (often a charismatic founding leader or conqueror) initially relies on personal ties to select his staff (i.e., traditional associates – *Genossen*), this reliance later shifts to tutelary bodies where inner circle positions can become hereditary, supported by other royal institutions that tie various elites (according to rank and title) to the center of power. While these institutions restrain rulers, they also stabilize kingly rulership and cultivate royal legitimacy, providing stability and predictability for elites and subjects.

The second key distinction refers to 'who' rules – a question too often answered for both types in

Table 1.6 – Comparing Personalist & Monarchic Rule

Type	**Personalist Rule**	**Monarchic Rule**
Leadership	One-man rule Invariable male	Dynastic rule Mostly male but with important roles for women
Institutions	Informal, weak and adaptable	Formal, strong and resilient to change
Separation of powers	No (on paper only)	Formally, consultation is required
Arbitrary rule	Yes	In case of absolutism
Maiestas (dignity)	Presidential, personality cult	Sacredness of kingship
Potestas (legal authority)	*De facto* executive power	Legislative, executive and often judiciary power
Auctoritas (personal influence)	Sometimes charismatic	Moral and/or charismatic authority
Imperium (control)	*De facto* control over civilian government Personal control over the military	Formal, in/direct control over civilian government Formal, in/direct control over the military
Legitimatio (right to rule)		
- External legitimacy:	Disputed	Rather yes
- Bound by traditional rule:	No	Yes
- Bound by legal-rational rule:	No	Often
- Sources of legitimacy:	Force, patronage Sometimes charisma	Tradition, custom, patronage Sometimes charisma
Origins	Can emerge in any regime type, even democracy	Institutionalizes a legacy of previous traditional rule
Time to establish	Within the lifespan of one ruler	Once a ruler establishes a dynasty
Succession methods	- Hereditary (most visible) - Non-hereditary (most common)	- Male primogeniture (most common) - Designation, election, etc.
Exit options	- Bad options (forced exile, jail, etc.)	- Abdication - Accept a symbolic function (i.e. constitutional monarchy) - Bad options (forced exile, jail, etc.)

Source: Author's own work.

the third person singular. However, power in **monarchies** lies with **dynasties**: Even if they often were short-lived patronal networks (cf. **patronalism**) that exaggerated their permanence and tradition (Duindam 2015: 74), these consisted of a loose group of (somewhat experienced) individuals, with shifting alliances, often related to one another through blood or marriage, that coalesced around a ruler and would re-group around a successor, albeit in a (slightly) different constellation; but committed to uphold continuity, nonetheless.

Third, regarding **succession**, personalist regimes actually draw the short straw. By dismantling institutions, they also remove the safeguards for orderly power transfers. As a type, they rarely survive the death of the ruler, and hereditary succession is actually not the dominant pattern of succession in such regimes (Brossier in Baturo et al. 2024). Still, party-personalist hybrids with a functional ruling party tend to perform notably better in this regard – see also 'classifications' below for examples. Without institutions or legitimacy, the **exit options & leader fates** of personalist dictators are much less attractive.

MEASUREMENT Many typologies identifying personalist regimes have now updated their categorical sorting criteria to account for scales of personalism. Below I present the most common ones that treat personalist rule both as a *regime type* (I) and a *dimension* (II). Other classifications that conceptualize **personalization** foremost as a *process* (IV) are described under that entry.

Geddes, Wright & Frantz (2018: 79-80, codebook:

2) identify eight specific criteria (a-h) for personalism, which together make up the *latent measure of personalism* (LMP). The more criteria are met by a regime, the more personalist it is. The authors have no specific cut-off point when treating it as a dimension. (Note: the older, original categorical criteria (12 items) can be found in Geddes 2003: 227).

The first metric, *high office (a)*, pertains that access depends on personal loyalty to the regime leader. Three metrics focus on a leader's control over the party: (b) whether he founded it *(create new party)*, whether (c) the party's executive committee is non-existent or merely endorses the regime leader's decisions (*rubber stamp party*), and whether (d) the regime leader manages appointments to the politburo *(party exec committee)*.

The remaining four metrics relate to control over the military and coup-proofing: (e) whether the ruler can dismiss commanding officers *(military purge)* and (f) whether he can fill security institutions with loyalists from his trusted circle *(military promotion)*. Additionally, they assess (g) whether the leader establishes a parallel security force *(paramilitary)* and (h) if he controls the security apparatus *(security apparatus)*.

Each of these eight criteria can be answered with a yes (1) or no (0), allowing for a scale from 0 to 8. This LPM scale is also expressed as percentages ranging from 0 percent to 100 percent, available per country year in the GWF database (2018).

Van den Bosch (2021: 10-12; 2024b: 571-572) builds on M. **Svolik** (2009; 2012) to measure personalism by examining the transformation of the relationship between a ruler and their inner circle during the **personalization** process. Drawing on Zygmunt Bauman's nomenclature, Van den Bosch (2015: 16) describes this shift as one from a 'proletariat' to a 'precariat' status, where inner circle members lose their collective agency to collaborate and challenge the ruler. As a result, they become politically weakened and divided, competing among themselves.

Before personalism peaks, inner circles can act collectively to check a ruler's power, potentially removing the latter through mechanisms like voting them out of the politburo or through a palace **coup**. However, as personalism intensifies, rulers implement divide-and-rule tactics, replacing key figures with loyalists selected according to ethnic, familial, or personal ties rather than for their competence. This strategy dilutes group unity and fosters competition for favor and patronage. Increasingly, loyalty and subservience to the leader translate into wealth and influence, and this allows followers to establish their own networks (as brokers or smaller patrons).

The exact threshold is when a ruling coalition is no longer able to oust or veto the dictator (or credibly threaten the latter with such actions). This is the moment when a personalizing regime (a contested dictatorship) transforms into a personalist regime (an established dictatorship) (Svolik 2012: 61; Van den Bosch 2021: 10-13; Baturo et al. 2024: 34). This is the turning point; after which regime behavior alters, and ruling becomes arbitrary. Next follows the consolidation phase, where state institutions are subverted to match this new political order (cf. **personalization**). The trend is not reversible during a dictator's lifetime, according to M. Svolik (2019: 63), although even established regimes can experience shocks that force them to (temporarily) lose some of their dominance. **Succession**, in turn, often results in de-personalization, but the mode, timing and a regime's experience with previous power transfers are key variables in the process. (For patterns of de-personalization, see: Van den Bosch 2024a.).

Of course, there are other approaches: To capture the relevant traits of personalist regimes, Baturo (et al. 2024: 46) identifies seven (a-g) key attributes, outlining whether each attribute is primarily related to personalism (A), patrimonialism (B), or both (A & B).

(a) *One-man rule* (A) refers to a leader's dominance in policymaking and appointments, holding more power than individual actors or entire groups like the military or Politburo. In extreme cases, the ruler wields more authority than all others combined, with no temporal limits and the ability to dismiss anyone, exerting strong control over security services.

(b) *Personalized decision-making* (primarily A) refers to the leader's degree of power concentration. Some leaders prefer to make decisions alone, while others delegate more, acting only as a final adjudicator.

(c) *Personal rule and de-institutionalization* (A & B) reflect the weakening of political institutions. In extreme cases, formal institutions hold no real power, and personalist rulers wield authority without holding official leadership positions.

(d) *Legitimation* (primarily A) may rely on **ideology**, tradition, or performance, but strong leader-centered legitimation fosters a **personality cult**. (e) **Clientelism** and **patronage** (B) involve the ruler's network penetrating state institutions, with loyalty directed to the person, not the officeholder. Under (f) *personal patrimony* (primarily B), the state is treated as the leader's personal property, leading to rampant corruption and deep client infiltration. Finally, the last metric is their tendency for (g) *dynasticism* and **succession** (B & A).

LITERATURE The most comprehensive contemporary works on personalist rule are the works of Geddes and her colleagues (Geddes et al. 2014; 2018), the edited works of Baturo et al. (2024), Lindstaedt & Van den Bosch (2024) also contain dedicated chapters and precious case studies.

Van den Bosch (2021) models their transitions and prospects for **democratization** (see below under 'key significance') by creating a middle-range theory to capture personalist behavior. The behavioral characteristics of one-man rule that make them stand apart from collegial regimes are their far-reaching measures of **coup-proofing**, a potential for unbridled **repression**, optimal capabilities for **gatekeeping** (cf. **linkage & leverage theory**), and their tendency for **hoarding**. All these actions have consequences that cumulate over time and affect transitions.

KEY SIGNIFICANCE Personalism in dictatorships leads to two significant consequences. First, it dete-

riorates the information environment, as leaders surrounded by sycophantic elites receive distorted feedback. This results in a perpetual state of uncertainty and paranoia, with leaders often misjudging threats to their rule. Such environments can lead to misguided decisions, as seen in Stalin's Soviet Union, where paranoia led to extreme measures like promoting a head chef to a general due to fear of poisoning (Frantz & Ezrow 2011; Frantz 2024).

Second, the concentration of power in personalist regimes eliminates accountability mechanisms, allowing leaders to make erratic and unwise policy decisions, often based on the leader's whims, leading to unpredictable and variable outcomes (Weeks 2012; Decalo 1985; Frantz 2024).

It is well documented that the personalist regime's distinct ways are notably different from their collegial authoritarian counterparts. This is manifested in their behavior at the domestic and international level:

Repression Coercian is typically more severe than in other authoritarian regimes due to the lack of institutional constraints on the leader's power. The leader's control over security forces enables targeted repression against political opponents and dissenters, ensuring regime stability through fear and intimidation (Davenport 2007).

Conflict Personalist regimes are prone to internal and external conflicts. Internally, the concentration of power can lead to factionalism and instability as potential rivals vie for influence. (Gurses & Mason 2010; Roessler 2011) Externally, personalist leaders may engage in aggressive foreign policies (even start wars) to distract from domestic issues or consolidate power, increasing the likelihood of international conflicts. (Peceny & Beer 2003; Weeks 2012; Chiozza & Goemans 2011)

A recent paper by Yu Bin Kim (2024) investigates the link between nuclear latency – the state of having the capability to develop **nuclear weapons** without actually possessing them – and international conflict initiation, highlighting discrepancies in previous research. It argues that latent nuclear states with personalist authoritarian regimes are more likely to initiate conflicts than those with democratic or collegial authoritarian regimes. This suggests that the degree of personalism influences the relationship between nuclear latency and conflict.

Development Many studies show how personalist rule affects development. State resources are used for personal gain, leading to inefficient governance and economic stagnation (Chang & Golden 2010). **Corruption** becomes systemic as the leader uses patronage networks to maintain loyalty, diverting resources away from public goods and development projects. More **systematic corruption** undermines state capacity (Li & Wright 2023) and even the misappropriation of **foreign aid** (the more personalist, the more growth decreases), cf. Wright (2010).

Transitions Regime changes from personalist regimes are often tumultuous due to the lack of established conflict-solving or succession mechanisms. The leader's death or **ouster** can create a power vacuum, leading to instability or violent struggles for control. **Exit options** are limited, as the regime's survival is closely tied to the leader's continued dominance, and strong institutions are absent (Wright & Escribà-Folch 2012).

Lee (2014) explores how the military's response is crucial in determining the outcome of mass protests against authoritarian regimes. It delves into why some militaries defect and side with protesters, leading to regime change, while others suppress uprisings to maintain autocratic rule. The central argument is that personalism creates conditions that increase the likelihood of military defection. In this zero-sum environment, military elites compete for the dictator's favor, resulting in winners and losers. Those who are sidelined or perceive themselves as losing out may become disaffected and more likely to defect during crises. The emergence of mass protests provides an opportunity for these disaffected officers to align with civilian opposition groups or other elements seeking regime change, as they see it as a chance to improve their position or secure a better future. Additionally, the lack of institutionalized power-sharing mechanisms in such regimes exacerbates these tensions (as it narrows the range of **exit options**) and thus increases the likelihood of military defections when faced with popular uprisings (Lee 2014).

Van den Bosch (2021) models **transitions** from personalist rule and finds that it is the combination of (ultimately inevitable) violent anti-regime contestation with hollowed-out state institutions that divert pathways toward civil war. The longer an **authoritarian legacy** is personalist, the more likely the successor regime will be personalist as well. Democratic transitions are possible but rare. An under-explored dimension is that international **gatekeeping** (e.g., **black knights** and foreign patrons), often boosted by **resource curses,** allows personalist dictators to consolidate their rule, stretching their reign and weakening the states they rule, thereby lowering the probability for (consolidated) democratic change. Abramson and Rivera (2016) find that rulers with long tenures are more successful when it comes to **succession**.

REGIONAL VARIATION There are a plethora of individual case studies (and too tedious to list exhaustively). Therefore, I only mention comparative works per world region that explicitly analyze personalist regimes or the most recent works for selected cases. Consult the respective 'regional variation' sections of **patrimonialism**, **neo-patrimonialism** and **sultanism & neo-sultanism** for case studies using such frames.

Latin America For a general overview: Lewis 2006; for the (infamous) historical Caribbean cases: Lindstaedt (in Baturo et al. 2024). Consult: Loxton & Levitsky 2018 (on personalist legacies); Resmini & Abbott 2024 (on leftist legacies regarding personalist party-building). For the personalist hybrid sphinx that is Paraguay, see: Roett & Sacks 2019. On the Cuban case and its successions: Centeno 2017; Gonzalez et al. 2004; Hofmann (in Batura et al. 2024). On Chávez'

Table 1.7 – Four Types of Personal Rule according to Jackson & Rosberg (1982)

Type	**Prince**	**Autocrat**	**Prophet**	**Tyrant**
Description	Machiavellian strategist	Absolutist commander	Ideological reformer	Impulsive mafiosi
Power comes from	- tradition - patronage	- dominance - patronage	- ideology - religion	- oppression - fear
Goal	Stay in power	Stay in power	Achieve mission	Arbitrary use of power
Role of ideology	Weak	Weak	Strong	Weak
Source of legitimacy (M. Weber)	Traditional-personal rule	None	Charismatic rule	None

Source: Author's own work based on: Jackson & Rosberg 1982: 73-83; Ezrow & Frantz 2011: 218-219.

Venezuela: Schneemayer 2019; Kestler & Latouche 2022; Arana Araya (in Baturo et al. 2024).

Sub Saharan Africa Older comparative works are Jackson & Rosberg 1982; 2018; Decalo 1985; 1986; Hughes & May 1988 (for Cold War cases). For today's Africa, read: Opalo 2011 (**ethnic politics**); Roessler 2011; Khisa 2016; Osei & Wigmore-Sheperd 2024 (on institutional dynamics); Baker 2002; Osei et al. 2020; Hartmann 2022 (on eroding **term limits**); Van den Bosch 2021; Hassan 2022 (on post-Cold War transitions); Battera 2023; Brossier (in Baturo et al. 2024) (on **succession** patterns); Dulani & Tengatenga 2020 (on **legitimacy** and political culture).

Some notable case studies are Osei & Bruhn 2024 (on contemporary Tanzania); Haynes 2002 (for Ghana's democratic transition around 2000); Ogbazghi 2011 (on the understudied case of Eritrea); Osei 2018 (on Togo's succession).

MENA For a comparison of cases before the Arab Spring: Brownlee 2005; for international context and **gatekeeping** frames, see: Ezrow 2015. The case of Turkey under Erdoğan is an evergreen: Lancaster 2014; Över & Tuncer-Ebetürk 2022; Öztürk & Reilly 2024. On Egypt and Syria: Hinnebusch 2021; 2024; on Syria's **succession**: Büchs 2009; Stacher 2011; on Libya: Magdy Kamel (in Baturo et al. 2024).

Eurasia For communist cases: Gill (in Baturo et al. 2024). For Russia, consult Graham & Haberman 2021; Burkhardt 2021; Baturo & Elkink 2021 (on the personalization of Vladimir Putin's regime); for Belarus: Frear in Baturo et al. 2024. On Central Asian cases: Anceschi 2021; (in Baturo et al. 2024); Isaacs 2020; Nanovsky & Knox 2024, and specifically: Horák 2022; Peyrouse (in Lindstaedt & Van den Bosch 2024) on Turkmenistan and its latest succession.

Indo-Pacific For a comparison on personalist pathways: Van den Bosch 2023. On Cambodia (a case hard to classify) see: Morgenbesser 2018; Loughlin 2021. For the poster child of contemporary dynastic tyranny, North Korea, recent works are: Song & Wright 2018; Dukalskis (in Lindstaedt & Van den Bosch 2024); Woo 2024.

CLASSIFICATIONS While other typologies, besides those mentioned, also include personalist regimes (e.g., **Kailitz** 2013), there are actually few breakdowns of personalist rule into subtypes, and hybrids are understudied.

Prince, Autocrat, Prophet, Tyrant Jackson and Rosberg (1982) developed four subtypes of personal rule to capture variation in Sub Saharan Africa (but not exclusively). All four are ideal types, shown in Table 1.7, and personalist rulers can gravitate to more than one type at a time, but also change trajectory over time, which makes it very difficult to classify cases undisputed. Still, the classification did contribute by highlighting various manifestations of personalist leaders and their styles.

The *Prince* (i) is an astute ruler who balances power among oligarchs and loyal clients, promoting 'politician politics' by encouraging competition for favor without allowing any one person to emerge as a serious threat. This flexible rule accommodates different political actors but risks losing control if clients gain too much independence.

The *Autocrat* (ii) dominates the state and ruling apparatus entirely, treating the country as his personal estate. Unlike the Prince, the Autocrat tolerates no shared power and eliminates rivals, reducing politics to subordination and administration. His rule resembles absolute monarchy, relying on the ruler's strength of will and control over the government.

The *Prophet* (iii) is driven by ideology, seeking to reshape society according to a visionary goal, often socialist. This type of leader views their mission as the only justification for rule, steering the state toward ideological ends. While charismatic, Prophets often struggle with limited resources and may face downfall if their vision fails to materialize.

The *Tyrant* (iv) represents the most extreme form of personal rule, where power is exercised without legal or moral constraints. Tyrannical rulers govern through fear, brutality, and arbitrary decisions, relying on violence and personal rewards to maintain control. Tyranny is characterized by instability and insecurity, as it often emerges when other forms of rule deteriorate into chaos.

Subtypes & Hybrids Within the group of regular personalist regimes (pure types as identified in the GWF dataset), Van den Bosch (2021: 250-251) distinguishes between rulers with a civilian and a military background. The author discovered that **coup-proofing** strategies differ between military and civilian despots, regardless of uniform. Military leaders, due to their experience, understand the army's inner workings, secure loyalty from within, and use secret services or presidential guards to maintain control (e.g., Bozizé in the CAR). Although no global comparative research exists, military-personalist leaders may be expected to be more successful at preventing and surviving coups than civilian leaders. In contrast, civilian personalist dictators, distrustful of the military, often engage more in weakening the army's capabilities, setting up **paramilitaries** or hiring **mercenaries** for protection.

Regarding the real hybrids, as identified by GWF, they tend to be quite stable. There are three types: (a) military-personalist, (b) single-party-personalist and those rare double hybrids: (c) military-single-party-personalist.

The military-personalist hybrids (a) behave just like other personalist regimes, but here, the army has remained an intact, cohesive force with the dictator drawn from these uniformed ranks. In contrast to regular personalist regimes, these hybrid military tyrants do not drive wedges between army factions to achieve more control over them. Similar to regular personalist rulers with a military background, these regimes also create militias or **death squads**, but for fighting rebels, not for coup-proofing purposes. Strangely enough, these hybrids (a) also exhibit more peaceful transitions when faced with massive protests and democratizing pressure, as seen in Pakistan, Myanmar, and Thailand. In line with Lee (2014), loyal but intact military structures may thus facilitate negotiated transitions, leading to elections within a competitive authoritarian framework, but often reversed later. Similarly, in Sub Saharan Africa, dictators like André Kolingba (CAR) and Ali Kountché (Niger) retreated under pressure when their international support waned (Van den Bosch 2021: 268).

Similarly, many established single-party-personalist hybrids (b) possess the institutional advantage (a functioning authoritarian party), making it possible to tie elites to new leaders over different generations: Afghanistan (1972-1992), Cuba (1959-), Eritrea (1993-), Gabon (1960-), North Korea (1948-), Liberia (1944-1980), Romania (1945-1989), Turkmenistan (1991-), Uzbekistan (1991-) These regimes all had at least one successful **succession** (Van den Bosch 2021: 284-285). Frantz and Kendall-Taylor (2017) find that even though personalist dictators often establish parties to counter immediate threats to their power from elites – especially the military – this strategy also promotes peaceful mass mobilization and a realignment of elite networks. These dynamics, in turn, increase the chances for **democratization**.

Finally, double hybrids, single-party-military-personalist (c), like Egypt (1952-2011), Indonesia (1966-1999), Paraguay (1954-1993) or Syria (1963-2024) remain rare but have extraordinary lifespans, while facing surprisingly few coups once they are consolidated.

METHODOLOGICAL ISSUES Personalism has often been equated with **sultanism & neo-sultanism**, **patrimonialism** or **neo-patrimonialism** with total disregard for the different trajectories of these related but different concepts (each one traveling with its own methodological baggage and conceptual stretch marks). Personalism has issues, of course, as shown here:

Operationalization While personalism is conceptualized and delineated rather well, classifying cases is still not always easy. As Geddes (1999) herself points out, the distinction between personalist and military rule is not always clear-cut. A leader with a military background, or one who wears a uniform, may still operate as an individual leader, which would warrant their classification as personalist. However, there are instances where the distinction remains ambiguous (Lidén 2013).

A *regime type* (I) personalism covers a diverse group. This can be explained by their different points of origin and the variation of the leader's personality and capability, which – as the dominant figure in the regime – has a direct influence on the functioning and behavior of each regime.

The trouble of dealing with a concept that is both a *regime type* (I) and a *dimension* (II) is that the exact cut-off point is not universally accepted. In any case, this threshold is also hard to measure, as scholars have little reliable information about the inner circle dynamics. The second issue is the overlap between the *process* (IV) of 'personalization' (increasing personalism) and 'sultanization' (the increasing corrupt control over the polity).

Static biases As a regime type, there is no way of accounting for fluctuation rates of personalism throughout a regime's lifespan. This is as true for regimes classified as personalist as for collegial regimes that have personalist episodes, like the Communist Party in the USSR under Lenin and Stalin, the Chinese Communist Party under Mao Zedong, or even Lê Duẩn in Vietnam. Once a regime is classified, it remains in that category until it breaks down and a new regime replaces it. Increasing personalization or de-personalization (e.g., after **succession**) is registered, even if this can significantly alter regime behavior. For instance, Rwanda, after Paul Kagame's takeover in 1994, was initially classified as a party-military hybrid by GWF (in 2013); currently, it is a personalist regime. Cuba has been strongly personalist since Fidel Castro's revolution in 1959, but after two power transfers, the regime has significantly de-personalized.

Another dimension of the 'static' bias can be found when one looks in the reverse direction toward the international realm. While this criticism applies to most state-centric regime typologies, their categories do not include international networks. For personalist regimes, international financial and business networks matter a great deal, especially in

their consolidation phase, when they rely on offshore **hoarding** to secure funds for **patronage**. **Patronalism** by H. Hale is a useful complementary frame in this regard.

Another issue is the actual size of polities: Veenendaal (2020) finds that smaller states are affected differently by informality and personalization, which generally do not translate into political volatility or government collapses. In fact, in many small states, informality allows political leaders to obtain vast powers that they could never have acquired on the basis of formal institutions alone.

Amalgam divergence When dealing with amalgams from the GWF typology, different authors use a different relational hierarchy of types in order to re-sort hybrids under one clear category. Usually military features trump civilian features (and thus also monarchies), and such hybrids are thus routinely folded under military rule. However, personalist hybrids are classified differently, according to the author. For instance, Escribà-Folch and Wright (2015) place 'military-personalist' and 'party-personalist' hybrids under regular military and party rule, respectively. Van den Bosch (2021) classifies both hybrids under personalism, as shown above in 'classifications.'

Reductionist bias Personalization is sometimes appropriated as a *proxy for non-institutionalism*. In many research designs, pure personalism is often considered the opposite (extreme) end of a continuous scale of institutionalist personalization. Such **continuous measures** of formal-informal rule (foremost for Large-N studies) rank 'personalism' toward the latter end because of their weak or nonexistent institutions. Such lack of constraints allows leaders to rule by decree and bypass or modify institutions at will. Note that such a one-sided interpretation is reductionist – even as it can be a useful proxy – and glosses over the various functions of hollowed-out institutions in dictatorships (beside their inability to constrain the policy-maker). Nor does this proxy capture the nature of the relation between a personalist ruler and his **inner circle** or his claims to rulership (**legitimacy**) – all important factors when studying their emergence, threat perception and related behavior or transitions.

Absolutist bias This bias concerns the misconception that leaders hold absolute power, which is often overstated. This bias arises from several factors: First, there is a belief that leaders make all critical decisions alone (and never delegate), overlooking the roles of informal networks and advisers. Second, the focus on a leader's personality (**psychological profile**) can obscure the influence of other actors and institutions (as well as the prevailing political culture). Third, **propaganda,** media control, and a **personality cult** reinforce the image of an all-powerful leader. Additionally, opaque decision-making processes make it hard to assess true power dynamics. Despite these perceptions, true 'one-man rule' is unattainable in complex polities as leaders are forced to rely on others and cannot control all aspects of governance. Even weak institutions shape power distribution and expectations, and patrimonial networks create a system of dependence influencing decisions. A leader's power can fluctuate based on internal and societal factors. Thus, while personalist leaders have significant power, assuming absolute control overlooks the complex interplay of influences in these regimes (Baturo & Elkink 2021; Anceschi in Baturo et al. 2024).

Fragility bias Scholars tend to overemphasize these regimes' inherent weaknesses, primarily due to the concentration of power in a single leader and their tendency for de-institutionalization. When taken too far, one may have the perception that such regimes are inherently unstable and vulnerable to sudden collapse, particularly during leadership transitions or crises. However, this view oversimplifies the complex dynamics within personalist regimes and overlooks their potential resilience. Personalist regimes can demonstrate significant adaptability due to their reliance on informal networks and personalized power structures, which can reduce susceptibility to elite divisions and enhance flexibility in policymaking (Baturo et al. 2024). Minimal institutional constraints enable swift and unexpected decision-making, which effects can only be known with time but do make these regimes adaptable in a fast-changing world.

Second, the methodological focus on regime transitions often neglects the gradual processes of personalization and de-personalization that occur over time, leading to misconceptions about sudden fragility. Arguably, leaders are most vulnerable during intermediate personalization phases (at the start of their consolidation phases) and during their first **succession** experiences, which empirically explain the long lifespans once rulers survive these moments. Thus, the fragility of personalist regimes is not an intrinsic characteristic but rather contingent upon various factors, including leadership strategies, societal grievances, and international pressures. A nuanced understanding requires examining both the vulnerabilities and strengths that these regimes exhibit in different contexts (Hess 2016).

Political Regimes

The most perilous moment for a bad government is one when it seeks to mend its ways.
– Alexis de Tocqueville

The differentiation between state, regime, and government is a foundational issue in political science, reflecting distinct layers of political organization and authority. Over the past five decades, the distinction between state and regime has become widely accepted, offering a clearer understanding of their respective roles and permanence.

Note that there also exists the concept of an 'international regime,' which refers to a set of principles, norms, rules, and decision-making procedures around which the expectations of international actors converge in a specific area of international relations, guiding and structuring interactions among these actors.

The concept of the state is one of the oldest in political science, with its definitions repeatedly refined over time. While regimes have been implicitly recognized since Aristotle's time, they only began to be treated as autonomous objects of analysis in the 1970s. Despite their widespread acceptance, until recently, few works have systematically compared definitions of regimes to improve conceptual clarity, although currently, the field seems to have reached a consensus in this regard.

A *state* is considered a permanent entity and is often regarded as the most significant actor in international politics. States are characterized by their control over a specific territory and the authority to use force within that territory. This territorial and authoritative control makes states enduring structures in the political landscape. (There are different interpretations about how to define states and whether the Weberian archetype can and should be applied universally, but such 'inter-state' discussions are beyond the scope of this book).

In contrast, a *political regime* refers to the set of formal and informal rules, norms, and decision-making procedures that dictate how power is accessed, exercised, and transferred within a state or *"the set of rules, norms, or institutions that determine how the government is constituted, how it is organized, and how major decision are made."* (Clark et al. 2018: 145).

Unlike a state, a regime can change without the state itself disappearing. For instance, a **coup** may result in a shift from a democratic regime to an authoritarian one without altering the state's existence. The term 'regime' is often used interchangeably with 'system of governance,' political system, powerholders, ruling elites, etc. (Boese 2019).

A *government* represents the group of individuals who hold positions of authority within a regime at any given time (foremost in the **executive** branch). Governments can change through **elections**, appointments, or coups, yet the regime and state may remain unchanged.

To conceptualize their relationship, one might think of the state as the hardware (the physical and institutional structure), the regime as the operating system (the rules of the game), and the government as the user (the individuals currently in control) (Bendel et al. 2002: 263).

Distinguishing between states and regimes has been a central point of contention between the fields of comparative politics (CP) and International Relations (IR), particularly in the study of authoritarian regimes. IR traditionally examines states as unitary actors in the global system, often downplaying internal regime characteristics unless they directly affect international behavior, although the discipline is also divided in this regard: Realist theories in IR have historically emphasized material capabilities like military power and economic resources over regime types, but liberal and constructivist perspectives have increasingly recognized that domestic regime characteristics shape states' **foreign policy** behavior and their interactions with international norms and institutions, as shown in the section **international relations**.

This clash of values between CP and IR plays out in comparative authoritarianism with CP exploring internal differences emphasizing domestic factors such as institutional structures, political actors, and socioeconomic conditions. Scholars in this field seek to understand how dictatorships function, how they maintain power and the processes that lead to regime change or democratization. CP tends to focus on case studies or cross-national comparisons to identify patterns and variations in authoritarian rule, often employing a detailed examination of specific countries or regions to draw broader theoretical insights (Landman 2002).

IR approaches the study of dictatorships primarily through the lens of state behavior in the international system. IR scholars are interested in how dictatorships interact with other states, participate in international organizations (cf. **authoritarian regionalism**), and are influenced by global norms and pressures. The field traditionally emphasizes material power variables such as military capability and economic strength while considering how regime type might affect a state's foreign policy behavior. (Landman 2002)

Distinguishing between regimes and governments is also crucial when studying political phenomena because the nature of a regime significantly impacts policies, economic performance, and political stability. Moreover, governments can be altered while the regime stays the same. This is particularly the case for authoritarian regimes (cf. **executives**), but even in democracies, subsequent **winning coalitions** with a different composition of political parties and movements are highly likely to distribute government posts reflecting the current power balance.

The definition of a political regime has evolved significantly over time, reflecting shifts in theoretical approaches and empirical needs in political science. Initially, the concept was heavily influenced by classical political philosophy, as seen in Plato's cycli-

cal theory of regime change outlined in *The Republic*. Plato's focus on the sequential transformation of regimes (**aristocracy** to **timocracy**, **oligarchy**, **democracy**, and **despotism**) emphasized the moral and philosophical characteristics of governance rather than its institutional or procedural dimensions (Skaaning 2006).

Modern conceptualizations began to emerge with the rise of comparative politics and democratization studies. Early definitions often conflated regimes with **ruling coalitions** or governments. For instance, some scholars defined regimes as alliances of dominant ideological, economic, and military actors or as sequences of governments controlled by a specific social group. These actor-centric perspectives largely ignored the role of institutions and rules in structuring political behavior (Skaaning 2006; Munck 1996). This reductionist view led to significant analytical limitations, such as the inability to distinguish between different institutional arrangements under similar actor constellations or to analyze the interplay between actors and institutional frameworks.

In response to these limitations, scholars developed more nuanced definitions that emphasized the institutional dimensions of regimes. A pivotal shift occurred with the recognition that regimes are best understood as sets of formal and informal rules that structure political power. These rules determine who holds power, how power is acquired, and how it is exercised and constrained both vertically (between rulers and ruled) and horizontally (among branches of government). This institutional perspective allowed for a clearer distinction between regimes, states, and governments: while governments are transient entities operating within a regime's framework, regimes themselves are more enduring structures that define the rules of political engagement within a state (Skaaning 2006).

The inclusion of informal institutions marked another significant development (**informality**). Scholars like Helmke and Levitsky highlighted that many outcomes in political systems are shaped by informal rules that operate alongside or even in contradiction to formal laws. This broader conceptualization addressed discrepancies between official regulations and actual practices, particularly in contexts where formal institutions were weak or ineffective (Munck 1996; Skaaning 2006).

To further refine the study of regimes, researchers introduced multidimensional frameworks. These frameworks disaggregate regimes into procedural (rules), behavioral (actor compliance), and attitudinal (normative acceptance) dimensions (Munck 1996). Additionally, typologies were developed to classify regimes based on their defining attributes, such as access to power, constraints on power, and the character of rulers. These typologies enabled scholars to differentiate between regime types (e.g., democracies vs. authoritarian systems) and subtypes (e.g., presidential vs. parliamentary democracies), providing a more granular understanding of political systems (Skaaning 2006; Munck 1996). Various approaches exist for classifying regimes and dictatorships. These are listed in the section **classifications & typologies.**

Power

Power is eaten whole
– Congolese proverb

In the words of Steven Lukes (2005), power 'is an essentially contested concept.' The meaning, origins and effects of power remain disputed, even if the concept is essential to anyone interested in politics, particularly in the fields or disciplines of political science (PS), political theory (PT) and International Relations (IR). For Hans Morgenthau (1960), one of IR's more prominent founders, without power, *"a theory of politics, international or domestic, would be altogether impossible, for without it we could not distinguish between political and non-political facts, nor could we bring at least a measure of systematic order to the political sphere"* Likewise, PS's object of study is bound to the meaning of politics, which is in turn defined through the concept of power: *"'Politics' might best be characterized as the constrained use of social power."* (Goodin & Klingemann 1996).

Given how pervasive the concept of power is to ordinary language, not to mention to other fields of inquiry (even the natural sciences), it is no cause for

wonder that it is difficult to pin down, conceptualize, and apply. However, making sense of power is necessary if one is to capture a facet of the human experience, such as whether a person can act or cannot, whether people dominate or are dominated by others, and how individuals belong to an association in the first place. All such experiences, among others, are often based on a concept of power. Nevertheless, such is the diversity of those experiences – not to mention their ubiquity – that PS, IR and PT have all been mired by debates as to the meaning, origins and effects of power. These discussions are only compounded by the fact that power has also been reduced – or otherwise related – to other concepts, such as domination, violence and authority. It also remains controversial whether power can be exercised by an individual as opposed to an impersonal systemic arrangement, such as a social structure. Were that not enough, power, as an English word, has also relied on other languages – such as Latin (*potentia, potestas*), French (*pouvoir, puissance*) and German (*Macht*) – to make sense of its semantics, thus prompting a rich – often multilingual – discussion as to its everyday meaning, and whether it is best understood as a plurality of ideas as opposed to a single, essential concept.

SEE ALSO The study of **political regimes** is mostly preoccupied with: Who holds power? How do they rule? And why do they rule? This entry delves deeper into the concept that makes all this possible. It forms a trinity with **soft power** and **sharp power** which both have their separate entries.

DEFINITION Defining power implies addressing the many scholarly debates as to its meaning. One compelling definition is to see it as *"a person's condition of having available possibilities for effective action, while representing these possibilities as such."* (Parietti 2022). In line with Peter Morriss (2002), Guido Parietti (2022) takes power to be a disposition or condition. Power is not an object or thing; rather the condition according to which action is possible at all. Parietti's (2022) definition is not consensual in PS, PT, nor IR, mainly because most other understandings of power tend to underscore 'power over' someone or some group in contrast to 'power to' act in the first place.

Parietti (2022: 41) nevertheless argues that 'power to,' as a condition, is logically prior to 'power over,' which is not to say that the latter is of no importance to politics: *"From a conceptual perspective, there is only one overarching notion of power, which is always a "power to", regardless of its being over someone or with someone, or of its normative significance in any given case. This is neither an empirical nor a philosophical contention, but rather a humble grammatical one: if your power over/with/from-whatever-source-you-want is not power to do (or to abstain from doing) something, the power to achieve something, then it is not power at all."* (Parietti 2022: 41).

Taking power to be a condition avoids conceptual conundrums that reduce it to specific objects, such as material capacities. This is not to say that certain capacities do not enlarge the possibilities of action of any one person, but that power need always be about a given potentiality. Actors hold power precisely when they are able to decide upon certain possible courses of action, the outcomes of which are largely unpredictable (Arendt 1958). These possibilities can nevertheless be represented, such that actors are aware of which actions they can exercise or not, in view of the culture within which they are embedded. Hence, power is not so much associated with capacities or potentialities than with the range of social and cultural possibilities that constitute action from the outset.

To take an example, Parietti (2022: 95-96) refers to the case of the war in Vietnam and the capacities which the US government had at its disposal: *"A familiar example is the Vietnam war. We know that the United States (…) had enough firepower (…) to kill everyone there many times over. What the United States did not have, arguably, was the power to win that war, in no small part because they did not have the power/pouvoir to deploy all their causative powers/puissances [capacities or potentialities]. Those arguing that what was lacking was merely the willpower missed the point because the collective willingness to do 'whatever it takes' cannot itself be summoned 'at will' by anyone, not even the most competent leaders one could imagine."*

Taking power to be a condition – dependent on a relationship between possibilities and representable outcomes – suggests that power springs not so much from objects or material capacities as from implied social relations that allow people to act in one way or another. In the end, a military general may detain all the material capacities or potentialities at their disposal and yet be powerless to act. Put differently, the general can only act within a certain social context, which is always 'representable' to that authority.

All the same, not all notions of power, especially those derived from the English language, are as comprehensive to the effect of addressing the underlying social context. In this regard, the notion of power usually encompasses that which allows people to hold 'power over' others. For Thomas Hobbes, power is the *"present means, to obtain some future apparent Good. And is either Originall, or Instrumentall."* (Hobbes 2017). By original, Hobbes means that it is power that stems from natural capacities, such as strength or nobility, whereas it is instrumental in that it derives from capacities that are obtained throughout one's life, as often can be the case of reputation and/or wealth. This more restricted definition of power captures the underlying capacities that allow people to hold "power over" others. Another more renowned definition is Robert Dahl's (1957) claim that *"A has power over B to the extent that he can get B to do something that B would not otherwise do."* This concept points to the usual effects of power, insomuch as it shows that it is a specific type of relationship that prompts an action against another. Nevertheless, Dahl's notion of power could easily be replaced by the notion of 'influence,' which is precisely what he subsequently does in his seminal 1961 work, *Who Governs*? (Dahl 2005).

That said, the idea that power is related to compelling people to do what they are potentially unwilling to do has inspired more comprehensive definitions.

Steven Lukes (2005) splits power according to three dimensions, as per his key 1974 contribution, *Power: A Radical View*. He claims that power need not be actively enacted by a person since it is often veiled up to the point of preventing people from acting in ways of which they had not been aware. This relates to Lukes's third dimension of power, which is impersonal and thus structurally based. In this case, power is experienced when certain issues are otherwise foreclosed from politics. Though perhaps more comprehensive, Lukes's definition focuses almost exclusively on the situations in which one has 'power over' someone as opposed to 'power to' act in the first place (Parietti 2022).

KEY SIGNIFICANCE Power is a core concept in social science. Regardless of disciplinary boundaries, be it sociology or PS, most social theories cannot avoid applying or defining the concept of power. Even economics, which has traditionally not addressed the concept of power, cannot fully avoid its effects.

At any rate, in spite of the divisions among the social sciences, power is central to PS and IR. After all, PS and IR have traditionally been defined as disciplines or fields of inquiry because they study power and its effects. In the case of IR, for instance, differing conceptions of Power among its more renowned thinkers opened up different research agendas (Mearsheimer 2001; Carr 2001; Barnett & Duvall 2005; Guzzini 2013b). Whether power is materially based, socially constructed or the product of concealed structures of domination, each IR theory has engaged with many issues and political regimes precisely because they differ on how power can and should be theorized. Likewise, key scholarly debates in PS have also been prompted by disagreements as to the nature of power, its effects and how to locate it empirically (Dahl 2005; 1957; Lukes 2005; Goodin & Klingemann 1996).

ORIGIN As the concept of power pertains to a specific type of political condition, more so than a social object or material thing, its origin is difficult to pin down, even more so because it depends on how it has been traditionally defined. According to Robert Dahl (1957), and as already aforementioned, power is what allows A to *"get B to do something that B would not otherwise do."* Hence, for Dahl, power's effects exist universally across time and space. Hence, as power is intricately connected to politics, Dahl's conception also presumes politics to be a perennial feature of the human condition since power is to be found everywhere and at all times. However, for other thinkers, such as Hannah Arendt (2005), a broad conception of power is simply untenable for the reason that it presumes that *"politics has existed in all times and everywhere and that men live communally in any historical or civilizing sense."* Suffice it to say that Arendt considers power, much like politics, to be a specific – historically contingent – condition. For Arendt, power originates from a spatial-temporal setting outside the realm of necessity. The latter forces humans and their communities to labor systematically to fulfill their biological functions, such as farming in a field so that food is produced to satiate hunger. For Arendt, it makes no sense to speak of power in such conditions. Rather, power presupposes a degree of freedom from necessity – as within a *polis* or city – that allows humans to have possibilities to act such that they are not entirely bounded by necessity.

All in all, the origin of power depends ultimately on how it is conceptualized. For some, power has accompanied humans ever since they came into existence; for others, it arises solely from a specific spatial-temporal condition.

As for the etymological origins of the concept of power, it derives from the Norman French verb *pouer,* meaning 'to be able.' The Norman French word stems, in turn, from the Latin *'potential,'* which is also related to the verb *potere,* that is, 'to be able.' In this sense, the notion of power has traditionally been associated with modal verbs, thereby denoting the condition currently understood as the 'power to' as opposed to the 'power over' (Parietti 2022). All the same, the Anglo-Saxon word 'power' has also been translated with recourse to words from other languages, such as the Latin *'potestas,'* which denoted a specific political office in ancient Rome. Whether or not power is derived from *potentia* or *potestas*, if not both, has been the object of intellectual debate (Altini 2010).

LITERATURE Most modern attempts at defining the concept of power spring from PS. In this sense, most debates on its meaning begin with Robert Dahl's 1957 conception of power. Scholars subsequently questioned his interpretation, leading to a broader debate within American PS as to the meanings of power. Lukes (2005) takes note of those debates, proposing three dimensions of power, thus seeking to encapsulate the varied subjective and objective ways in and through which power can be experienced.

Besides PS, IR has a long tradition of dealing with the concept of power. In fact, many of the so-called classical debates in the discipline, between so-called realists and idealists (also known as liberals or utopians), stem from whether power and its effects were conceptually brought into consideration or simply neglected (Carr 2001). In this respect, realists in IR are traditionally conceived as staunch proponents of the concept of power (Morgenthau 1960; Mearsheimer 2001; 2004). In any case, the debates in IR also have to do with how best to deal with the notion of power, namely on whether it can be reduced to a material capacity, also known as **hard power**, or whether it also depends on ideas and speech, such as **soft power** (Barnett & Duvall 2005; Nye 2004; 2021). IR scholarship, mainly through Joseph Nye's (2004) contribution, began subsequently referring to 'soft power' to denote modes of interaction that were not always reduced to force or coercion. Furthermore, as IR embraced the post-modern turn, alternative conceptions of power relating to Marxism and Foucault's approach to language came to be considered, so much so that contemporary scholarship routinely refers to more than one empirical manifestation of power (Barnett & Duvall 2005).

For a deeper engagement with the notion of power and its relationship to PS and IR, see Steven Lukes'

(2005) extensive work on the three dimensions of power, *Power: A Radical View*. For a distinctive approach centered on 'power to' and the political dimensions of power, Hannah Arendt's *The Human Condition* provides perhaps one of the more engaging, phenomenological understandings thereof. For a comprehensive view of how power has traditionally been deployed in the field of IR, see Hans Morgenthau's *Politics among Nations* and Stefano Guzzini's *Power, realism, and constructivism* (Guzzini 2013a; Morgenthau 1960; Arendt 1970; 1958).

METHODOLOGICAL ISSUES The overarching methodological issue with which studies of power must deal pertains to ontology. Depending on whether power is conceived as a contingent social condition or else as a trans-historical phenomenon, scholars apply very different methods to very distinct social situations.

Beyond ontology, major methodological debates in PS have been promoted on the basis of how power is manifested in practice. In this regard, PS, not unlike IR, has generally been focused on the issue of 'power over' more so than 'power to.' As a result, the methodological issues relate to how to analyze powers (or potentialities) that are deployed in and by political communities. In this regard, methodologies diverge on whether self-conscious actors employ those powers or whether they are concealed by specific social objects or structures that impose themselves upon a given group of people (Lukes 2005).

Moreover, focusing exclusively on the notion of 'power over' others – or domination – may subsequently render power synonymous with other concepts such as violence and coercion.

MEASUREMENT As per the methodological issues, the challenges related to measuring the concept of power stem from two features: agential vs. structural manifestations and material vs. ideational potentialities.

Agential vs. structure manifestations Provided power is considered to be a condition that specific groups of people exercise, the measurement of both its condition and effects implies studying whether publicly announced wishes were subsequently accepted and followed by others. Structural manifestations of power do not necessarily require agency to be exercised. Such manifestations of power are thus more difficult to measure. Scholars can focus on how certain issues are not open to public discussion; otherwise, they can also demonstrate how certain structures harm people who remain unfamiliar with the degree to which they are powerless.

Material vs. ideational potentialities Since PS and IR have traditionally conceived of power as either a material or ideational potentiality/capacity, power may be split into a variety of categories. In this regard, IR scholars and policymakers often refer to soft and hard power (Nye 2021). PS, by contrast, addresses several facets of power, such as symbolic power, economic power, structural power, and those potentialities that allow actors to hold 'power over' others, as in to compel or to dominate others (Lukes 2005).

IMPACT ON POLICY As a specific condition, as opposed to an object, power has no discernible impact on policy. Rather, it is precisely the grounds upon which policy is formulated (Parietti 2022). The same does not follow, however, for notions of 'power over' such as specific capacities or potentialities. In this case, different conceptions may open horizons for specific policymakers who were perhaps unfamiliar with how to exercise influence over others. For example, the idea that governments and people are open to being persuaded by soft power as opposed to fearing hard power has contributed to growing investment in propaganda and public diplomacy across sundry actors in the international arena, with one of the most notable examples being the People's Republic of China since the early twenty-first century (Voon & Xu 2020; Lai & Lu 2012).

Prebendalism

Flies will never leave the shop of a sweet maker.
– Persian proverb

Democratic politics and prebendal politics are two sides of the same coin in Nigeria: each can be turned over to reveal the other.
– Richard Joseph (1987)

Max Weber's understanding of prebendalism is integral to his broader typology of **rulership**, particularly within the framework of **traditional rule**. Prebendalism, as **Weber** conceptualized it, refers to a system in which the ruler grants *benefices* – nonhereditary rights to land or allowances in kind – to members of the administrative staff in exchange for their services. These prebends are personal grants from the ruler and are revocable at will, distinguishing them from feudal arrangements where rights and privileges are often hereditary and based on contractual relationships.

Weber's use of the term 'prebend' originates from its ecclesiastical roots, denoting allowances or support provided to clergy, but he extends it to describe secular administrative arrangements. In a prebendal system, officials are maintained through prebends rather than salaries, and their authority is tied to their loyalty to the ruler rather than impersonal legal norms. This system is characterized by its reliance on traditional legitimacy and the ruler's discretion, with prebends serving as a form of compensation (**patronage**) that reinforces personal dependency and loyalty (Curtis 2009; Lemke Bakker 2007).

Weber argues that prebendal and feudal forms of patrimonialism often oscillate, depending on the ruler's capacity to centralize authority. When rulers maintain a highly centralized system of governance, they can resist the centrifugal forces that characterize feudal systems, where power tends to become more diffused among local lords. In such feudal arrangements, the ruler's domain may shrink geographically but can remain substantial in influence. A key mechanism for maintaining the centripetal force in prebendal systems is the ruler's active presence throughout their territory, often achieved by traveling with their retinue to assert authority and reinforce loyalty (Lemke Bakker 2007). The more patrimonialism relies on feudal practices involving reciprocal obligations between lords and vassals, the more it shifts away from its ideal type toward collegial rule: the *Patrimonium* becomes fragmented, and power diffuses. Feudalism (as shown in Box 1.14) is, of course, a much richer albeit contested concept.

Prebendalism is the preferred form of **rents** for pre-modern **personalist rule** as it is more precarious than feudalism because it lacks hereditary security and depends entirely on the ruler's favor (Bruhns 2012; Szelenyi 2016). Weber links prebendalism foremost with **sultanism** and distinguishes the latter from **patrimonialism** in that it is much more extreme, centralized, personalized, no longer bound by traditional custom, and thus not reliant on feudalism. In patrimonial systems, administrative staff may appropriate certain powers or resources but remain under the ruler's overarching control.

Within Weber's framework, prebendalism represents a 'premodern' bureaucratic arrangement where officials' positions are not institutionalized but are instead contingent on their relationship with the ruler. This system hinders the development of rational-legal rule because it perpetuates arbitrariness and personal discretion in governance. Prebendal arrangements were common in various historical contexts, particularly in societies where centralized authority sought to maintain control over administrative functions without ceding hereditary rights or creating autonomous power bases (Curtis 2009; Lemke Bakker 2007).

Few scholars have used the label prebendalism before the 1980s. (An exception is Kim (1970), who applied it to Korean history.) Furthermore, few scholars use it today outside treatises of Weber's works. However, the label prebendalism has really stuck with case studies on Nigeria, particularly by native scholars, even to this day. It is quite clear that Richard Joseph's (1987) publication *Democracy and Prebendal Politics in Nigeria. The Rise and Fall of the Second Republic* is responsible. Although Joseph was criticized for his statist approach to prebendalism and the 'essentialist' nature of African **ethnic politics**, his coverage of the Nigerian Second Republic was done in great depth.

Joseph (1983: 1987) argued that existing frameworks like patron-client relations, class analysis, and ethnicity were insufficient to capture the nature of state power in Nigeria and other parts of Africa. Drawing on Weber, his concept of prebendalism refers to a system where public offices are allocated and exploited as personal benefices by officeholders, but this practice is legitimized by political norms that frame it not merely as individual greed but in service to specific societal groups (kinship or ethnic ties).

In his words: *"a prebendal system will be seen not only as one in which the offices of the state are allocated and then exploited as benefices by the office-holders but also as one where such a practice is legitimated by a set of political norms according to which the appropriation of such offices is not just an act of individual greed or ambition but concurrently the satisfaction of the short-term objectives of a subset of the general population."* (Joseph 1987: 67).

Joseph highlights a shared expectation across social classes – *bourgeois*, *petit-bourgeois*, and plebeian – that competition for public resources will be conducted along ethnic and sectional lines (**ethnic politics**). This system intertwines morality and pol-

itics, presenting a fundamental dilemma that underpins Africa's developmental challenges. By normalizing the appropriation of state offices for private and group benefits, prebendalism perpetuates systemic inefficiencies and obstructs equitable governance (Oloruntoba & Falola 2018).

For Joseph (1987), prebendalism and **clientelism** are interdependent and reinforce each other in political systems. To secure and retain clients, it is necessary to acquire a prebendal office, which provides access to state resources. Conversely, to ensure a reasonable chance of obtaining such an office for oneself or one's kin, it is essential to cultivate a network of clients. This reciprocal relationship creates a cycle where prebendal positions are used to distribute resources and favors, solidifying the loyalty of clients, while the support of these clients enhances the likelihood of securing or maintaining prebendal offices (Joseph 1983; 1987).

So, while prebendalism has almost disappeared from the mainstream, it remains strong as a permanent (self-appropriated) label for Nigerian neo-patrimonial exceptionalism all the way to its fourth republic (cf. Demarest 2021). Of course, interesting perspectives have emerged: Pratten (2013) highlights an under-explored dimension of Joseph's concept, namely that prebendalism is inherently linked to insecurity and uncertainty (as per Weber's logic of prebends). This fosters a context where the perception of vulnerability and unpredictability permeates both material and political life. This insecurity affects not only those excluded from access to critical resources but also those temporarily in control, as their positions remain precarious and subject to the ruler's discretion, perpetuating a cycle of exclusion, anxiety, and further instability (Pratten 2013). This approach resonates with 'time horizons' (in Box 5.5).

Gallego and Wantchekon (2017) reintegrated the concept back into a spectrum of various forms of **systemic corruption**. For them prebendalism represents an extreme form of **patronage** where public resources are allocated to clients, but with significant differences in how these resources are exploited. Unlike conventional patronage, where some level of public service delivery – albeit inefficient – is expected from brokers, prebendalism involves the outright extraction of public resources by clients for personal enrichment, leaving little benefit for the community (cf. **kleptocracy**). In this system, the patron loses substantial control over public offices, which are used almost exclusively for the personal gain of the client, undermining professional civil service and leading to appointments based on political favors rather than merit.

The prevalence of prebendalism is influenced by the strength of the rule of law, institutional frameworks, and state capacity; weaker systems allow patronage to devolve into prebendalism. Rather than viewing these concepts as binary opposites, they can be understood on a continuum, with prebendalism representing the most corrupt end of the spectrum. For example, appointing a strategic broker to a senior customs office might reflect patronage, but allowing that broker to manipulate taxes for personal gain exemplifies prebendalism. This distinction underscores why institutions in developed countries are better equipped to prevent patron-client relations from escalating into such corrupt practices (Gallego & Wantchekon 2017).

While this is an elegant way to reframe the concept and prolong its conceptual shelf-life, it pulls prebends completely out of their Weberian shell: Sultanistic rulers do not lose control over their *Patrimonium*: They 'own the state to rule them all, and through prebends bind them.'

Box 1.14 Feudalism: Who Owns the Land Owns the Law

The petty thief is imprisoned but the big thief becomes a feudal lord.
– Zhuang Zhou (Zhuangzi), Chinese Daoist Thinker (ca. 369 – ca. 286 BCE)

Feudalism is a socio-political system that structured society in medieval Europe roughly between the ninth and fifteenth centuries. It was based on a hierarchical relationship between landholders (lords) and those who worked or fought for them (vassals and serfs). The essence of feudalism lies in the exchange of land for service, particularly military service, which created a network of obligations and loyalties that shaped both governance and social order.

The word 'fief' comes from the Latin *feudum* (also *feodum*), and the term probably has Germanic roots. The practice of awarding land for services (rendered) is older, and in late Roman times, such a gift of land was called a *precarium.* By the eighth century it was referred to as a *beneficium*, to be replaced in turn by *feudum* after the ninth century.

At its core, feudalism was a decentralized system where political power was fragmented among various local lords rather than concentrated in a central authority. Lords granted land to vassals in exchange for military and other services, while indentured peasants (serfs) worked the land in return for protection. This system created a rigid social hierarchy with the king at the top, followed by nobles and knights, with peasants at the bottom.

Several key features characterized feudalism. First, it operated within a land-based economy where land was the primary source of wealth and power. Second, it established a hierarchical structure in which society was organized into distinct classes – kings, nobles, knights, and peasants – each with specific roles and obligations. Third, it relied on reciprocal obligations: lords provided protection and land to vassals in exchange for military service or labor. Fourth, political authority was decentralized among local lords rather than centralized in a single ruler. Finally, *manorialism* accompanied feudalism as an economic system where peasants worked on estates (manors) owned by lords.

The concept of feudalism has been the subject of extensive historical debate. Scholars have disagreed on its origins, nature, and applicability outside of Europe. Some historians argue that feudalism emerged as a response to external threats such as Viking invasions or the collapse of centralized Roman authority. For instance, Otto Brunner (1992) attributed its rise to Arab invasions and technological innovations like the stirrup, which facilitated cavalry-based warfare. Others, like Marc Bloch (1961), emphasized the social relationships that developed during this period, particularly the bonds of interdependence between lords and vassals. However, Bloch has been criticized for downplaying the coercive nature of these relationships.

Traditionally, feudalism has been viewed as a uniquely European phenomenon. François Louis Ganshof's classic definition from *Qu'est-ce que la féodalité?* (1944) focuses on Western Europe's legal and military obligations between lords and vassals. However, some historians have extended the concept to other regions with similar hierarchical structures. Feudal-like systems have been identified in Japan under the shogunate, medieval Ethiopia during the Zagwe dynasty, and even parts of India under Mughal rule. However, applying the term feudalism outside Europe has been controversial. Critics argue that it risks oversimplifying complex social systems by forcing them into a European framework.

Scholars have also debated how feudalism evolved or declined over time. Robert Brenner (1976) focused on political power dynamics to explain regional differences in how feudalism developed or disintegrated. He argued that in Western Europe, state power coexisted with feudal structures, allowing peasants to retain certain rights even under pressure from lords. In contrast, Eastern Europe saw weaker state power and more oppressive forms of serfdom. Henri Pirenne (1937) emphasized economic factors like trade and urbanization as key drivers in transitioning away from feudal structures.

Scholars like Susan Reynolds have argued that the Ganshofian model of feudalism (Ganshof 1944; 1964) was largely a construct of post-medieval legal scholars who based their ideas on twelfth-century legal texts rather than on the actual social structures of earlier periods. Reynolds, in her seminal work *Fiefs and Vassals* (1994), contended that neither vassalage nor fiefs were as central to early medieval warrior society as previously believed. Instead, these institutions developed later, influenced by bureaucratic and legal changes in the twelfth century. This view turns the traditional understanding of feudalism upside down by suggesting that much of what historians have labeled as 'feudal' was a later development imposed retroactively on earlier periods. (Bagge et al. 2011: 1-2)

Another element in the debate is Jean-Pierre Poly and Eric Bournazel's (1980) concept of a 'feudal mutation' (or transformation), which posits a violent crisis in early eleventh-century France that led to the breakdown of Carolingian structures and the rise of local lords (*castellans*) who controlled fortified castles. This model became influential in French historiography but is challenged by Barthélemy (in Bagge et al. 2011: 57-75), who argues that historians had misinterpreted changes in medieval charters as evidence of social upheaval when they were merely changes in legal forms. (Bagge et al. 2011:1-2)

Feudalism provides important insights into political regimes and their evolution over time. It highlights how political power can be fragmented across multiple actors rather than centralized in one ruler or institution. This decentralization is particularly relevant when contrasted to later periods labeled the 'age of **absolutism**.'

In some regions, remnants of feudal structures persisted well into modern times. For example, Russia's serfdom system lasted until 1861, while elements of manorial control lingered in Central Europe until the nineteenth century. Understanding these legacies helps explain how historical patterns of elite control and consultation continue to shape contemporary political

regimes.

Feudal lords maintained control through **patronage** – granting land or privileges to their vassals in exchange for loyalty. Even in such forms of **traditional rule** (cf. Max **Weber**), hereditary practices (of titles and offices) at all levels forced rulers into routine (re-)negotiations with their lesser lords, especially right after ascending the throne or when their **legitimacy** was otherwise challenged. This observation made Weber analytically separate feudalism from **prebendalism** and so distinguish between different types of **patrimonialism**.

Since wealth was tied up in land, **succession** practices evolved towards primogeniture (Box 5.10) to halt the division of familial wealth with every inheritance. With multiple children and only one main heir, sovereigns started granting 'appanages' to their younger children (especially sons) not in line for the throne to ensure they could maintain a lifestyle befitting their status. The term is derived from the Medieval Latin *appanare*, meaning 'to provide with bread.'

Rents

The difference between doing a good job and doing a lousy job is driven by how many people a leader has to keep happy.
– Bruce Bueno de Mesquita & Alastair Smith, *The Dictator's Handbook* (2012)

In economics, rent is traditionally defined as income derived from the ownership of a resource or asset that is fixed or limited in supply, such as land, natural resources, or monopolistic privileges. This form of income is distinct from wages or profits earned through productive activities, as it arises from the mere possession of a resource rather than through active participation in the production of goods or services. Political rents, however, extend beyond this economic definition and play a crucial role in political economy and development studies.

Political rents refer to unearned income or profits that are generated not through market competition or entrepreneurial efforts but through control over scarce resources, monopolies, or special privileges often granted by the state. Unlike economic rent, which is tied to naturally limited resources like land or minerals, political rents are primarily the result of institutional arrangements and political power. These rents are typically associated with non-productive activities that allow certain individuals or groups to gain wealth by leveraging access to political connections, regulatory advantages, or state-granted monopolies.

Within frames of **patronage** and **clientelism**, rents are a critical resource to structure elite power relations in the **ruling coalition** (see also **winning coalition** in the frame of **selectorate theory**). They are the main currency in regime behaviors like **co-optation** and **hoarding**. Its effects at the top political level are synonymous with **systemic corruption**.

One key form of political rent is resource-based rent, which is particularly prevalent in resource-rich economies. In such contexts, governments or elites derive significant income from natural resources like oil or minerals without needing to develop other productive sectors of the economy. This reliance on resource-based rents can lead to what is known as the **resource curse**, where economies become overly dependent on natural resources and fail to diversify into other industries. The result is often economic stagnation and vulnerability to external shocks.

Another form of political rent is state-granted monopolies, licenses, or regulations that allow individuals or entities to charge higher prices than would be possible under competitive market conditions. At times, rulers appoint allies to positions so that they can profit from the spoils of office (i.e., **prebendalism**). These rents are common in non-democratic regimes or highly centralized states where political elites can extract wealth by controlling access to lucrative markets. This type of **rent-seeking** behavior often leads to inefficiencies and stifles innovation because it discourages competition and instead rewards those with political connections rather than those who contribute productively to the economy.

The pursuit of these rents gives rise to rent-seeking behavior, where individuals or groups actively

seek to acquire or maintain access to these unearned sources of income. Rent-seeking can take many forms, including lobbying, corruption, or other means of influencing policy decisions in favor of those who seek to benefit from state-granted privileges. This behavior diverts resources away from productive activities and fosters inefficiencies within the economy. Rather than investing in innovation or improving productivity, rent-seekers focus on securing their privileged position within the political system.

At its extreme, rent-seeking behavior can lead to **state capture**, where powerful interest groups exert disproportionate influence over state institutions and decision-making processes. In such cases, the state becomes an instrument for distributing rents rather than serving broader public interests, as shown through frameworks of **patrimonialism** and **neo-patrimonialism**. This upholds autocracy or undermines democratic governance and exacerbates inequality by concentrating wealth and power in the hands of a few. In extreme cases, they become known as **kleptocracies** when their ruling regimes become so predatory that economic **development** is notably affected.

Finally, **rentier states** are those whose economies rely heavily on rents derived from natural resources or other forms of unearned income rather than from productive sectors like manufacturing or services. In these states, governments often prioritize maintaining control over resource flows rather than fostering economic diversification. As a result, rentier states may experience weak institutions, limited accountability, and a lack of incentives for economic reform.

Political rents represent a critical concept in understanding how unearned income shapes both economic development and political power structures. By examining the dynamics of rent-seeking behavior, state capture, and rentier states, we can better grasp how certain economies become trapped in cycles of inefficiency and inequality driven by access to scarce resources and political privileges rather than productive activity.

Resource Curse

Ten years from now, twenty years from now, you will see; oil will bring us ruin. Oil is the Devil's excrement.
– Juan Pablo Pérez Alfonzo, Venezuelan Minister for Energy (1975)

How is it possible that countries with high **rents** from natural resources have lower economic growth? This is the first puzzle that the study of 'resource curses' tries to explain. Since the early 1990s, there have been heated debates on whether the resource curse was real or not, with much digging into the empirical evidence and scrutinizing the causalities (Wright & Czelusta 2004; Lederman & Maloney 2007; Dunning 2008; Lederman et al. 2008; Crownson 2010; Di John 2010). After 2000 the mainstream discussion switched to institutions and governance with a separate branch gauging if resource abundance leads to conflict.

ORIGIN Much of the development and democratization literature has been focusing on the 'resource curse' since the 1950s. (Ross 1999) Richard M. Auty invented the concept itself in 1993 (Auty 1993), and it usually affects developing states with a dependency on their oil wealth and mineral abundance. The 'curse' element of his thesis refers to the puzzling correlation between the presence of natural resources in developing nations and these states' slow growth rates and susceptibility to conflict. This 'resource curse' thesis received a boost when D.J. Sachs and M.A. Warner concluded that resource-rich governments gravely underperformed between 1970-1989 because of their trade policy closure designed to counter the employment-diminishing effects of so-called 'Dutch disease.' (Sachs & Warner 1995) – see Box 1.15.

DEFINITION Since the 'resource curse' is actually a hypothesis it does not have a standardized definition. Originally, it solely posits a causal relation between the high rents from resource abundance available to power-holders and underwhelming economic performance. **Rents** are defined as the *"surplus revenue after deducting all production costs including a risk related return on investment"* (Auty 2019: 2). Such rents can also come from **foreign aid** or income gathered from services rendered, like renting army bases, cf. Djibouti (Brass 2008)

The phenomenon has also been named the 'paradox of plenty' (T.L. Karl), 'natural resource trap' (P. Collier), and the 'oil curse' (M. Ross). (Karl 1997; Collier 2007; Ross 2012 cited in: Guliyev 2014: ii) In his later publications, R.M. Auty (2019) has rebranded the phenomenon a 'rent curse' to account for the complexity of the issue, but also because not all rents responsible for dysfunctional development and the deterioration of governance derive from resource wealth.

As the debate evolved to break open the black box of the state and include institutions (Acemoglu et al. 2001) the hypothesis was broadened to differentiate among political regime types to explain the variation in performance. The more exclusive the insti-

tutions, the more severe the effects of the resource curse. Today, scholars criticize the linear causality between resource rents and political-economic performance, and acknowledge the complexity of these relations: the impact of rents from other sources, macroeconomic trends, etc. (Auty 2019: 4-5).

SEE ALSO The concept is closely related to 'rentierism' and the aspects of **neo-patrimonialism** that consider **state capture** and **rent-seeking**. When it comes to measuring the level of dependence and rentierism, consult the section 'measurement under **rentier states**. Prolonged management of high-income resource wealth to stabilize authoritarian regimes is associated with rentier states like the oil **monarchies in the Arab world**. In contrast, their unsustainable variant with 'predatory rule' or **kleptocracy** is most pronounced under **personalist rule** and **sultanism & neo-sultanism**. **Rebel regimes** and **warlords** are also known to sustain themselves from **rents** from alluvial resources, and the latter often impede peace processes in order to continue to profit from such revenues.

LITERATURE The literature on this topic spans over several decades and is enormous. Some recent comprehensive overviews are: Ross 2018; Mansoob Murshed 2018; Auty & Furlonge 2019; Smith & Waldner 2021.

The study of resource curses has been a central topic for development studies for decades, and as its scope extended to include the study of political regimes and conflict studies, it has not lost its relevance. However, a deeper understanding of the phenomenon, supported by more detailed Large-N data and in-depth case studies, has reduced the significance of the resource abundance *an Sich* to make way for a more nuanced treatment of 'rents' of all kinds, also abandoning the original hypothesis' linear and deterministic assumptions.

The scholarship can be roughly divided into three major strands: (i) the original focus on the negative link between high resource rents and economic growth, (ii) the link with authoritarianism, and (iii) the posited causality with civil war and conflict.

Scholarship addressing the link with economic growth (i) mostly covers the mechanics of high rents and its effects, such as 'rentierism' and the 'Dutch disease' (see Box 1.15) and volatile revenue. The focus is on sectoral imbalance and the disincentive of entrepreneurship. Research after 2000 goes much further than these economic mechanics, taking into account political factors as well, especially the policymaking accompanying the initial resource boom and this rent-seeking.

By the early 2000s, institutional failure and authoritarianism (ii) became the new focus once researchers discovered how point-source (concentrated) resources (see Table 1.8) impede governance quality and democracy and, in turn, growth (e.g., Mavrotas et al. 2011; Zulfan Tadjoeddin 2012). The works of Michael Ross were the main impetus to disseminate this approach into the mainstream (Ross 1999; 2001; 2003; 2012; 2015). The jump to conflict studies (iii), which developed in parallel, is a logical outcome. Here, resource rents become a causal factor in explaining conflict dynamics (Ross 2006), often analyzed in greed vs. grievance frames (e.g., Mansoob Murshed & Zulfan Tadjoeddin 2009).

CLASSIFICATIONS It is essential to differentiate between the characteristics of natural resources, as they play a significant role in the dynamics of various types of resource curse. Scholars such as Varisco (2010), Le Billon (2008), Ross (2015), and McLaughlin Mitchell & Thies (2012) identify key attributes influencing resource-related conflicts: *lootability, concentration, proximity* to centers of power, *obstructability, renewability, mode of production*, and *legality* of trade.

Lootable resources, such as timber, alluvial diamonds, gold, gemstones, and drugs like coca or opium poppy, are relatively accessible due to low extraction costs. They can be harvested through artisanal methods and traded in legal or black markets by private actors or small groups. In contrast, non-lootable resources – including oil, natural gas, kimberlite diamonds, and minerals like bauxite or copper – require expensive extraction technology, often necessitating substantial investment by states or multinational corporations.

Lootability is closely linked to *concentration*. Mines and oil fields are concentrated at specific points, making them easier to control, whereas resources like alluvial diamonds or timber are spread over larger, harder-to-regulate areas. *Proximity* to administrative capitals further affects control; resources located far from the political center are costlier to manage and more vulnerable to exploitation by non-state actors. *Obstructability,* or the ease of blocking transportation routes, often overlaps with proximity, as distant point-sources provide opportunities for armed groups to disrupt exports and challenge state authority.

Other characteristics also influence resource dynamics. *Renewability* determines stakes: non-renewable resources like oil and minerals tend to provoke higher contestation than renewable ones, such as timber or drugs. The *mode of production* – whether a resource is extracted (e.g., minerals) or cultivated (e.g., opium) – and its *legal* trade status further shape its impact.

As shown in Table 1.8, these factors create a spectrum of control: 'non-lootable, proximate, and concentrated' resources are easier for governments to manage, while 'lootable, distant, and diffuse' resources are highly attractive to non-state actors or competing states, making them hotspots for conflict.

Among the three major literature strands on the resource course mentioned earlier (i-iii), the scope of this entry focuses on the study of resource curses and authoritarianism (ii). Within this sub-stream of the larger debate, and inspired by Le Billon (2008) and C.T. Call (2011), this entry organizes this substream of the larger debate into three parts: a 'legitimacy curse' (A) a 'capacity curse' (B) and a 'security curse' (C) (Van den Bosch 2021: 115-125).

Legitimacy curse (A) The legitimacy curse highlights how resource wealth undermines democratic accountability and reinforces authoritarianism

Table 1.8 – Resources & Observed effects

Resource	Features	Observed Effects
Oil (& gas)	CONCENTRATED NON-LOOTABLE (especially offshore) Rents are (extremely) **high**.	- Known to strengthen personalization and rentierism since rents can maintain elaborate coercive apparatuses. - Increases gatekeeping (leverage) capabilities of regimes to avert foreign pressure. - Regimes have funds for warfare (e.g. Petro-aggression). - Distant, onshore deposits tend to encourage secession. - Distant, offshore deposits can trigger international disputes.
Kimberlite* diamonds, bauxite, gold, copper, uranium etc.	CONCENTRATED LESS LOOTABLE Rents are **medium-high**: prices are volatile. Resources are costly to extract but easier to control.	- The effects are less pronounced in strengthening personalist rule or maintaining large security apparatuses. - Distant deposits tend to encourage secession.
Alluvial minerals and gemstones, timber, etc.	DIFFUSE LOOTABLE Rents are **low-medium**: labor-intensive to extract and costly to control.	- Rent seeking fosters unaccountable predatory rule as rents are too low to boost state capacity (public services, etc.). - Can finance rebellions and facilitate rebel recruitment. - Attracts foreign predation. - Create initiatives to maintain conflict.

* Kimberlite or 'primary' diamonds are geographically concentrated in underground pipes and generally involve substantial capital intensities in production, provide high barriers to entry for private actors but high rents for states. (Dunning 2008: 6) The name 'Kimberlite' derived from the famous Kimberley mines in the Northern Cape Province (South Africa), also known as 'the big hole.'
Source: Author's own work based on: Van den Bosch 2021

(**autocratization**). Evidence suggests that oil wealth primarily helps autocratic regimes stay in power rather than eroding or subverting existing democracies (Smith & Waldner 2021). The negative effects of resource wealth on democracy may be conditional on factors such as inequality and institutional quality (Ross 2018).

Personalist regimes, which concentrate power in the hands of a single leader, are particularly prone to this dynamic (Guliyev 2014). Oil wealth, for instance, allows rulers to reduce their reliance on taxation, severing the link between citizens and the state ('no taxation without representation') (Narh 2023). Instead of fostering inclusive governance, these regimes use resource rents to fund patronage networks, suppress opposition, and maintain loyalty through corruption and repression. This creates a politically passive population reliant on state handouts but excluded from decision-making processes (Ross 2000; 2013; 2018; Smith & Waldner 2021; Bannon & Collier 2003, Van den Bosch 2021).

Examples include Muammar Qaddafi in Libya and Paul Biya in Cameroon. Additionally, resource rents reduce external democratizing pressures by diminishing reliance on **foreign aid** or loans, insulating regimes from international accountability. This **gatekeeping** function is evident in cases like Gabon and Cameroon, where oil wealth enabled rulers to resist domestic and foreign pressures for reform.

Capacity curse (B) The capacity curse focuses on how resource dependence erodes state capacity and exacerbates grievances. Resource wealth often leads to uneven development and economic distortions (e.g., the Dutch disease in Box 1.15), increasing inequality and fostering perceptions of injustice among marginalized groups. The sudden influx of oil wealth can lead to over-rapid spending and investments that the domestic economy cannot effectively absorb. (Ross 2018) This can fuel inflation, distort the real exchange rate, and create imbalances in the economy (Mansoob Murshed 2023).

For instance, oil revenues often benefit elites while excluding other societal groups from economic gains. Weak institutions fail to mediate these grievances or manage resource wealth effectively, leading to elite infighting, declining public services, and environmental degradation. Oil-dependent governments may fail to develop robust **bureaucracies** capable of effectively managing public resources and addressing societal challenges. (Bannon & Collier 2003).

Both Nigeria and Venezuela are good examples of how oil rents have reduced state capacity as a result of **systemic corruption** and inequality-driven unrest. (Auty & Furlonge 2019). In fragile states, diffuse resources like alluvial diamonds or timber are difficult to control, creating opportunities for predatory behavior by state agents or private actors. Such dynamics weaken the state's monopoly on violence and its ability to address grievances effectively.

Security curse (C) The security curse examines how resource wealth fuels violent conflict. Resources provide financial incentives for rebellion (greed) or exacerbate grievances that motivate insurgency.

The unequal distribution of resource wealth often marginalizes communities in resource-rich regions, leaving them excluded from the benefits of extraction activities. Weak institutions that fail to manage resource revenues transparently and equitably can deepen social and economic inequalities, further fueling tensions and increasing the likelihood of conflict. This exclusion is compounded by the environmental degradation caused by resource exploitation, which disproportionately impacts local populations. Additionally, competition over limited resources such as land, water, and minerals can intensify grievances and escalate tensions, particularly when these resources are critical to sustaining local livelihoods, potentially triggering violent conflicts (Narh 2023).

Rebel groups easily exploit lootable resources like diamonds or timber to fund armed conflicts, as seen in Liberia and the Democratic Republic of Congo. Meanwhile, point-source resources like (onshore) oil deposits can trigger secessionist movements (e.g., South Sudan) or coups due to their concentrated value. Oil-rich regimes may also use rents to bolster military spending (**coup-proofing**), reducing the likelihood of successful coups but increasing repression. Additionally, resource wealth attracts foreign predation or intervention, further destabilizing conflict-prone regions.

Basedau & Lay (2009) find that this propensity for conflict varies and that windfall revenues, like from oil or gas, may stabilize some regimes if clientelism is not too pervasive, i.e., **monarchies in the Arab world**. Colgan (2013) suggests that revolutionary oil states are more war-prone.

KEY SIGNIFICANCE The relationship between resource curses and regime types is multifaceted, with significant evidence indicating that resource wealth, especially from oil, tends to impede democratization and reinforce authoritarian regimes. This dynamic is particularly pronounced in regimes with weak institutions. Oil wealth has a particularly strong effect in entrenching authoritarian rule compared to other natural resources. This is largely due to the concentrated nature of oil revenues, which typically flow directly to the state and are easier for governments to control. However, the impact of resource wealth on governance is not deterministic but contingent on the quality of a country's institutions (Auty & Furlonge 2019; Bannon & Collier 2003; Guliyev 2014).

Countries with strong, producer-friendly institutions – regardless of regime type – are better equipped to manage resource wealth effectively. Such institutions promote transparency, accountability, and a stable environment for investment, reducing risks of **rent-seeking** and **corruption** while fostering economic development and improved governance.

Democratic regimes may have some advantages in mitigating the negative effects of resource wealth due to their more inclusive decision-making processes and stronger accountability mechanisms. Parliamentary systems, in particular, may be more resilient in preventing resource wealth from being captured by special interests compared to presidential systems. Nonetheless, even democracies are not immune to the resource curse if they lack robust institutional checks and balances, effective anti-corruption measures, or long-term development strategies (Kim & Lee 2018).

In autocratic regimes, the type of autocracy also influences how resource wealth shapes political outcomes. Research suggests that oil wealth is especially beneficial for the survival of **personalist rule** and **military regimes** compared to other forms of autocracy. These regimes tend to be highly centralized and rely heavily on **patronage** and **repression** to maintain power, making resource rents particularly valuable for their stability (Ross 2018; Mansoob Murshed 2023).

It is also important to recognize that the relationship between resource curses and regime types is not static. While resource wealth often bolsters authoritarianism initially, it can also contribute to instability and regime change over time. Mismanagement or a decline in resource revenues can lead to economic hardship, social unrest, and challenges to the legitimacy of ruling regimes – whether democratic or authoritarian – potentially triggering political transitions or upheavals. Thus, the effects of resource wealth on regime types are shaped by a combination of institutional quality, regime characteristics, and long-term economic management strategies.

The case of Timor-Leste illustrates that there is no path dependency and that agency matters. The country has defied the resource curse by establishing the *Petroleum Fund* to prudently manage its oil revenues, ensuring economic stability and intergenerational equity. It strengthened institutions through transparency initiatives like *Extractives Industries Transparency Initiative* (EITI), diversified its economy into agriculture and tourism, and invested in education and health to build human capital. Political stability since independence has further enabled effective governance. These strategies have allowed Timor-Leste to leverage its natural resources for sustainable development rather than succumbing to the challenges typically associated with resource wealth. (Schmoll & Swenson 2024)

Box 1.15 Dutch Disease

The greatest wealth is health.
– Virgil

Coined by *Time* magazine (1977) to describe the experience of the Netherlands after the country discovered and exported natural gas from the North Sea in 1959, the term, in purely economic terms, denotes the paradox of a negative fallout resulting from a major boon in foreign earnings. The 'Dutch disease theory,' or the exact economic mechanism behind the phenomenon, was designated by Corden and Neary (1982).

Such rent windfalls can come from natural resource exports, foreign income (e.g. the Panama or Suez Canal tolls), foreign direct investment (FDI) (Lartey 2011), remittances (Acosta et al. 2009), and can even result from foreign aid influx (Rajan & Subramanian 2011; Fielding & Gibson 2013). (For the case of FDI in Columbia, see Botta et al. 2016.)

Smaller open economies, particularly developing countries with fragile agriculture and industry sectors, are most vulnerable to the Dutch disease. The main effects of the phenomenon are listed below, but even these are deducted from a theoretical economic model and based on some core assumptions and thus not always grounded in empirical evidence. Kojo (2015) offers a comprehensive overview of some of the myths and assumptions regarding the Dutch disease.

In the short term, any such spike in foreign earnings (stimulating imports) contributes to an overvalued national currency, depressing the regular export industry (because of the reduced-price competitiveness of national goods).

In the middle term, domestic level investments and services become less attractive in those sectors that compete with foreign markets, especially agriculture and industry, which leads to unemployment and de-investment.

In the longer term, and this is particularly true of dictatorships, the pitfall of the Dutch disease refers mostly to structural de-industrialization or de-agriculturalization as a result of the large inflow of foreign currencies from natural resource exports. These factors weaken the economy's other productive sectors, until skills and experience in these sectors are permanently lost, resulting in even more rent-dependency and **rent-seeking** behavior. This can lead to widespread uneven development, poverty, corruption and institutional problems (Zulfan Tadjoeddin 2012: 112).

R. M. Auty describes the dynamic of a high rent-cycle in detail as follows:

"High rent deflects political and economic agents into rent capture and distribution at the expense of wealth creation because the benefits of rent redistribution are both substantial and immediate, whereas the benefits of wealth creation accrue through the long term and may be captured by successors. This triggers a negative economic circle because it boosts the fraction of rent cycled through patronage channels rather than markets, which reduces investment efficiency so that GDP growth slows even if the rent sustains high investment. A prolonged reliance on primary exports also skips the labour-intensive industrialisation phase of the low-rent model so that surplus rural labour persists and feeds income inequality. Wary of urban unrest, governments deploy rent to create employment that markets will not support, typically by protecting infant industry and over-extending the bureaucracy. (…) Finally, the high-rent negative social circle is rooted in the rise in income inequality explained above. The resulting social tension is exacerbated when faltering GDP growth necessitates rent rationing." (Auty 2009: 34-35)

In dictatorship studies, the Dutch disease is thus intrinsically linked to the **resource curse** and is the typical result of unresponsive **rent-seeking** elites that ignore the warning signs of economic distress, thus plunging their populations into poverty, all the while enriching themselves.

Ruling Coalition & Inner Circle

The three most important characteristics of a coalition are: (1) Loyalty; (2) Loyalty; (3) Loyalty.
– Bruce Bueno de Mesquita & Alastair Smith, *The Dictator's Handbook* (2012)

The study of ruling coalitions and inner circles in comparative authoritarianism is essential for understanding how dictators maintain power within their organizations, gather information, navigate succession, and shape power dynamics within authoritarian regimes.

DEFINITION A 'ruling coalition' in a dictatorship is a group of elites who support the **incumbent** and are crucial for maintaining the regime's stability. This coalition typically includes individuals holding key positions within the government, military, and potentially other influential sectors. Paraphrasing Sean Yom (cited in Buehler & Ayari 2018: 1): elites retained in coalitions complain not *if* but *how* autocrats should reign.

While the terms 'inner circle' and 'ruling coalition' are sometimes used interchangeably, they represent distinct concepts crucial to understanding power dynamics in dictatorships. The inner circle refers to a smaller, more exclusive group of individuals who are particularly close to the dictator and enjoy a high degree of trust and influence. The inner circle is thus a more informal subset of the larger ruling coalition.

"As always under Stalin, Politburo membership and team membership were closely related but not identical categories. Stalin stuck to his old habits of gathering an inner circle – 'the Five,' 'the Seven,' and so on – that included only a chosen group from the Politburo. This offended the newcomer [Sergei] Syrtsov, and he complained that Kuibyshev, Rudzutak, and Kalinin, as well as himself, were excluded from inner-circle consulta-

tions. He called it 'factionalism,' but that's probably not the most accurate way of seeing it: the 'in' faction could change, so it was basically a way of Stalin exerting control via the power of inclusion/exclusion over his associates." (Fitzpatrick 2015: 72)

The basis of membership also differs; inner circle membership is primarily driven by personal ties and trust (cf. **family**) while ruling coalition membership balances loyalty and competence. Functionally, the inner circle acts as a close advisory body, whereas the ruling coalition is responsible for the regime's overall stability and functioning. So, the key differences between these concepts include size and exclusivity. The inner circle, in a way, represents the dictator's own faction within the ruling coalition and is the main vehicle through which control is exerted.

SEE ALSO The ruling coalition in a **political regime** is often used synonymously with the term **winning coalition**, which is one of several interlinked groupings of (elite) actors in regimes as described in **selectorate theory**. Such ruling networks are also analyzed through frameworks such as **clan politics** and 'pyramids' cf. **patronalism**. The inner circle then links the organization of power with **informality** and personalism, like the inclusion of a ruler's **family** members in the apex of power.

LITERATURE Membership in the ruling coalition is based on a combination of loyalty, competence, and strategic considerations, as dictators seek to balance the need for loyal supporters with the need for capable individuals to govern effectively. The primary function of the ruling coalition is to ensure the regime's stability by implementing policies, suppressing dissent, and preventing challenges to the dictator's authority (Geddes et al. 2018).

There is striking variation in the duration autocrats retain elites within their ruling coalitions. Among the elites who served as ministers in Tunisia's authoritarian regimes (1957-2011), 14 percent remained in office for over a decade, 41 percent for more than five years, and 19 percent for less than one year. Some, like Minister Lassaad Ben Osman (in government: 1969-1988), held their positions for over 20 years as core coalition members, while others, such as Mohamed Snoussi (Justice Minister, 1969-1970) and Noureddine Hached (Minister of Labor, 1985-1986), were dismissed within less than a year as tertiary coalition members (Buehler & Ayari 2018).

The composition of a ruling coalition is thus dynamic, as dictators strategically manage these groups through tactics such as purges, appointments, and promotions to ensure loyalty and prevent challenges to their authority. This dynamic nature of the relationship between the dictator and the ruling coalition is characterized by both cooperation and potential conflict (Geddes et al. 2018; Bakir 2023; Mahdavi & Ishiyama 2020). The **longevity, stability & resilience** of a dictatorship are closely tied to the dictator's ability to manage the ruling coalition effectively (Gandhi & Przeworski 2007).

Affinity and shared background matter. Whereas Tunisia's Habib Bourguiba (reign: 1957-1987) retained former elites as ministers due to biographical similarities, capacity to represent influential social groups, and competence, its second autocrat (Zine El Abidine Ben Ali, reign: 1987-2011) did not. He became more likely to dismiss types of elites retained under the first autocrat, purging his coalition of ministers perceived to be potential insider threats due to their favored status under his predecessor (Buehler & Ayari 2018).

The concept of 'coup constraint' is central to understanding the relationship between the dictator and the ruling coalition (Mahdavi & Ishiyama 2020). The ruling coalition's capacity to launch a coup (or credible threat thereof), along with the potentially fatal costs associated with it, keeps rulers up at night (when most coups occur) and clouds their mood during the day. This dilemma of authoritarian power-sharing (Svolik 2012) is one of the core issues of autocratic rule and foremost plays out in the ruling coalition, as explained in detail in the **personalization** entry. The power balance between the ruler and the ruling coalition, divided into different (usually fluid) factions, significantly influences the dictator's decision-making process regarding power-sharing and personalization.

Svolik (2012) finds that all regimes without procedures have an inherent drive to personalize. Rulers' insecurity by enabling potential usurpers to share power with them drives leaders to embark upon a range of actions to reduce ruling coalitions' ability and willingness. Leaders usurp the power to make appointments, alter promotion rules and command structures, take control of existing institutions, take control over patronage networks (**hoarding**), create parallel organizations (**coup-proofing**), or eliminate rivals (**purges**). Initially, this is a dangerous process, as any power moves might trigger a reaction (a coup, in the worst case). After a certain threshold, the unity, capacity and audacity of the ruling coalition are so eroded that coups are no longer credible. This is the threshold after which a regime is transformed into **personalist rule** (Svolik 2012; Timoneda et al. 2024).

Still, a highly disloyal coalition may necessitate dictators to use aggressive personalization tactics to strengthen their grip on power. Conversely, a loyal coalition allows for more gradual personalization and potentially greater regime stability (Gandhi & Przeworski 2007; Timoneda et al. 2024). The constitution of ruling coalitions thus changes over time, especially during regime consolidation phases after power takeovers (Bokobza et al. 2022), after failed coup attempts (Easton & Siverson 2018), and when a planned **succession** is nearing (Goldring et al. 2024).

For example, in the Soviet Union under Stalin, the ruling coalition consisted of members of the Politburo (Box 8.4) who held significant influence within the party and state apparatus. Lenin was its natural leader (charisma), but Stalin strategically managed this coalition through appointments, **purges**, and institutional reforms to consolidate his power (Khlevniuk 2009; Fitzpatrick 2015).

Similarly, in North Korea under Kim Jong-Il (reign: 1994-2011), the ruling coalition initially centered around military elites. To prepare for his succession,

Kim Jong-Il strategically empowered party elites outside his inner circle to create a power base for his successor, Kim Jong-Un (Goldring et al. 2024).

In contrast, membership in the inner sanctum is routinely based on personal relationships, shared experiences, and perceived loyalty, which can be familial, ethnic, or rooted in shared ideology. The inner circle serves as the dictator's primary advisory body, providing counsel on critical decisions and shaping the regime's overall direction. Importantly, the inner circle may not always align with formal positions of power, as dictators might rely on a select group of advisers outside official government or party structures.

Dictators build trust with their inner cliques through strategies that foster loyalty, reduce fear, and ensure control. A key method is nurturing mutual trust by signaling faith in advisers' indispensability. For example, Stalin granted his generals more autonomy and halted purges during WWII, encouraging open dialogue to gain their professional opinions. Such actions create a sense of security, prompting advisers to speak candidly without fearing immediate repercussions, though long-term trust remains precarious (Honig & Zimskind 2017).

Another approach is appointing loyalists who have proven their dedication through past actions. In Jordan, King Hussein trusted General Habes al-Majali after he attempted to protect his grandfather, King Abdullah I during a visit of the Al-Aqsa Mosque in 1951 (but Majali's advice was ignored and Adbullah was killed). In Egypt, Mubarak relied on General Omar Suleiman, who saved him from an **assassination** attempt. These shared crises strengthen personal bonds, making advisers feel valued and less likely to betray (Honig & Zimskind 2017).

Dictators also use ethnic or societal ties to generate trust. Shared backgrounds foster a sense of solidarity and mutual survival. Stalin trusted Lavrentiy Beria, a fellow Georgian, while Bashar al-Assad relied on Alawite officials amid Syria's sectarian conflict. This dynamic discourages betrayal, as the group's survival is tied to the dictator's (cf. 'ethnic stacking' in **coup-proofing**. (Honig & Zimskind 2017).

Finally, leaders often select advisers who cannot pose a credible threat due to minority status. For instance, in Iraq, Saddam Hussein relied on Tariq Aziz, a Christian, and King Hussein in Jordan appointed an Armenian to lead the Royal Court. These individuals, unable to rally majority support, are perceived as less likely to usurp power, making them trusted confidants. Through these measures, dictators balance their need for advice with the imperative of maintaining control (Honig & Zimskind 2017).

KEY SIGNIFICANCE The inner circle is a ruler's own loyal faction. Dictators leverage their inner circle to exert control over the broader ruling coalition, ensuring regime stability and maintaining their grip on power. The inner circle acts as a conduit for the dictator's will, communicating directives, implementing policies, and enforcing loyalty within the ruling coalition (eyes and ears). This centralized control through a trusted group allows the dictator to maintain a firm grasp on decision-making processes, even when formal institutions or procedures suggest a more distributed power structure.

Strategic appointments within the ruling coalition often originate from the inner circle. Dictators carefully select individuals for key positions, prioritizing loyalty and alignment with their objectives. This practice ensures that individuals occupying important roles within the ruling coalition are beholden to the dictator and less likely to challenge their authority.

Historical examples of such strategic plotting include elite families in early Joseon Korea arranging marriages to solidify power and create a hereditary line of control within the ruling class (Hong et al. 2021). Similarly, dictators may manipulate the composition of their ruling coalition to prepare for succession by strategically empowering individuals likely to support their chosen heir (Goldring et al. 2024).

The inner circle also plays a critical role in managing information and shaping the narrative within the ruling coalition. Dictators may limit the free exchange of ideas and information within the broader ruling coalition, relying instead on their inner circle to filter and control information flow (Bakir 2023). This control helps maintain unity and prevents dissenting voices from undermining the dictator's authority.

METHODOLOGICAL ISSUES Researchers employ both quantitative and qualitative methods to examine these groups. Quantitative analyses utilize datasets on elite appointments, cabinet duration, co-occurrences at public events, and biographical information to identify patterns and test hypotheses related to coalition management, power consolidation, and the impact of personal loyalty on regime stability. Good examples are Mahdavi & Ishiyama 2020 (on North Korea) and Buehler & Ayari 2018 (on Tunisia). Others use game theory to explore the relationship between rulers and key elites: Francois et al. 2014.

Qualitative studies draw on historical records, memoirs, and interviews to provide in-depth analyses of specific cases, offering rich contextual insights into the motivations, strategies, and decision-making processes of dictators and their inner circle members, like many biographies of Stalin and his transformation of the Politburo show: Khlevniuk 2008; Fitzpatrick 2015; Belova & Gregory 2002 and Box 8.4. For other examples, consult Raimundo et al. 2009 (Portugal under Salazar) and Pinto 2002 (including other fascist regimes).

Scholars often focus on informal networks (**informality**) and personal relationships within the ruling coalition and inner circle, recognizing that formal institutions may not accurately reflect the distribution of power in dictatorships, although understanding their interplay is crucial, as shown by the interactions of inner circle and ruling coalition to enable **personalization** and **succession**.

Sharp Power

All warfare is based on deception
– Sun Tzu (孙子 – *Sūnzǐ*, 771-256 BCE), Chinese Strategist and Philosopher

Sharp power foremost encapsulates the various means by which non-liberal states gain influence or preponderance over other liberal democratic states. The concept is meant to underscore the alleged rise of illiberal practices in international politics and the extent to which liberal democracy is vulnerable to **propaganda**, **disinformation**, or **censorship** as it interacts with non-liberal regimes. The concept differs, therefore, from the notion of **soft power**, which usually denotes the ability to gain influence by means other than coercion. However, sharp power is also distinct from hard power insofar as the latter corresponds to the uses – or potential uses – of force for the sake of securing a preferred outcome.

DEFINITION While there is no precise definition of the concept, sharp power points to how non-democracies gain influence *vis-à-vis* their democratic counterparts without resorting to brute force or political persuasion. It is considered a sharp – as opposed to soft or hard – form of power because of how non-democracies are able to puncture the target state by taking advantage of the freedom of information within most liberal democratic regimes.

In the words of Christopher Walker and Jessica Ludwig (2017: 13): *"Authoritarian influence efforts are 'sharp' in the sense that they pierce, penetrate, or perforate the information environments in the targeted countries. In the ruthless new competition that is under way between autocratic and democratic states, the repressive regimes' 'sharp power' techniques should be seen as the tip of their dagger – or indeed their syringe. These regimes are not necessarily seeking to 'win hearts and minds,' the common frame of reference for 'soft power' efforts, but they are surely seeking to manage their target audiences by manipulating or poisoning the information that reaches them."*

Precisely because of how such regimes make use of the freedoms that do not otherwise exist in their own countries, sharp power is related to, albeit distinct from, **soft power**. The latter is often defined as: *"It is the ability to get what you want through attraction rather than coercion or payments. It arises from the attractiveness of a country's culture, political ideals, and policies. When our policies are seen as legitimate in the eyes of others, our soft power is enhanced"* (Nye 2004b: x).

SEE ALSO Joseph Nye's work on **soft power** has its own entry, as well as **power** as a meta-concept. Closely linked are the entries on **censorship**, but especially **disinformation** and **propaganda**.

ORIGINS The concept was introduced by Christopher Walker and Jessica Ludwig in 2017 in a publi-

cation for the *National Endowment for Democracy*. As non-liberal democracies became ever more preponderant and influential in the international liberal order, particularly as Russia and China acquired more wealth and rose to prominence, the notion of sharp power was conceptualized. It was applied to make sense of how such states, with illiberal regimes, often acquire influence via instruments that appear to be fair, impartial and non-coercive but which, in actuality, rely on misinformation, indirect pressure, propaganda and censorship (Walker 2018).

METHODOLOGICAL ISSUES The concept was propounded in the policymaking world to account for democratic resilience in the face of an apparent rise in global authoritarianism (see above). Were it only to be taken as a warning, the concept need not be operationalized. Caution is nevertheless necessary when applying it to practice, and several issues arise.

First, sharp power relies on a rigid distinction between democratic and authoritarian regimes. On top of the problems related to defining each of those categories, insofar as they remain disputed in political science and political theory, sharp power belies a range of (hybrid) regimes. To that end, where does liberal democracy end and authoritarianism begin so that the concept can be applied, and what is to be said about states that are located somewhere in between that spectrum? (cf. **hybrid regimes**).

Second, the question of whether democracies do not seek to obtain influence by means other than persuasion, as soft power would seem to suggest, is not thoroughly conceptualized nor empirically demonstrated. It requires further inquiry.

Third, whether the reasons for penetrating the information systems of liberal democracies stem from the nature of the regime, as opposed to wealth requires additional clarification. Put differently, powerful, wealthy states often seek to influence and undermine other states by all sorts of means, including liberal democracies. Hence, is it the nature of the regime that is prompting those practices or the capabilities and threats they face? (cf. **regime promotion**).

Fourth, the concept is difficult to distinguish from **soft power**. While the latter arises from persuasion and admiration, more so than coercion or manipulation, isolating the source of one type of power over another is methodologically difficult to operationalize. While certain forms of **propaganda** may eventually shape the opinions of individuals, authoritarian regimes may be a source of admiration. Their culture, history, as well as social and economic achievements can also penetrate liberal democratic societies. Hence, it is difficult to distinguish which effect – admiration or manipulation – is shaping their influence among the public of particular democracies.

Fifth, it is also unclear whether the concept exaggerates how influence is acquired. While open societies may be more vulnerable to multiple sources of information, including **disinformation**, it is precisely because they are open that they are likely to be scrutinized or undercut. This is to say that domestic political cultures and economic practices may also have an impact in shaping how audiences receive information and whether they are more likely to accept certain types of information over others.

IMPACT ON POLICY As the United States and the European Union increasingly discussed the presence and interference of Russia and China in their domestic affairs, such as during the 2016 presidential election in Washington D.C., the idea was to demonstrate why and how authoritarians manipulate civil liberties to their own advantage. The concept has been important in the policy world as a means of supporting democratic resilience. Currently, the concept seems to retain relevance and is in the process of being developed: Cole 2018; Shao 2019; Walker et al. 2020; Walker 2022.

Single-Party Regimes

However [political parties] may now and then answer popular ends, they are likely in the course of time and things, to become potent engines, by which cunning, ambitious, and unprincipled men will be enabled to subvert the power of the people
– George Washington, *Farewell Address* (1796)

Under democracy one party always devotes its chief energies to trying to prove that the other party is unfit to rule – and both commonly succeed, and are right
– H.L. Mencken

Single-party regimes are political systems where one party holds a dominant, unchallenged position of authority, wielding substantial political control over decision- and policymaking processes, as well as over elites and society at large. While their authority often rests on an apparatus of coercion, these regimes typically also seek to secure and maintain power through other mechanisms that mitigate potential rebellion or discontent through co-optation, patronage and propaganda. The result is an intricate web of repression of dissent, mobilization of loyalty, and strategic use of institutions aimed at fending off potential threats to the regime's survival. The balance between these numerous mechanisms employed and the institutional arrangements upon which they are based vary between regimes as well as within regimes as they respond to changing regional or international conjunctures. Their success and single-party regimes' ultimate longevity differ considerably and often unpredictably (Kalyvas 1999).

In reality, political systems range along a continuum from archetypal single-party systems to archetypal multi-party systems (cf. **parties**), and many states' particular institutional arrangements do not conform sharply with one or the other (Robertson 2004). At one end of the spectrum, we find single-party regimes with a complete prohibition on other parties and suppression of opposition, such as in China. Somewhat further on the spectrum, we find hegemonic party systems, where other parties are allowed to compete but have very little chance of winning a plurality or majority of seats, such as in Mozambique after 1994. Even further, we have dominant party regimes, with free, competitive parties but a skewed playing field. Nevertheless, even in those countries seemingly dominated by just one party and placed under the overarching umbrella of 'single-party regimes,' the nature and basis of that party's authority and control vary widely. This diversity highlights the fluid and diverse landscape of party systems across different political settings, as well as their contextual and historical specificity.

SEE ALSO Civilian rule, embodied in its archetypal single-party regimes is one of the conceptual blueprints of **authoritarianism** alongside **military regimes**, **monarchies** and **personalist rule**. Its survival strategies vary as party-based rule is tilted more toward 'closed' regimes (**autocracy**) often with a guiding ideology (**totalitarianism**) or toward 'open' forms like **electoral authoritarianism**, **competitive authoritarianism** and **hybrid regimes**, which hide behind democratic *façades*.

DEFINITION In single-party regimes, one party controls access to and dominates political office, as well as the state apparatus at all its levels. Despite significant variation, these regimes share considerable features that justify the distinctive nature of their rule and the emergence of a specific typology to describe it. Barbara Geddes (1999) originally classified single-party regimes as regimes where power was concentrated in the hands of a single party that exercised complete control over policy. In contrast to personalist or military regimes, single-party regimes exhibit higher degrees of institutionalization, with members of the party actively involved in discussions about policy and legislation. Because there are so many veto players (Box 6.6) involved in policymaking, this slows down the process of making decisions, leading to much more stable foreign and domestic policy output, which in turn creates predictability (Ezrow & Frantz 2011). As noted in the section on **personalist rule**, amalgams are possible, as there are many variations, such as single-party-personalist rule, single-party-military rule, and single-party-military-personalist rule.

KEY SIGNIFICANCE Single-party dictatorships tend to be the longest-lasting form of autocracy because, in contrast to military regimes, the factions and fissures that occur in single-party regimes are common but not destabilizing. Party elites prefer to resolve differences rather than engage in behavior that could upend the regime (Geddes 1999). Single-party regimes are also resilient because they have institutional channels for handling succession (Kendall-Taylor & Frantz 2016). Internal party elections are held which helps to manage these leadership transitions.

Power concentration The ruling party accumulates significant power, centralizing decision-making and dominating all aspects of governance while minimizing scrutiny. Policies and laws are conceived, approved and implemented by the ruling party without significant input from other actors. Formal state structures may be sidelined in favor of the party's elite, where authority truly lies.

Coercion & suppressed opposition Coercion ensures the regime's monopoly on power. Alternative voices are limited or actively suppressed to silence dissent and enforce loyalty. Peaceful protesters and critics of the regime are often met with harsh crackdowns and legal persecution. Citizens are monitored and

surveilled, and opponents and critics are frequently imprisoned or 'disappeared,' creating a climate of fear to deter discord (cf. **repression**).

Weakened checks-and-balances Safeguards like an independent **judiciary**, free press, and strong **civil society** are undermined, allowing unchecked party control and the maintenance of policies designed to keep the ruling party in power.

Narrative control & media restrictions Independent and critical media outlets are tightly controlled and face censorship, harassment, and even closure, severely limiting public discourse and restraining alternative views of the ruling party itself or of their claimed achievements. Single-party dominance is often justified by ambitious and long-term goals, presenting the ruling party as the vanguard of societal transformation, prioritizing ideological coherence and national unity over dissent and pluralism.

Indoctrination Revolutionary or developmental narratives, which serve to legitimize the party's monopoly on power, are typically presented as essential for national unity or progress. Re-education camps and other forms of **indoctrination** may also play a role in preventing and punishing dissent and the exertion of dominance over citizens. Officials are strict enforcers of the party line, and deviation can have severe consequences.

Party ubiquity The party occupies the entire space connecting and is the sole mediator between citizens and the state. It maintains a close interaction with the masses, who need to be converted into supporters or followers of the party's political project. Party cells are hence omnipresent, working not only to foster political mobilization but also as a tool to disseminate **propaganda**, enforce **censorship**, manage dissent and incentivize conformity and loyalty toward the regime.

Co-optation & patronage Single-party regimes are not sustained by brute force alone; they thrive by weaving themselves into the social fabric, distributing **patronage**, co-opting elites (**co-optation**), and creating institutions that legitimize their rule in the eyes of the governed. The ruling party serves as a platform for patronage and wealth accumulation for political elites. State resources and opportunities are distributed through clientelist networks (**clientelism**), which favor the party elite in order to secure loyalty, cement one-party control and marginalize opponents.

Challenges of dissent & legitimating tools Challenges such as economic crises, public discontent, and demands for accountability pose risks to single-party regimes. Some regimes have collapsed under these pressures, while others have weathered them through strategic reforms or repression. Leaders' ability to navigate internal and external pressures determines the survival or transformation of these regimes. Single-party regimes have often accommodated selective economic and political liberalization, such as elections and other forms of controlled popular participation, while manipulating them to respond to popular challenges and ensure the ruling party's continued dominance – for instance, by rigging electoral processes.

The **longevity, stability & resilience** of single-party regimes in an evolving global order is reliant on their capacity to adapt to internal and external circumstances and demands. A unique form of governance, the single-party regime blends authoritarian control with selective democratic elements that serve the ultimate goal of maintaining power.

ORIGIN While authoritarian regimes have existed throughout history, authoritarianism in pre-modern times typically did not involve political parties. In the modern era, however, single-party systems emerged as the dominant form of authoritarian governance, just as multi-party systems became the hallmark of democracies (Huntington & Moore 1970: 509).

Single-party regimes have emerged or been instituted at various times and places over the past 100 years, each rooted in its specific historical, social, and ideological context. Their appearance often coincides with periods of profound political upheaval and societal transformation, where a concentration of power may be seen as a legitimate response to ensure stability and ideological coherence in the face of political, social, economic or cultural challenges to the traditional order. The establishment of single-party rule has also been justified as a means of efficiently addressing pressing needs and aspirations, such as post-war recovery, state-building, national unity and economic development.

The twentieth century witnessed the emergence of three waves of single-party regimes. The first began during WWI, driven by the collapse of empires and the propagation of revolutionary ideologies. The Russian Revolution of 1917 marked a pivotal moment, with the Bolshevik seizure of power and the subsequent establishment of the Soviet Union under the Communist Party becoming the model for single-party rule based on Marxist-Leninist ideology.

A second wave amidst the economic and social turmoil of the interwar period saw the rise of fascist and militaristic single-party states. In Italy, Benito Mussolini's Fascist Party came to power in 1922, creating a fascist regime that sought to control not only politics but also culture, economics, and the media. Similarly, Adolf Hitler's Nazi Party took power in Germany in 1933, ushering in a brutal fascist regime characterized by extreme nationalism, racial ideology, and aggressive territorial expansion.

In the post-WWII era, the Cold War rivalry between the US and the USSR spurred a third wave, marked by the global proliferation of single-party regimes. Both sides provided significant foreign aid and military support to personalist, military and single-party regimes. Superpower backing was often at the cost of democracy and political plurality, even assisting with coups to overthrow and replace democratically elected governments and regimes that did not align with their ideological and strategic interests. Communist parties, inspired by the Soviet model, established single-party states in countries such as North Korea (1948), China (1949) and Cuba

(1959). Meanwhile, in Latin America, the *Institutional Revolutionary Party* (PRI) in Mexico (1929-2000) enjoyed some US backing.

In Africa and Asia, between the 1950s and the 1970s, many postcolonial nations adopted single-party regimes under charismatic leaders. These leaders took over from colonial powers and drew their legitimacy from their protagonism in the political movements leading to independence, such as was the case in Mozambique, Angola and Tanzania, in Africa and Malaysia, Singapore and Vietnam in Asia. While most of the single-party regimes in Africa evolved into personalist or single-party dictatorships, the single-party regimes in Asia remained strongly institutionalized and under civilian control.

Throughout the second half of the twentieth century, single-party regimes had become a defining feature of global politics. However, as the century drew to a close, the global bipolar order dissolved, and the triumph of liberal democracies – and concomitant multi-party regimes – undermined the one-party option. Externally, therefore, the ideological shift away from authoritarianism, combined with economic and political pressure from Western countries, undercut the **legitimacy** of excluding other parties from participating in national politics or contesting power. Internally, single-party regimes' claims of efficiency and stability were already under challenge. Relying often on patronage networks and funneling wealth and resources to party elites, single-party regimes encouraged favoritism and the marginalization of minorities, which, in turn, exacerbated social divisions. Unchecked **corruption** and mismanagement also stalled economic growth and development. As these regimes faced economic crises, including mounting debt and falling commodity prices, public support waned. Grassroots movements and pro-democracy protests, backed by regional and international pressure, challenged the legitimacy of authoritarian rule as demands for political reforms and multi-party elections intensified. Eventually, throughout the 1990s, many of these regimes gave way to democratization or collapsed. For instance, in Eastern European countries like Poland, Hungary, and Czechoslovakia (soon to become the Czech Republic and Slovakia), the fall of communist regimes paved the way for the creation of multi-party democracies. In Africa, many countries held multi-party elections for the first time. By the end of the decade, single-party regimes had significantly diminished in global influence.

Yet, the legacy of single-party rule has persisted in various forms. Adapting to new political landscapes, these regimes managed to survive and evolve, often blending authoritarianism with democratic elements, such as regular elections. In some countries, like Mozambique under FRELIMO or Angola under the MPLA, former single parties now contest periodic elections but remain in power and continue to dominate the political scene. Additionally, the global rise of populism and nationalism has led some multi-party regimes to adopt characteristics of single-party rule. In Turkey, for instance, Recep Erdoğan, through his *Justice and Development Party* (AKP), has gradually dismantled democratic institutions and checks on power while repressing **opposition**. Though Turkey is not technically a single-party regime, Erdoğan's growing concentration of power has undermined the country's multi-party democracy. The persistence of single-party regimes in countries like China also highlights the complex global balance between democracy and authoritarianism in the modern age. That the twenty-first century has not seen the complete eradication of authoritarianism suggests this form of governance remains resilient and adaptive to new technological, economic, and geopolitical realities (Geddes 2003; Levitsky & Way 2010; Ezrow & Frantz 2011).

CLASSIFICATIONS The diversity of single-party regimes, each with its specific nature, underscores the need to look at the historical context out of which each has arisen. Nonetheless, looking at such regimes over the past century, one can classify them according to three broad types of single-party regime: *ideological*, including communist (A), fascist (B) and postcolonial states (C) and *non-ideological:* personalist (D); and patrimonial (E). These are broad categories, and the characteristics of a specific regime may correspond to more than one possible classification, for example, with regimes in which strong party ideology goes hand-in-hand with a concentration of power in an individual leader.

Communist states (A) For much of the twentieth century, many of the single-party regimes were communist states, from the Soviet Union and its central and eastern European satellites to Cuba or China. In these examples, the party provides the ideological foundation of the state (**communism** or **socialism**), leading it in a transition to a better society. In this revolutionary process, the interests of the party are juxtaposed with those of the bourgeois state representing capital and the capitalist class; power needs to be concentrated to both further the ideological project and prevent counterrevolution. The first single-party regime in modern times is generally considered to be the Bolshevik regime established after the Russian Revolution of 1917. Its Politburo leadership structure (Box 8.4), justified as in the dictatorship of the proletariat (Box 1.3), was widely copied. The *Communist Party of the Soviet Union* (CPSU) became the model for other communist single-party states and marked a significant departure from earlier authoritarian systems by institutionalizing ideological and party-based rule as central to its governance. Differences in ideology were inevitable over time, cf. Box 4.9 on 'Fifty Shades of Socialism.'

Fascist states (B) In the interwar period and through WWII, a number of fascist single-party regimes took power (cf. **fascism**), such as those in Germany, Italy, Spain or Portugal. These were characterized by a very extreme form of nationalism, anti-communism, and the centralization of power in not only a single party but typically an individual dictator. In particular, in the cases of Germany and Italy, totalitarian control featured prominently, with the single party regime permeating every sphere of

society, including the economy, education, and the media (**totalitarianism**). National pride (**ultra-nationalism** and **racism**), militarism, and territorial expansion were hallmarks of these regimes. Nevertheless, in contrast with communist regimes, fascist parties were often less central to the exercise of state power, control over the coercive apparatus of the state resting more directly with individual leaders. In Portugal, for instance, the *National Union* was always relatively weak, with power and strength lying directly with dictator António Salazar, while in Germany, the Nazi Party was instrumental to Hitler's rise but quickly became less significant in mediating state power or connecting citizens to government.

Postcolonial states (C) Following the end of WWII, single-party regimes were increasingly found in the periphery of the international system in postcolonial, developing states. Leaders of newly independent countries often justified a monopoly on political power in the name of national unity, the necessary means to suppress polarizing political forces, abate ethnic divisions and create a superseding national identity in societies marked by the violent and divisive legacies of colonial rule. In these cases, single-party regimes emerged as vehicles for national unity and state-building in the postcolonial era, when political fragmentation threatened stability. They claimed to represent nationalist ideologies – as well as often a form of African socialism (cf. Box 4.9), as in Tanzania under Nyerere – legitimized by their role in the struggle for independence and claiming to embody the aspirations of the newly sovereign state. Many parties promoted their ideologies as central to the nation's identity, emphasizing unity and development as central goals.

Personalist single-party regimes (D) These regimes are centered around a single leader who exercises significant control over the party and the state (cf. **personalization**). The leader often holds supreme power and uses the party as a vehicle to maintain control. Many single-party states, in fact, have evolved into **personality cults** orbiting around a single-party leader, cultivating an image of the party/leader as the indispensable savior of the nation. Examples include North Korea under first Kim Il-Sung and later Kim Jong-Il and now Kim Jong-Un, Syria's Ba'ath Party under Hafez al-Assad and his son Bashar al-Assad, Cuba under Fidel Castro, and Zaire under Mobutu Sese Seko (cf. Box 1.7).

Patrimonial states (E) These regimes are based on patronage networks, where the ruling party provides economic, political, or social benefits to supporters in exchange for political loyalty. They typically focus on maintaining power through alliances with elites and patron-client relationships. **Patronage** networks, headed by a dominant patron (usually the ruler), shape, in turn, both formal and informal political institutions. While these regimes may allow elections and rest on formal constitutions, such institutions often serve as mechanisms to manage elite expectations and channel dissent rather than ensure democratic accountability (Hale 2015). Political stability in these regimes, therefore, relies heavily on the strength and cohesion of the patronage networks.

METHODOLOGICAL ISSUES A single-party regime is a concept applied to a myriad of different contexts and is often employed to describe a range of overlapping phenomena theorized in the political science literature, such as autocracy, hybridity or patronage, potentially leading to theoretical misunderstandings. It is often used interchangeably with 'one-party' regimes or even 'party-state.' Moreover, single-party 'rule' or single-party 'system' is conflated with regime (Kalyvas 1999). The concept also overlaps with some analyses of 'hegemonic parties' in countries that hold elections in contexts labeled as **competitive authoritarianism**.

Analyzing single-party regimes presents, therefore, several methodological challenges, particularly due to their overlap with other non-democratic systems of government, with which they share many characteristics, hindering the ability to isolate the unique features of single-party rule. These categories often blur together, complicating efforts to define and differentiate single-party regimes consistently. Attempts to distinguish single-party regimes from hegemonic-party systems illustrate these analytical difficulties. Some single-party regimes prohibit opposition parties outright, while hegemonic-party systems allow limited political competition, albeit ensuring the dominance of the ruling party. However, this distinction becomes ambiguous in cases where **elections** are manipulated to the extent that opposition parties are technically allowed, but only insofar as they do not pose a real threat to the dominant party's survival. The same difficulty is presented with cases labeled as competitive authoritarian regimes, where elections do exist but are systematically unfair to the opposition, and might reasonably be considered little more than a tool of legitimation of the single party. The classification of such cases is fraught with difficulty, often relying on subjective evaluations of, say, the extent of electoral manipulation and constraint. (These distinctions are explained in greater detail in ruling **parties**).

Even once particular characteristics associated with a single-party regime are identified, such as political dominance, opposition exclusion, and institutional control, evaluating their level or extent poses a further methodological challenge. Qualitative measures resting on subjective judgments are disputed, while quantitative indicators, such as vote shares or party membership, may not fully capture the true level of popular support, given the specific context of authoritarian practices that penalize dissent.

IMPACT ON POLICY Political control and centralized decision-making are two salient features of single-party regimes that directly shape policy. Nevertheless, the extent to which a regime's single-party nature may impact policy varies considerably, depending on its level of institutionalization, the specific domestic and international contexts within which it operates, and the ideological orientation of

the party in power and its commitment to achieving predefined goals. Moreover, it is important to distinguish between self-serving claims made by those defending this particular model of governance and the significant variation in outcomes found in states adopting it.

Efficiency A particularly prevalent claim is that of efficiency – the so-called 'authoritarian advantage.' Government performance, it is argued, benefits greatly from a single party's ability to both make swift decisions and commit to long-term strategies. The centralized nature of power rids the decision-making process of dissent, opposition and blockage, freeing the hands of those in charge to set long-term and large-scale goals, allocate the necessary resources, and pursue them unhindered by the delays and forced compromises often seen in multi-party systems.

Critical areas, such as infrastructure development, industrial policy or bold economic reforms, are said to profit, in particular, from this type of regime. China's rapid modernization and its ambitious *Belt and Road Initiative*, for instance, have been hailed as owing much to the country's centralized governance model. However, this claimed policy efficiency often comes at the expense of oversight and accountability, which, in turn, potentially leads to corruption and mismanagement. Moreover, the lack of alternative viewpoints – which ensures ideological purity – can restrict the emergence of new ideas or the contestation of poorly conceived policies, further reducing incentives for single-party leaders to be responsive to their citizen's evolving needs. A stagnant policy environment, which deteriorates public institutions and dulls society's aspirations for social transformation, may, thus, be a longer-term effect of this type of rule.

Ultimately, single-party regimes can limit or block, as much as they facilitate, structural change. Additionally, even where potential efficiency gains enable significant projects, the lack of political contestation can have nefarious consequences. State-led mega projects often steamroll over workers' rights or environmental protections in the absence of constituencies able to influence policymaking or even, where single-party rule is combined with entrenched authoritarianism, publicly defend them. The lack of a democratic check on power leaves considerable space for prioritizing party (or personal) interests and security over society's needs. That this model of policy efficiency is necessarily in the best interest of the nation under a single-party regime is, therefore, an assumption that needs to be thoroughly and constantly scrutinized.

Stability Single-party regimes often emphasize political stability as a key benefit of their governance model. The strong-party/strongman approach can be particularly appealing when contrasted with a picture of chaotic governance, deriving from multi-party contexts and fragile coalition arrangements' prone to short-term and very limited understandings and commitments. That appeal is all the stronger in times of political, economic, and social upheaval or uncertainty. These parties and leaders inevitably position themselves as embodying decisiveness and unity in leading a country toward the realization of its national aspirations. Suppressing dissent and divergent voices, however, is most often not a sign that political fragmentation has been resolved. On the contrary, stability, in such cases, is maintained through repression of existing and genuine pluralism, which ultimately can exacerbate, rather than resolve, underlying societal tensions. Indeed, when cracks in a regime's control begin to surface – the result, for instance, of intra-party squabbles or tensions wrought by economic crisis – stability tends to unravel quickly.

Representation & inclusivity In single-party regimes representation is often limited or merely symbolic. Political participation is tightly controlled, with opposition parties either banned or heavily co-opted. While these regimes may claim to represent the collective will of citizens, particularly through mechanisms like consultative assemblies or nominal elections, genuine representation is lacking. As already noted, the absence of a diverse and fully representative range of political views and voices means that government policies often prioritize the controlling party's interests rather than addressing those of the broader population. With criticism and opposition suppressed, robust discussions on policy issues are substantially limited.

Moreover, because single-party regimes' continuing political power does not rest on securing a broad electoral mandate, they often end up marginalizing considerable sectors of society representing, for example, particular ethnic, class or other groups, further undermining the representation of society as a whole in their governance. In short, with power concentrated within a narrow political elite, single-party regimes are typically not characterized by inclusivity. Marginalized groups often struggle to have their voices heard or their interests represented in policymaking. While some regimes introduce limited reforms, such as the promotion of cross-ethnic unity (**ethnic politics**) or gender representation (**gender equality**), these efforts are usually superficial and serve to reinforce the regime's legitimacy rather than foster genuine inclusivity.

Legitimacy Single-party regimes seek to derive legitimacy from their ability to maintain order, promote economic growth, and present themselves as guarantors of national unity. By controlling the political narrative and suppressing or eliminating opposition, these regimes often foster an image of constancy and competence. For example, in countries like China and Vietnam, economic success and poverty reduction have bolstered public perceptions of legitimacy. However, this legitimacy comes at the expense of popular participation in policymaking. Rooted in performance rather than democratic consent, such legitimacy remains vulnerable and may quickly erode, especially during economic downturns or crises of governance.

NEW FRONTIERS Samuel Huntington (1991) once observed that every wave of democratization (Box 6.3) has been followed by a 'reverse wave,' characterized by a worldwide decline in democratic governance. A common inquiry of the twenty-first century has, therefore, been whether another such 'reverse wave' is occurring. Those analyses that answer yes typically point as evidence of democratic reversal to the prevalence of single-party regimes, especially where they have replaced supposedly multi-party systems of governance.

Highlighting significant cases where authoritarian regimes have solidified power, such as in Nicaragua, Russia, Turkey, and Venezuela, or where illiberal elected leaders have undermined core democratic norms and principles from within, as in Brazil (under Bolsonaro), Hungary (under Orbán), India (under Modi), and the US (under Trump), some authors identify a worrying pattern of democratic backsliding (Diamond 2015; Bermeo 2016; Foa & Mounk 2016; Levitsky & Ziblatt 2018; Mainwaring & Bizzarro 2019; Haggard & Kaufman 2021). With a view to assessing why some democracies survive and others fall, they explore the various dimensions of democratic erosion – including economic stress, political polarization, populism, institutional decay, and international influences.

Moreover, they point to an ongoing process of re-legitimization of single-party regimes, which have adapted strategically to shifting domestic and international pressures. On the one hand, the apparent need for concentration of political power and decision-making to tackle national crises and bolster economic performance has been central to consolidating domestic support through claims that this model is crucial for stability, pragmatic governance, and long-term development, as in the cases of the Malaysia or Vietnam. On the other, changing international dynamics have further reinforced the legitimacy of single-party regimes, with a weakening global push for democratization giving space for more autocratic governance to gain acceptability as an alternative model. The rise of authoritarian powers like China has created a counter-narrative to liberal democracy, allowing single-party regimes (in their various formats) not only to endure but to thrive as a significant force in global politics today.

With varying degrees of pessimism regarding the future of world democracy, some authors tend to frame their findings as a worldwide phenomenon across many regions, ultimately signaling a global trend (Lührmann & Lindberg 2019; Alizada et al. 2021). Others, like Brownlee & Miao (2022), however, contest this assertion of 'an anti-democratic *Zeitgeist,*' emphasizing the resilience of democratic institutions, pointing to the fact that those instances showcased in the literature, despite high-profile, are relatively few, and warning "against an evidence-resistant 'tyrannophobia' that treats every bumptious and overweening executive as the next Mussolini." Others caution against the failings of paradigms – be it that of democratic transition (Carothers 2002, cf. Box 5.3 on 'transitology') or democratic backsliding (Cianetti & Hanley 2021) – or the turn from overly optimistic to overly pessimistic verdicts (Levitsky & Way 2015), questioning the idea of linear progress implicit in some such assessments. However, what these authors and their research have in common is underscoring the fragile nature of democracy, pointing to the coexistence of democratic elements with autocratic practices. This work suggests the need for a more nuanced view of democracy and autocracy, single-party and multi-party regimes, that takes into account complex realities on the ground.

Soft Power

Ideas are more powerful than guns. We would not let our enemies have guns, why should we let them have ideas?
– Joseph Stalin

Soft power is essential for understanding dictatorships as it reveals how these regimes sustain control and influence without relying solely on coercion. By utilizing attraction and persuasion, authoritarian leaders can project an image of legitimacy both domestically and internationally, reducing the need for overt repression. This is particularly significant in managing global perceptions, where regimes engage in strategies like 'sportswashing' to distract from human rights abuses and enhance their international standing. Hosting major events such as the Olympics or World Cup allows dictatorships to create a positive image while deflecting criticism.

DEFINITION Soft power is a non-tangible resource and a non-forceful type of influence on other political subjects. Joseph Nye (2011: 20-21) defines soft power as *"the ability to affect others through co-optive means of framing the agenda, persuading, and eliciting positive attraction in order to obtain preferred outcomes."*

Power as capability refers to resources operationalized into foreign policy instruments available to be used by a state. This is a resource definition of power (Nye 2011a: 12). *"Getting from resources to behavioural outcomes is a crucial intervening variable,"* estimates Nye (2011a.) and calls this *power conversion*. Therefore, the second aspect of power is no longer the static possession of resources and instruments to act but rather the very application of these instruments in relation to other actors in international politics – power as an influence.

The 'soft' in power as capability Soft power relates to both aspects of power: as a state property (capability) and as an effect of a state's actions (influence). Its connection lies in the nature of capability or influence, contrasting with 'hard' capabilities and influences. The term 'soft' refers to the types of capabilities possessed and developed by a foreign policy actor and the types of influence it exerts in the international community. Resources are classified into material, semi-material, and human resources (Hill 2003), while foreign policy instruments include diplomacy, culture, economic, and military tools (Brighi & Hill 2012; Hill 2016). Although not universally classified, these tools are consistently categorized as soft or hard power instruments.

Hard resources include natural resources like minerals, oil, and arable land. Soft resources derive primarily from human activity, such as scientific knowledge, political systems, societal values, civil society openness, education, and cultural products. Intermediate resources include historical interpretations, productivity, competitiveness, and media ownership. Military instruments are traditionally seen as hard power capabilities but can also encompass soft power through technological development and scientific knowledge. Similarly, the 'Made in Italy' brand reflects both hard power in industrial capability and soft power in marketing Italy's positive image through its goods, values, and culture.

The 'soft' in power as influence Power as influence can be understood along a continuum of soft and hard strategies used by states in the international community. Hard power is defined as *"the ability to get preferred outcomes through coercion and payment,"* while soft power is *"the ability to get preferred outcomes through the co-optive means of agenda-setting, persuasion, and attraction"* (Nye 2011a: 16). Hill (2016: 147) describes these as two ends of the spectrum: hard power involves compelling other actors through force and deterrence, while soft power involves swaying decisions through persuasion and deference.

ORIGIN The concept of soft power was introduced to contrast with 'hard' power, yet it has evolved to complement it. Joseph S. Nye, Jr., in his 1990 book *Bound to Lead: The Changing Nature of American Power*, initially defined hard power as a state's coercive influence based on military and economic capabilities. In contrast, soft power refers to influence derived from culture, political and social values, and diplomacy. Through these means, a state can alter others' preferences to achieve its own goals by being attractive. The key innovation of soft power is its inclusion of non-material elements, such as values and ideas, allowing a state to set a moral example and be perceived as appealing by others (Nye 1990).

SEE ALSO Soft power, a concept relatively new to International Relations (IR) since the 1990s, is context-dependent, manifesting in **foreign policy** through culture, propaganda, public relations, and

diplomacy. It has been studied from an interdisciplinary perspective but lacks systematic scholarly analysis, with *The Routledge Handbook of Soft Power* (2017) being a notable exception. While the 'soft' aspect is less explored, the **power** component is well-researched in PS and foreign policy analysis (FPA), where it is a central concept. There is no comprehensive analysis of soft power use by dictatorships, which often spread **ideology** through **propaganda** or public diplomacy. As Box 1.16 shows, even a state as isolated and closed-off as North Korea can have soft power. Soft power contrasts with hard power, and together they form 'smart power,' as defined by Nye. In November 2017, the concept of **sharp power** emerged in *Foreign Affairs*, describing authoritarian regimes' aggressive and subversive tactics in democratic countries (**disinformation**). Unlike soft power, sharp power involves manipulation but is not the opposite.

Consequently, this discussion begins with a conceptualization of power, distinguishing between 'power as capability' (primarily addressed in FPA) and 'power as influence' (a focus of IR). Soft power has since evolved into an interdisciplinary field of scholarship. It is most simply defined as *"a cultural artefact that represents a body of thought associated with resources invested in attraction-power and strategies for using such resources to further actors' interests"* (Chitty 2017a: 1).

KEY SIGNIFICANCE Critical scholars of soft power often highlight its underdevelopment and insufficient theorization (Chitty 2017a). This is attributed to two main factors: (a) the eclectic academic approaches linking soft power to culture, **propaganda**, influence, hegemony, **charisma**, and public diplomacy, and (b) the tendency of foreign policy practitioners to exploit the concept's vagueness. Its ambiguity allows for imprecise measurement of effects and facilitates instrumental interpretations that justify its application while securing funding for competitive communication of national interests.

In summary, power as influence encompasses two extremes: coercion and persuasion or attraction. Soft power manifests in two ways. First, it appears in direct relations through agenda-setting in international institutions and persuasion or deference in negotiations. Second, it involves non-action by the foreign policy actor, as it depends on the perceptions of others. As Nye (2011a: 19) notes, *"Since attraction depends upon the minds of the perceiver, the subject's perceptions play a significant role in whether given resources produce hard or soft power behavior.'"*

LITERATURE Both IR and FPA study how states behave toward each other via their **foreign policy**. FPA focuses on **power** as a property of a state and thus relates to it as a means to rule the country (to have power) or even as a position of the ruler itself (to be in power). From this perspective, power is an intrinsic quality of the state itself and is projected outside of the state's borders via its foreign policy means; ontologically, this is an actor-specific theory perspective of FPA (Hudson 2007). Conversely, IR as a discipline studies the nature of the international political system and focuses on the structural view of the distribution of power at this level of analysis. Thus, only the results of state behaviors make up its *explanandum*, not primarily the origin of state influence. This applies a more actor-general theorization (Hudson 2007).

Nye (2011a: 11) defines a state's power as *"the ability to affect others to produce preferred outcomes."* Holsti (1995) recognized that power has a somewhat static element of *capability* (i.e., the 'ability to affect' with Nye) and a relational element that is exercised via behavior, called *influence* (production of outcomes by Nye). This has been taken as a convention by other researchers of states' foreign policy (e.g., Brighi & Hill 2012; Hill 2016).

MEASUREMENT A specific measurement of soft power capabilities was developed by McClory (2019) due to its increasing relevance in the absence of major international wars following the Cold War. *The Soft Power Index* comprises six sub-indices: culture, enterprise, digital, government, education, and engagement. The culture sub-index includes metrics for 'high' culture, such as visual arts, and 'pop' culture, like music and film. It also considers international tourist arrivals, music industry exports, and international sporting success. The education sub-index evaluates the number of international students, the quality of universities, and academic output (McClory 2019: 28).

The engagement sub-index measures a country's diplomatic presence through the number of embassies or high commissions abroad, membership in multilateral organizations, and contributions to overseas **foreign aid**. The enterprise sub-index assesses the attractiveness of a country's economic model by examining factors such as ease of doing business, corruption levels, and innovation capacity. The digital sub-index captures a country's technological embrace, digital connectivity, and use of digital diplomacy via social media platforms. Lastly, the government sub-index evaluates political values, public institutions, and policy outcomes using metrics on individual freedoms, human rights, human development, societal violence, and government effectiveness (McClory 2019: 28).

EXAMPLES Autocratic leaders such as Adolf Hitler and Joseph Stalin have historically sought to project an aura of invincibility to attract followers, a tactic also adopted by some leaders in southeastern Europe. This strategy aligns with Joseph Nye's concept of co-optive power, where the indirect use of force can create awe and attraction, functioning as a form of soft power. In contrast, when force is used directly for coercion, it represents the 'first face of power,' which focuses on direct control (Nye 2011b). This approach is also evident in small states with dictatorial regimes that pursue nuclear weapons. These regimes seek nuclear capabilities not only for deterrence but also to enhance regional influence and global prestige. Nye (2011b) cites North Korea and Iran as examples where nuclear capabilities are pursued partly for their soft power potential.

Another example of soft power employed by

authoritarian regimes is 'sportswashing' (see also: **spectacle politics**), where autocrats use sports mega-events to improve their tarnished human rights reputations on the global stage. As Boykoff (2022: 343) explains, *"With global leaders traveling to sports mega-events like the Olympics and soccer World Cup, where they engage in grin-and-grip photo opportunities with other global powerbrokers and sport barons, the result can be a sporty halo effect for the host nation and its political leadership."* Notably, sportswashing is not exclusive to authoritarian regimes and can also occur in putative democracies.

Contemporary examples of soft power application by autocratic or semi-democratic regimes include strategic communication efforts during the COVID-19 pandemic in 2020 and 2021. Chinese leader Xi Jinping engaged in 'mask diplomacy' (Kowalski 2021), while Serbian President Aleksandar Vučić employed 'vaccine diplomacy' (Bechev 2021).

IMPACT ON POLICY A conceptual decoupling of soft power into passive and active capabilities reveals that every country, regardless of its government or regime, possesses elements of passive capability, such as cultural heritage. For instance, Egypt's pyramids and antiquities exert attraction regardless of its political system (Chitty 2017b: 23). However, soft power derived from historical objects or narratives can be re-politicized by contemporary rulers or **civil society** actors. A distinction exists between cultural entrepreneurs, who enhance community solidarity from a republican virtue perspective, and political brokers, who manipulate social and political realms for their purposes (Chitty 2017b: 23-24). An example of manipulation is Saddam Hussein's use of narratives to delegitimize UN **sanctions** on Iraq (Nye 2011b).

In southeast Europe, increasingly authoritarian states politicize historical narratives related to national identity. This is similar to the rise of authoritarianism in the Western Balkans through nationalist rhetoric in the media and foreign influence (Bieber 2020), i.e., **black knights** manipulating international ties (cf. **linkage & leverage theory**). In dictatorships, civil society is restricted, allowing regimes to create or rediscover heritage-based narratives. Ethno-nationalist discourse often exemplifies this process. Chitty (2017a: 27-28) notes that constructive government dialogue with citizens enhances soft power through good governance and reduces corruption. However, dictatorships typically lack this positive internal (I-soft) and external (E-soft) power due to unattractive policies.

In crises requiring effective leadership, strategic communication may become more attractive, particularly among allies. Direct communication between leaders can be more effective than state-generated messages. Thus, a dictator's domestic rule might be secondary to their role in addressing international crises.

Nye (2011b: 84) suggests that when governments focus on promoting democracy, human rights, and freedom, soft power often surpasses hard power. While this may seem irrelevant for dictatorships, it is crucial for promoting specific **ideologies**.

NEW FRONTIERS Kivimäki (2014) argued that the Cold War's bipolar context, within which the concept of soft power was developed, tied it to co-optation and the willingness to accept US political hegemony. Nye's (1990) definition has been criticized for promoting American or 'Western' ideals, such as freedom and democracy (cf. (**democracy promotion**). In response, Chinese scholars sought to counter this narrative by emphasizing the relevance of China's soft power. Efforts were made to incorporate Chinese-specific dimensions into the concept, leading to a debate on 'soft power with Chinese characteristics' and attempts to expand the framework to include other country-specific aspects.

Recent studies on Chinese soft power continue to highlight influence, attractiveness, favorable outcomes, and achieving goals through non-coercive means as core elements, but with distinct substantive features, such as 'Confucian values' and 'harmony among states' (Li 2009; Blanchard & Lu 2012; Lai & Lu 2012). Additionally, research has extended to other authoritarian regimes, particularly within BRICS nations. Scholars such as Gallarotti & Chatin (2016) and Stuenkel (2016) have examined how these regimes adapt and apply soft power strategies within their specific political and cultural contexts.

Box 1.16 North Korean Bronze Statue Building in Africa

Peace secured by slavish submission is not peace.
– Kim Il-Sung

The construction of enormous bronze statues in Africa by North Korean artisans started in the early Cold War period as a part of the Democratic People's Republic of Korea (DPRK)'s Third World diplomacy against South Korean international state recognition efforts. It included establishing diplomatic ties with liberated African nations and their authoritarian leaders, within which the building of monuments and bronze statues served as diplomatic gifts and anti-imperial propaganda, next to limited but effective military assistance (e.g., training presidential guards and intelligence services). After the Cold War, the bronze statue building transformed into one of the DPRK's **sanctions** and embargo evasion techniques in order to accumulate foreign currency and spread the regime's **soft power** in African countries. The bronze statues were built by the regime's *Mansudae Art Studio's Project Overseas*. This reflected the broader context of Soviet-Chinese-American competition over geopolitical influence in the Global South.

Since the outbreak of the Cold War, new countries were gradually emerging on a political map as a result of the global decolonization process and ongoing liberation campaigns in Latin America, Asia and Africa. With the Korean War (1950-1953) and the division of the Korean Peninsula along the 38th parallel, the Stalinist-like regime of the DPRK sought diplomatic support from like-minded countries for recognition. DPRK's 'free exports' of statues to the liberated African countries were part of a diplomatic strategy within international competition between the two Koreas and, thus, between the communist and the democratic camps in the context of the Cold War. (Che 2018)

Seoul and Pyongyang vied for international recognition as the sole government of the Korean peninsula from the mid-1960s to the late 1980s. One diplomatic battleground for this 'inter-Korean' competition was Africa, the site of a number of newly independent nations that were rising in diplomatic importance as member states in the United Nations (UN). (Young 2015) Kim Il-Sung wanted African support at the UN to drive the US military forces out of Korea (Onejoon Che in Kućma 2022). Thus, the fact that the US had military camps in South Korea while there was no Soviet army in North Korea was likely a reason for DPRK's initial instrumental support of African countries.

The DPRK supported Africans suffering under the racist policies of Apartheid (Box 4.7) and similar regimes in Africa (**racism**). African and anti-apartheid revolutionists in the 1960s formed an important foundation for North Korea's African policy. DPRK used this policy to demonstrate a willingness to fight on behalf of those suffering under imperial pressure (Choi & Jeong 2017: 334). African leaders viewed the DPRK as a better alternative to large communist powers like the People's Republic of China (PRC) or the USSR. The North Korean brand of development had attracted mostly right-wing African leaders admiring the DPRK's military's guerrilla tactics and the Kim family's **personality cult** (Young 2015: 101).

After the Bandung (Asia-Africa) Conference in 1955, which addressed the needs of the newly-liberated or independent decolonized countries, Africa emerged as the key destination for North Korean diplomacy, where the choice of export articles such as military expertise and monumental architectonic gifts originated. The DPRK provided scholarships for African students, military assistance, expertise for constructing functional buildings, political residences, and bronze statues. In the past decades, monuments honoring the independence leaders and celebrating the African Renaissance were erected in a number of African countries (Kućma 2022). Many of them were built by North Korean workers who offered cheap labor (Onejoon Che in Kućma 2022).

The bronze statues in Africa were built in the North Korean socialist realist style derived from Soviet socialist realism that mingled with the Korean tradition of the *Mansudae Art Studio*, established in 1959. Perhaps the largest art factory in the world, the *Mansudae* is composed of 14 creative groups including the specialization on bronze sculptures. (Onejoon Che in Samudzi, 2022) *Mansudae* was involved in constructing over 170 monuments and 3800 bronze statues in the DPRK (Che 2018), including famous monumental bronze statues of Kim Il-Sung in 1972 and Kim Jong-Il in 2011 within the Mansudae Grande Monument. (Gabriel 2021) A designated division, the *Mansudae Overseas Projects* became the key export factory.

Mansudae has served the Kim family for decades, producing state **propaganda** posters, paintings, statues and monuments based on aesthetics of self-reliance and features of unification based on the state ideology *7*, guided by the 'great leaders' of the North Korean state. The companies within the *Mansudae Overseas Project Group* (Che 2018) sent migrant workers and artists to Africa to build bronze statues and accumulate foreign currency for the Kim family. The US Treasury Department sanctioned *Mansudae Overseas Projects* in 2016, prohibiting UN member states from directly or indirectly acquiring statues from North Korean individuals and entities and avoiding doing business with Pyongyang directly (The Sentry, 2021: 6; Salisbury 2021: 204). Mansudae's foreign missions have been a key revenue stream for North Korea's regime.

Shine Choi (2021) explains *Juche* ideology not only as a means of legitimization of the 'Hermit kingdom' but also as a sphere to understand the international positioning of the DPRK. By means of the 'Grand Monument' in Pyongyang, Choi proposes to see the *Juche* ideological features as a "visual-textual process," in which the monumentality represents the social positioning of the nation via the monumental politics, in which the monuments are approved narratives of the regime. (Choi 2021: 436) Oneejon Che sees the DPRK's relationship with Africa as the pragmatic export of *Juche*, based on the principles of political and military independence and economic autonomy. *Juche* architecture, as Supreme Leader and amateur architectural theorist Kim Jong-Il wrote in 1991 in a treatise on the subject, systematizes the relationship between society and the Workers' Party (Samudzi 2022).

Totalitarian architecture emerged in the early twentieth century and was, from the start, closely associated with totalitarian regimes such as the USSR. Symbolizing the power and authority of the state, its grandiose monumentality reflects the **personality cults** and **totalitarian legacies**. The idea that architecture can be used as a propagandistic tool to reinforce the values and ideals of the regime in power is central to architectural theory. An urban landscape imposed with control and order by totalitarian architecture should inspire awe and respect for the state or other functions such as 'the culture of memory,' including the memory of mass crimes (Niezen 2018) and the struggle for identity after colonization.

Under **totalitarianism,** architecture and art are used as tools for **propaganda** promoting the **ideology** of the ruling regime. Such a regime thus dominates all aspects of society, including arts and architecture. To emphasize the power and authority of the regime, North Korean bronze statues are typically large and imposing. This monumentality is achieved by using huge proportions and exaggerated features, such as outsized heads and hands. Totalitarian art tends to simplify complex concepts and ideas into digestible symbols. Simple, easily recognizable symbols of power and authority, such as military uniforms, flags, and weapons, are being implemented in the North Korean bronze statues in Africa.

Troensegaard (2016: 4) examines the origins of the word 'monument', which comes from the Latin word *momentum*, which means the memory of something, particularly of a person's act or deeds that endure. Such a monument thus has a "commemorative value." Wood and Terry (2016) delved into responses of North Korean art in juxtaposition to the totalist power of the regime. Based on a personal visit to Pyongyang's Mansudae Grand Monument, they observed the bronze statue of the 'Dear Leaders,' referring to Kim Il-Sung and Kim Jong-Il. They contemplated aspects of *Juche* ideology of self-reliance and unification, while acts of posing next to the bronze statues and bowing are a "*choreographed performative that pulls subjects into a specific ideographic vocabulary*" (Wood & Terry 2016: 511). People as subjects are also products of the ideology, considered to be "concrete measurements" in the DPRK. (Wood & Terry 2016: 506; 511)

There are numerous *Mansudae*-built bronze statues in different African countries. The *Three Dikgosi* Monument in Gaborone was erected in 2005 as a commemoration of the post-independence unitary state. The three *Dikgosi* or chiefs symbolize the pivotal role of three tribal chiefs – Khama III, Sebele I, and Bathoen I – in the country's path to independence. These chiefs traveled to Britain in 1895 to successfully petition against the incorporation of the Bechuanaland Protectorate into Cecil Rhodes's British South Africa Company, ensuring that Botswana remained under direct British rule rather than being absorbed into what would become apartheid South Africa.

In addition to its sculpture workshop in Windhoek, *Mansudae* had extensive experience designing southern Africa: Harare's Heroes' Acres (commemorating Rhodesia's Bush War) and Windhoek's Freedom Park's statue depicting Namibia's founding president (Sam Nujoma, holding a copy of the Namibian Constitution), as well as a Nelson Mandela's statue at a Johannesburg shopping center, among others. (Parsons 2006: 680)

Perhaps the most famous North Korean bronze statue is the *African Renaissance Monument* (in French, *Monument de la Renaissance Africaine*) in Senegal. Senegal is the country with the tallest (North Korean) bronze statue in Africa. It was opened in Oukham, Dakar, on the outskirts to the public in 2010 at the ceremonial unveiling by President Abdoulaye Wade. Despite some controversies, this gigantesque representation of a family (man, wife, boy), with liberal use of nudity in a Muslim country, with a boy pointing towards the future, has become a symbol of decolonization and rejuvenation of African nations. It is a reminder of the ways in which commemorative landscapes can be used for foreign interference and to exercise soft power. (The Contested Histories Initiative, 2021: 10) However, the bronze statues as diplomatic gifts by the DPRK unveil a more complicated North Korean engagement on the African continent.

In Zimbabwe, formerly Rhodesia, Robert Gabriel Mugabe established his political foundations thanks to North Korea's contribution to the liberation of the country. (Choi & Jeong 2017) The *Juche Idea Study Centre* was established at the University of Zimbabwe in 1981 by the revolutionary and politician Mugabe as a follow-up to a Kim-Mugabe meeting in Pyongyang the year before. The Cold War provided a complex political environment for both Kim Jong-Il and Robert Mugabe. The latter found Kim's "methods of governance" useful in his quest to dominate Zimbabwe's political sphere (Choi & Jeong 2017: 330) and borrowed from Kim's *Juche* ('self-reliance').

Over a hundred North Korean military advisers were sent to Zimbabwe, and some firearms were offered as partial aid. DPRK's military specialists trained the new brigade of the *Zimbabwe National Army* (Choi & Jeong 2017: 340) and instructed 3,500 members of Mugabe's elite military unit, the infamous Fifth Brigade. (Young, 2015: 102). Mugabe sought military help from North Korea for his political party, the *Zimbabwe African National Union-Patriotic Front* (ZANU-PF), to brutally crush political opposition and later massacre over 20,000 civilians.

One particular monument, erected in 2010, the bronze statue of Mugabe's former fellow revolutionary Joshua Nkomo (ZAPU), was ill-received and eventually not placed in its intended position in Harare in 2011 due to controversies related to North Korean involve-

ment in the repression of ZAPU (by the Fifth Brigade) and other symbolic slights directed at ZAPU. (Voanews, 2010) Joshua Mqabuko Nyongolo Nkomo (1917-1999) was a revolutionary leader fighting for independence with his movement (ZAPU). He became a political opponent of Mugabe after the Gukurahundi conflict in 1983 until 1987 when he joined Mugube's regime and served as vice president (a ceremonial position) until he died in 1999.

Namibia is another African country that implemented DPRK's monumentalism. Marschall (2006: 173) refers to a "socialist style of memorialization" that has been present in African countries, such as Namibia.

Replacing the controversial German colonial-era *Reiterdenkmal* equestrian statue in front of the Independence Memorial Museum, the bronze statue erected in 2014 depicts the first Namibian President Sam Nujoma. It is considered to be an expression of a "*state-sanctioned narrative of national identity*" (Niezen 2018: 555). Some features of the monument are perceived to be more Asian than African, or rather North Korean, which is a critique aimed at covering Namibian creativity with non-Namibian expressions (Baas 2022: 61). In the context of African liberation movements, Stonehouse (2018) refers to the politics of memorialization in Namibia, on how the *South-West African People's Organization* (SWAPO) had used North Korean arts as sources of legitimization of the present regime that evolved from a liberation movement into a dominant political party in a multi-party democracy.

The Independence Memorial Museum was constructed in the style of North Korean monumentalism, designed and built by North Koreans. Through this architectural approach, SWAPO sought to reinforce its "master narrative of liberation history" by adopting North Korean modes of memorialization, which emphasize authority and cohesion as key cultural elements (Stonehouse 2018: 19, 29, 54).

Rather than representing a dramatic break from the past, these newer memorials added layers of aesthetics and meaning to Windhoek's urban memory landscape. This transition moved from the political aesthetics of German colonialism to the Stalinist socialist realism of North Korean design, which now underpins Namibian nationalist memory politics (Zuern 2017).

The UN has imposed **sanctions** on North Korea following its nuclear weapons tests, prompting Pyongyang to develop various methods to evade these restrictions. One such method thus involves the export of bronze statues, a strategy aimed at generating hard currency for the Kim regime, as detailed in Mallory's RAND report (2021). In Africa, nearly all countries maintain diplomatic ties with the DPRK, and Mallory (2021: 7) categorizes these relationships based on the extent of DPRK's sanction evasion activities. These include arms supply in 13 African nations, military technology proliferation (including missile, nuclear, and chemical technologies) in 13 countries, and construction projects in 14 nations (The Sentry, 2021: 6).

The bronze statues built by North Korea in Africa exemplify totalitarian architectural and artistic principles. They emphasize monumentality, propaganda, simplification, and centralized control. These statues are meticulously designed to align with the regime's standards and convey specific political messages. They symbolize solidarity between DPRK and the host African nations while showcasing Pyongyang's global influence. Additionally, they reflect revolutionary ideals and underscore a shared authoritarian ethos across continents.

State Capture

As long as politics is the shadow of big business, the attenuation of the shadow will not change the substance.
– John Dewey, American philosopher

State capture is a concept used in political science (PS), economics, and related disciplines in order to describe the penetration, privatization, or appropriation of a state by economic or political actors.

DEFINITION The definitions of state capture differ in terms of (a) whether state capture is a form of grand or **systemic corruption**, or a distinct phenomenon (network), or (b) which actors are involved in penetrating or capturing the state. One of the first definitions of state capture described this phenomenon as a form of grand corruption based on *"the efforts of firms to shape the laws, policies, and regulations of the state to their own advantage by providing illicit private gains to public officials."* (Hellman & Kaufmann 2001: 31). A relatively similar definition, which, however, does not specify which type of actors are involved, was provided by David-Barrett (2021: 4), who defined state capture as *"a type of systematic corruption whereby narrow interest groups take control of the institutions and processes that make public policy, excluding other parts of the public whose interests those institutions are supposed to serve."* Other definitions do not perceive state capture as a form of grand corruption, such as Grzymala-Busse (2008: 640), who defined state capture as *"the appropriation of state resources by political actors for their own ends: either private or political benefit."* Arguing that in the case of state capture, both public and private actors are involved, Fazekas and Tóth (2016: 320) define state capture broadly as a *"distinct network structure in which corrupt actors cluster around parts of the state allowing them to act collectively in pursuance of their private goals to the detriment of the public good."*

SEE ALSO Several concepts used in PS refer to patterns similar to state capture. Although there is no consensus in the literature on relations between these concepts, with some degree of simplification, **neo-patrimonialism** can be understood as a more general term than state capture, more associated with **informality** as such, while **clientelism**, **rent-seeking**, **systemic corruption**, and **prebendalism** constitute components of state capture.

KEY SIGNIFICANCE Although the concept of state capture has been used in different geographical contexts, such as Tunisia (Rijkers et al. 2017), South Africa (Chipkin & Swilling 2018; Dassah 2018), Mexico (Guerrero 2010), Greece (Trantidis & Tsagkroni 2017), or the USA (Hertel-Fernandez 2019), it has been mostly applied in studies on informal politics in post-communist countries from Russia and post-Soviet states (Iwasaki & Suzuki 2007; Kopeček 2016; Tudoroiu 2015; Yakovlev 2006) to countries of Central and Eastern Europe (Fazekas & Tóth 2016; Klíma 2019) and the Balkans (Keil 2018; Vachudova 2019). According to Bach (2011: 288), the concept of state capture denotes the in principle neo-patrimonial patterns in post-communist countries, where these patterns are closely connected with *"[t]he accumulation of economic power in the hands of the so-called oligarchs [and] a massive transfer of state assets into private hands, with the result of a weakening of the institutional and normative environments inherited from the Communist era."* The regional usage of the concept of state capture stems from the fact that the *Business Environment and Enterprise Survey* (BEEPS), on the basis of which the concept of state capture was developed, has been conducted in several rounds (since 1999) in the countries of Eastern Europe and Central Asia (EBRD 2023).

ORIGIN The term state capture originated within the theories of public choice, public interest and regulation. Since the 1970s, political scientists and economists have begun to point out that while regulation of some industries should be *"instituted primarily for the protection and benefit of the public at large,"* in fact, the regulation is frequently actively sought by relatively small groups to obtain regulation beneficial for them (Stigler 1971: 3). This pattern of behavior was later termed as capture (e.g., regulatory capture, captured economy), and its perpetrators as captors (Bardhan & Mookherjee 2000; Kalt & Zupan 1984; Laffont & Tirole 1991). The present-day usage of the concept of state capture, however, dates back to the early 2000s and is closely connected with studies of political and economic transition and the BEEPS survey, realized by the World Bank and the European Bank for Reconstruction and Development. In a series of working papers and articles analyzing the results of the 1999 round of the BEEPS, Hellmann, Jones, Kaufmann, and Schankerman conceptualized state capture as a form of grand corruption through which economic actors manipulate state policies or shape the emerging rules of the game (Hellman & Kaufmann 2001; Hellman et al. 2000; 2000; 2003; Hellman & Schankerman 2000). However, later works have treated state capture as a phenomenon of its own (informal network or system) and focused not only on the privatization of the state by companies or 'oligarchs' but also by politicians themselves (Grzymala-Busse 2008; Wedel 2003).

LITERATURE The original concept of state capture is provided by Hellman et al. (2003), and different conceptualizations were offered by Wedel (2003), Grzymala-Busse (2008), and Fazekas & Tóth (2016). A critical account of avenues of future research on state capture is provided by Pavlović (2022). Larger empirical monographs on particular cases of state capture, which also contain critical discussion of the concept, are offered by Hertel-Fernandez (2019), Klíma (2019), Chipkin & Swiling (2018), and Leitner & Meissner (2016). A growing body of literature also

looks at political party state capture and its impact on elections (Canen et al. 2023; Innes 2014; Klíma 2019; Pavlović 2022).

CLASSIFICATIONS Most of the classifications of the phenomena of state capture are based on the scope and degree to which the corrupting actors penetrate the organs of the state. For example, Wedel (2003: 433, 437) differentiated between the partially appropriated stated and the clan-state, *"which is characterized by a much higher degree of penetration of state bodies and authorities than a partially appropriated state."* In the partially appropriated state, *"informal groups (…) take over from the state, or privatize, certain functions, [… they] work with relevant state authorities or what is left of them, but the group as such is not synonymous with the authorities."* In the clan-state, members of informal groups *"actually occupy positions in the executive branch"* and the state and the informal group (so-called clan) become almost synonymous (cf. **neo-patrimonialism**, **sultanism & neo-sultanism**). Wedel's approach has been further developed by Fazekas & Tóth (2016), who discuss the relation between corruption and state capture. They differentiate between corruption-free state (corruption is rare), corruption without state capture (corruption is frequent, but random, without being organized into clusters of corrupt organizations), partially appropriated state (some public organizations lose all of their institutional autonomy, while the capture can be only local), and fully captured state (all public institutions lose their autonomy, and the capture is rather 'global,' i.e., state-wide). Canen et al. (2023) differentiate between direct forms of capture (firms control bureaucrats directly) and indirect forms of capture (firms control bureaucrats through elected officials).

A different approach is taken by Grzymala-Busse (2008), who perceives state capture as a phenomenon existing in extractive regimes (cf. **kleptocracy**) and builds her typology on the combination of two binary variables – the presence of rent distribution (cf. **rent-seeking, rentier states**) and the presence of competition between groups. The result of this model is four types of state capture: (i) clientelism (competition is present, rent is distributed), (ii) predation (no competition, no rent distribution), (iii) fusion of party and state (no competition, but rent is distributed), and (iv) exploitation (competition is present, rent is not distributed).

MEASUREMENT The *State Capture Index*, developed by Hellman, Jones, and Kaufmann (Hellman & Kaufmann 2001; Hellman et al. 2003), stood at the very birth of the concept of state capture and was based on the data from the BEEPS survey conducted in 1999. The index was based on *"'firms' reporting that their businesses are directly and significantly affected by private payments made to public officials to influence decision making in one or more of the following six institutions: parliament, the executive apparatus, the criminal courts, the civil courts, the central bank, and political parties."* (Hellman & Kaufmann 2001: 32). On the basis of this index, the authors differentiate between high-capture and low-capture economies. Fazekas & Tóth (2016) developed a method for measuring state capture on the basis of public procurement data from Hungary. It is based on the combination of network analysis and their own proxy indicator of corruption (called the CRI), which *"represents the probability of particularistic contract award and delivery in public procurement."* (Fazekas & Tóth 2016: 326). In the case of Benin, Canen et al. (2023) developed the *Direct Capture Index*, which is based on data collected by interviews, which are then quantified.

METHODOLOGICAL ISSUES Studies of state capture are typically based on data originating from one or more sources; these include fieldwork (mostly interviews), public databases (e.g., procurement), larger international surveys (e.g., the BEEPS), leaked data (e.g., Wikileaks, Panama Papers), and investigative journalism. In this regard, rigorous triangulation, a critical approach to secondary data, and consideration of ethical and safety aspects of research are of crucial importance. Although several indices measuring state capture have been developed, their usage is mostly limited to a few studies, and therefore, comparing the scale of state capture between more cases is complicated. Also, the regional focus of the concept limits its potential for larger comparisons.

EXAMPLES A shining example of state capture in a flawed democracy, which was also closely followed by the media, is the case of the Gupta family, which moved from Uttar Pradesh, India, to South Africa, where they became one of the greatest and most influential economic players. Thanks to their close contacts with South African President Jacob Zuma, the Gupta family was frequently described as a shadow government (Chipkin & Swilling 2018; Myburgh 2017; Pauw 2017).

Another well-documented example of state capture in an authoritarian regime is Azerbaijan under Ilham Aliyev, where the Aliyev-Pashayev ruling family became almost synonymous with the state. While the Pasha Holding openly controls large shares of Azerbaijan's economy, the ruling family also controls the oil extraction via the state-own SOCAR company and the *State Oil Fund* (SOFAZ). The money from state budget (and the SOFAZ in particular) are frequently spent on large construction projects, which are realized by companies secretly owned by members of the ruling family. The structure of this system was largely uncovered thanks to Wikileaks, the Panama Papers, and the systematic work of several investigative journalists; some of them, such as Khadija Ismayilova, faced persecution from Azerbaijani authorities (Kopeček 2016; Safiev 2016).

IMPACT ON POLICY State capture has a serious impact on fair distribution of public goods (Canen et al. 2023; David-Barrett 2021) and on performance of transition economies (Iwasaki & Suzuki 2007; Jensen 2002; Tudoroiu 2015). In particular, state capture plays a negative role in development assistance and democratic consolidation (Richter & Wunsch 2020) and in turn supports democratic backsliding and the rise of authoritarianism (Keil 2018).

OTHER LANGUAGES The concept of state capture comes from English, and its usage in non-English literature remains limited. However, in several Central and East European languages, such as in Serbian/Croatian/Bosnian, the concept (translated as *zarobljavanje države*) is used in empirical case studies with a typical focus on political party state capture (Pejić & Stojanović Gajić 2018; Pešić 2007; Račić 2021).

NEW FRONTIERS Unlike other similar concepts, state capture is relatively well conceptualized and several existing indices of state capture prove that it can be also relatively easily operationalized and measured. However, there is a need to systematically use the already developed indices of state capture in more case studies and, therefore, enable systematic comparison of this phenomenon. A growing number of studies applying the concept of state capture on cases from different regions could be a good sign in this regard.

Sultanism & Neo-Sultanism

If the cockroach wants to rule over the chicken, then it must hire the fox as a bodyguard.
– Sierra Leonean proverb

In Max Weber's theoretical framework of **rulership**, 'sultanism' is a more extreme form (a subtype) of **patrimonialism** associated most with **despotism**. Both forms fall under the umbrella of traditional rulership but are manifested as more elaborate personalist political systems with administrative staff. Sultanism is a pre-modern legitimacy system characterized by barely restrained leadership, dependent on its armed forces, with a leader derived from, but no longer beholden to, tradition or a customary elite hierarchy (class, caste, etc.).

The related term, 'neo-sultanism' – often confusingly just referred to as 'sultanism' (even by its creator) – is a concept derived from **neo-patrimonialism**, coined by Spanish sociologist Juan José Linz (Storch de Gracia, 1926-2013) to study a system of supreme power without restraint in modern(izing) political systems, maintained not by tradition, ideology or charisma, but solely through a mixture of fear and rewards.

Despite the significant differences in definition between both concepts or in their application and impact on scholarship, both are often confused and are thus treated here alongside one another in this entry. To avoid misunderstandings, the original Weberian form of rulership is exclusively referred to as 'sultanism,' and the Linzean regime type as 'neo-sultanism.'

Moreover, unlike Linz and his colleagues, we refer to such leaders as 'neo-sultanistic' rulers or leaders. The term 'sultan' (originally from the Aramaic *'šulṭānā'* meaning 'power, dominion' and used as a title by Muslim sovereigns since the eleventh century) is reserved solely for the supreme powerholder of a sultanate, a (pre-modern) monarchic system, now usually Islamic, but with pre-Islamic, Sassanid (Iranian) roots – thus fully espousing traditional legitimacy.

DEFINITION Weberian sultanism shares all the main characteristics of its 'pure' type, **patrimonialism**: (a) In scope, it is a more complex form of traditional rulership that extends political power beyond the household of the ruler and thus encompasses staff (the 'patrimonial bureaucracy') and the means to enforce such rule (direct control over a 'patrimonial army'). (b) The bond *(Verband)* between rulers and bondsmen is based on personal relations. (c) The ruler has a traditional claim to power.

The differences with patrimonialism are found in (a) the level of discretion the ruler possesses in selecting staff and hence the composition of the latter group; (b) the ruler's utmost reliance on 'prebends' (non-hereditary offices providing revenues) to reward loyalty and service; (c) the resulting lack of traditional restraints on a ruler's decision-making.

The shift from patrimonialism to sultanism is reflected in the relationship of the ruler toward its staff. In less complex traditional legitimacy systems, the staff is made up solely of traditional associates *(Genossen),* retaining their respective rights (see below). Under patrimonialism the ruler has quite some discretion in recruiting staff 'extra-patrimonially' by selecting preferred bondsmen and vassals into his personalist patronage system. Sultanism skews this relationship even further, with rulers able to pick personal (loyal) favorites and fully dominate the relationship with their staff, reducing the latter's position to 'subjects' (*Untertanen*), rendering them fully dependent on a ruler's arbitrary discretions.

So, like in other traditional systems of rulership, staff owe their ruler personal allegiance (and are not duty-bound to the offices they hold), but the ruler's disproportionate power over individual staff members upends their ability to enforce their traditional rights, their *'Genossenrecht'* – that a ruler's policies must be substantively exercised in the interest of his followers, his traditional associates (*Genossen*). Under sultanism, the staff serves at the whim of the leader, and their future depends on remaining in the leader's good graces. They cannot counter a ruler's policy decisions because their political positions (their offices or 'prebends') are insecure and may be taken away by the ruler at any time for any reason.

Weber found patrimonialism to be the ideal type of despotic power and its sultanistic subtype to be more unstable due to the tensions between the class of traditional ruling elites and the handpicked favorites of the ruler, displacing them in the highest offices. Also, with pure reliance on a personal 'patrimonial army,' sultanistic rulers were actually more exposed to violent overthrow if this relation soured. Difficulties might arise in the event of a ruler's death or after military defeat. Fiscal arbitrariness was also a risk factor for regime survival. (Curtis 2009: 271-272, 281, 283)

Juan J. Linz, inspired by Guenther (Günther) Roth (1968), also drew on Weber's writings of traditional rulership when he dusted off the latter's concept of sultanism in 1975 to identify a particular form of 'modern' autocratic rule that differs from totalitarian regimes and regular authoritarian regimes. Neo-sultanism applies to non-traditional rulership (in the same way that **neo-patrimonialism** does) by capturing the hybridity between two logics of rulership (traditional/sultanistic and legal-rational) in contemporary regimes. Like Weber's sultanism, neo-sultanism is an extreme subtype of its respective 'pure type.' Analogically, it was devised by Linz to be applied as an ideal type (Chehabi & Linz 1998: 6, 9). However, unlike these deceiving parallels, it is important to stress that neo-sultanism is an ideal type to classify political regimes, while sultanism is an ideal type to classify forms of **rulership** (systems of **legitimacy**) – see lower: 'measurement' and 'methodological issues.'

Using a Weberian lens, neo-patrimonialism and neo-sultanism both operate in between tradi-

tional and legal-rational systems of rulership – the fusion of private and public – but neo-sultanism, in particular, is characterized by the absence of any traditional legitimacy and hollowing out the legal-bureaucratic logic of its political system with unconstrained, arbitrary rulings. Operating behind a constitutional *façade*, without ideology, impersonal mission, charisma, or historical claims to power, pure-type neo-sultanistic rulers actually find themselves devoid of any form of legitimacy, hence their absolute reliance on **patronage politics** and their personally-controlled security apparatus. This also explains their tendency to develop **personality cults** and make claims to **charismatic rulership**.

As a regime ideal type, *"no empirical reality fully matches all characteristics [and] it would be preferable to talk about "[neo-]sultanistic tendencies," indicating a development in the direction of the ideal-typical [neo-] sultanistic regime"* (Chehabi & Linz 1998: 9). In this regard, the pure type concept is categorically demarcated in juxtaposition to Linz's other regime types (along four dimensions) and in relation to neo-patrimonialism (by degree of (lack of) restraint on the ruler) (Gilbert & Mohseni 2011: 282-283; Guliyev 2011). Neo-sultanism utterly differs from totalitarianism by the absence of ideology and its weakness in mobilizing its population, but it shares many aspects of the latter's unrestrained leadership, going even further (since it is not even bound by ideology). Linz contrasts neo-sultanistic with authoritarian regimes by their very narrow support base and their lack of strong or autonomous (military or party) institutions (Linz 2000; Chehabi & Linz 1998).

J. Linz and A. Stepan (1996) provide a full comparative overview of modern regime ideal types (cf. **Linz & Stepan**) that characterizes neo-sultanism along four dimensions (pluralism, ideology, mobilization, and leadership). To summarize, under pure type neo-sultanism, the law does not protect against the unrestrained exercise of power by the leader. Limited ***pluralism*** may exist, but regime insiders, opposition figures and civil society elements can be equally targeted by despotic intervention. Rule is exercised without an elaborate or guiding ***ideology***, with a highly arbitrary manipulation of symbols. Without strong institutions or impersonal missions, ***mobilization*** of social forces is very low, without permanent organization, but can, on occasion, be manipulated for ceremonial purposes by applying coercive and clientelistic methods. ***Leadership*** is exercised without any (legal-rational) checks and balances and directly controls the security apparatus (Linz & Stepan 1996: 44-45, 51-54).

With a larger literature at his disposal, C.M. Davidson (2021: 72-73) summarizes neo-sultanism's defining characteristics as follows: (a) consolidated **personalist rule**; (b) establishing dominant patronage networks; (c) personal control over the military and security services, sometimes creating private paramilitaries; (d) eroding or sidelining the power of judicial and political institutions; (e) a tendency to establish dynasties; (f) adapt to the opportunistic manipulation of current ideologies, but never be bound by them; (g) cultivating specific aspects of traditional and religious culture (for nation-building purposes and legitimacy); (h) creating **personality cults** as charismatic *façades*.

Neo-sultanism's key defining elements taken from Weber's sultanism are (i) unrestrained personal rulership, (ii) direct control over the armed forces (the 'patrimonial army') and (iii) its 'patrimonial bureaucracy' (see: **patrimonialism**) resulting in states with a high fusion of private and public, with low levels of institutionalization. Such regimes have strong dynastic tendencies, and staff is drafted from kin, friends, business associates or from the security apparatus. All these relations are personal ones, with no professional career paths that are organized or bound by legal-rational norms. Staff is bound only by loyalty to the neo-sultanistic leader, not by any duty to the office they hold (Linz 2000; Linz & Stepan 1996; Chehabi & Linz 1998).

SEE ALSO Derived from **patrimonialism** and **neo-patrimonialism**, respectively, Weber's sultanism occupies a unique position in his theory of **rulership** aimed to capture **despotism**, while Linz's neo-sultanism has greatly influenced and contributed to the study of **personalist rule** and its related concepts of **patronage politics**, **systemic corruption**, **kleptocracy**, **clientelism**, **prebendalism**, and nepotism (Box 1.1).

ORIGIN Sultanism was based on Weber's (mis-) understanding of the Abbasid (751-1258) and Ottoman (1299-1922) empires, where sultans were deemed to be unfettered despots, wielding supreme judicial authority (cf. Box 1.13 on: Kadi justice), dependent on their personal military forces: the Janissary or Mamluk (slave) armies (see **presidential guards**) (Curtis 2009: 271). Subsequent scholarship (İnalcık 1992; Gerber 1994; Imber 2002; Arslantaş 2019) has exposed Weber's misinterpretations of Ottoman rule.

In the words of Metin Heper: *"[The Ottoman state] showed strong signs of the 'Rechtstaat:' the system required all in the bureaucratic center, including the Sultan, to respect absolutely its rulers and traditions. 'Like pages, [young male servants] the Sultan himself studied with tutors on certain days of the week. He had meticulously to observe ceremony, customary usage determining even the words he had to use on certain occasions.'"* (Heper 1985: 26, cited in Gerber 1994: 129).

The legitimacy of Ottoman sultans was always supported by tradition and bound by law, reliant on elaborate bureaucratic structures and stable property rights. (For a detailed review of the nature of Ottoman property rights, see Boucoyannis 2021; Arslantaş 2019). Therefore, Weber's term 'sultanism' is a bit of a misnomer and has been criticized for being 'orientalist' – see also 'methodological issues' below.

The model for neo-sultanism was borne out of Juan J. Linz's encounters with Jesús de Galíndez (Suárez) (1915-1956), a Spanish exile of the Franco regime, Basque nationalist, and professor of international law, who was abducted by the Trujillo regime from New York, where he had fled to in 1946 after turning into a dissident of the Dominican dictatorship in the early 1940s, where he had been teaching law. Once

in the US, his scathing magazine articles, pamphlets and PhD dissertation for Columbia University, *La era de Trujillo: un estudio casuístico de dictadura hispanoamericana* (de Galíndez 1956), published posthumously, exposing the inner workings of the Trujillo regime, made him a target for abduction, torture and extra-judicial killing. This bold, illegal rendition by the Trujillo regime led Linz to borrow Weber's concept of sultanism to capture extreme leader discretion in political regimes. Trujillo became the archetype of neo-sultanistic dictatorships. (Chehabi & Linz 1998: 4-5; Time Magazine 1956).

EXAMPLES Being such an extreme form of patrimonialism, few examples actually come close to Weber's sultanistic ideal type. One close example would be the Russian *'pomest'e system'* ('military fief system' or местничество – *'mestnichestvo'* in Russian); a system established after the subjugation of the traditional elites by the Muscovite princes (later the tsars) including the expropriation of their nobility property rights; a process starting under Ivan III (reign: 1462-1505) and abolished in 1682. This system of land tenure turned vassal princes and 'boyars' (noblemen) into servicemen (помещики – *'pomeshchiki'*) by designating them estates staffed with serfs (холопы – *'kholopy'*) and semi-free indentured peasants (смерды – *'smerdy'*) for their upkeep. Such landholdings were temporary leases (in theory) and could only be used in order to meet their military or administrative obligations to the ruler (and not for gathering taxes or sub-letting like in feudal systems). 'Combat serfs' (боевые холопы – *'boevye kholopy'*) together with the lowly gentry ('boyar scions' or дети боярские – *'deti boyarskie'*) were enrolled into the military retinue of these subordinate tenants, and constituted a large part of the ruler's 'landed army' (поместное войско – *'pomestnoe voĭsko'*) (Szelenyi 2016: 13-15; Van den Bosch 2021a: 395; Hosking 2001: 93-96).

The prime examples of neo-sultanism were the Cold War Caribbean dictatorships (the Trujillos in the Dominican Republic, Fulgencio Batista in Cuba, the Somoza family in Nicaragua, the Duvaliers in Haiti, Marcos in the Philippines and the Pahlavi shahs in Iran). Around the same time frame, many African dictatorships were identified as neo-sultanistic: Foremost Joseph-Désiré Mobutu in Zaire (see Box 1.7), Idi Amin in Uganda, Macías Nguema of Equatorial Guinea, Jean-Bédel Bokassa in Central Africa; and at times Sani Abacha in Nigeria (Chehabi & Linz 1998; Bach 2011: 279). All cases stood out by their **systemic corruption** and fearsome security apparatus, cf. **presidential guards**.

Note that Linz and his colleagues considered neo-sultanistic regimes to be temporary phenomena, unlikely to be established in advanced industrial societies, but rather compatible with agrarian export economies, where its isolated, uneducated, passive rural masses can more easily be subjugated through a system of fear and rewards (Linz 2000: 153).

LITERATURE Farid Guliyev (2011) disentangles how sultanism and neo-sultanism relate to other concepts. Gilbert & Mohseni (2011) provide a useful visualization of how neo-sultanism relates to Linz's other types. The original and updated work *Totalitarian and Authoritarian Regimes* by Linz (1975; 2000) and later expansions on neo-sultanism with his colleagues, especially Houchang Chehabi (Linz & Stepan 1996; Chehabi & Linz 1998) constitute the main canon. A very comprehensive overview of both terms and their literature is provided by Christopher Davidson (2021).

KEY SIGNIFICANCE Unlike patrimonialism, Weber's original term was initially forgotten until Linz exhumed it. Without a doubt, their concepts have contributed enormously to the study of **personalist rule** and contemporary **despotism**. Note that *"Linz's revival of the idea of [neo-]sultanism in 1975 occurred at the very instant when authoritarianism had reached its peak and was beginning to ebb"* (Young 1999), and therefore many of his archetypes became outdated in the decade after his seminal work. Problems with conceptual delineation and matching the idiosyncratic neo-sultanistic ideal type to real-life cases impeded the systematic comparison of regimes (Lidén 2013: 53; Snyder & Mahoney 1999: 117; Hadenius & Teorell 2007: 144). Most works borrowing the frame are single-country case studies.

Linz and his colleagues observed various factors that enabled neo-sultanistic rule and have furthered study in these areas: Their reliance on natural resource wealth made such regimes often compatible with **resource curses,** and scholars should not ignore geopolitical contexts nor the "interests in 'order' of foreign investors that have always established 'business' relations with the ruler." (Linz 2000: 154). Moreover, they witnessed common psychological patterns in neo-sultanistic rulers' personalities (cf. **leader personality**) (Chehabi & Linz 1998: 37). Foremost, Linz et al. documented the obstacles to democratic transition and consolidation from this regime type (Linz & Stepan 1996: 55-65; 70-71; Chehabi & Linz 1998: 37-41, 45-81).

METHODOLOGICAL ISSUES & MEASUREMENT Linz and his colleagues admit that Weber's use of the term 'sultanism' itself is a misnomer – see also: 'origin' higher – and that their adaptation should be called 'neo-sultanism' but they refuse to abandon or alter the term (Chehabi & Linz 1998: 6-7). For critiques on Weber's Orientalism, ruler-centric vision or sexist (patriarchal) perspective, see: 'methodological issues' under **neo-patrimonialism**.

Note that Weber nor Linz never specified the exact process of 'sultanization,' which is the source of its issues with 'operationalization' (see below). In contrast, works on the mechanics of **personalization** are currently being developed. When accounting for (neo-)sultanism's broader scope blurring a form of rulership and an ideal regime type, one can posit that sultanization refers to the interrelated processes by which a ruler obtains undisputed dominance over his **inner circle** (agenda-setting, vetoes and appointments), erodes the restraints of legal-rational or traditional rule and establishes personal control over the state's coercive apparatus and economic assets,

thus providing him with the levers, loyal staff, means and unchallenged position to manipulate, dominate and privatize the whole polity.

The cut-off point between sultanism and patrimonialism was never precisely marked by Weber, who revised his works several times, altering the relation between these concepts over time. Therefore, it is impossible to state when exactly prebendal, discretionary patrimonialism actually becomes sultanistic or to what level traditional legitimacy should be diluted for the former to transform into the latter ideal type.

Sultanism's inherent roots in **traditional rule** make it problematic to correctly apply the term to contemporary cases that are not monarchies. Conceptually – as shown in Table 1.9 – sultanism is closer to **absolutism** and **despotism** (both **monarchies**). These systems of governance are 'legal' even if policymaking is 'arbitrary' because rulers are not bound by the laws of men. Sultanism is, of course, extreme and (like absolutism) rather an ideal type than a regime type.

Neo-sultanism clearly corresponds to **tyranny** (which is also not exclusively used for monarchic rule). These political systems are unbound by any laws, and rulers are fully unrestrained. Nevertheless, unlike tyranny, which suffered from conceptual dilution over time, neo-sultanism has bigger methodological troubles.

Neo-sultanism suffers from similar ailments regarding delineation and operationalization as its pure type (also consult: 'measurement' under **neo-patrimonialism** for comparison). For these reasons, it is almost always exclusively used by scholars today as a theoretical reference for single-country case studies and not for comparing neo-sultanistic regimes with each other.

Delineation The main issue with neo-sultanism is that it is an ideal type to classify political regimes, derived from Weber's older ideal type to classify forms of **rulership**. This regime type is contrasted to democracy, totalitarianism, (post-totalitarianism) and authoritarianism along four dimensions (pluralism, ideology, mobilization, and leadership), but Linz never developed a hierarchy of its core defining elements, so comparing cases without such benchmarks becomes troublesome. Which neo-sultanistic tendencies in regimes bring them closest to the ideal type? Was Nicolae Ceaușescu's Romania less neo-sultanistic (because it still espoused a guiding ideology) than Alfredo Stroessner's Paraguay (retaining a more autonomous ruling party)?

By identifying neo-sultanistic tendencies in various regimes (without a clear hierarchy or benchmarks for each tendency), it already becomes difficult to sort autocratic regimes into Linz's main classification, but this picture gets even more complicated when taking into account that neo-sultanistic regimes are evolutionary, and thus came out of other forms of rule.

The analytical separation from its 'pure type' also remains unclear: Where does neo-patrimonial rule end, and neo-sultanism start? How narrow must a leader's support base become before it can be considered neo-sultanistic? Moreover, the 'neo-' prefix begs the question: Where do pre-modern states end and modern states begin?

Operationalization Linz's neo-sultanism, together with **totalitarianism** and **authoritarianism,** are, in essence, three subtypes of a non-electoral archetype. When applying his frame from 1975 to contemporary regimes with **elections** – which boomed in the 1990s – Linz's distinguishing features for classification became inadequate (Gilbert & Mohseni 2011: 279, 284). This leaves very few recent real-life cases that actually match his ideal type, either leading to conceptual stretching by scholars to make them fit or rendering Linz's typology unattractive for operationalization (Van den Bosch 2021b: 17-18).

Table 1.9 – (Neo-)Sultanism & Related Concepts

	Sultanism	Neo-Sultanism	Absolutism	Despotism*	Tyranny
Arbitrary rule	Yes	Yes	At times	At times	Yes
Legitimate or not	Yes	No	Yes	Yes	No
Main sources of Power	Force, custom, tradition	Force	Law, custom, tradition	Law, custom, tradition	Force
Private army	Yes	Yes	No	Yes	Yes
Polity is the 'Patrimonium'	Yes	Yes	No	Yes	Yes
Bound by traditional rule	No	No	Yes	Somewhat	No
Bound by legal-rational rule	No	No	Yes	No	No
Bound by the laws of men	No	No	No	No	No
Bound by divine law	No	No	Yes	Somewhat	No

* In its original meaning, before it was fully equated with tyranny.
Source: Author's own work.

REGIONAL VARIATION As mentioned higher, most contemporary studies focus on single case studies and their transitions. Some despotic regimes have been picked out repeatedly: Aleksandr G. Lukashenko's Belarus (Eke & Kuzio 2000; Rouda 2012); the Aliyev dynasty in Azerbaijan (Guliyev 2005); Saparmurat A. Niyazov's Turkmenistan (Kunysz 2012; in Czech: Kurian 2007; in Spanish: Ramas 2017); Alfredo Stroessner's Paraguay (Riquelme 1994; in Spanish: Nickson 2020); Equatorial Guinea (Peterson 2022); and Muammar Gaddafi's Libya (Geha & Volpi 2016).

Some of Linz's original examples continue to get some attention: Trujillo in the Dominican Republic (Turits 2003); Nicaragua (in Spanish: Baltodano 2020); the Philippines and Indonesia (Thompson & Cullinane 1995; Fukuoka 2015; Krüger 2016); and Iran (Ganji 2005; Ansari 2013).

OTHER LANGUAGES The Czech Republic, in particular Charles University, has a proud tradition of applying Linzean typologies to various case studies, but there is no evidence that the concept of neo-sultanism developed differently in different language zones.

NEW FRONTIERS Currently, Christopher M. Davidson (2021) is likely the only scholar who has surveyed the literature, specifically on sultanism and neo-sultanism, thoroughly, with the aim of gauging the prevailing theoretical frame in relation to contemporary cases.

While ignoring the contrast between Weber's sultanism and Linz's non-traditional counterpart, he rather blurs their literature and focuses on the shared characteristics of both terms. His goal is to take a closer look at the drift of authority structures in Saudi Arabia and the UAE over time, and the increased discretionary consolidation of power in these states compared to other Gulf monarchies.

Davidson launched the subtype of 'advanced sultanism' – a hybrid personalist regime type, combining its patronage logic with populist economic reforms and social transformations, underpinning ruling strategies aimed at adaptation, survival and longevity, characteristics that were never before attributed to the original concepts of sultanism and neo-sultanism (Piscatori 2021).

Systemic Corruption

Corrupt politicians make the other ten percent look bad.
– Henry Kissinger, American politician

I usually accept bribes from both sides so that tainted money can never influence my decision.
– Francis Bacon, English philosopher

Systemic corruption is a type of **corruption**, which is endemic and institutionalized; in countries stricken by systemic corruption, corruption is not the exception to the rule, but rather the rule or norm itself.

DEFINITION Defining systemic corruption is not possible without defining or at least conceptualizing corruption as such. Legalist definitions reduce corruption to practices "prohibited by laws established by the government" or to "illegal actions concerning public officials." These kinds of definitions are useful for Large-N comparative studies; however, corruption is then reduced to a few most visible (and therefore measurable) practices, such as bribery or fraud (Vergara 2020: 13-14). A widespread, although somewhat broad, definition popularized by *Transparency International* is that corruption is the abuse or misuse of entrusted power for private gains. Similarly, Nye (1967: 419) defined corruption as a *"behaviour which deviates from the formal duties of a public role because or private-regarding [...] pecuniary or status gains; or violates rules against the exercise of certain types of private-regarding influence."* The problem with these kinds of definitions is not only their broadness, but also their problematic operationalization. For example, Scott (1972: 3) argues that while corruption "involves a deviation from certain standards of behaviour," it is not clear "what criteria shall we use to establish those standards." Similarly, Kurer (2015: 34) argues that the main problem in this regard dwells in how to operationalize 'misuse' or its equivalents. Therefore, those definitions that aim at operationalizing corruption typically focus on one of the following issues – violation of legal norms, harming of public interest, and perception of corruption by public opinion. Inevitably, each of these approaches has its advantages and disadvantages, which are clearly summarized by Kurer (2015) and Gardiner (2017).

Another problem closely connected to the definition of corruption is the debate about the universality or relativity of the concept of corruption. As demonstrated by a number of studies, at a certain level of abstraction, corruption is a cross-cultural concept understandable around the globe; as summarized by Persson et al. (2013: 455), *"there in fact seems to be decisive moral disapproval of corruption in the majority of countries, including the most corrupt ones."* However, there is a disagreement among scholars on whether cultural differences "explain or excuse acts of corruption" (Larmour 2012: 155). While, for example, Alatas (1968) sees Western cultural relativism regarding corruption as naive, others, such as Heidenheimer (2017) or Larmour (2012), point out that cultural context is useful in understanding which actions people perceive as corrupt.

Heywood (2017: 2) claims that the problem is not the absence of a widely accepted definition that would operationalize corruption but the corruption itself; he rather asks "why corruption occurs and what needs to be done to prevent it." In this regard, Heywood (2017: 5) suggests that we should "move away from an undifferentiated conception of corruption" and calls for a typologization of corruption and operationalization of types of corruption, including systemic corruption.

Recently, the academic debate on systemic corruption concentrated on its conceptualization. A voluminous body of literature has conceptualized corruption, including systemic corruption, as based on the principal-agent relation. This perception stems from the economic theory and *"looks at ways*

of designing incentives to induce agents to act in ways that are optimal for those employing or directing them (their principals), when the agent's behaviour cannot be directly observed." (Philp 2015: 18). A seminal definition of corruption using the principal-agent theory was provided by Klitgaard (1988: 24), who defines corruption as behavior which *"occurs when an agent betrays the principal's interests in pursuit of her own."*

A number of authors have taken issue with the conceptualization of systemic corruption as a principal-agent problem (e.g., Grødeland et al. 1998; Karklins 2005; Mungiu-Pippidi 2006; Persson et al. 2013; 2019; Rothstein 2018) and have proposed that the collective action theory offers a better conceptual framework. As explained by Persson et al. (2013: 450), in countries with systemic corruption, *"we cannot assume the existence of 'principled principals' willing to hold corrupt officials accountable as suggested by the principal-agent framework,"* even for the 'principals,' Persson et al. continue, *"corruption is the expected behaviour [and] at least the short-term benefits are likely to outweigh the costs."*

The collective action framework of systemic corruption has been criticized by Marquette & Peiffer (2018: 500), who argue that we should aim more at functions that corruption serves and that *"corruption is the means through which many solve real problems that have deep social, structural, economic, and political roots."* The discussion between two groups of scholars advocating different conceptual frameworks for systemic corruption has become somewhat heated, as apparent from the articles published in the Scholarly Exchange section of the journal *Governance* (Marquette & Peiffer 2018; Persson et al. 2019). For a dispassionate discussion on conceptualizing systemic corruption, see Heywood (2017).

SEE ALSO While **corruption** includes many more phenomena, several concepts used in political science refer to patterns similar to systemic corruption, such as **state capture** (sometimes perceived as a form of systemic corruption), or **clientelism**, **patronage**, **rent-seeking**, and **prebendalism,** which are phenomena (informal institutions or practices, cf. **informality**) typical for countries stricken with systemic corruption.

KEY SIGNIFICANCE The concept of systemic corruption is useful for studying countries where corruption is not an exceptional behavior, but rather a general pattern of behavior that is systemic and institutionalized. There have been three main avenues of research on systemic corruption. The first (i) one focuses on the very concept of systemic corruption throughout history and its negative impact on democratic government (Vergara 2020; 2021; Cuèllar & Stephenson 2022). The second (ii) one aims at investigating systemic corruption in modern democracies (Rhodes 1997; Saint-Martin 2015; Langr 2018), and the third (iii) and the largest one studies non-democratic or hybrid regimes of the Global South or from the post-Soviet area, where the concept of systemic corruption has been studied in the context of democratic and economic transition or economic development (Stefes 2008; Znoj 2007). An important debate has occurred in terms of fighting systemic corruption on the basis of its conceptualization, i.e., the problem of collective action, function, or principal-agent relations (Marquette & Peiffer 2018; Persson et al. 2013).

ORIGIN The concept of corruption is as old as the state and government (Klitgaard 1988: 7). Several authors provide us with concise accounts of the history of corruption from antiquity to modern times, such as Noonan (1984), van Klaveren (2017), Brioschi (2017), or Vergara (2020: 15-25). According to Noonan (1984: 13-14), whose book with the simple title *Bribes* is a seminal work in this regard, the concept of corruption or bribery was already known in ancient Mesopotamia and Egypt. When looking for historical conceptions of corruption, Western literature typically turns to ancient Greece, where corruption was known under the term *phthora* (φθορά). Interestingly, the usage of the concept of *phthora* was very modern because it did not refer to something inherently illegal but rather to the destruction, decay, or degeneration of constitutional principles.

The beginnings of modern research on corruption, however, date to the 1950s and 1960s and were closely connected to the process of decolonization and the dominating modernization paradigm in economics and political science. Therefore, from the very beginning, modern studies on corruption have centered on developing countries (Scott 1972: 9). Simultaneously, there was a definitional and conceptual debate among several camps of scholars on the nature, role, and effects of corruption. While some authors perceived corruption as something inherently immoral, others offered the 'grease the wheel' hypothesis, claiming that corruption can have positive effects on the economy, followed by the 'sand the wheel' hypothesis, claiming very much the opposite (for a concise account on these debates, see, e.g., Méon & Sekkat (2005) or Nur-tegin & Jakee (2020). Only in the last decade of the twentieth century a growing number of authors began to investigate corruption in democratic and developed countries. This fact, however, does not mean that the focus on developing, transitional, or non-democratic countries would grow weaker in corruption studies.

While Wallis (2006) convincingly shows that the notion of systemic corruption dates back in history to ancient Greece and has also constantly appeared in British and American political practice, the pioneering academic accounts on systemic corruption date back to the 1970s (Caiden & Caiden 1977; Dobel 1978). The body of literature on systemic corruption began to grow only at the turn of the twentieth and the twenty-first century (Johnston 1998; Persson et al. 2013; Stefes 2007).

LITERATURE A good overview of research on corruption, including systemic corruption, is provided in larger volumes edited by Heidenheimer & Johnston (2017), Heywood (2015), and Mendilow & Peleg (2014). The most influential works on systemic corruption include Persson et al. (2013), Johnston (1998), and Marquette & Peiffer (2018), which provide an important conceptual debate.

CLASSIFICATIONS As noted by Bussell (2015: 24), *"the empirical literature, in practice, largely ignores variation in corruption, typically analyzing only one example of corrupt behavior without categorizing it as a particular form of corruption."* There are several ways of how to typologize **corruption**. The literature on corruption frequently operates with binary typologies, such as 'petty' and 'grand' corruption, 'need' and 'greed' corruption, or 'individual' and 'systemic' corruption. In contrast, these typologies are universal and also useful in structuring the research field (cf. Heywood 2017: 5), and they still produce relatively large and diverse categories with limited analytical potential. In this regard, Bussell (2015: 35) argues that *"[r]ather than attempting to fit one typological schema onto all efforts to analyze corruption, we are better served by explicitly identifying the character of corruption that is relevant to our analytic goals and then working within that conceptual definition and, if necessary, suitable typology."*

In terms of systemic corruption, there have been a few attempts at typologies serving analytical goals. For example, Karklins (2002) identified three types of post-communist corruption – i.e., (a) low-level administrative corruption, (b) self-serving asset stripping by officials, and (c) '**state capture**' by corrupt networks. While low-level corruption can have an *ad hoc* character, the higher hierarchical levels of post-communist corruption clearly have a systemic nature. In his study on systemic corruption in Armenia and Georgia, Stefes (2008) differentiates between centralized and decentralized systemic corruption and claims that political leaders prefer the former type to the latter, as it enables them to control better potential rivals. In a Large-N study on corrupt states, Darden (2008) offered three types of informal mechanisms of administrative control: state-benign, state-weakening, and state-strengthening graft. He convincingly shows that while random corruption behavior *"neither enhances nor undermines loyalty in the administrative hierarchy of the state"* (Darden 2008: 41), i.e., is state-benign, there are systemic patterns of corrupted behavior which either weaken the state or, in turn, strengthen it. Systemic corruption weakens the state if agents break rules that their principals expect them to follow. On the contrary, Darden shows that in a number of relatively strong states, systemic corruption is used in order to reinforce administrative hierarchies and provide the basis for loyalty and obedience of state officials. If (almost) everyone is corrupt, but corruption is illegal, it is relatively easy for principals to control corrupted officials-agents, as demonstrated, e.g., by Kopeček (2016) in the case of Azerbaijan.

MEASUREMENT Recently, the composite indices have become widely used tools for measuring corruption at the level of individual states. These include the popular *Corruption Perception Index* developed by *Transparency International*, the *Control of Corruption Indicator developed* by the World Bank, the *Business Environment and Enterprise Performance Survey* (BEEPS), sponsored by the World Bank and the *European Bank for Reconstruction and Development*, and the *Global Corruption Index* developed by the *Global Risk Profile*. In particular, it is the BEEPS, which can be useful for measuring systemic corruption, as it differentiates several forms of corruption. A critical assessment of composite corruption indices was provided by e.g. Søreide (2006) and Stefes (2007). Indirectly, systemic corruption can be measured using a network analysis (Fazekas & Tóth 2016) or by a combination of quantitative and qualitative methods (Langr 2018). See also **state capture** and its section on 'measurement.'

METHODOLOGICAL ISSUES The main methodological issue in researching corruption, and systemic corruption in particular, is that corruption is, by its nature, a hard-to-observe phenomenon. Large-N studies have to rely on highly aggregated data, which are typically based on corruption perception. On the contrary, small-n and single case studies mostly rely on abduction as a type of inference, providing the best explanation of the hidden phenomenon on the basis of known facts. Another problematic aspect of research on corruption is that while understanding which practices or actions are corrupt is based on local cultural context, the voluminous part of the literature on corruption is based on Western assumptions about the state, free market, and economic development, and these Western assumptions are then applied to non-Western societies, which Western scholars or practitioners typically see as most corrupt (cf. Persson et al. 2013: 455-456; Philp 2015: 23).

EXAMPLES Stefes (2008) offers a useful comparison of Armenia and Georgia after the break-up of the Soviet Union; in these countries, systemic corruption manifested itself in different ways. While Armenia has been an example of a centralized model of systemic corruption, which enabled its political leaders to consolidate their control over the state, Georgia has been an example of a decentralized model of systemic corruption, which led to the disintegration of the state apparatus and its rebuilding after the Rose Revolution.

IMPACT ON POLICY Fighting corruption is a *Leitmotif* of many political programs. However, fighting systemic corruption is a difficult task given its nature and the frequent involvement of leading political figures; furthermore, unsuccessful anti-corruption policy *"renders voters extremely cynical and threatens to subvert public trust in emerging democracies"* (Mungiu-Pippidi 2006: 82). There are, however, diverging views on anti-corruption policies. For example, in a volume edited by Mungiu-Pippidi and Johnston (2017), several cases of successful anti-corruption strategies and transitions to good governance are analyzed using the 'virtuous circle' approach, i.e., a chain of events that reinforces itself through a feedback loop resulting in a continuous process of improvement. On the other hand, Rothstein (2011: 246) advocates the indirect 'big bang' approach and claims that *"targeting corruption directly is probably not going to lead to change if it is not accompanied by an 'indirect' strategy in which many, if not most, other*

public institutions are changed from adhering to particularistic practices to universalism and impartiality."

NEW FRONTIERS Besides the conceptualization debate on systemic corruption, the main avenue of research on systemic corruption should aim at studying successful cases of fighting corruption or the origins of strong institutions preventing states from being systemically corrupted (cf. Persson et al. 2013: 466).

Technocracy

Often the perception is that the elected politicians have already failed, by being corrupt or not capable of decisive economic action.
– Anna Killick (2023)

Technocracy is a multifaceted concept that can be understood as a regime type (A), an ideology (B), and a political strategy (C). Foremost, it is considered an authoritarian tendency in democracies, but broadly across regime types, it is actually a specific type of governance, the result of a regime's policy choices in the field of economics, welfare, environmentalism, privatization, etc. (agenda-setting and expert-input in policy-making).

One of the key reasons for its renewed attention today is the argument that technocracy should be regarded as a major driving force behind the global rise of populist movements (Rummens 2017).

DEFINITION As a *regime type* (A), technocracy contrasts with **populism** and party democracy by emphasizing governance through scientific or technical expertise. It is defined as a 'tendency within (democratic) governance to increasingly rely on experts for decision-making, based on their knowledge of the common good.' This approach stands in opposition to liberal **democracy**, which derives political legitimacy from popular will and democratic processes (Bickerton & Accetti 2017).

Technocracy is further divided into 'old' and 'new' forms: the former is associated with bureaucratic structures of the welfare state where experts held significant influence, and the latter is characterized by governance networks that transcend traditional bureaucratic boundaries, often operating on global or regional levels (Rummens 2023).

As an *ideology* (B), technocracy is considered 'thin' because it lacks the comprehensive worldview typical of ideologies like liberalism or socialism. (For this reason, this entry is not located under **ideologies & worldviews**).

Technocracy also functions as a *political strategy* (C) within democratic systems. This strategy involves adopting a 'technocratic style,' characterized by an emphasis on 'good governance' rhetoric and delegating policy decisions to experts while maintaining accountability to democratic institutions. This style has gained traction in contemporary politics, possibly due to factors like the mediatization of politics and voter volatility. However, while it can operate within democratic boundaries, there is a risk that it may contribute to the 'hollowing out' of democracy by undermining the responsiveness of political institutions.

SEE ALSO Technocracy is thus contrasted with **populism** but at the same time framed as democratic backsliding (**autocratization**) due to the move away from party politics. As a narrative and source of **legitimacy**, it is associated with **military regimes** and **bureaucratic authoritarianism**.

Overall, technocracy's complexity lies in its evolution and internal contradictions, as well as its interactions with other political forces. It requires a critical understanding of its claims and an awareness of potential tensions between expertise and democratic values. Consult Bertsou & Caramani (2020) on how to measure the concept in democratic systems.

ORIGINS The term was first coined by the American engineer William Henry Smyth in 1919, who introduced the term in an article titled *Technocracy: Ways and Means to Gain Industrial Democracy*, published in the journal *Industrial Management* (Esmark 2020). Thorstein Veblen popularized the term soon after. (Stabile 1987)

During much of the twentieth century, it aligned with Keynesian welfarism, which prioritized economic growth and equitable distribution. More recently, it has shifted toward neo-liberalism, emphasizing market-based solutions and competition across society. Technocrats typically avoid explicit ideological stances, presenting themselves as neutral experts driven by scientific knowledge (Rummens 2023).

Technocracy centers on the belief that expert knowledge is the primary source of legitimate political authority, often sidelining popular will or democratic processes. Historically, it has functioned within broader ideological frameworks.

KEY SIGNIFICANCE One key aspect is the role of technocracy in legitimation strategies. Authoritarian regimes often seek to enhance their **legitimacy** by demonstrating competence and effectiveness in addressing complex issues. Technocracy, with its focus on expert-driven solutions, provides a means for these regimes to project an image of rationality and efficiency (C). By showcasing technical achievements, authoritarian leaders can mitigate public discontent and strengthen their grip on power.

Furthermore, the **co-option** of expertise is a critical strategy employed by authoritarian leaders. By strategically appointing loyalists to key positions or manipulating scientific data to support predetermined agendas, these regimes can legitimize their decisions and policies. Analyzing these dynamics helps reveal the mechanisms through which authoritarian regimes maintain control and shape public perception.

Technocracy also contrasts with **populism**, offering a divergent approach to political legitimacy. While technocrats derive authority from their expertise, populists appeal directly to 'the people' and often position themselves against elites, including technocrats. Understanding how these forces interact within specific regimes can provide deeper insights into the tensions and power struggles that shape political landscapes. For instance, a populist leader might initially criticize technocratic institutions but later embrace them to fulfill promises of

economic prosperity or national security.

Additionally, technocracy highlights the tensions between political leadership and **bureaucracy**, particularly under populist authoritarian regimes. Leaders often seek to assert control over bureaucracies, viewing them as obstacles or potential sources of opposition. Analyzing these tensions provides insights into the resilience or vulnerability of institutions under authoritarian rule (Rockman 2019).

From the perspective of **autocratization**, Friedman (2019) emphasizes that democracy's legitimacy does not depend on its ability to produce optimal policies but rather on its capacity to resist domination, uphold equality, and express collective will. By separating democracy and technocracy, Friedman cautions against undermining democratic legitimacy based on criticisms of public ignorance or perceived irrationality, the shared arguments of libertarians and authoritarians alike.

Theocracy

No one expects the Spanish Inquisition!
– Monty Python's Flying Circus, *The Spanish Inquisition* (1970)

Theocracy as a regime type can be defined in multiple ways, leading to potential confusion. At its simplest, theocracy is understood as the 'rule by God.' However, since divine beings do not directly govern worldly affairs, theocracy is typically interpreted as rule by clergy (equating it with *hierocracy* – 'clerical rule') or a self-appointed group claiming to govern by divine mandate (Ferrero 2013).

A broader and more analytical definition of theocracy describes it as a political system whose **legitimacy** is derived from a supernatural source. This perspective distinguishes theocracy from other regime types based on the origin of their ruling power rather than the specific individuals in power (Potz 2020).

This broader definition is particularly useful for political analysis as it applies to both historical and contemporary regimes, including Muslim states that may not be *hierocracies* – where religious and secular leadership are indistinguishable. This understanding clarifies that even when religious and secular offices are separate, a government can still be classified as a theocracy if its legitimacy is rooted in a supernatural source, regardless of whether its leaders are clergy (Potz 2020).

Houston (2021) contrasts theocracy with *anthropocracy* to explore governance modes and their religious relationships. Theocracy involves divine authority, with human rulers acting as intermediaries between the deity and people, characterized by divine power delegation through religious institutions. In contrast, the 'rule of humans' derives legitimacy from people rather than the supernatural. The latter often incorporates religious elements to legitimize human rule, using religion to support human authority rather than divine rule, but to do so, they need to reverse the organizing values of theocracy by emphasizing human sovereignty while utilizing religious institutions to reinforce this sovereignty (Houston 2021).

The source of legitimacy serves as a criterion for classifying political systems. Traditional **classifications & typologies** are based on how leaders are chosen and the extent of political control over individuals. However, these categories are not mutually exclusive, leading to classification challenges for regimes like illiberal democracies. This issue is particularly pronounced for theocracies, which may be misclassified as authoritarian or totalitarian based solely on their level of oppression. Some theocracies might employ democratic succession procedures, such as elections.

For this reason, Maciej Potz (2020) considers religion to be the source of legitimacy (in analogy with tradition – patrimonial regimes; knowledge – meritocratic regimes; popular will – contractual regimes, no legitimacy – despotic regimes). **Weber's** theory of **rulership** applies as well: While the Catholic Church is a theocratic organization, it derives authority from **traditional rule** (apostolic succession), rational-legal rules (codified laws), and, historically, **charisma** (Potz 2020).

The operation of theocratic regimes is multifaceted and can be understood through various frame-

works: The *transactional perspective* views the relationship between rulers and the ruled as an exchange of goods and services. In theocratic regimes, religious functionaries provide legitimacy to secular rulers, who, in return, offer material support and social status to these functionaries. This exchange underscores the political power of religion, even in non-theocratic settings. However, theocracies introduce an additional layer to this dynamic: religious functionaries and allied secular rulers engage in an *unequal exchange* with the faithful. The religious goods offered, particularly 'intercession' and 'ultimate salvation,' are deemed invaluable (priceless), leading the faithful to reciprocate with 'submission' to the rulers. This distinct exchange differentiates theocracies from other regimes influenced by religion, where legitimacy does not stem from religious authority (Salmon in Ferrero & Wintrobe 2009).

Theocracies possess a unique advantage in generating loyalty through religious belief, which enhances their power relative to other dictatorships with similar resources. Consequently, theocracies often operate with smaller budgets (through religious restrictions on some economic spheres) but wield significant power (Ferrero & Wintrobe 2009). This model suggests that theocracies tend to be more repressive than other forms of dictatorship, utilizing religious institutions to enforce control. Historical examples include Calvin's use of religious authority in Geneva and the Papal States' reliance on 'the Inquisition' (Padovano & Wintrobe 2012; 2013). Note that *Inquisitio* properly referred to a judicial process of the ecclesiastical courts of the Catholic Church, not any organization.

M. Ferrero and R. Wintrobe (2009) organize theocratic regimes according to his rational-choice theory (cf. **Wintrobe**). They note that for some subtypes, especially totalitarian theocracies, control over information flow is critical for how they operate. Methods include **censorship**, **propaganda**, and religious education (**indoctrination**) to maintain ideological conformity and limit exposure to alternative ideas.

Interestingly, Ferrero and Wintrobe (2009) state that religions can be classified as behavior-based or doctrine-based, influencing their relationship with theocracy and suppression. *Behavior-based religions*, like Islam, Judaism, and Protestantism, focus on public behavior and societal norms, making them more vulnerable to suppression by rulers who can alter societal practices, such as outlawing polygamy or unveiling women. These religions often intertwine with public governance, facilitating their alignment with theocratic structures. *Doctrine-based religions*, like Catholicism and Orthodoxy, emphasize internal beliefs and rituals conducted behind closed doors, enabling survival under hostile conditions. Suppressing such religions requires targeting practices directly, which historically proved challenging. Consequently, Catholic theocracies were rare and often arose under specific conditions, such as the Papal states or colonial missionary efforts.

Political institutions in theocracies also play a crucial role in their operation. Like any political system, they require mechanisms for leader selection, lawmaking, and law enforcement. The source of legitimacy influences these mechanisms. **Succession** procedures vary widely; leaders may be divinely chosen (Israel) or selected by religious elites (Papal state) or democratic processes believed to reflect divine will. Legal systems may rely on religious law or a blend of religious and secular laws, with church institutions enforcing these laws. Consult Hirschl (2021) on theocracy's historical background and additional examples and Hirschl (2010) on constitutional theocracy.

An example of an election would be the seventeenth-century Puritan colonies in New England, illustrating how classifying regimes by their source of legitimacy enhances our understanding of theocracies. Although Puritans used democratic procedures to elect their governor, they believed his authority was divinely sanctioned rather than derived from the electorate's will. This demonstrates how a transactional perspective can further elucidate theocratic relationships. In this view, relationships between religious functionaries, secular rulers, and citizens are seen as exchanges of goods and services. Religious functionaries grant legitimacy to secular rulers in exchange for material benefits and social status (Potz 2020).

Iran and Saudi Arabia represent two distinct models of modern theocracy, each with unique characteristics and complexities (cf. **Islamic States**). Iran's political system is described as an electoral theocracy, a hybrid regime combining elements of democracy within an authoritarian framework. This system is characterized by the coexistence of divine and popular sovereignty, with ultimate authority vested in jurists. Despite the ruling clergy's influence, Iran holds regular **elections**, which have occasionally led to unexpected outcomes and power shifts, such as Hassan Rouhani's victory. These elections serve to legitimize the regime while highlighting tensions between theocratic and democratic principles. However, Iran lacks a stable multi-party system, and its press is tightly controlled, often leading to manipulated electoral processes (Ghobadzadeh & Zubaidah Rahim 2016).

In contrast, Saudi Arabia's governance is described as a 'theo-monarchy' rather than a straightforward theocracy. The Saudi constitution and legal system are grounded in Islamic principles, yet there exists a *de facto* separation between religion and politics. This system features a power-sharing arrangement between religious scholars (the *Ulamā*) and rulers (the *Umarā* cf. emir/amir). Historically, the *Ulama* legitimized the ruler's authority through religious interpretation. Over time, they have been integrated into the state apparatus, influencing legislation and endorsing political decisions. Despite their influence, the *Ulama* do not operate as an autonomous power center but collaborate with the monarchy to validate decisions that may conflict with Islamic law (Al-Atawneh 2009).

Timocracy

If honor were profitable, everybody would be honorable.
– Thomas More

Timocracy (τιμοκρατία, *timokratia*) is a term for an aristocratic or oligarchic constitution employed almost exclusively by Plato (in the *Republic*) and Aristotle (in the *Nicomachaean Ethics*), cf. **Plato & Aristotle**. Both authors use the term in different senses based on different understandings of the etymology of the word. Timocracy, needless to say, was not a concept commonly used in general Greek political theory or practice.

In Plato's *Republic*, timocracy is the best of Plato's corrupt constitutions (followed by **oligarchy**, **democracy** and **tyranny**), into which the ideal state, ruled by philosopher kings, will decline in turn. The successive degeneration of the ideal *Callipolis* through these four stages prepares for the climax of the dialogue: the comparison of the 'Just City' with the worst possible kind of constitution, that of tyranny. By this means, the superiority of justice over injustice is demonstrated.

Plato defines timocracy as the 'constitution that loves victory and loves honor' (τὸν φιλόνικόν τε καὶ φιλότιμον, 8.545a. 2-3). This state is 'according to the form of the Spartan constitution' (8.545a3), but it is not defined as an **aristocracy** (which is the term used for the ideal state, as 'the rule of the best') nor an oligarchy (here the state into which timocracy declines, which is the rule of the rich who lack virtue). For Plato, the term timocracy is derived from the Greek word τιμή (*timē*), which is regularly translated as 'honor,' 'respect' or 'value.' The Platonic timocrats are midway between the Platonic 'aristocrats' and 'oligarchs:' They concern themselves only with fighting and martial glory and do not dabble in money-making, but they also have no interest in virtue gained from the study of philosophy, unlike the Platonic 'aristocrats' or philosopher kings (8.547c-548a).

Aristotle, in the *Nicomachaean Ethics,* uses the term *timocracy* in a notably distinct fashion. Aristotle here outlines a tripartite categorization of constitutions into kingship, aristocracy and timocratic government (τιμοκρατική, *timokratikē*, 1160a.34). This last constitution is a kind of popular government, but one that includes property valuations or qualifications for office, in Greek *timēmata* (ἀπὸ τιμημάτων, 1160a.33). The more usual term for this moderate form of popular government, and the one employed in the *Politics*, is *Politeia*. The corrupt equivalent of timocracy/'Politeia' in Aristotle's six-part schema of constitutions is democracy. As an example of timocracy, Aristotle may have in mind the settlement made at Athens in around 594 BCE by Solon, which involved four property qualifications to determine eligibility for political office but which was arguably nonetheless a precursor to the later classical Athenian democracy.

A further distinct concept of timocracy is provided by Ronald **Wintrobe** (1998). He explicitly borrows the term from Plato, but his understanding of its meaning is slightly different (Wintrobe 1998: 14-15). For Wintrobe, timocracy is not an aristocratic constitution but rather an autocracy that aims to inspire high levels of loyalty in its subjects through relatively low levels of repression. Historical examples offered of such forms of timocracy include the Roman Antonine emperors: a relatively benign regime that was later transformed into a tyranny by the emperor Commodus (177-192 CE).

Box 1.17 Caesaropapism: The Best of Two Worlds?

I contemplate with sovereign reverence that act of the whole American people which declared that their legislature should 'make no law respecting an establishment of religion, or prohibiting the free exercise thereof,' thus building a wall of separation between church and State.
– Thomas Jefferson (1743-1826), US President.

No emperor has power over the things which belong to God.
– John Chrysostom (398-404 CE), Patriarch of Constantinople

Caesaropapism refers to a political system where the secular ruler (often an emperor or king) holds supreme authority over both state and religious matters, effectively combining political and religious power. The term is most commonly associated with the Byzantine Empire, where emperors exercised significant control over the Eastern Orthodox Church, appointing patriarchs, presiding over church councils, and issuing ecclesiastical edicts. In this system, the head of state often acted as the protector and manager of the church, though not necessarily its spiritual leader. The concept contrasts with **theocracy**, where religious institutions dominate political authority.

The importance of caesaropapism in comparative politics lies in its illustration of how different political systems manage the relationship between religion and state power. Caesaropapism provides a model for understanding how secular rulers can exert control over religious institutions to consolidate power and legitimize their rule, as seen in historical examples like Byzantium, Russia under Peter the Great, and even Henry VIII's England after the Reformation.

The term was likely coined by Justus Henning Böhmer (1674-1749), a Protestant canonist who made significant contributions to the history of Catholic canon law. He used the term in his work on Protestant canon law to describe a system where secular rulers exercised authority over ecclesiastical matters. However, it was later popularized and further developed by sociologist Max **Weber** (1864-1920), who described caesaropapism as the complete subordination of religious authority to secular power. (Arifi 2017)

The roots of caesaropapism can be traced back to the (Eastern) Roman Empire, particularly after Emperor Constantine I's conversion to Christianity in the early fourth century. Constantine played a crucial role in shaping the relationship between the church and state by convening councils, such as the First Council of Nicaea (325 CE), and involving himself in theological disputes. Although he did not claim doctrinal authority, his influence over church matters set a precedent for future emperors. (Downey 1968; Geanakoplos 1965)

By the time of Emperor Justinian I (527-565 CE), caesaropapism had turned into **theocracy**. Justinian saw himself as both a political and religious leader responsible for maintaining unity within the empire through control over both secular and spiritual matters. He presided over church councils, appointed bishops, and even issued religious edicts. This close integration of imperial and ecclesiastical power is encapsulated in Justinian's vision of a harmonious relationship between the *imperium* (state) and *sacerdotium* (church), referred to as *symphonia* (συμφωνία – 'accord'). (Downey 1968; Geanakoplos 1965)

The concept of caesaropapism was later adopted by the Russian Tsars, especially after Ivan IV (the Terrible) assumed the title of tsar in 1547. Ivan subordinated the Russian Orthodox Church to his rule, using it as an instrument of state power. This trend continued under Peter the Great in 1721, who abolished the *Patriarchate of Moscow* and replaced it with a government-controlled body called the *Most Holy Synod*, effectively turning the church into a department of the state. (Toumanoff 1946; Runciman 1957) Both cases are also good examples of **patrimonialism**.

While caesaropapism is most closely associated with Eastern Christianity, similar concepts appeared in Western Europe. For example, during the English Reformation under Henry VIII, the king declared himself Supreme Head of the Church of England, effectively merging royal and ecclesiastical power.

Totalitarianism

Мы живем, под собою не чуя страны,
Наши речи за десять шагов не слышны,
А где хватит на полразговорца,
Там припомнят кремлёвского горца.
(We live, not feeling the country beneath us,
Our speech inaudible ten steps away,
But where they're up to half a conversation,
They'll speak of the Kremlin mountain man.)
– Osip Mandel'shtam, *We Live, Not Feeling* (1933)

The opening of the poem above captures the feeling of insignificance of the individual under totalitarian rule where all opposition is repressed and aspects of life are controlled by the state. Totalitarianism is a commonly-used term with many meanings and is controversial, both scholarly and politically. It is a kind of 'devil term' (Weaver 1985) that is variously misused. It evokes aspects of centralized power (not pluralism), autocracy, and demands complete subservience to the state.

DEFINITION Totalitarianism can be understood in different ways. Scholars often split the concept into two strains of thought: Roger Scruton (1998) distinguishes two applications of the term: as a system of government and as an ideology that serves it. The Polish philosopher Ryszard Legutko (2006) similarly presents two theories of totalitarianism: The first being political with totalitarianism as a system, and the second being anthropological involving the 'human soul.' These are completely different perspectives of understanding the concept. In contemporary political science (PS), totalitarianism is most often understood as a type of political system. It is considered one of the archetypes of **dictatorship** or, in other words, a specific way of governing a non-democracy. Consult the entry on **authoritarianism** to get an overview of how these concepts differ in the typology of **Linz & Stepan**.

The first academic attempt to define it as a regime can be found under the entry *State* in the *Encyclopaedia of Social Sciences* from 1934. With a critical look at the development of theories on totalitarianism, one can distinguish three generations of scholars: The first – the founding one – appeared in the 1930s and 1940s and included Raymond Aron, Ernst Fraenkel, Franz L. Neumann, Sigmund Neumann, and Victor Serge. **Aron** (1951) mentioned the difference between totalitarian regimes and historical dictatorships. He pointed out that, unlike the old dictatorships, totalitarian regimes are ideological (**ideocracies**), and he called totalitarian ideology a secular religion (*religion séculaire*). Fraenkel (1941) emphasized its characteristics of terror and leadership. F. Neumann (1942) noticed the regime's attempt to dominate its entire society completely. S. Neumann (1942) captured totalitarian regimes as one-party systems, ideological, based on leader veneration and permanently politically mobilizing society. Through his analysis of the Soviet Union, Serge (1937) defined the 'totalitarian state' as a regime in which the bureaucratic caste monopolized everything, not only politics but also economics and culture. In this way, totalitarianism controlled the whole human.

S. Neumann came closest to the definitions of the second – classical – generation. The most influential authors here were Carl Joachim Friedrich and Zbigniew Brzeziński, who published the first edition of their famous book *Totalitarian Dictatorship and Autocracy* in 1956, highlighting the notorious 'six-point syndrome' (Schapiro 1978) of a totalitarian regime: (a) totalitarian ideology, (b) one ruling party, (c) a system of terrorist control of society, (d) monopolistic control of mass communication, (e) monopolistic control of armed power, (f) monopolistic control of the economy (Friedrich & Brzezinski 1962: 9-10). This six-point catalog is still accepted today as the basis of research on totalitarianism, even though it has been criticized.

Hannah Arendt (1951) chose a slightly different approach. She did not view the totalitarian regime exclusively as a system. According to her, the key thing is ideology and the state's effort to penetrate the everyday life of society. Rulers are not content with merely exercising power but want to transform society and create a new human. They wield mass ideological **indoctrination** and state terror (Box 3.13) for this purpose. For this to be possible, two conditions must exist: (a) Society is run by a single political party headed by a deified leader who is the bearer of ideology and terror. (b) Society has a mass character, causing the isolation of people and uprooting them from traditional social structures.

The classic generation of scholars was followed by a third generation, whose best-known representatives include Raymond Aron (again), Juan J. Linz, Giovanni Sartori and Leonard Schapiro. Linz (2000) defined three main conditions of totalitarianism: (i) The existence of a single center of power (not necessarily internally homogeneous), (ii) ideology governing society, and (iii) massive political mobilization of society. Aron (1965, 1996), together with Sartori (1987, 1995), speak of an ideology elevated to the position of the only official truth, this ideology becoming a secular religion (Aron) or a political religion (Sartori) to save humanity. In contrast, both authors do not place so much emphasis on terror as a key feature of totalitarianism. Sartori (1987) argues that, in general, terror, permanent **purges**, and extermination camps are all pre-routine characteristics of the establish-

ment phase of a totalitarian regime. Once the regime stabilizes, which is determined by its routinization, the physical terror will subside, but this does not change the totalitarian nature of the regime. Finally, according to Schapiro (1978), a totalitarian regime is based on five contours and three pillars. These contours are: (a) leader, (b) subjugation of the legal order, (c) control over private morality, d) ongoing mobilization, and (e) mass legitimacy. The pillars are (A) ideology, (B) party, and (C) state administration.

As one can see, each of the listed scholars identified a new aspect while agreeing with others on some aspects and rejecting other defining characteristics. The basic principles remain essentially the same, and to summarize this all, we can thus define a totalitarian regime as follows: (i) Totalitarian regimes arise in mass societies, which distort them so that the individual becomes an isolated element, uprooted from all traditional social structures. (ii) There is a **single party** that is the center of both political (state) power and all other aspects of life (a *monistic* center of power cf. Linz 2000: 70). The party controls all social functions; there can be nothing outside of it. The party is usually headed by a deified leader, whose quasi-divine attributes can have various confessional sources (cf. **personality cults**). The totalitarian regime declares its unequivocal anti-religion, but it is a gnostic type of religion, or at least it uses many religious elements as a means of its legitimacy. (iii) Society is completely subordinated to an ideology that supposedly explains all social reality and lays out a plan for action. Based on this foundation, the party rules, upholding a messianic narrative about itself and its mission. The **ideology** with an absolute character provides an absolute justification for all the means used to achieve the set goals. (iv) A totalitarian regime is an activist regime. It demands the active participation of citizens to survive. Society is politically mobilized, and everything is politicized. All aspects of life, including the economy, culture, sports, and even people's private lives, are judged politically (ideologically). (v) Society is controlled by state terror, which does not always have to take the form of direct physical violence; it can be psychological. (vi) Totalitarian regimes have creative ambitions. Through ideology and terror, they want to create a new type of human, freed from old attachments (Balík & Kubát 2015).

SEE ALSO Totalitarianism as an archetype is closely related to concepts such as **dictatorship** and **authoritarianism**. Its usual creation through **revolution** and ensuing **revolutionary legacy** affect regime performance. As an **ideocracy**, its preoccupation with **ideology** can merge with either **fascism** or **communism**. Its leadership veneration relates to **personality cults** and **personalist rule**. Some scholars erroneously draw parallels to **sultanism & neo-Sultanism**, but in the regime typology of **Linz & Stepan,** totalitarianism is considered a distinct type.

KEY SIGNIFICANCE Totalitarianism is one of the most important concepts in the social sciences. Regardless of its controversies, modern research on dictatorships is inconceivable without it. The concept of totalitarianism, in various ways, influenced entire generations, not only political scientists but also historians, political sociologists and others. Its conceptualization in the 1930s provided the impetus to develop new regime classifications, and their incarnation under Stalin and Hitler rendered the twentieth century the age of totalitarianism.

ORIGIN The linguistic basis of the term *totalitarianism* is Latin. It is derived from the word *totus* (in medieval Latin *totalis*), which means 'all' or 'total.' Later, this expression, in various modifications, became a common part of Italian and is, therefore, not a linguistic novelty. However, its use in a political sense is recent.

It is believed that the term *totalitarian* was 'invented' by the fascist political theorist Giovanni Gentile. Gentile, indeed was one of the main promoters of the word, but he was not its originator. Gentile only changed its connotation from negative to positive. Italian anti-fascist journalists who criticized the fascist regime were the first to use the term totalitarian. Probably the very first author who used this word in polemics with fascists was the journalist Giovanni Amendola. On 12 May 1923, Amendola called Mussolini's government a 'totalitarian system' in *Il Mondo* magazine. The noun *totalitarianism* appeared in a political context on the pages of *La Rivoluzione Liberale* on 2 January 1929 in an article by Lelio Basso (under the pseudonym Promento Filodemo). Giovanni Gentile took the term totalitarian from his ideological enemies and reversed its meaning. He influenced Mussolini, who himself started using this word and popularized it in Italy at the time (Balík & Kubát 2015).

In the Anglo-Saxon world, the terms *totalitarianan* and *totalitarianism* spread thanks to Italian anti-fascist emigrants. In 1926, Luigi Sturzo's well-known book *Italy and Fascismo* was published, in which he often used both terms, of course, in a negative sense. Since the 1920s, the words 'totalitarian' and 'totalitarianism' have gradually spread across Europe and entered dictionaries and encyclopedias. This happened for the first time in 1934 when it appeared under the entry *State* in the *Encyclopaedia of Social Sciences*.

The issue of the origin of totalitarianism can also be understood empirically. The question is when and where it appeared. There are two approaches here. The first (primordial) approach claims that totalitarianism is an eternal phenomenon; it is a part of human nature, and therefore, it has existed since ancient times. This opinion is held by political philosophers such as Karl R. Popper (1945) or Jakob L. Talmon (1952). In contrast, comparative political scientists who understand totalitarianism as a type of political system hold a modernistic point of view and claim that modern non-democratic regimes differ in their nature (structure) and way of functioning from the political regimes of, for example, ancient Sparta, Calvin's Geneva, or Jacobin France (cf. **modernization theory**). Arguments for this approach relate to the rise of state power and control mechanisms (regarding repression, information, etc.) and are contained in the above-mentioned definitions.

In this context, it should be noted that fascist Italy, which gave the world the words totalitarian and totalitarianism, is far from being considered totalitarian by scholars. According to Giovanni Sartori (1987: 193): *"(…) no Italian who lived the experience of fascism has ever written a scholarly book taking fascism seriously as a totalitarianism. (…) To Mussolini, the 'total state' sounded impressive, important; and the label 'totalitarian state' appealed to his vanity and rhetoric. (…) Fascism, in Italy, was a clear-cut case of authoritarian dictatorship-far more than a 'simple dictatorship' but far less than a totalitarian state."*

LITERATURE There is a vast literature on totalitarianism that can be classified in various ways. It is noteworthy that the main works on totalitarianism are written by those who had personal or family experience with this type of dictatorship. In other words, they witnessed totalitarianism with their own eyes: e.g., Arendt, **Aron**, Brzeziński, **Linz & Stepan**, **Sartori** and others. Furthermore, the works on totalitarianism come from different geographical and cultural environments (Anglo-Saxon, French, German, Italian, Polish, Spanish, etc.), and one cannot find one predominant 'center' in this literature.

Totalitarianism's presence in works is usually dedicated to the phenomenon or is part of a broader analysis of dictatorships of various types. It appears in comparative perspective (juxtaposed to democracy) and empirical-analytical works of a more political theoretical nature. As an archetype, it is also included in various 'standard' handbooks and textbooks.

Totalitarianism – in contrast to other modern forms of **authoritarianism** – has the recurrent subject of artistic treatment, primarily in novels but also in film and music. There is even a special literary genre called dystopia or anti-utopia depicting an ideal totalitarian world. The most famous representatives of this genre include Margaret Atwood (*The Handmaid's Tale*), Ray Bradbury (*Fahrenheit 451*), Aldous Huxley (*Brave New World*), Jack London (*The Iron Heel*), George Orwell (*1984*) and Yevgeny Zamyatin (*We* – in Russian: *Мы* – *'My'*).

In addition to fiction, one finds its treatise in memoirs of people persecuted by totalitarian regimes, whose works are not only documentaries but are also of high artistic, literary quality, and even analytical value. We can mention here Aleksandr I. Solzhenitsyn (1973) or Gustaw Herling-Grudziński (1951). Several publicists and intellectuals also addressed the topic. Typical examples are the French left-wing novelist and winner of the Nobel Prize for Literature and critic of Stalinism, André Gide (1936) or the Czech admirer of Stalinism and victim of Nazism, Julius Fučík (1932).

An example of a dystopian film that is not based on a book is *Equilibrium* from 2002, written and directed by Kurt Wimmer. In music, for example, the famous trash metal band *Megadeth* often deals with similar topics.

REGIONAL VARIATION Totalitarianism is a maximalist concept, and as such, identifying regional variants is challenging. The regime is either totalitarian or it is not. On the other hand, totalitarianism indeed appeared in very different countries and contexts, prompting the question if 'national totalitarianism' exists. This problem was analyzed by the French political scientist Jean Leca (1984). If we say that totalitarianism occurred under completely different conditions, then we expose ourselves to the objection that we are placing under one label multiple cases that might have nothing in common at all. According to Leca, this problem can be solved in two ways. First, we primarily identify the 'conditions for emergence' that enable or facilitate the creation of a totalitarian regime. Here, we can distinguish between endogenous and exogenous totalitarian regimes. Endogenous totalitarian regimes will arise locally, while exogenous totalitarian regimes are either imposed or arise through imitation. Second, we define the so-called 'totalitarian syndrome' in the sense of a general summary of its features, which are monism, ideocracy or theocracy, revolutionism and state control.

The totalitarian syndrome does not differ in principle from mainstream definitions of totalitarianism, as shown above. We thus return to the introductory remark that maximalist requirements for totalitarianism mean that a regime is either totalitarian or another type of dictatorship. This leads to two conclusions. First, totalitarian regimes are rare (see 'measurement'). Second, it is difficult to create typologies of totalitarian regimes (see 'classifications').

METHODOLOGICAL ISSUES Giovanni **Sartori** (1987, 1995) considers totalitarianism as one of the ends of an imaginary axis, the other end of which is democracy. So, they are Weberian ideal types, ideal constructions, and systemic visions that do not occur in practice. Between them is the space where all the existing political systems – democratic and non-democratic – move. It means that we cannot expect any political regime to be purely totalitarian. We thus have one ideal totalitarianism and specific regimes that they are getting closer (or, on the contrary, move away from) to ideal totalitarianism. So, there is a difference between ideal, theoretical *totalitarianism* and a concrete *totalitarian regime*.

In practice, however, the terms totalitarianism and totalitarian regime are used simultaneously and interchangeably. As a political system, a totalitarian regime is defined according to its definable characteristics (listed higher). Such an approach is established in PS, and essentially, all relevant definitions of totalitarianism or totalitarian regimes follow this logic. This approach has been criticized by claims, among other things, that totalitarianism understood in this way is always a static model that does not take into account its emergence, development and demise of totalitarianism (Sartori 1993; Soper 1985).

MEASUREMENT Classifying cases of totalitarianism is an ambiguous endeavor. Due to the maximalist requirements for totalitarian regimes, it is sometimes difficult to tell which regime is really an established totalitarian regime and which one aspires to become one but fails to do so. Furthermore, there is no universally accepted list of totalitarian regimes

in the PS literature. However, the assumption is that totalitarian regimes are rare, and if they do appear, they are rather short-lived. Totalitarian regimes usually include: some stages of development in the Soviet Union, Nazi Germany, Mao Zedong's China, Pol Pot's Kampuchea, and North Korea, which is also an exception to the rule that totalitarian regimes are not durable. Among European communist countries, Enver Hoxha's Albania and Nicolae Ceaușescu's Romania are mentioned (Balík & Kubát 2015). However, there are also opinions that one should consider Iran under the rule of Ayatollah Ruhollah Khomeini (1979-1989) or the (first) Taliban rule in Afghanistan (1997-2001) as totalitarian regimes (Merkel 1999). Some even argue that Eritrea is another modern-day example of 'silent totalitarianism' (Saad 2018; Walker 2022), with its revolutionary legacy, single party, state-controlled media, mass repression, and forced military conscription *de facto,* resulting in mass slavery (Tronvoll & Mekonnen 2014).

The classification of different cases can be discussed endlessly. For example, there is a large debate about how to rank the communist countries of Eastern Europe from 1948-1989. Were they totalitarian, or was it some other type of dictatorship? This debate triggered new (and competing) typologies that included totalitarian regimes, cf. **Linz & Stepan** or **Kailitz**.

CLASSIFICATIONS Classifying totalitarian regimes into subtypes is very problematic. There are very few such attempts and thus far, have not been very convincing. Moreover, it is noteworthy that the main theorists of the concept did not attempt to classify them (due to their maximalist approach). Nevertheless, some classifications exist: Below, there are two typologies with classical subtypes (where differentiating attributes are added to the core concept) and one with radial subtypes (where distinguishing characteristics are already contained in the root concept but stressed differently or with some diminished).

Wolfgang Uwe Friedrich (1997) distinguished three types based on the criterion of the presence of terror. According to him, there are: a) terrorist totalitarian regimes, b) bureaucratic totalitarian regimes and c) theocratic totalitarian regimes. The first group (a) includes Lenin's and Stalin's Soviet Union, Mao Zedong's China, North Korea, Pol Pot's Kampuchea, Ceaușescu's Romania, Hoxha's Albania, a brief period (1937-1938) in Spain before Franco's rule, and the German Third Reich. These are countries where terror is the main way to control society. The second group (b) includes the communist regimes of the Eastern Bloc after Stalin's death and China after Mao's death. They are regimes where the ruling bureaucracy is identical to the party structure or works under its control. The regime does not work rationally but subordinates everything to ideology. The third group (c) includes countries dominated by an Islamist ideology like Khomeini's Iran (cf. **Islamic States**). Such an Islamist ideology is then considered a theistic variant of historicist ideologies such as Nazi and communist doctrines (cf. **ideocracy** vs. **theocracy**).

Another classification of totalitarian regimes is the contribution of Wolfgang Merkel (1999). Merkel first distinguishes between totalitarian and authoritarian variants of Nazism and communism. The boundary is the form of the powerholder – either it is a (A) *Parteidiktatur* (party-dominated dictatorship) or a (B) *Führerdiktatur* (leader-dominated dictatorship). The totalitarian variant is the second (B), while the other (A) is the authoritarian variant. Merkel further distinguishes three basic types of totalitarian regimes: a) communist totalitarian regimes, b) fascist totalitarian regimes and c) theocratic totalitarian regimes. Examples have already been mentioned. The first group (a) consists of the USSR (1929-1953; so, excluding the Lenin era), China (1949-1976), Kampuchea (1975-1979), North Korea (since 1945), Albania (1945-1985), and others. The second group (b) consists only of the German Third Reich (1938-1945). Note that fascist Italy does not belong here. The third group (c) consists primarily of Iran (1879-1989) and Taliban rule in Afghanistan (1997-2001). They are Islamic states that draw on a fundamentalist interpretation of religion. However, this is not a purely religious regime but a government of people who have instrumentalized religion as an ideology.

An interesting discussion concerns the position of the communist countries of Eastern Europe in the years 1948-1989 (see 'measurement'). Were these countries totalitarian or not, and if so, to which extent? This is where derivative types (radial subtypes) related to totalitarianism appear, like: pre-totalitarian regime, post-totalitarian regime, quasi-totalitarian regime, etc.

The most well-known terms are (a) pre-totalitarian and (b) post-totalitarian regimes because they are part of Linz's (2000) well-known typology of authoritarian regimes. While both types originally fell under authoritarian regimes, **Linz & Stepan** (1996) later extracted the post-totalitarian regime from this typology and made it a separate type of dictatorship. A *pre-totalitarian regime* (a) wants to become totalitarian, but its progress toward this goal is hindered for various reasons. These are the totalitarian projects in the countries of Central Eastern Europe in the years 1944-1948. Alternatively, it can be a case of 'interrupted' totalitarianism, which, for some reason, misses some of its core attributes. In such a case, it is 'defective totalitarianism,' and an example would be the Soviet Union during the period of the New Economic Policy (1921-1924).

The *post-totalitarian regime* (b) is characterized by a greater degree of societal 'pluralism' than in its totalitarian root concept. Unlike authoritarianism, however, we do not find any 'limited political pluralism' here: A single party still fulfills the role of the leading force of political life. The leaders of the regime are still the same as the originally revolutionary parties, but they tend to govern more bureaucratically and technocratically than charismatically. The refined leading ideology fulfills the function of a 'holy book' (Box 1.18), but the rulers increasingly consider it a utopia, and society no longer believes in it. The regime is mobilizing society but with far less intensity than before. Participation in rituals is still generally obligatory, but it no longer has an enthusi-

astic character. In short, the regime shows signs of totalitarianism, but to a large extent, only formally (Linz & Stepan 1996).

According to Linz, post-totalitarianism came in various variants. In general, it can be said that it denotes the regimes of Eastern Europe roughly from the middle of the 1950s to the end of the 1980s. Linz labels regimes of the period of the late 1940s and early 1950s as quasi-totalitarian. Other communist regimes are consultative authoritarianism (Poland after March 1968), quasi-pluralistic authoritarianism (USSR 1954-1964), democratizing and pluralistic authoritarianism (Czechoslovakia in 1968), and anarchic authoritarianism (China during the Cultural Revolution).

The term *quasi-totalitarian* regime was also used by Gordon Skilling (1970), relating to socialist Czechoslovakia. It is a regime that is not fully totalitarian. It is close to it but not reaching it. It is an apparent or approximate totalitarian regime. It wants to be totalitarian, but for some reason, it does not succeed, so it settles for its incomplete variant. This is a case of some Eastern European regimes that aspired to become totalitarian and were usually much closer to totalitarianism than to authoritarianism (Novák 2007).

There are more terminological equivalents of quasi-totalitarianism. For example, Guy Hermet (1990) used the term 'soft totalitarianism' (*totalitarisme mou* in French), and Jacques Rupnik (1988) spoke of a "so-called 'totalitarian' system" or referred to a "system's totalitarian tendencies." Eckhard Jesse (1994) used the neologism 'autholitarian dictatorship' (*autolitäre Diktatur*) to express that, according to him, Honecker's German Democratic Republic was a combination of *autho*-ritarianism and tota-*litarianism*.

In the end, one of the authors of the term post-totalitarian regime was Václav Havel, who introduced it in his famous essay *The Power of the Powerless* in 1978. According to him, the Czechoslovak regime of his time was post-totalitarian because it had become purely ritualistic or routine. Havel used Linz's term 'post-totalitarian' intuitively and unconsciously, not in the context of current scholarly discussions – at least Havel does not refer to these – stating that during his writing, a better term simply did not occur to him (Havel 1990).

EXAMPLES One of the few communist cases of true totalitarianism was actually Albania. It was also the only Eastern European communist country to retain a 'classic' Stalinist constitutional system modeled on the 1936 USSR constitution throughout the whole communist period. After the war, in February 1946, the Communist Party of Albania (from 1948 the 'Party of Labor of Albania' – *Partia e Punës e Shqipërisë*) and its leader, Enver Hoxha, declared that a revolutionary-democratic dictatorship of workers and peasants led by the Communist Party had been established. After initial intra-party power struggles, Hoxha definitively consolidated his personalist rule in 1948. An anti-communist opposition never formed in Albania; it was active only abroad.

Albania soon nationalized industry, collectivized farms, and subjugated the church. The peak of totalitarian rule came in 1965 when Hoxha announced the so-called permanent 'revolutionization.' Its task was to mobilize society to support the party and its leader. The result was total control of society, including people's private lives. The party eliminated private property, abolished all churches (declaring Albania the first atheist state in the world in 1967), and fully controlled education, science, culture, and the media. Society was heavily militarized (e.g., a program to build a million bunkers was announced).

The party terrorized everyone (through the *Sigurimi* secret police) without exception: ordinary people as well as purges in the party, state, and military apparatus. Top officials were sentenced to death and executed. According to the criminal code, even children from the age of twelve could be given death penalties for conspiracy against the state and sabotage. Resorting to kin punishments, also family members of those convicted were targeted for repression. Acts like not renouncing one's religion, not showing up for elections, a 'bourgeois' way of dressing, listening to foreign radio stations and (later) watching foreign television, participating in illegal religious ceremonies, etc. were all punishable offenses. Citizens were not allowed to travel abroad; their mobility was restricted even within Albania.

The constitutional development of the country was simple. Albania had two constitutions, 1946 and 1976, which differed only ideologically, not institutionally. The basis of the state was the People's Assembly, elected in general but non-competitive elections, which covered all state branches (legislative and executive). The People's Assembly elected a presidium (headed by a chairman), which had all state powers when the assembly was not in session. Alongside this hierarchical structure, the Council of Ministers operated as the highest administrative institution. This constitutional system was only formal because all the power was held by the Party of Labor of Albania and its leader, Enver Hoxha (Fevziu 2017; Woodcock 2016; Zavalani 2015).

IMPACT ON POLICY Totalitarianism is like a revolution. Totalitarian power grows beyond all standards of normal politics (Buchheim 1962). In its consequences, it leads to complete not only political, but also economic, social, and cultural transformations of such societies. This results primarily from its ideological essence because totalitarian ideology aims to create not only a new country and society but also a new human.

Totalitarian regimes have greatly influenced world politics and have structurally reshaped countries' internal and international (world) views. Despite the divide between Nazi and communist totalitarianism and their contrasting national and racial goals versus internationalist aspirations, the latter was also much more focused on economic and social transformation (Brooker 2000). However, they were very similar in their ideology-driven expansionism – their desire to convince, control and subjugate other areas, countries, and nations. This inevitably led to 'criminal' policies (Brooker 2000), primarily wars, but accompanied by other phenomena, such as (many forms of) genocide (Lemkin 1943), GULAG-

style prison systems, widespread ecological disaster, and cultural onslaught (Box 1.19).

This has enormously impacted international relations. The experience of totalitarianism and war triggered the integration process in Western Europe and led to the creation of the United Nations and the modern concept of **human rights** (Universal Declaration of Human Rights).

Given totalitarianism's holistic impact on society, it also affects society's 'non-political' spheres. A typical example would be art (e.g., socialist realism) or, for example, their megalomanic architecture (sacral or propagandistic), which are full of symbolism and monumentality (Ward 2015), often entwined with **personalist cults**. Furthermore, these architectural remnants are still very much present in the urban landscapes touched by totalitarian overlords. However, the true **totalitarian legacies** can run much deeper and become stable elements of political cultures in such societies and political systems.

NEW FRONTIERS The concept of totalitarianism is historical today. The only old-fashioned totalitarian example remaining is North Korea. As a result, the phenomenon is not being re-conceptualized at present. Various 'new' or 'innovated' forms of dictatorships appear in the world (Brooker 2014), but none take the form of totalitarianism. It is a question for further research to what extent such regimes as, for example, contemporary Russia with its nationalist ideology or China with its modern methods of mass surveillance, correspond to at least some characteristics of twentieth-century totalitarianism.

Box 1.18 Holy Books: The Ideological Foundations of Ego & Ideocracy

We must fight against revisionism with all our might because it is a betrayal of Marxism-Leninism.
– Enver Hoxha, *Reflections on China* (1979)

The term 'holy book' in authoritarian regimes typically refers to the publications, visual arts, and other artifacts that construct the image of dictatorships and their leaders. Chronicles, songs, and other forms of oral traditions historically served as the primary tools for legitimizing rulers. With the spread of literacy and the advent of printed and electronic media, dictators were able to craft a positive image and disseminate **propaganda** across their territories. In recent years, the digitalization of authoritarian ideologies through internet visual arts or mobile phone applications has become another powerful tool for penetrating society, especially in contexts where internet usage is restricted or monopolized. The modern internet era has shifted the focus from traditional 'holy books' to sets of 'holy texts' – shorter, more straightforward content designed for quick consumption by the public.

The more centralized and personalized a given dictatorship, the more likely their writings become dogmatic and propagated. Such dictators do not entertain alternative opinions, as the typical hierarchical structure of **personalist rule** is supportive of far-reaching sycophancy (cf. Box 6.5) toward and around the leader. In turn, such rulers consider themselves as the most suitable candidates for their highest positions, which have to be legitimized by any means, including the writing of books. (For a selection of their alternative artistic outlets, see Box 3.5)

The books allegedly written by or about dictators can have different functions. In most cases – as shown in Table 1.10 – they serve as a political, economic or social program that leaked into most dictatorships' domestic and foreign policy spheres. Adolf Hitler's *Mein Kampf (My Struggle)* or Muammar al-Qaddafi's *Green Book* (الكتاب الأخضر – *al-Kitāb al-Aḫḍar*) were considered their respective visions of how the state should be managed and what kind of foreign policy is desired. In some cases, like the previous examples and also Saparmurat Niyazov's AKA *Türkmenbaşy* ('Father of all Turkmen') *Ruhnama (Book of the Soul)*, and – in part – the *Little Red Book* of Mao Zedong and Kim Il-Sung's *Seonjip* (Selected Works) or *Jeojakjip* (Collected Writings), these works illustrate and determine the whole philosophical system and state-ideology or, at least, aim to create a kind of guiding ideological system that becomes obligatory throughout the territory they control.

In extreme scenarios, books not only serve as the foundation for ideological contexts or to legitimize the rule of certain dictators, but their function extends even further. For example, Niyazov's *Ruhnama* in Turkmenistan and Kim Il-Sung's writings in North Korea were designed to act as spiritual guides for their respective citizens. Studying these texts became mandatory and was essential for career advancement and navigating everyday life under the regime. Exams based on the *Ruhnama* or Mao Zedong's *Little Red Book* became an obligatory part of daily life, with their content enforced in routine activities. The pocket-sized edition of Mao's *Little Red Book* exemplifies this, as it was intended to be a concise, portable companion that citizens could carry with them at all times.

Contrarily, several 'holy books' – or their collection as in the case of Lenin's or Ho Chi Minh's multiple volumes – are, however, extremely sophisticated and/or vast that they need to be simplified and popularized before dissemination. Although Iran's Khomeini's *Valayat-e faqih (Guardianship of the Islamic Jurist)* is a relatively tiny book, the scientific (theological) language (including long parts written in Arabic) is hardly promotable in its original form and was simplified to be understandable for the general public. Lenin's collections consist of about fifty volumes, depending on the edition (Ленин 1972; Lenin 1976), so the simplified version or 'quotation books' were created for access by the general public. Mao Zedong's *Little Red Book*, the collection of the leader's quotations and principal ideas, belongs to the same category for squeezing the ruling philosophy (Maoism in this case) into simple postulates available to everybody.

At the same time, not all dictators or ideologists of authoritarian regimes tend to publish their ideas as a single 'holy book.' Instead, most written books from and about dictators start with the collection of their speeches and photos, and eventually, their propaganda uses other visual arts tools. Although the collections of speeches do not pretend to be one single and centralized 'holy book' that everybody must prove their knowledge about, they could be an authoritative source for spreading a kind of ideology. As such, these books could become a required part of the educational and **indoctrination** process and, consequently, at different levels of daily life. For example, students, academics and other local researchers should obligatorily dedicate a certain percentage of their respective publications to quotes from these ideological writings. In some cases, this leads to absurd situations if these requirements are mandatory, for example, in the exact natural sciences such as mathematics, geology, biology, etc. (Social scientists could be in a better position, although they are obliged to link and adapt their texts almost exclusively to the regime's ideological context.)

Concerning the authorship of holy books, **propaganda** shows the presidents tirelessly working on their books in their free time, during their holidays, and thinking about their respective nations. Most of the books or collections of speeches are written by regime insiders surrounding these dictators, like their advisers or prominent pro-regime scholars.

The activity of book writing is not predetermined by the character of the regimes nor the level of authoritarianism. Somehow, moderate authoritarian leaders can be involved in writing the books (such as Kazakhstan). At the same time, some repressive dictators – such as Alfredo Stroessner in Paraguay, Teodoro Obiang Nguema in Equatorial Guinea, Mobutu Sese Seko in Congo, or, to

Table 1.10 – A Selection of Famous Ideological Writings of Dictators

Ruler	State (period)	Holy Book	Type / aim
Kim Il-Sung (1946-1989)	North Korea	*Seonjip* and *Jeojakjip*	Collection of texts Foundation for the *Juche* ideology
Ayyatollah Khomeini (1979-1989)	Iran	*Velayat-e faqih*	Theological treatise Foundation for the Iranian political system
Vladimir I. Ulyanov (Lenin) (1917-1924)	Russia/USSR	Collection of works	Books, articles Foundation of the Soviet philosophical and political system
Adolf Hitler (1933-1945)	Germany	*Mein Kampf*	Program book of the Nazi regime
Ho Chi Minh (1945-1969)	Vietnam	*Collection of Works*	Articles and collection of speeches, Proclaimed as the foundation of Vietnam's system of values and politics
Mao Zedong (1949-1976)	China	*Little Red Book*	Concise and brief program book for state ideology (Maoism)
Muammar al-Qaddafi (1969-2011)	Libya	*Green Book*	Foundation for political system of *jamahiriya*
Saparmyrat Niyazov 'Türkmenbaşy' (1986-2006)	Turkmenistan	*Ruhnama*	Spiritual book, collection of moral code and historiography of Turkmenistan
Xi Jinping (2012-)	China	*Xi Jinping Thoughts*	Part of Chinese Communist Party 'constitution' The ideology of the 'Chinese Dream'

Source: Author's own work.

some extent, Vladimir Putin in Russia – prefer other tools for promoting their ideology. They limit themselves to policy statements and articles that do not evolve into a comprehensive ideological system. The decision to create or refrain from creating a 'holy book' or other forms of 'sacralization' through ideological texts lies with both the dictator and their sycophantic inner circle. This choice is influenced by the dictator's background and beliefs, the nature of the regime, and the composition of the ruling elites. Dictators are often motivated by ambitions to establish an ideological or programmatic framework for the regimes they lead or by personal desires to be recognized as grand writers. The political elite typically supports the promotion of such writings to either gain or maintain favor with the leader, particularly in the ideological sphere.

Box 1.19 Genocide

Aequat omnes cinis
(Ashes level all)
– Seneca

Genocide is closely connected to mass killings based on religion, race, and ethnicity. Genocide is a total social practice that affects all aspects of group life (Moses 2009: 13); it is a campaign of mass extermination that targets entire groups, but the term has also been used to refer to massacres that target all members of a particular group in a given area (Lieberman 2010: 45-46; see also Shaw 2007).

The massacres of Elamites and Babylonians by Assyrians (900-700 BCE), the Roman sacking of Carthage (146 BCE) during the Third Punic War, the systemic extermination of native Americans during colonization, the Zhunghar annihilation by the Qing dynasty (1755-1758) – although the practice goes back centuries, genocide has been initially defined only during the WWII by Raphael Lemkin, who crafted a framework to describe the abhorrent mass killings of Jews in Poland by Nazis. Since the adoption of the *Convention on the Prevention and Punishment of the Crime of Genocide* in 1951 by the United Nations, the legal definition of genocide has been more precise, but scholarly debates about its usage and the history of mass and intended killings, have been very lively, especially in the light of the inflatory use of the term.

Lemkin described genocide as follows: *"Genocide has two phases: one, destruction of the national pattern of the oppressed group; the other, the imposition of the national pattern of the oppressor. This imposition, in turn, may be made upon the oppressed population which is allowed to remain, or upon the territory alone, after removal of the population and the colonization of the area by the oppressor's nationals"* (Lemkin 1944: 79). In 1946 Lemkin wrote that genocide is *"the criminal intent to destroy or cripple permanently a human group"* (Lemkin 1947: 147).

The UN Convention defines genocide as *"any of the following acts committed with intent to destroy, in whole or in part, a national, ethnical, racial or religious group, as such: (a) Killing members of the group; (b) Causing serious bodily or mental harm to members of the group; (c) Deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part; (d) Imposing measures intended to prevent births within the group; (e) Forcibly transferring children of the group to another group."* Crucially, Lemkin's definition and the UN convention recognize the trans-historic moment in the act of genocide. However, as Robins (2010) wrote, the UN Genocide Convention has been set up on a judicial and legal basis in order to punish the perpetrators of such crimes.

Mass murders and the organized killing of people have a longer history than the use of the term genocide (Kiernan 2007; Levene & Roberts 1999). However, it has also been used to explain historical mass killings. Scholars have looked back to ancient and medieval times and identified some genocidal practices (see: van Wees 2010; Scales 2007; Fraser 2010). Many times, colonial repression and the mass murders in Latin and North America have been used as cases of genocidal policies (Stannard 1993; Robins 2010; MacDonald 2023), the mass murders in Africa during the colonial times (Schaller 2010), while notorious twentieth-century examples include the Armenian genocide (1915-1917), the Holocaust (שואה – *Shoah* in Hebrew), the Biafran, Rwandan and Burundian cases; the Yugoslav secession wars and the genocide in Srebrenica (Mann 2005; Simon 2023). Sometimes, those who rebelled against colonial exploitation and mass murders engaged themselves in retributive genocidal killings (Robins 2002; 2005)

Scholars have differentiated between different types of genocides: retributive, institutional, utilitarian, monopolistic, developmental, despotic, optimal, progressive, reactionary, hegemonic, etc. (Du Preez 1994; Smith 2000; Jonassohn & Chalk 1990; 2000; Fein 1993; Van den Bosch 2024). Although often regarded as external to modernity, the analyses of Frankfurt School members, such as Adorno and Horkheimer (2016), alongside other critical theorists like Arendt (1965) and Bauman (1989), have argued that genocide – particularly the Holocaust *(Shoah)* – is inherently linked to the instrumental rationality and technological advancement of modernity. Bauman claimed that *"in the last resort – the choice of physical extermination as the right means to the task of Entfernung was a product of routine bureaucratic procedures: (…) budget balancing, universal rule application. To make the point sharper still – the choice was an effect of the earnest effort to find rational solutions to successive 'problems,' as they arose in the changing circumstances. (…)"* (Bauman 1989: 17).

The reasons for the occurrence of genocides and mass killings are typically attributed to several factors: deep divisions within society, such as ethnic or religious conflicts (Kuper 1986); wars, revolutions, and severe crises, which can provoke mass killings either due to a search for scapegoats or because political elites exploit these crises to achieve their goals and consolidate power (Staub 1989; Mazian 1990; Melson 1992; Shaw 2003).

Scholarly research has increasingly focused on the connections between **totalitarianism**, **authoritarianism**, **personalist rule**, and genocide. It is often argued that democratic governments, by their nature, do not kill their citizens and that the restraint on government power reduces the likelihood of aggressive and destructive behavior (Rummel 1994). Within this framework, genocides have typically been associated with totalitarian or authoritarian/personalist regimes. Horowitz (1976: 36) famously asserted that *"Genocide is the operational handmaiden of a particular social system, the totalitarian system."* Similarly, Rummel (1994) argued that absolute power is the critical factor behind 'democides' – a broader term encompassing various forms of mass killings, including genocide. Van der Maat (2024) builds on this thesis, linking mass killings and genocides to authoritarian regimes and intra-elite rivalries. Supporting this, Straus (2010: 74) observed, *"Like the idea that deep divisions and enmity between groups is a wellspring for genocide, the idea that genocide is more likely in dictatorial states has a certain common-sense resonance. It seems intuitive mass killing would be more likely where power is concentrated among the few and where citizens do not enjoy broad democratic rights."*

Despite this widely held belief that democracies do not commit genocides, scholars such as Michael Mann and Mark Levene have demonstrated that democracies can also perpetrate mass killings, ethnic cleansing, and genocides (Mann 2005; Levene 2005). Leopold II of Belgium (reign: 1865-1909), a constitutional monarch of a democracy, bears personal responsibility for the genocidal predatory system in the Congo Free State (now DRC). He also set up outsourcing 'concessions' to corporate multinationals in extractive industries (mining and rubber) without oversight. Scholars do disagree on the level of 'intent to destroy' (since these enterprises needed the forced labor) and thus if Leopold's 'red rubber regime' meets all (legal) defining criteria of the term genocide.

Valentino (2004) emphasized that democratic governments may engage in mass killings abroad or support authoritarian regimes responsible for such actions. Krain (1997) challenged the automatic correlation between concentrated power and state-sponsored mass killings, suggesting that other factors play a role. Mann (2005) offered a nuanced perspective, arguing that newly democratizing states are more likely to commit ethnic cleansing than stable authoritarian regimes. Levene went further, asserting that *"British colonial and American tendency to genocide [occurred] in notable tandem with the evolution of these states toward liberal, even democratic credentials"* (Levene, 2005: 112).

Traditional Rule (Weber)

The law showed what man ought to be. Christ showed what man is, and what God is.
– William Paton Mackay (1839-1885), Scottish doctor and Presbyterian minister

Max Weber's concept of traditional rule, rooted in the sanctity of long-standing customs and practices, finds a natural connection between **monarchies** and institutionalized religion. Traditional authority legitimizes power through inherited status (**dynasties**) and adherence to established norms, often intertwined with religious doctrines. Historically, institutionalized religion played a crucial role in reinforcing traditional rule by providing divine justification for power structure as expanded upon in **religions of the world & statecraft.** For instance, the 'divine right of kings' framed monarchs as chosen by God, making obedience a religious duty. Similarly, patriarchal authority within households was often justified through religious teachings that emphasized male dominance as divinely ordained.

Weber observed that in societies with enduring empires, such as Imperial China or medieval Europe, the fusion of religious and secular power reinforced traditionalism. Religious institutions not only sanctified rulers but also shaped societal norms, discouraging dissent and maintaining hierarchical structures. This intertwining of religious and secular authority created a stable social order but often impeded rationalization and modernization. Traditional authority's reliance on inherited customs contrasted sharply with the legal-rational rule that underpins modern bureaucratic states and market economies, a more advanced political order, **Weber** believed.

Weber's framework can be extended to analyze **ideologies** as mechanisms for legitimizing power in ways analogous to traditional rule. Like traditions, several ideologies provide coherent belief systems that justify and sustain existing power structures. For an overview, consult the individual entries in the section on **ideologies & worldviews**. For example, patriarchal ideologies (e.g., **fascism**) have historically mirrored traditional authority by legitimizing male dominance within families and society at large. Similarly, **nationalism** invokes historical narratives or cultural traditions to legitimize political power, framing the nation-state as a continuation of an ancestral legacy.

Certain political ideologies also function like traditional beliefs in upholding specific hierarchies or social orders. For instance, like caste systems, class-based ideologies rely on entrenched beliefs about social stratification, akin to how traditional authority depends on the sanctity of inherited customs. In both cases, legitimacy stems from shared beliefs in the inherent rightness of specific structures or leaders.

As described in the overview of his classification, **Weber** identified three subtypes of traditional rule. *Patriarchalism* represents its simplest form, found in familial systems like households ruled by male elders or *gerontocracies* (cf. Box 1.12). Authority here rests with elders or males seen as custodians of sacred traditions, relying on voluntary compliance rather than administrative staff. As societies grew more complex, **patrimonialism** emerged, characterized by rulers treating the state as an extension of their household, with loyalty-based administration. In extreme cases, this evolved into **sultanism**, marked by centralized and arbitrary power. Finally, estate-type rule or feudalism (1.14) involved decentralized authority, where nobles controlled resources in exchange for loyalty and military service, creating reciprocal obligations but limiting economic freedom (Weber 2019).

For a deeper exploration of Max Weber's intellectual contributions to analyzing (authoritarian) leadership, consult his concept of **charismatic rule,** which explores the sources of charisma, its routinization, transformative power and later interpretations.

Traditional rule is illustrated in detail in its original and post-Weberian subtypes, including **patrimonialism**, **neo-patrimonialism**, **sultanism & neo-sultanism**. These frameworks have been particularly influential in comparative authoritarian studies, offering insights into **personalist rule** and **hybrid regimes**. (Weber's legal-rational rule is not treated as a standalone topic in this encyclopedia; however, it is addressed within discussions on **bureaucracies** and **bureaucratic authoritarianism**.)

Trust (Political Trust)

Trust is good, but control is better
– Attributed to Vladimir Lenin

Доверяй, но проверяй
(Trust but verify)
– Russian saying

Trust is like blood pressure. It's silent, vital to good health, and if abused it can be deadly
– Frank Sonnenberg

The study of political trust in authoritarian regimes highlights the importance of context-specific factors such as elite power dynamics, state-society relations, and the role of coercion versus voluntary compliance. Unlike democracies, where political trust is often linked to institutional performance and civic engagement, in authoritarian regimes it is more closely tied to regime survival strategies and the manipulation of public perception. Political trust in dictatorships functions differently than in democracies – it is often manufactured or conditional and serves as a critical instrument for maintaining regime stability. However, its fragility underscores the inherent challenges faced by such regimes in sustaining long-term legitimacy.

DEFINITION Political trust generally refers to citizens' confidence in political institutions and procedures and/or in past performance. Political trust means that citizens believe that the government is both competent and committed to acting in the interest of its citizens (Levi & Stoker 2000: 476; Miller 1974; Mishler & Rose 1997; 2001; Shi 2001; 2014).

Political trust is sometimes confused with interpersonal trust. Interpersonal trust, or social trust, constitutes the extent to which individuals trust other individuals in society beyond their family ties. It supports the establishment of strong community bonds and helps societal institutions function. Societies with low levels of trust cannot take people for their word and might be more likely to rely on family members to do things (such as in business and politics) rather than a more qualified stranger. Social trust is also necessary to foster cooperation and resolve collective action problems. It reinforces voluntary participation and helps reward citizens to participate in **civil society** (Zmerli & Newton 2007). Societies that have low levels of interpersonal trust will be able to capitalize upon divisions in society to justify autocratization and gain support for anti-democratic action. Scholars such as Almond & Verba (1963) and Inglehart (1990) argued that social trust and participation were at the heart of a democratic political culture. Social trust is also often associated with good governance and development and is higher in democratic regimes.

Political trust is also closely related to support and/or satisfaction with the regime and support for democracy, but there are key distinctions. Citizens can trust that the government or state is transparent, honest and competent but may still be dissatisfied with a specific regime's policies. Along those same lines, citizens can also support democracy intrinsically but have low levels of trust in the current government. More often than not, however, trust in the government is conflated with support for the regime and satisfaction with democracy. While diffuse support for democracy tends to be more stable, satisfaction with democracy tends to be more variable. Political trust lies somewhere in the middle – it is relatively stable but could be impacted by the latest government scandal and perceptions of **corruption** of the current regime.

In any event, political trust is critically important for the survival of a regime. It is regarded as a cornerstone of a regime's **legitimacy,** which determines the scope of the government's power (Badie & Birnbaum 1983; O'Connor 1973; Wong et al. 2009). Scholars of democracy have often focused on the importance of high levels of trust in order to make 'democracy work' (Putnam 1993; Almond & Verba 1963; Dahl 1971). Nevertheless, surprisingly, regime type does not necessarily determine levels of political trust. Far more important is whether or not the state is able to offer public goods, how corrupt the government is perceived to be, and how well government narratives show

SEE ALSO Political trust is associated with political **legitimacy** and government support. In **democratization** theories, political trust is correlated with a vibrant **civil society**. Low political trust then correlates with higher levels of **informality**. Others assess how **uncivil society** banks on and perpetuates low social trust.

KEY SIGNIFICANCE Political trust is an important indication of political legitimacy (Easton 1975). Political trust is also associated with higher levels of support for government programs that offer a public good. It was widely assumed that authoritarian regimes would suffer from low levels of political trust, and declines in public trust in autocracies would be a precursor for democratic transitions (Qi & Shin 2011). Nevertheless, some authoritarian regimes have found ways to cultivate political trust, and autocracies are more interested in cultivating political trust and **legitimacy** than previously thought.

LITERATURE Scholars have noted that there are various explanations for political trust (Citrin 1974; Hetherington 1998, 2005; Hetherington & Rudolph 2008). Trust that is based on looking at past perfor-

mance is known as specific support or the evaluative orientation toward government (Stokes 1962; Easton 1965; Mishler & Rose 2002; Norris 1999; Tang 2005; Zhong 2014; Askvik et al. 2011; Espinal et al. 2006; Morris & Klesner 2010; Wong et al. 2011). The evaluative sources of political trust are based on government outputs and officials' performance. Typically, the perception of **systemic corruption** is associated with low levels of trust, while economic success is associated with high levels of trust, and political trust could decline when the public is not satisfied with how the government is performing. However, political trust that is based on performance may fade and only offer temporary legitimacy for a regime.

In contrast, trust that is based on procedures is known as 'diffuse support' (Easton 1965). In this instance, political trust develops when there is the perception that institutions and procedures are impartial, fair, efficient, honest, equitable, and responsive to society's needs (Miller & Listhaug 1990). Diffuse support is important for retaining trust during difficult times, such as during economic slowdowns or political instability (Hetherington & Rudolph 2015).

In addition to looking at institutions and performance, some scholars have also looked at the affective orientation toward government (Stokes 1962). The affective dimension of political trust stresses how cultural values and beliefs are passed on from one generation to another and can affect how citizens feel about specific political institutions, thereby impacting diffuse support (Easton 1965).

Citizens also expect that there are adequate opportunities for input into the decision-making process, which is less likely in authoritarian regimes (Dahlberg & Holmberg 2014; Van der Linde 2012). Thus, not surprisingly, earlier studies of authoritarian regimes expected trust to be much lower (Mishler & Rose 2001). However, a closer look at what occurs in many authoritarian settings challenges these assumptions.

World values surveys have revealed that trust is slightly lower in democracies than in non-democracies (Huang & Schuler 2018; Mauk 2020). This is in spite of the fact that authoritarian regimes often do not have regular and effective channels to incorporate citizens' opinions. However, authoritarian regimes do care about political trust to some extent because grievances can boil over into **protests** and other forms of contention (Li 2004; Zhu & Rosen 1993). Some dictators care more about political trust than their democratic counterparts and are effective in disseminating information that will increase and influence public trust toward the government, i.e., **disinformation** (Barber & Miller 2019; Cantoni et al. 2017; Chen 2017; Kao 2021; Stockmann 2013; Voigtlanderand & Voth 2014). Dictatorships can also offer to buy political support by offering material benefits (Burns 2003; Gimpelson & Treisman 2002; Smith 2004). Those who have been co-opted are more likely to support the regime (Geddes 2005).

Many Asian countries that are authoritarian have surprisingly high levels of trust (Shi 2001; Yang & Holzer 2006). Countries like Singapore and China have been able to consistently deliver goods to the public, while also conveying a message that the state is competent. Singapore, in particular, enjoys high levels of trust because the public sees the government as effective, successful and honest. Autocracies that have been able to manage the economy properly may also be able to generate public trust, which is important to staving off protests (Bratton & van de Walle 1997) and elite defections (Reuter & Gandhi 2011; Pepinsky 2009). This contrasts with other authoritarian regimes, such as Egypt and Iran, which have lost the trust of their publics due to economic mismanagement and a series of corruption scandals.

Scholars note that trust is even weaker in new **democracies**. Just after a country transitions to democracy, there is a good chance that citizens will be disappointed. Another issue for new democracies is that, in some cases, officials trained under the old corrupt regime remained in place. In post-communist societies, trust has been incredibly low due to the perception that the government is both corrupt and inept. Surveys reveal that post-communist countries are disappointed with government ineffectiveness and have little trust that the government is working for them.

Nevertheless, it is not all bad news for democracies. When it comes to dealing with multi-linguistic societies democracies that pursue the right policies tend to do better than authoritarian regimes. Studies have shown that democracies that recognize minority languages are able to gain the trust of their publics, while authoritarian regimes that do so are viewed with suspicion, and this calls attention to other inequalities (Kao et al. 2023).

Authoritarian regimes also do not perform consistently well when it comes to social trust. Citizens living under autocratic rule lack confidence in each other because they live in an environment where **power** is exercised arbitrarily. Citizens also tend not to trust one another because they are constantly being surveilled by both state and citizen informants (Box 3.11). This lack of trust, in turn, negatively affects the building of social capital, which is critical to democracy (Mishler & Rose 2001). Other studies, however, have countered that social trust is reasonably high in authoritarian regimes (Rahman 2002; Liverani 2008; Cavatorta and Durac 2010).

Another issue is that communist regimes did not trust citizens. Citizens were constantly being watched and surveilled, with some citizens being used as informants. Despite communist states' 'positive' **constitutionalism** – offering state and welfare services regarding healthcare, housing, education, pensions, etc. – they lacked the rule of law and many citizens were treated unfairly and not able to receive their benefits. Post-communist regimes also faced a challenge in their economic effectiveness – to create institutions for a market economy in order to fill the void left by the collapse. Post-communist institutions did not perform well and were considered untrustworthy.

When it comes to civic engagement in authoritarian regimes, the relationship with trust is not

straightforward. On the one hand, there are usually very low levels of civic engagement in authoritarian settings. Nevertheless, some authoritarian regimes have tried to co-opt **civil society** and control it rather than allowing it to participate and contest the state freely (Heydemann 2007; Jamal 2007). Co-opting strengthens the authoritarian regime as the trust level increases with these clientelistic relationships.

Research has also looked into the drivers of trust at the individual level. At the individual level, the poorest and wealthiest are more likely to trust government and institutions than the middle-income classes (Espinal et al. 2006). Age is also a factor with older people more trusting than younger people. Younger people are more likely to question authority and challenge the *status quo*.

CLASSIFICATIONS Concepts related to political trust are (a) 'diffuse support' and (b) 'specific support' for democracy, but these are more dimensions than categories: *Specific political trust* (a) refers to trust in particular officeholders, such as presidents, prime ministers, or other political leaders. It is often tied to their performance, qualifications, or policies. *Diffuse political trust* (b) refers to trust in the broader political system, including its principles and institutions (e.g., democracy, the rule of law). This type of trust is more enduring and less influenced by short-term events (Easton 1965). These can also be referred to as 'leadership trust' (a) and 'institutional trust' (b).

Norris (2017) refines and expands Easton's (1965) model by delineating five components of political support, arranged from the most specific to the most generalized level. The first (i) and most specific component pertains to the approval of incumbent officeholders, focusing on assessments of the performance and qualifications of leaders such as presidents, prime ministers, politicians, and civil servants. Research by Nam & Lee (2021) underscores the importance of leadership skills, including vision, effective communication, and efficient government management, in fostering trust in government. The next (ii) component concerns confidence in regime institutions, encompassing the **legislature**, **executive**, **judiciary**, and other governmental bodies. The third (iii) component evaluates regime performance, which takes a more abstract approach by examining the processes and outcomes of government policies. The next component (iv) reflects support for the core regime, emphasizing adherence to democratic principles and rejection of autocratic values. Finally, the most diffuse component (v) is national identity, capturing sentiments of patriotism and national pride (Choi & Woo 2023). Besides this one main approach, there are no real alternative classifications of political trust, but there are different ways of measuring it. For more on this see the section on measurement.

MEASUREMENT Political trust is measured by using survey data of citizens. Numerous surveys measure trust, including the regional barometer surveys, *Pew Research*, *Gallop polls*, and *YouGov*, to name a few. These surveys ask citizens a series of questions to measure levels of trust including the most direct questions of how much do you trust the government and how much do you trust other citizens.

In addition to surveys, trust is also measured through civil society membership; societies with a high number of citizens involved. Studies have shown that social trust and political trust are highly correlated (Mishler & Rose 2005; Zmerli & Newton 2007). Longitudinal data (or data over time) suggests that people trust each other less today than they did 40 years ago (Cook & Cook 2021; Pharr et al. 2000).

METHODOLOGICAL ISSUES Low trust may be more easily found in democracies than authoritarian regimes, but this could be due to citizens in authoritarian regimes not being truthful in answering the surveys. Measuring trust in authoritarian regimes is not that straightforward, since citizens may be inclined to give answers that do not put them at odds with the regime (i.e. self-censorship – see **censorship**). There are possibly cultural reasons which may make measuring trust more challenging in non-democratic regimes. Some have argued that measuring political trust in Russia is hard to do accurately because Russian culture led to submissive attitudes and a tendency toward compliance (Jowitt 2005; Lukin 2009).

EXAMPLES In authoritarian contexts, much of the work studying political trust has looked at China and how the government has been effective in generating high levels of trust, particularly since the Tiananmen Square protests in 1989. Since the communist regime came to power, China has experienced record economic growth, and surveys have shown that China has relatively high levels of political trust (Bratton & Mattes 2001; Li 2004; Zhai 2019). Governmental performance is one of the most relevant factors in sustaining political trust in China (Tang 2005; 2016; Wong et al. 2011; Yang & Tang 2010; Zhong 2014). In fact, the Chinese have higher levels of confidence in the government than in many other advanced industrial societies.

Another way in which China has managed to generate high levels of trust is by allowing some civil society actors to become active. In particular, China has allowed citizens to become active in apolitical issues to help develop bonds of trust. By doing so, the Chinese state has strengthened linkages of trust toward the government, strengthening its own rule. China has invested heavily in revamping its curriculum and propaganda efforts to sell a narrative that the regime is competent and that it is important for Chinese citizens to be good citizens. Nationalistic rhetoric and propaganda have been effective. Studies have shown that since citizens have been exposed to this new curriculum, this has changed their levels of support for the regime (Cantoni et al. 2017).

Robinson and Tannenberg (2019: 7) reveal that self-censorship significantly distorts reported levels of regime support in authoritarian states, demonstrating that apparent high support for regimes like the Chinese Communist Party is inflated and consistent across survey dimensions. This challenges the validity of cross-national surveys and suggests that studies on the determinants of regime support may

be biased, as self-censorship can obscure or even invert observed relationships between background factors and political attitudes as measured by direct questioning.

IMPACT ON POLICY As previously mentioned, political trust is vital to the survival of regimes. For this reason, regimes – both democratic and non-democratic have worked to measure political trust and understand why it has declined so precipitously in the last several decades. More governments are using their own public opinion surveys to gauge public opinion and better understand how to respond to the needs and interests of their citizens. This has led, in some instances, to the rise of more populist policies in some cases. In other cases, there has been a growth of elections and surveys along with other avenues for regimes to have an ear to the ground of what their public wants. Increasingly, authoritarian regimes are concerned with improving levels of public trust to enable them to rely less and less on more repressive strategies.

NEW FRONTIERS As public trust is so critical to implementing complex state objectives, such as getting citizens to comply with directives during the COVID-19 pandemic, more work is being done to understand how states generate higher levels of public trust. Early on in the pandemic (before the roll out of vaccinations) it was authoritarian regimes that enjoyed high levels of trust that were able to make the biggest inroads. Also, in democracies, support fluctuates, and scholars investigate why this is the case (e.g., Schraff 2021).

The relation between political trust and the level of 'democraticness' is complex and still being investigated. Mauk (2020) explores how democratic value orientations influence political trust, finding that this relationship is contingent on citizens' perceptions of their regime's democratic quality rather than the regime's actual level of democracy. Torres-Vega et al. (2021) demonstrates that economically threatening contexts, such as economic crises and low socioeconomic status, foster authoritarianism and trust in authoritarian leaders through psychological mechanisms, including a dangerous worldview and low perceived sociopolitical control.

Regime agency matters. Sika (2024) examines how interpersonal trust, **repression**, **co-optation**, and mobilization (**protests & uprisings**) interact in authoritarian regimes, arguing that while high interpersonal trust supports mobilization, excessive repression and strategies like co-optation and infiltration are used by regimes to fuel distrust, fragment movements, and lead to demobilization.

While authoritarianism tends to bolster political trust in non-democratic contexts, populism has the opposite effect. Populist attitudes often erode trust in institutions by framing them as corrupt or unrepresentative of 'the people.' This creates a bidirectional negative relationship between **populism** and political trust. In authoritarian regimes that incorporate populist rhetoric (e.g., "authoritarian populism"), this tension can complicate governance by undermining institutional legitimacy while simultaneously consolidating **personalist rule** (Stanojevic 2023).

Tyranny

There is nothing among mortals more unjust nor more stained in blood than tyranny.
– Herodotus, *Histories,* 5.92A.1

Tyranny is a political regime in which one individual controls a monopoly of power in a state and is therefore not, in practice, constrained by legal checks and balances of power. Theorists of tyranny, starting from at least Plato, Xenophon and Aristotle in the fourth century BCE, regularly make the further assumption that such unrestrained and arbitrary rule is in most cases necessarily repressive and thus morally repugnant. In classical and medieval categories of constitutions, tyranny is the worst possible type of government, diametrically opposed to kingship, which is understood to be the ideal form of one-man rule.

It has been argued that tyranny fell out of favor as a term for autocratic constitutions by the mid-1750s, displaced by the concept of **despotism**. Machiavelli is perhaps the first theorist to eschew the term 'tyrant' in favor of his alternative '*principe nuovo.*' In modern political theory (PT), 'tyrannical' regimes are commonly described as **personalist rule**, **sultanism & neo-sultanism** or **patrimonialism**. Tyranny in popular discourse, and some academic discussions, is widely used to refer to the exercise of *any* form of abusive or arbitrary rule, whether at the level of the state, the individual or in relations between states. There have been, however, and continue to be, efforts to reintroduce the concept of tyranny, as understood by classical theorists, to modern political discourse.

DEFINITION Tyranny is a remarkably resilient concept in Western PT, one that has continued in use for over two and a half millennia. Mario Turchetti (2013) has demonstrated that, in this long sweep of history, political philosophers have held a generally consistent understanding of the meaning of tyranny. (Note though the contrary view of Newell 2013, who attempts to argue for a modern notion of impersonal and idealistic tyranny that is opposed to ancient tyrants' exploitation of power for personal gratification).

Two aspects of tyranny predominate. First, in classical PT, tyrannies are defined by the distribution of power. Tyranny is a form of constitution (in Greek: πολιτεία – *'politeia'*) pertaining to a state (πόλις – *'polis'*). Classical schemata of constitutions, such as that of Aristotle, define a *politeia* by the person or sovereign people (τὸ κύριον – *'to kurion'*) within that state (Aristotle, *Politics,* 1279a26). In tripartite categorizations of constitutions, the tyrant is thus an individual who possesses the only share, or all the power, in the state. In Aristotle's six-fold schema, tyranny is distinguished from kingship (βασιλεία – *'basileia'*). Kingship, unlike tyranny, is an established hereditary monarchy with constitutionally-defined powers that serve to limit the king's authority (cf. Thucydides, *Histories,* 1.13.1). Tyranny is unaccountable rule (ἀνυπεύθυνος – *'anupeuthunos'*) (Aristotle, *Politics,* 1295a20), whereas kingship is in accordance with law (κατὰ νόμον – *'kata nomon'*) (1295a15; Plato, *Statesman,* 302e). Tyranny is further distinguished from kingship as power is for the benefit only of the tyrant, unlike a king who governs for the sake of the common good (Thucydides, *Histories,* 1.17; Plato, *Republic,* 345d5-e1; Aristotle, *Nicomachaean Ethics,* 1160a36-b3).

Thus, tyranny is also inevitably government without the consent of the people (Aristotle, *Politics,* 1295a15-23; Xenophon, *Memorabilia,* 4.6.12). However, consent is not an issue of prime importance when defining the tyrant, except in order to differentiate tyrannical rule from **despotism** (itself a species of tyranny in Aristotelian theory where consent is granted by the populace, on which see Turchetti 2008). It is possible, as Aristotle noted, for a tyrant to rule more in the manner of a king and so preserve his rule longer. In this instance, the people may in fact be reconciled with tyrannical rule. Yet the crucial factor is power (δύναμις – *'dunamis'*) (Aristotle, *Politics,* 1314a35-7), and the power to rule without popular consent if necessary. This the tyrant cannot relinquish without losing his tyranny. For this reason, Polybius (*Histories,* 2.47.3) was able to claim that Cleomenes III turned Sparta from a lawful monarchy into a tyranny when, in 227 BCE, he abolished the constitution. The key determinant in this case is not the manner of Cleomenes' rule or popular consent, but the narrow distribution of power that followed Cleomenes' coup and his removal of checks on his authority. Given the importance of the distribution of power, the term 'tyranny' may thus be legitimately applied to historical and contemporary regimes that are more commonly labeled as **personalist rule** in modern political science. These are precisely those regimes where "dictators (…) have concentrated powers in their own hands" (Geddes et al. 2018: 11).

The second important aspect in any definition is the assumption that tyranny, as supreme and arbitrary power, leads naturally to the abuse of that power. This view was expressed best and most famously by Lord Acton in his letter to Mandell Creighton of 5 April 1887: *"Power tends to corrupt and absolute power corrupts absolutely. Great men are almost always bad men, even when they exercise influence and not authority: still more when you superadd the tendency or the certainty of corruption by authority."* (Acton 1907: 504).

We find echoes of this claim in one of the earliest theories of constitutions: that provided by the Greek historian Herodotus (active ca. 430 BCE). In a possibly fictional constitutional debate by a group of Persian nobles, the proponent of popular government argues, as a criticism of monarchy: *"How could autocracy be a suitable constitution, in which the power to act as one wishes with impunity resides? For it would turn even the best of men from his accustomed ways of thinking if he assumed this office"* (*History,* 3.80.3).

Here it is suggested that all autocrats may be vulnerable to moral corruption (conforming to a tripar-

tite theory of constitutions). In practice, however, a contrast between monarchy and kingship is still arguable. This is because the corrupting tendencies are less severe in the case of kingship, where the ruler's power tends to be more circumscribed and better established. In tyrannies, the need to preserve a new and relatively unstable regime may lead the tyrant to adopt ever more repressive means of coercion. This pattern is assumed even by **Machiavelli**, who controversially did not employ the term tyrant in *The Prince*, but nonetheless describes how structural pressures might affect the behavior of 'new princes' in a similarly negative way: *"a prince is always compelled to injure those who have made him a new ruler [sc. unlike a hereditary monarch]"* (Machiavelli 1974: chapter 3).

Some ruthlessness is required for successful bids for power and this ruthlessness may be gradually engendered in the established tyrant. Plato (*Republic,* 565d) uses the story of the cult of Apollo Lycaeus, in which the drinking of human blood turns the initiate into a werewolf, as a metaphor for how the tyrant can become brutalized as a result of his struggle for survival. Fear is initially assuaged by violence, but violence itself breeds fear of retribution. The tyrant is progressively consumed by paranoia: he listens readily to informers, both in order to identify threats and to encourage rivalry and ill-feeling between courtiers. At the same time, unrestrained wealth affords limitless opportunities for dissipation and vice. Tyranny is thus defined (especially by Plato in the *Republic*, cf. Parry 2007; Johnstone 2015) by corruption in the soul of the tyrant. As a result, the term is routinely used polemically as a pejorative label for corrupt or abusive rule, often as part of an effort to prompt **revolution** and **tyrannicide**. Used in this sense, tyranny may signify not just absolute or **personalist rule**, but bad government in general.

SEE ALSO Tyranny existed side-by-side with the concept of **despotism** until it was sidelined in the mainstream by the latter after the 1750s. When tyranny is defined as arbitrary, absolute one-man rule, it overlaps with concepts like **personalist rule**, **patrimonialism** and its more extreme forms **sultanism & neo-sultanism**.

KEY SIGNIFICANCE As tyranny is a term with a long history, part of its significance is in its ability to facilitate comparative study of autocracy, and ideas concerning autocracy, in the ancient, medieval, early-modern and modern worlds. Theorists such as Leo Strauss (1968: 21) have argued that 'tyranny is a danger coeval with political life': study of this ancient concept is essential, therefore, if we are to recognize such threats in the contemporary world. Other terms, most notably **totalitarianism**, may on the other hand imply a uniquely modern and exceptional form of government. As Mark Lilla (2002) has argued, a fixation on the historical model of twentieth-century authoritarianism may make it difficult to recognize the existence in the modern world of simpler forms of autocracy that correspond more closely to the classical model of tyranny. Daniel Chirot (2005) has suggested, for example, that the classical model of tyranny is especially relevant to the study of twentieth-century African personalist dictatorships. He argues that both the terms tyranny and Weber's term of **patrimonialism** can be usefully employed to characterize these regimes.

Second, tyranny is a term which specifically implies moral (and negative) judgment. As Leo Strauss (1968: 22) noted, for this reason, twentieth-century political scientists generally avoided the term tyranny due to a *"belief that 'value judgments' are inadmissible in scientific considerations, and to call a regime tyrannical clearly amounts to pronouncing a 'value judgment.'"* And yet, if moral judgments are impossible then a false moral equivalence is the only result. Given its history, no term is perhaps more suitable than tyranny for use as a label for abusive and arbitrary rule and no term is better calculated to galvanize resistance to illegitimate government.

ORIGIN The words 'tyranny' and 'tyrant' are derived from the classical Greek τυραννίς and τύραννος, in origin themselves terms borrowed from Luvian (a language of ancient Anatolia). The earliest appearance of the word τυραννίς in Greek appears in a fragment of the seventh-century BCE poet Archilochus of Paros (fr. 19, in West 1992). In this work, Archilochus denied any desire both for the possessions of Gyges, a king of Lydia in ancient Anatolia, and tyranny. This suggests that the word was initially borrowed to describe Greek rulers who most closely resembled Eastern monarchs, who in the Greek imagination were extraordinarily wealthy and powerful. If so, the term has a similar origin to the English 'nabob,' derived from the Urdu word for ruler (*nawwāb*), but which from the eighteenth century could be used to describe any rich individual, especially those who made their fortunes in India.

It has sometimes been suggested that the word 'tyranny' in Greek was a largely neutral and value-free term until the time of **Plato & Aristotle** in the fourth century BCE (Parker 1998). However, tyrant could in fact be used as a pejorative label at least two centuries earlier and we know of no ruler who has ever styled himself a tyrant (Stewart 2021). Many Greek cities, moreover, sought to enact laws from at least the sixth century BCE that would prevent the accumulation of tyrannical power (Harris 2006: 17-18; Joyce 2022: 7-8). It is probable that Aristotle's definition of tyranny was neither controversial nor especially innovative.

LITERATURE A comprehensive overview of political theory relating to tyranny from antiquity to the present day is provided by M. Turchetti (2013). For a similarly wide-ranging historical survey of tyrannies throughout the ages, see Newell (2016). The classic study of tyranny in ancient Greece is Berve (1967), though non-specialists may find the brief history by Lewis (2009) more approachable. For summaries of ideas on tyranny from the ancient world to the Renaissance, see the volume edited by Panou & Schadee (2018). The decline in the importance of tyranny as a concept in eighteenth and nineteenth century politics is discussed by Richter (2005). For an attempt to study 'modern tyrants,' see Chirot (1994).

Important discussions of how tyranny might be reintroduced to modern political discourse include Lilla (2002) and Koivukoski & Tabachnick (2005).

MEASUREMENT There is no accepted measure for tyranny, which is one of the main limitations on its practical utility as a political concept. One of the very few theorists to attempt to establish a framework for objectively identifying tyrants was the Italian jurist Bartolus of Saxoferrato (1313-1357). In his work *De Tyranno,* he attempted to define tyrants in Roman law under two main headings: a ruler's lack of legal title (*ex defectu tituli*) and a ruler's behavior (*ex parte exercitii*). In the process, he sought to provide the means by which tyrants could be identified and legally removed by higher authorities, such as the Emperor or the Pope.

In contemporary times, Ronald **Wintrobe** includes the concept in his classification on dictators' attitudes toward demanding loyalty and their drive for control, but does not provide precise coding criteria. If tyranny is to be equated with **personalist rule**, then Barbara Geddes, Joseph Wright and Erica Frantz's *latent measure of personalism* provides a possible means by which tyrannies may be identified. **Geddes, Wright & Frantz** (2018: 79-80) identify eight criteria for personalism but there are a number of difficulties facing comparative study with historical regimes before the twentieth century. These are principally due to the paucity of datasets and also because the terms used by Geddes et al. are not all immediately applicable to the context of ancient or medieval politics (the factions of ancient tyrants, for example, bear only a superficial resemblance to modern political parties).

METHODOLOGICAL ISSUES While the meaning of 'tyranny' has remained relatively stable over time, the application of the term to particular historical or contemporary regimes is a source of fierce disagreement. As noted above, no reliable means for measuring tyranny has been developed. When used simply as a term of abuse, the value of tyranny as a concept in political analysis is inevitably lessened. For this reason, Thomas Hobbes (1651) declined to include tyranny in his analysis of constitutions, since he regarded it simply as a 'misliked' form of government: 'for they that are discontented under Monarchy, call it Tyranny' (*Leviathan*, II.19). Timothy Snyder's pamphlet *On Tyranny: Twenty Lessons from the Twentieth Century* (2017), written shortly after Donald Trump's (first) election as US president, provides a modern example of how the word tyranny can be misappropriated in exactly this way. Snyder sought to advise Americans on how to confront the looming prospect of tyranny under Trump's presidency. Such an analysis has proved decidedly alarmist given the resilience of American democracy following the 2020 and 2022 elections. In these polls, Trump's waning support among the electorate did in fact result ultimately in a loss of power and influence, which suggests that (regardless of his aspirations, which are debatable) Trump had made little or no actual progress toward establishing a tyranny during the four years of his presidency. Despite its title, Snyder's twenty 'lessons' provide little or no analysis of actual tyrannies, nor do they establish a sound method by which a given regime may be called tyrannical (that is, it remains unclear at what point Trump would have successfully transformed America from a democracy into a tyranny during his first term). 'Tyranny,' in this context, is merely a rhetorical device, employed to stoke fear and harden resistance to particular brands of politics in democracies.

The meaning of tyranny has widened from a specific constitution of a state, defined by an excessively narrow distribution of power, to a simple term for power misused (or its use 'misliked'). As such, Chirot (1994: 14) defines tyranny simply as 'the abuse of power.' Yet definitions of this kind encourage only limited differentiation between constitutional and legal structures, since power may be abused in all constitutions, including democracies. Newell (2016), for example, places not only 'garden-variety' classical tyrants under the umbrella of tyranny, but also ideological millenarian movements such as Islamic terrorist groups, which are neither a form of autocracy nor even, necessarily, a form of state government. Tyranny may equally be applied to forms of injustice that are perpetrated at the level of individual citizens – 'tyranny' consisting in the exclusion, for example, of *"homosexuals, the psychologically different, the 'idle,' the 'unhealthy,' those of mixed race, the 'antisocial'"* (Tormey 2005: 78). Alternatively, in the field of relations between states, the application of international law can become 'tyranny' (O'Donaghue 2021). Such a change in the meaning of tyranny is concerning because it invites a dangerous equivalence between injustice committed in democracies (including the practices of demagogues (Box 4.6), such as Trump, who may misuse some limited power but who are ultimately accountable to the electorate), and the more extreme abuses of absolute power that are only possible in a tyrannical regime.

In contrast to those who broadly apply 'tyranny' to all such forms of abuse, theorists such as Hannah Arendt (2017: 7, 611-612) or dissidents such as Václav Havel (2018: 356-358) have viewed tyranny, or 'classical dictatorships,' as inadequate terms for modern forms of totalitarian authoritarianism (most particularly Nazi Germany and the Soviet Union). For both Arendt and Havel, **totalitarianism** is a more developed ideological movement that aims not simply to force obedience but to create docile and fearful subjects through arbitrary terror and the promulgation of a warped view of reality as unquestionable fact. As Simon Tormey (2005: 78) has argued, *"modernity has (…) rendered the question of tyranny redundant," due to a fundamental "change in the nature of power."*

However, despite these objections, it does not necessarily follow that a term, because it is widely misused, cannot accurately describe objective reality if employed with greater precision. While tyranny may be a simpler, more 'primitive' form of autocracy, it is nonetheless potentially one found in the modern world. The prospects for the revival of tyranny in modern political discourse rest on the development of suitable measures and criteria for the identification of tyrants.

EXAMPLES The Greek world of the seventh to the early fifth centuries BCE is sometimes regarded as an 'age of tyrants.' Common examples include the Cypselid rulers of Corinth, the Pisistratids of Athens, or the tyrant Phalaris of Acragas in Sicily. These rulers conform, at least in part, to the stereotype both of the unconstitutional and of the abusive tyrant in literary sources, beginning with Herodotus. By the late fifth century, Thucydides (*History,* 1.18.1) was capable of suggesting that the era of tyrannies had come to an end. However, the fear of tyranny remained potent, at least in Athens, and with some justification: the fourth century and Hellenistic period provided several paradigmatic tyrants, such as Dionysius and Agathocles of Syracuse. The Romans adopted the term *tyrannus* and were capable of applying it to the Roman emperors, such as Julius Caesar *(huius tyranni)* (Cicero, *de Officiis,* 2.23) or Tiberius (*tyranni saeuitia)* (Suetonius, *Life of Tiberius,* 75.3) following their deaths. In the modern world, it applies to highly personalist and extremely brutal rulers, including Mao Zedong, Stalin, etc. and arguably Vladimir V. Putin or Xi Jinping are likely to go down in history labeled as such.

IMPACT ON POLICY Classical theory on tyranny assumes that the monopolization of power will lead inevitably to negative behavioral traits. Work in Political Science has demonstrated that the personalization of power in twentieth-century dictatorships can indeed be correlated with pathologies including greater repression (Davenport 2007; Frantz et al. 2020) and greater belligerence (Rosen 2005; Weeks 2012). The personality of the tyrant is likely to become increasingly unstable due to his reduced access to reliable information and tendency to believe flattery, rumor and slander. Tyrants may thus appear unpredictable in their behavior and even irrational, apparently unaware that they are acting against their own interests. But, as Peter Rosen (2005: 129) has argued, tyrants are not irrational, but simply 'calculate differently from other rulers.'

Tyrannical regimes differ fundamentally from democracies, and potentially also other forms of non-democracies, in representing the most extreme forms of closed and repressive societies. A failure to recognize this distinction may tempt democratic policymakers to underestimate the threats posed by tyrannies to the global international order (as the threat posed by Vladimir Putin was arguably underestimated before the seizure of Crimea in 2014 and then again before the 2022 invasion of Ukraine). By contrast, 'tyranny' is a label that can be used to mark out morally repugnant regimes and implies a clear moral distinction between (highly personalist) dictatorships and democracies. This basic moral distinction between democracies and non-democracies was central to George W. Bush's war on the 'Axis of Evil' (though an awareness of differences between various types of non-democracies was arguably absent, cf. Davenport 2007). Since America's 2022 withdrawal from Afghanistan, it is increasingly unlikely that Western policymakers will seek to effect regime change in tyrannies. However, when engaging in negotiations with personalist dictatorships, it remains important to recognize the fundamental differences that exist between tyrants and democratic politicians in their motivations, interests, career backgrounds and *modus operandi*. Such negotiations have historically tended to result in poor outcomes for democratic policymakers. While democratic politicians assume good faith and have confidence in their own powers of persuasion through their experience of politics in open societies, tyrants always assume bad faith and cannot be persuaded to act in any way contrary to what they perceive to be their own personal (rather than national) interests. Policymakers attempting to engage with tyrants must expect to be met, for their pains, with denial, deceit, distrust, distraction, dissimulation and, in the end, false promises.

Box 1.20 Masters & Tyrants: Slavery & Shifting Loyalties

Malo periculosam, libertatem quam quietam servitutem
(I prefer the tumult of liberty to the quiet of servitude)
– Thomas Jefferson, *Letter to Madison* (1787)

The association between chattel slavery and forms of despotic rule is an ancient one. Freedom, conceived both as freedom from slavery and certain kinds of political freedom, appears as a concept even in the monarchies of the ancient Near East (von Dassow 2011). The ancient Greeks specifically conceived the absence of political freedom under tyranny as a form of slavery, even for nominally free persons. The Greek word δεσποτής / *despotēs* (cf. **despotism**) is generally used to refer only to masters of enslaved people; the only exceptions are when it is used to refer to the subjects of a tyrant.

In the narrative of the Greek historian Herodotus, for example, the Lydian noble Pythius addresses the Persian king Xerxes (ca. 518-465 BCE) as 'master' (δέσποτα, *despota*, 7.38.2), while Xerxes confirms that the former is indeed his slave (δοῦλος, *doulos*, 7.39.1). Aristotle believed that tyrants maintained control of elites by forcing them to attend to their persons so that they "continually work as slaves" (αἰεὶ δουλεύοντες, *Politics* 5.1313b.8-9).

Slavery has a further and deeper connection with tyranny in the ancient world. Enslaved people, in many cases, lived in close proximity to their masters and were privy to many of their owners' secrets. The power that a master possessed to sell, beat or even murder an enslaved person meant that such 'chattels' could, in many cases, be regarded by their owners as more trustworthy than free persons. However, this trust is dependent on the ability of the state to uphold the property rights of enslavers and to ensure that absconding enslaved people were found and punished.

In a **tyranny,** such property rights are not guaranteed. Rather, according to Aristotle, in tyrannies, enslaved people (as well as women) were granted far greater freedom in order to induce them to spy on their masters: *"There is a* gynocracy *(γυναικοκρατία) in private households, so that they may denounce their husbands, and licence for slaves for the same reason"* (5.1313b.33-5). This claim is not merely theoretical nor the result of prejudice or misogyny. In a democracy such as Athens, enslaved people could only inform against their masters in special cases of sacrilege, embezzlement of public funds or treason. Otherwise, evidence offered in court was only permissible after the enslaved persons had undergone torture, and this could only happen with the agreement of their master (see Hunter 1994: 70-95; Porter 2024: 559).

Historical tyrants, on the other hand, regularly manumitted the slaves of their enemies and even, in some cases, handed the property of their former masters to them as a reward (e.g., in the case of Nabis, tyrant of Sparta (207-192 BCE), see Polybius 16.13.1). Enslaved people thus provided a tyrant with a powerful tool for control and surveillance of private homes.

In modern political discourse, there continues to be a strong identification between slavery and citizenship in authoritarian regimes, one notable especially in the title of F.A Hayek's 1944 classic, *The Road to Serfdom*. The same basic concept of an enslaved nation can be articulated in a more modern sense by referring to the whole state as an effective prison. Soviet dissidents, in this way, described the life of a nominally free person in the USSR as living "in the larger zone" of the great prison that was Russia (Sharansky 1988: 233). More recently, the association between slavery and tyranny has been revived in Ukraine following the 2014 *Revolution of Dignity*, where the maxim "there are no slaves in heaven" has been adopted to galvanize resistance to Russian aggression. In a speech delivered in 2023 to memorialize the Heavenly Hundred martyrs of the Euromaidan, Volodymyr Zelenskyy declared, *"Slaves are not allowed into paradise. This is the essence of the Ukrainian interpretation of freedom. This is the reason why there will be no enemy left on our land."* (MoD UA, 2023)

Winning Coalition

一人得道，鸡犬升天
(yī rén dé dào, jī quǎn shēng tiān)
(When a man obtains the Dao, even his chickens and dogs ascend to heaven.)
– Chinese proverb

This is a term of **selectorate theory** and identifies a group of people (elites) as a subset of a larger selectorate. Its support endows the ruler(s) with political power over the remainder of the selectorate as well as over the disenfranchised members of society. In other words, it is often synonymously used for the inner circle or **ruling coalition** of a **political regime** that shares the **rents** (spoils of office) and influences policymaking.

In selectorate theory, members of this group are considered to be 'the essentials.' The size and composition of the group significantly shape a leader's strategies for distributing resources, with smaller coalitions incentivizing private goods distribution and larger coalitions favoring public goods.

Selectorate theory, however, does not account for the nature of the power relations between the ruler and their 'staff' in the Weberian sense (i.e., **personalization** and **personalist rule**) and is somewhat biased regarding formal structures; therefore, there are discrepancies with other frameworks.

'Veto players' (Box 6.6), as defined by G. Tsebelis, are actors whose agreement is necessary to change the *status quo*. In systems with multiple veto players, policy change becomes more difficult due to the need for consensus among actors with divergent preferences. The size and cohesion of a winning coalition can thus influence the dynamics of veto players. For instance, in systems where the winning coalition overlaps significantly with institutional veto players (e.g., **legislatures** or **judiciaries**), leaders may face greater constraints in policymaking. Conversely, in autocracies with small winning coalitions (e.g., **juntas**), veto players are often co-opted or neutralized through private goods distribution, reducing their ability to block decisions.

The relationship between the winning coalition and 'audience costs' (Box 7.1) – the domestic political costs leaders incur when they back down after making public commitments – is also significant. Audience costs are typically higher in democracies with larger winning coalitions because leaders depend on broad public support for survival. In such contexts, failing to deliver on public promises can erode **trust** among coalition members and voters, undermining a leader's position. In contrast, autocracies with small winning coalitions are less exposed to audience costs because leaders rely on a narrow base of elite supporters rather than public opinion. Nonetheless, in (collegial) authoritarian regimes, audience costs may arise if elite members of the winning coalition perceive backing down as a sign of weakness that jeopardizes their shared interests.

SECTION 2
CLASSIFICATIONS & TYPOLOGIES

5 (New) Zaïres, Zaire (now Democratic Republic of Congo, 1993), depicting 'Président-fondateur' Joseph Mobutu Sese Seko Ngbendu wa Za Banga, strongman, ideologue and notorious kleptocrat.

5 Shillings, Uganda (1977), depicting President Idi Amin Dada Oumee, the 'Butcher of Kampala.'

10 Dalasis, The Gambia (2015), depicting His Excellency Sheikh Professor Alhaji Dr. Yahya Abdul-Aziz Awal Jemus Junkung Jammeh Naasiru Deen Babili Mansa, strongman and megalomanic.

CLASSIFYING POLITICAL REGIMES & RULERS

Measurement is central to the scientific enterprise, and it is intimately connected to the process of concept formation.
– Gary King, Robert Keohane and Sidney Verba, *Designing Social Inquiry* (1994)

How we bound and pose our questions determines what we see and what we miss.
– Charles Tilly, *Big Structures, Large Processes, Huge Comparisons* (1984)

Tracing back to **Plato & Aristotle**, and N. **Machiavelli**, the human urge to classify and compare systems of government had a proud tradition once monarchies were no longer the only game in town. The sparks of republicanism initiated innovative classifications, the undoing of absolute monarchical rule, the fall of empires, subsequent waves of democratization (cf. Box 6.3) and revolution, the rise of totalitarianism, as well as the sudden demise of colonialism together with unprecedented globalization and hitherto unseen disparities in modernization. Moreover, with these changes scholars went about to order and explain this divergence of political systems.

Previously, such classifications were guided by their inventors' worldviews and tailored to specific purposes. Furthermore, this is still the case today. There are no 'neutral' or 'unbiased' classifications of government systems: for this reason, this section of the *Encyclopedia Tyrannica* provides an overview of some of the most important contemporary political regime classifications, highlighting their purpose, rationale, biases, blind spots and contributions to comparative authoritarianism.

With so many different systems of rule, dating back to the first-known polity (the Sumerian city-state of Ur, founded around 3800 BCE), ever-evolving in greater and new levels of complexity for over five millennia, it goes without saying that mapping old and new classifications of political systems is not a straightforward task. Short overviews of the most salient contemporary regime typologies are compared along four dimensions listed below. They are presented chronologically to trace their respective contributions to political science back to the original inventors.

RESEARCH OBJECT The theoretical 'Russian doll' of state-regime-government-ruler offers at least four nested *loci* of analysis. Most typologies operate on one main level with second-tier sorting criteria from other levels: Some classifications barely break open the 'black box' of the state, comparing only some of its (institutional) components. Others dig deeper into the ruling regimes' informal rules of operation. The (potential) high overturn of democratic political regimes – always reconstituting into new ruling coalitions – renders a government-focus more salient for comparison for this regime subset, while measures of powerful executive offices have sprouted ruler-focused categorizations (sometimes even dipping into **psychological profiles** of leaders). For scholars borrowing classifications, checking if the level of analysis of the desired classification matches their own research object should be the very first step of the research design. Keep in mind that these four levels are not the only possible ones. Polities can be classified according to the mode of origin, their method of succession, their performance, etc., and such codifications indirectly convey information about the nature of their ruling systems.

FOCUS Some typologies are autocracy-focused, others are clearly democracy-focused. Such 'focus' refers to a typology's main *explanandum* ('that what needs to be explained'): Is the purpose to draw a clear line between 'democracies' and 'non-democracies'? Or is the goal to sort out those regimes in the 'murky middle' – those **hybrid regimes** – that possess attributes of both autocratic and democratic rule? Or is the focus purely on the classification of dictatorships, ignoring everything considered a democracy? The design of a classification logically determines the scope of its applicability, and the original intention of the inventors impedes their typologies from being freely borrowed and implemented for other research agendas. Scholars trying to capture nuances of internal regime organization by lending a typology constructed for sorting between free and fair elections will not get far.

Table 2.1 extrapolates the definition of **political regimes** by S.-E. Skaaning (2006) along four characteristics and highlights how each type of typology tailors to a different set of research questions and *explanandum*. Skaaning (2006: 15) finds that a political regime is a group of people operating according to (a) an institutionalized set of formal and informal rules, (b) identifying the political power-holders (character of the possessor(s) of ultimate decisional sovereignty) also regulating the appointments to the main political posts (extension and character of political rights), in addition to (c) its vertical limitations (extension and character of civil liberties granted to the population) and (d) horizontal constraints on the exercise of political power (extension and character of division of powers – referring to control and executive autonomy) (Skaaning 2006; Van den Bosch 2014: 112). The figure below shows that these purposes widely vary: some typologies are unable to make any inquiries into the nature of dictatorships, and others are primed for studying transitions and democratization processes. Another group is designed for tracking regime trajectories over time, but does not clearly sort them in categories.

Figure 2.1 also somewhat visualizes these different approaches, with democracy-oriented research designs focusing on sorting regimes between those that fall clearly in the space marked A and those that

Table 2.1 – Focus & Explanandum of Classifications

Family	Level	Question	Focus*	*Explanandum*
Categorical	Dichotomous	How can we classify the behavior of states?	Character	Explaining (foreign) policy or performance by breaking open the black box of the state
	Trichotomous	How do elections affect regimes and their behavior?	Character, Horizontal Vertical	Democratization of states and political systems from within.
	Polychotomous	How does the internal constellation affect regimes and their behavior?	Character Who rules? Horizontal Vertical	Durability of regimes Impact of leadership Tolerance *vis-à-vis* opposition and dissent Regime resilience to external and internal actors.
Continuous	-	What is the level of freedom and constraints on the executive?	Horizontal Vertical	Monitoring the evolution of cases over time. Tracking the human rights record of regimes

*Focus according to Skaaning's (2006) four defining characteristics of regimes:

Character of the regime – The institutionalized set of fundamental formal and informal rules identifying the political power holders
Who rules? – Regulation of the appointments to the main political posts
Vertical limitations – Extension and character of civil liberties
Horizontal limitations – Extension and character of division of powers
Source: Adapted from: Van den Bosch 2014, based on Skaaning 2006; Boix et al. 2013.

do not. Those zooming in on regimes with imperfect elections (for instance, with the aim to study ongoing or potential **democratization** processes and **transitions**) fix their analytical gaze on the space marked B. Those who are autocracy-focused try to bring conceptual order to the complex group in space C. The scope of included regimes, however, is not always limited to just those observations falling in these respective spaces, but the explanatory value of typologies diminishes greatly with regard to their 'residual' categories. It is not because a dataset includes most countries in the world that a typology's focus is designed to increase our understanding of all covered cases.

CATEGORICAL vs. CONTINUOUS This aspect of typologies refers to their method of measurement. Continuous typologies attribute regimes with values to rank them across a continuum (along one or several dimensions), measuring them along the corresponding scales. Categorical classifications, in contrast, draw hard boundaries between regime 'types.' The basic ones are mere 'descriptive' (providing criteria to identify variables) and are combined to move up to the next level of 'classificatory' typologies (conceptually grouping criteria to sort observed cases into concepts); and on the next level, one finds 'explanatory' classifications (linking datasets to theoretical insights with the aim of comparing cases, predicting behavior and testing (new) hypotheses) (Elman 2005a: 3; Collier et al. 2008: 153.) Explanatory typologies are thus most valuable for qualitative analysis (but also used in quantitative research). Note: The works of C. Elman (2005a/b), G. Goertz (2008), Collier et al. (2008), Munck (2009), Boese (2019), and Meng (2024) offer solid methodological insights on the use of such typologies with guidelines how to construct them.

To quote C. Elman (2005: 3) in full: *"An explanatory typology is based on an explicitly stated preexisting theory. That theory may have been originally derived inductively from observations, or deductively using ordinary language or formal methods. Regardless of how the theory was first produced, however, an explanatory typology is primarily a complement to deductive approaches, because filling in [its variables] requires working through the logical implications of the theory [according to] its posited causal relationships."* A ludicrous counter-example would be a (fictional) typology to sort regimes according to their rulers' hair color (blond, dark, red, etc.). While one could technically distribute all the world's supreme power-holders along this single criterion, thus compiling a global dataset, it would be absurd to make any predictions about their behavior this way because hair color is not linked to a sensible explanatory theoretical frame.

There are two distinct 'families' of typologies (categorical and continuous), as shown in Table 2.1 visualizing their distinct logic and purpose. *Categorical* regime classifications can be subdivided into three

groups: Figure 2.1 illustrates how such classifications relate to one another and cover different aspects of the vast continuum of all known political regime manifestations. It also provides several examples of trichotomous, polychotomous and continuous typologies with their main sorting criteria. Table 2.2 shows how the contemporary classifications covered in this section relate to this systematization.

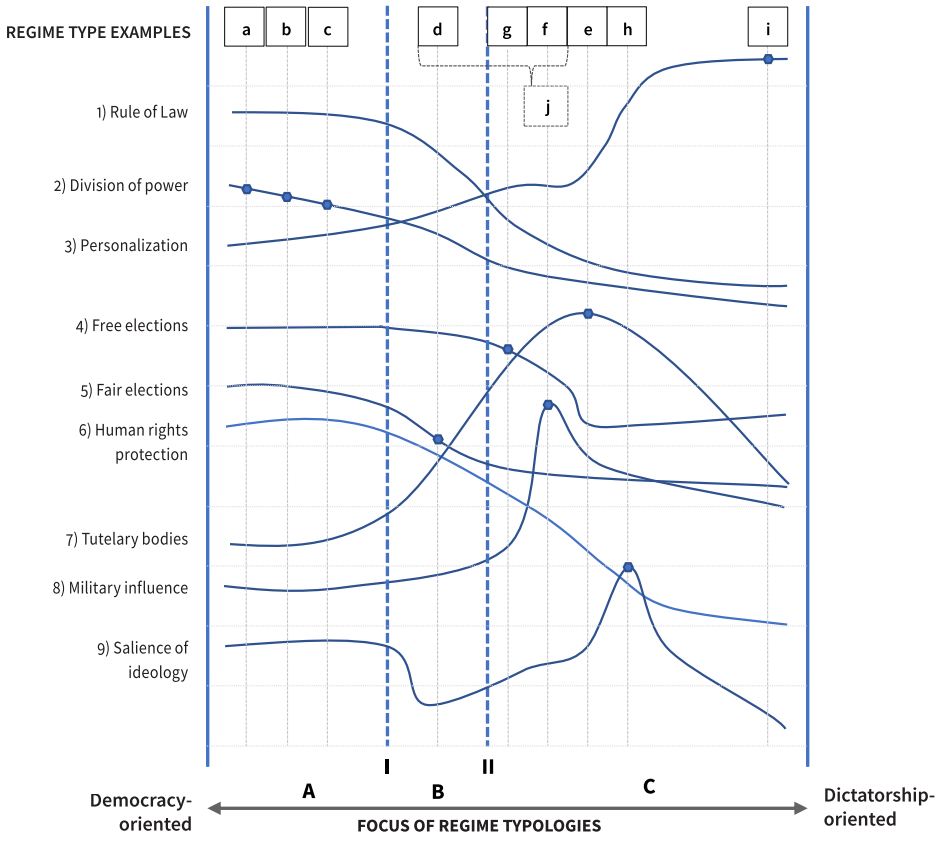
Dichotomous categories rigidly allocate regimes into two mutually exclusive categories. Most of them are designed to sort regimes in democracies (space A) and non-democracies (B & C). They differ in where exactly and how they draw the line that separates these two groups (cf. dotted line I). Such typologies are most robust is isolating democracy, and their (often) clear coding criteria allow for datasets to extend their scope back in time, sometimes even to the French Revolution (1789) or earlier.

Trichotomous categories tend to focus on space B – the 'in-between' of **hybrid regimes** – and aim to conceptually separate them from regimes in space A and C because, as a group, such regimes encompass characteristics of particular interest to some research, especially **democratization** theories that focus on the role of **elections**, **party** behavior other endogenous factors that can influence **transitions** toward (and from) consolidated liberal democracy.

Polychotomous categories then are different altogether. They categorize regimes with a greater level of complexity, using two or more criteria (and often subdivisions). They are often embedded in 'middle-range' theories – usually analyzing only a subset of regimes – and their intricacy permits amalgams (categorical hybrids) because their conceptual criteria are not mutually exclusive. While these typologies are more ambitious in their aims, any unclear categorical hierarchies, overlapping categories or amalgams can create methodological havoc. Their datasets are also more labor-intensive to compile and often reliant on subjective coding criteria.

Continuous measures can be simple or complex, ranging from a single-dimensional linear scale (e.g., pluralism) to intricate, multidimensional criteria, all tackling different aspects of regime organization or behavior. Most datasets cover spaced A, B and C but refrain from imposing any real (theory-grounded) categorization. Note that many of these do retain some arbitrary cutoff points to generally group cases, but it is a mistake to label and interpret these as 'categories' for analytical purposes.

These classifications might not label regimes, but they are excellent ways of tracking the trajectories of cases or their level of 'democraticness' or 'freedom' along their chosen criteria. Their scales provide information for measuring their evolution over time toward or away from autocracy and serve as an 'alarm bell' when regimes are backsliding regarding their **human rights** or eroding their democratic institutions. (Van den Bosch 2014: 215)



INDUCTIVE vs. DEDUCTIVE This last characteristic should be considered a spectrum, and most typologies travel back and forth between empiricism and theoretical deduction during their creation phase, informing choices about the selection of criteria. It is fairly impossible to consider a typology to be fully in the former or latter camp, for one extreme would be purely descriptive and the other impractically abstract. Still, some conclusions can be drawn about the choices of its creators, and with their choices come methodological trade-offs that have to be taken into account.

If a classification is *deducted* from a set of theoretical organizing principles, like, for instance, R. **Dahl's** (1971) typology (extrapolating regimes along two axes: 'political participation' and 'public contestation'), its resulting categories are often so-called 'pure types' or 'ideal types' – meaning: abstract concepts that have no matching equivalent in reality. To operationalize these, scholars can attribute each concept with more concrete coding criteria, making the process of identifying cases and sorting these into categories more manageable. Nonetheless, often, it is difficult to establish precise thresholds between categories, and without clear coding guidance, it becomes impossible to pigeonhole cases. Delineation and operationalization are thus the main challenges when linking deductive typologies to the empirical world. Note that continuous measures, even with precise measuring scales, always suffer from this predicament because of the absence of any thresholds.

When classifications are *inducted* from a set of observations, the selected sorting criteria in how to divide cases utterly depend on the chosen sample and the level of in-depth analysis. Any sample can contain several methodological biases when formulating claims about them or constructing a typology. These biases are: (a) Unequal *availability of data*, where less-known or hard-to-access cases are omitted altogether or unequally utilized to induct theoretical claims. For instance, many regime datasets ignore countries with less than three million inhabitants, and this easily amounts to 97 contemporary polities (out of a total of 234). (b) The *assumption of homogeneity* is another caveat. Treating both Russia and Belarus or China and Vietnam as identical types gravely underestimates the effects resulting from the size, power, resources, etc. (c) *Selection by outcome bias*, where faulty causal relations are inferred, outliers ignored, or the relationships of the (reduced, incomplete) sample cannot make any claims about excluded cases. *Historical contingency* (d), where the contemporary sample available – as is the case with countries and regimes – is the product of successful survival and adaptation. This means that cases that were maladaptive have already disappeared from the sample, resulting in a bias when proclaiming generalizations (that actually solely apply to 'winners') (Ebbinghaus 2005).

Since all typologies are a reduction of reality, merely a lens to study it, and in addition, they oscillate between deduction and induction during their design process; they tend to stumble into methodological pitfalls on both sides. The fairest approach is to acknowledge that they cannot be perfect, applaud their contributions (either new insights or exiting hypotheses) and find new, innovative ways to address their methodological shortcomings.

Figure 2.1 – Spectrum of Regime Classifications

The figure illustrates the analytical complex of how classifications can approach the full spectrum of political regimes. Shown are (only) nine abstract indicators (1-9) that can be used as potential sorting criteria for typologies. Without scale, each hypothetical indicator is presented by a curve (low – absent/weak vs. high – present/strong. The dots indicate which criterion is most characteristic for each regime type example.

(Disclaimer: The curves are purely illustrative to show the heterogeneity of political regimes, not authoritative. The location of the (contemporary) regime type examples is approximate and criteria are presented without overlap for the sake of simplicity.)

One finds thus a spectrum of political regimes (a-j), ranging from space A (liberal democracies) to C (closed dictatorships) that can be treated either as a multidimensional continuum (by continuous typologies) or can be subdivided as follows:

CATEGORICAL TYPOLOGIES:

- Dichotomous classifications aim to establish the most precise divider (I) between A and non-A (often blurring B & C), enabling robust separation of democracy and non-democracy.
- Trichotomous typologies focus mostly on hybrid regimes and aim to define, isolate and subdivide cases in space B (hybrid regimes) and establish the cut-off lines (I & II) on both sides.
- Polychotomous typologies are more difficult to pin down, since they operate at middle-range and are often just limited to one space (A, B or C). They operate on two or more indicators to make multi-dimensional categorization possible (allowing amalgams).

CONTINUOUS MEASURES (usually) cover the whole spectrum (A, B & C) according to one or several categorizing criteria, but refuse to draw thresholds (like I & II) dividing the continuum. By adding measures of scale, they allow monitoring regime trajectories along the chosen criteria.

LEGEND:

Contemporary regime type examples			
a	Parliamentary democracy	**f**	Military regimes
b	Semi-presidential (mixed) democracy	**g**	Single-party regimes
c	Presidential democracy	**h**	Totalitarian regimes/ ideocracies
d	Dominant-party regimes	**i**	Personalist/ neo-sultanist regimes
e	Monarchies	**j**	Authoritarian regimes (grouped)

SELECTED EXAMPLES: Below several well-known typologies are listed highlighting their corresponding sorting criteria with those presented in the figure. These are necessarily proximate for illustrative purposes, not authoritative. (Note: classifications might use more categories than those nine selected for display in the graph.)

CATEGORICAL TYPOLOGIES

Trichotomous classifications (main focus on B)

- Schedler (2006): electoral authoritarianism (d) – using criteria 4.
- Levitsky & Way (2010): subdivide (d) into 'competitive authoritarian' and 'hegemonic electoral authoritarianism' – using criteria 4 & 5.

Polychotomous classifications

Democracy-oriented (focus on A)

- Duverger (1978): parliamentary (a), mixed (b), presidential (c) – using criterion 2 (division of power).

Dictatorship-oriented (main focus on C)

- Linz (2000): totalitarian (h), authoritarian (j), [neo-] sultanist(ic) (i), traditional (e) – using criteria 3 (leadership), 4 (pluralism), 9 (ideology) and mobilization.
- Geddes et al. (2012, 2013): monarchy (e), military (f), single party (g), personalist (i) – using criteria 3 (personalization), 7 (tutelary bodies), 8 (military influence) from the perspective of the ruler.
- Hadenius & Teorell (2007): limited multiparty (d), monarchies (e), military (f), single party (g) – using criteria 4 (pluralism), 7 (tutelary bodies), 8 (military influence) regarding regimes' organization of power.
- Kailitz (2013): liberal democracy (a-b-c), electoral autocracy (d), monarchy (e), military autocracy (f), one-party autocracy (g), communist autocracy (h), personalist autocracy (i) – using criteria 3, 4, 5, 7, 8 & 9.

CONTINUOUS MEASURES

- Freedom House Rating – focus on A, B, C – using criteria 1, 2, 4, 5 & 6 among others.
- Polity IV – focus on A, B, C – using criteria 2 (executive recruitment), 3 (constraints on chief executive) & 4 (political participation)
- Svolik (2012) – focus on B & C – using criteria 2 (legislative selection), 3 (executive selection), 4 (restrictions on political parties), 8 (military involvement).

Source: created by J.J.J. Van den Bosch, based on: Boix et al. 2013; Duverger 1978; Geddes et al. 2012, 2013; Gilbert & Mohseni 2011; Hadenius & Teorell 2007; Kailitz 2013; Levitsky & Way 2010; Linz 2000; Schedler 2006; Skaaning 2018; Svolik 2012; Vaccaro 2021; Van den Bosch 2014

The sections below compare and present examples of regime and ruler typologies. An overview of all contemporary classifications is listed in Table 2.2, indicating their family, level, logic (inductive vs. deductive) and focus. They are ordered by type of classification, listing their strengths and methodological pitfalls. The selected examples are meant to be representative of the literature but not exhaustive, and each one is examined according to the four dimensions of this introduction (research object, focus, categorical vs. continuous, inductive vs. deductive).

COMPARING DATASETS The number of datasets has boomed in the last decades. Before, there was a structural shortage of regime data in comparative political science that severely impeded Large-N comparisons of political regimes. Today, we find ourselves at the other end: *"Empirical advancement has outpaced our theoretical and conceptual improvement."* Gerschewski (2023: 7) cautions against this trend, heralded since G. Sartori – *"Today, we find ourselves in a situation in which we are often tempted to use only those quantifiable measures of observable events and institutions that are currently readily available for our concept building. But, as we are reminded, concept building is not a decision by fiat and not a mere 'prelude to serious research.' (...) It is an integral part of the research cycle. Shaky concepts lead to shaky theories."* (Gerschewski 2023: 7, citing Schedler 2011: 370).

The regime classifications described in this section provide basic information about the scope and range of the accompanying datasets (if these exist). However, the idea of a detailed comparative overview of coding methodologies, for instance, provided by S.-E. Skaaning (2018) for measures of democracy, was abandoned once it became clear how often coding criteria are updated, expanded and improved. Besides his excellent overview, consult Meng (2024) for a survey of the use and evolutions of quantitative

studies for comparative authoritarianism.

Democracy, as a form of governance, is a relatively recent phenomenon in human history. Even with the most generous interpretation (accepting exclusive forms, i.e., without female suffrage), it has existed in its modern form for only 100 to 150 years.

Today's classifications of political regimes are utterly preoccupied either by capturing or measuring this contested concept or slicing up the universe of regimes into broader categories, democracies and non-democracies, and designing categories to understand variation in just one group. So, even when the focus is not explicitly on democracy, these approaches remain inherently democracy-biased (alternative versions are being explored, e.g., Van den Bosch 2024). Democracy routinely serves as the implicit standard against which all other regime types are measured, reflecting a pervasive belief in its superiority (one forgets, this was not always the case, as covered in **classical & early modern classifications** – as also expanded upon in Box 2.1).

This bias is deeply rooted (often hidden) in Western-centric moral convictions that liberal democracy represents the pinnacle of governance – a belief that has become so entrenched and ubiquitous that it has become the new normal. While liberal democracy has indeed emerged as a dominant voice of righteous government, human history has known numerous contenders for 'just rule' or the 'truest' form of governance. In retrospect, these historically dominating regime types have largely been eclipsed by the newcomers. Who knows when liberal democracy will be dethroned by something 'more just'? Maybe a 'sustainable 'green' democracy'? Maybe the nation-state model has to be improved upon first?

Nevertheless, as the 'liberal' components of contemporary democracy face increasing contestation globally, existing typologies for classifying political regimes have so far remained resistant to conceptual evolution (Wolf 2023). This rigidity not only limits our understanding of potential improvements beyond liberal democracy but also constrains our ability to fully grasp the diversity and complexity of autocratic regimes throughout history. Consequently, current typologies are not definitive; they are open to revision and expansion as new frameworks emerge to capture better the nuances of political systems, old and new, and what is to come.

Box 2.1 Regime Types – The Break between Past & Present

The limits of my language mean the limits of my world.
– Ludwig Wittgenstein

The disciplines of Political Science, Comparative Politics, and International Relations (IR) are recent academic creations, and all have done much to enrich our understanding of politics. Nevertheless, as relatively new scholarly developments, they do not always dialogue with an older tradition of political thought, a tradition that still affects how politics is spoken about across Europe and the American continent. Suffice it to say that Ancient Greek and Latin languages remain the staple way through which political regimes are categorized in this day and age (democracy, dictatorship, republic, among many others), but beneath the semblance of continuity lies a number of misleading changes. This text is mainly concerned with pointing to the origins of those variations and why they can become either paradoxical or confusing.

Alasdair MacIntyre began his classic book, *After Virtue*, with a 'disquieting suggestion.' Imagine, he wrote, that the natural sciences were to suffer the effects of a catastrophe so that all that remained were loose 'fragments' of what was once a cohesive and disciplined approach to studying the natural world (MacIntyre 2013: 1). Unsettling though the loss of science may be, almost as disquieting was that no one after the disaster realized that they were no longer performing *"natural science in any proper sense at all"* (MacIntyre 2013: 1). The 'periodic table' was commonly invoked, although nobody had any sense of how the table's elements were apprehended and later classified. MacIntyre constructed that image for allegory to suggest that *"in the actual world we inhabit the language of morality is in the same state of grave disorder as the language of natural science in the imaginary world"* (MacIntyre 2013: 2).

MacIntyre's purpose was to showcase how modern ethics had become increasingly fragmented throughout the Enlightenment. Bearing the spirit of his critique, the goal herein is to suggest that the language of politics is as fragmented now as the discourse of ethics. This sense of disarray is often made evident by the plethora of terms that are currently used across the social or political sciences: **authoritarianism**, **totalitarianism**, **dictatorships**, **tyranny**, **autocracy**, and **democracy**, among many others. There are reasons why so many terms have proliferated, most of which have proved useful in interpreting the contemporary world. This sense of fragmentation surrounding the nature of politics was and is partly instigated by major social and economic changes, not least by the rise of mass politics, which have shaped most modern societies since at least the nineteenth century. However, social and economic changes are not the only explanation. The persistent search for conceptual novelty after the appearance of totalitarianism in Europe in the middle of the twentieth century further split the past from the present, which in turn contributed to growing confusion as to how to categorize political regimes and how to determine their relationship with certain phenomena, such as populism and pluralism.

Indeed, contemporary misunderstanding is especially evident in the debates over the rise of **populism**, the relationship between authority and democracy, and the nature of dictatorships. At any rate, before making sense of modern linguistic confusion and how best to mitigate it, the question of whether political language is at all fragmented requires answering. Unraveling the ascendancy of democracy is a step in that direction. Viewed mainly with skepticism until the Enlightenment, not to say disdain, it is the contemporary world's archetypical **political regime**. The ascendancy of democracy points to a shift in political thought, a shift that increasingly separated ancient political language from its modern iteration.

Aristotle referred in his *Politics* to political regimes (or constitutions) – six in total (see: **Plato & Aristotle**) – on the basis of whether they were good or deviant. The good regimes were monarchy, aristocracy and the (constitutional) polity, whereas their problematic deviations were tyranny, oligarchy, and democracy, respectively (Aristotle 1998: Book III, Chapter VII). Democracy was seldom considered virtuous throughout the long history of political theory (Keane 2009), in sharp contradistinction to contemporary attitudes. There are many reasons for this shift. A simple one resides in democracy's subversive nature. Democracy was, after all, unconventional, if not seditious, up to the nineteenth century, which explains why it garnered so much enthusiasm throughout the Enlightenment and especially after the French Revolution. Linguistic outliers are convent heuristics that disparage political adversaries, especially those who defend the *status quo*. Revolutionaries thus appropriated Democracy in their struggle against monarchy and aristocracy.

Giuseppe Mazzini's polemics in the 1830s against François Guizot are a case in point, as he extolled the benefits and rise of democracy: *"Too long the power of this word, democracy (…) has been despised. Branded not long ago as the watchword of certain obscure fanatics, now it meets us as if by enchantment; it is central to all questions of any weight; it has become the burden of all writers, even the most quiet loving, to whatever rank they may belong"* (Mazzini 2009: 66).

Mazzini was correct. Democracy has indeed become a burden to all modern writers. No longer the malevolent regime of mob rule, it ceased to become deviant, regardless of whether it was repudiated by some critics throughout the twentieth century (for example, Schmitt 1988; 2007; Weaver 2013). So prominent became the concept of democracy in the last two hundred years, that many felt natural to claim that it was the standard toward which all other regimes headed. As the Cold War ended, not only was the ambitious *Journal of Democracy* launched in 1990, but the field of political transitology (Box 5.3) – now largely discredited – addressed when and how non-democratic regimes were to transition into full-blown democracies as practiced across North America and Western Europe (Carothers 2002; Kubicek

2000; Wiarda 2001).

Even those politicians who questioned the benefits of transitioning to democracy in the late twentieth century did so on the grounds that the pace of reform was not universal and that cultural specificity had to be incorporated against universalizing, Eurocentric conceptions. Either way, none of those late twentieth-century critiques explicitly rejected democracy. On the contrary, democracy remained immaculate, even among non-liberal conceptions thereof. In this regard, the liberal tradition is not the only reference to democracy today; the PRC, for instance, still refers to democracy in its Constitution, albeit to the *"people's democratic dictatorship that is led by the working class and based on an alliance of workers and peasants,"* a faithful endorsement of the Marxist-Leninist tradition (cf. Box 1.3).

Moreover, so embedded is democracy in contemporary political discourse, that it has seeped into IR. In the wake of Russia's full-blown invasion of Ukraine in early 2022, both Moscow and Beijing underscored just how much they were seeking to move toward a "multipolar, just, democratic world order" (CBS News, 2022). Were that not enough, democracy and its defense – particularly against illiberalism – comprise a major segment of international political literature, primarily concerned with the future of the contemporary global order (Cooley & Nexon 2021; Doyle 2012; Ikenberry 2020; Wilson 2005; Zakaria 1997).

Besides its revolutionary appeal and the extent to which ideas of democracy encroached upon political thinking in the nineteenth century, the shift from a 'despised' regime to a source of 'enchantment' has partly to do with major social and economic changes. Those changes subsequently spawned an era of mass politics. The rise of nationalism, industrialization and imperialism meant that politics was no longer limited to a privileged few.

Benjamin Constant already contended in 1816 that the liberty of the ancients had ceased to be the liberty of the moderns; politics was entering a new era in which the mass could no longer be ignored: *"Back then, each people constituted an isolated family, the born enemy of other families; whereas now there is a mass of human beings that have the same basic nature, though with different names and forms of social organization. This mass is strong enough to have nothing to fear from barbarian hordes. It is enlightened enough to find war a burden. Its uniform tendency is towards peace"* (Constant 1988: 313).

Modern mass politics affected the study and discourse of politics, effectively changing how politics was discussed after that. Liberalism and **Socialism** became two distinctive modernizing ideologies that responded to the challenges of mass politics. Likewise, (political) sociology, as a field, dealt precisely with the causes and consequences of mass society. In the late nineteenth and early twentieth century, Émile Durkheim's *anomie* and Max **Weber**'s reflections on bureaucracy and legitimation, to name just two suppositions, were geared towards reflecting on the particularities of mass politics (Durkheim 2007; Weber 1998a/b). The trend persists today.

Contemporary research questions in the field of comparative politics are also partially constituted by the advent of mass politics. Robert **Dahl,** his mid-twentieth century classic, *Who Governs?* accounts for how large-scale democracy transitions from oligarchy to pluralism (Dahl 2005b). Dahl also pioneered another conception of democracy, namely polyarchic democracy, in order to accommodate the effects of major social-economic on political representation (Dahl 2005a).

Were that not enough, the challenges posed by mass politics were further exacerbated by technology in the first half of the twentieth century, particularly by new types of mobilization that unsettled the division between the public and private spheres. Those changes then instigated a new set of challenges. No longer was **tyranny** the only nefarious regime since the terror of totalitarianism displaced it. While tyranny displaced the public arena, totalitarianism, as a novel practice, went a step further by encroaching upon the private space (Arendt 1958b: 1979; Linz 2000).

The advent of totalitarianism shifted the political lexicon even further. That being said, prior to the age of mass politics, the range of political regimes had already changed as it became increasingly condensed. Baron de **Montesquieu,** in his influential *Spirit of the Laws* (1748) in the eighteenth century, dropped three of Aristotle's six regime types (Montesquieu 1989). The trend persisted in the aftermath of the twentieth century, although the prominence of democracy mediated it as the ideal type.

In other words, the enchantment with democracy, coupled with the rise of totalitarianism, conceptualized by the later 1950s, meant that regimes were gradually reduced to being either democratic or non-democratic. Under **Linz** (2000), the latter residual category was then further parceled into two types: **totalitarianism** and **authoritarianism**. So elegant was Linz's ([1975] 2000) dichotomy between democracy and authoritarianism that discussions over the nature of political regimes were increasingly reduced to pointing out the differences between democratic, authoritarian and totalitarian regimes and how one could potentially transition to another.

That said, democracy itself, despite remaining the ideal standard, was itself split into variants. In this sense, the contemporary political lexicon is reduced to a dichotomy but paradoxically characterized by a persistent search for novelty, as if pressured to look beyond the duality of democracy versus authoritarianism. Not only does the literature currently refer to direct, participatory and polyarchic democracies, it also speaks of liberal, illiberal, sovereign, embedded, managed and hybrid democracies, as per this volume.

All in all, the reduction in regime types ironically led to a proliferation of new and hyphenated terms. The goal was to provide nuance, seeing as democracy, authoritarianism and totalitarianism by themselves could not do justice to all the variety across the globe. For all the changes, however, some traditions remain. Despite the importance of Linz's (2000) concepts and the extent to which they borrow from – but also modified – Aristotle's and Weber's conceptions, some assumptions or biases persist. Orientalism, for instance, still pervades: scholars deploy specific concepts, such as **sultanism**, to characterize non-Western regimes, much in the same way Aristotle deployed **despotism** to categorize people outside Greece (Richter 1990). Aristotle circumscribed **tyranny** to Greek-speaking peoples, whereas **despotism** was the 'politics' of those who lived eastward. In a similar vein, H.E. Chehabi & Juan Linz refer exclusively

to countries outside Europe and North America in their edited volume *Sultanist Regimes*, namely to the Dominican Republic, Cuba, Nicaragua, Haiti, Iran and the Philippines (Chehabi & Linz 1998).

In sum, nineteenth-century political struggles against monarchy and absolutism, coupled with major social and economic shifts, separated the past from the present language of politics. Democracy, in particular, turned into a virtuous regime, and so the study of politics was forced to grapple with how to differentiate between democracies and non-democracies, particularly as the menace of totalitarianism affected twentieth-century societies. The linguistic shifts reflected, in sum, an attempt to accommodate major social change, but not always with success. Although novel terms like *polyarchic democracy* and **totalitarianism** are innovative to the effect of clarifying trends that were neither possible nor even fathomable two thousand years ago, conceptual novelty also holds a negative – confusing – side, not unlike MacIntyre's warnings.

Political concepts are sometimes applied without their etymology being fully delineated. The fixation with democracy, coupled with other linguistic innovations, has led to conceptual paradoxes that would be easily resolved had older distinctions been brought to the fore – had the link between past and present not been as fragmented as it is now. There is indeed a break between past and present thinking on politics: partly derived from democracy's subversive (or emancipatory) potential, partly from the rise of mass politics, and partly from linguistic creativity. It is with the latter issue to which this essay now turns.

Linguistic creativity has fostered confusion regarding three contemporary issues. The first has to do with separating dictatorship from democracy or even autocracy. To take an example, Gordon Tullock's (1987) study, *Autocracy*, carves out a distinction that actually mixes very different political practices, which he takes to be analogous: *"In the actual government, however, there is not much difference between a hereditary ruler and dictator. There are differences (…)but they clearly belong in the same family of governments. The word 'autocracy' encompasses both."* (Tullock 1987: 1).

The problem with Tullock's distinction is that dictatorship historically was never a type of government to begin with, even if it is often referred to as such in modern political speech. Juan Linz (2000), for instance, was well aware of dictatorship being exceptional, a temporary curtailment of freedom for the benefit of a magistrate, that is, the dictator, upon whom a range of powers was bestowed to deal with emergencies: war, civil strife or a natural disaster. Democracies or republics, following the Roman tradition, were legally allowed to suspend civil liberties to become dictatorships in certain circumstances, whereas autocracies held no such need insofar as the autocrat already possessed the powers necessary to deal with any emergency. An autocracy does not encompass a dictatorship simply because the autocrat needs no additional powers. Furthermore, a dictatorship is not necessarily the opposite of democracy. Rather, democracies potentially accommodate dictatorship; the 'people' may well decide to curb civil liberties temporarily, as during wartime (cf. Box 1.2 on elected dictatorship & protection pacts).

The second confusion arises from the distinction between authoritarianism and democracy itself. It is an unfortunate distinction because not only do both those concepts stem from different, albeit terminologically rich, languages – 'authority' from Latin, and 'democracy' from Greek – but because they misleadingly suggest that authority (from which authoritarianism derives) is somehow alien to modern liberal democracies. Authority or *auctoritas*, following the Roman tradition, speaks to a specific type of non-coercive and non-persuasive power, often constituted by tradition, whereas democracy refers to a regime, that is to say, to those practices from which **power** (*kratos*) derives (Arendt 1956). That being said, when Linz (2000) conceptualized authoritarianism, he provided his definition to make sense of twentieth-century political trends, particularly of Spain under Francisco Franco's rule.

The contention herein, however, is that coining the opposite of democracy as authoritarianism was unfortunate, for *auctoritas* remains central to the workings of the modern liberal tradition. The latter emphasizes the rule of law against the encroachment of mob rule. The Roman senate, from which the original concept of *auctoritas* originated and which later constituted the underlying hierarchy of the Roman Catholic Church, spoke to a power that was neither persuasive nor coercive in its entirety (Arendt 1956; Lincoln 1993). Contemporary political discourse has been increasingly compelled, both in IR and political science, to revisit the concept of authority (Arendt 1956; Barnett 2001; Costa Lopez 2020; Hopgood 2009; Hurd 1999; Lake 2007; 2009; Lincoln 1993; Osborne 2023). Indeed, the distinction between authoritarianism and democracy (or liberal democracy) provides too sharp a contrast when it is, in fact, the balance between authority and people's power – and not the exclusion of one over the other – that has been the source of debate since at least the eighteenth century.

Third, the fragmented nature of political language leads to further linguistic confusion over the relationship, if there is a relationship at all, between **populism** and **democracy**. So prominent is democracy as an ideal type that those who remonstrate against elites by appealing to the 'masses' are labeled not 'democrats' but 'populists' (Albertazzi & McDonnell 2008 – cf. demagogues in Box 4.6). Nevertheless, for the ancients, the only difference, perhaps, between populists and democrats was one of language: a democrat was speaking in Greek, a populist in Latin. Both democrats and populists, as each word suggests, advocated power to the people against elite privilege, much in the way that revolutionary Mazzini cautioned against Guizot and much in the way that the Roman *populares* (democrats) disparaged the *optimates* in the late Republic (Seager 1972).

The shift from an ancient Greek word (democrat) to a Latin variant (populist) is thus deceptive. The only way in which to avoid said confusion is to hyphenate democracy, to the effect of contrasting populism with *liberal* democracy. The confusion extends further, however, because populists are often criticized for their surreptitious authoritarianism (for example, Gricius 2021). In other words, if populists are simply taken to be democrats, then the distinction between authoritarianism and democracy falls apart. A brief incursion into ancient political language is especially worthwhile in this regard.

Linz (2000) characterized **authoritarianism** as a system in which pluralism was lacking, but that is precisely why democracy was considered dangerous by Aristotle, including many others who discoursed on politics up to the nineteenth century. The danger of democracy lay in giving power to an unruly majority, often swayed by a demagogue. As a result, the liberal-democratic ideal requires authority – the authority of the law – to curb the potential for mob rule and the rise of charismatic demagoguery (Box 4.6). To that effect, modern liberal democracies are not opposed to authority; rather, they are partly based on it. Contemporary democracies in Europe and the United States are as much based on mediating people's power with the authority of the law and its magistrates. Populism or 'democracism' is thus not an abandonment of democracy for the sake of authority but of fully neglecting authority for the sake of democracy.

To conclude, making sense of how past and present concepts are deployed in the political sphere remains a relevant research endeavor. The reduction in standard regime types, coupled with the multiple hyphenated terms that are meant to refine and allegedly distinguish modern political practices, suggests that something might be wrong with the language by which existing political phenomena are studied. Hence, a return to their approximate meanings is important for the study of politics and for the study of regime types especially. There are approaches in political theory that are suited to that task. Hannah Arendt's political theory, for instance, was partly constituted by Martin Heidegger's philosophical hermeneutics insofar as it sought to recall the past to make sense of continuity and change (Arendt 1958a; 1965; 2005). That said, despite her attempt to search for clarity with recourse to the past, Arendt was also no stranger to linguistic creativity, as she was one of the first thinkers to study and clarify the meaning of **totalitarianism**, clearly demarcating it from its past forebearer, **tyranny**.

Following from the tradition of hermeneutics, the work of Reinhardt Koselleck is also relevant. Interested in the impact and origins of political concepts, including how they changed over time, Kosselleck's *Begriffsgeschichte* (or conceptual history) offers a luminous contribution to the history of ideas beyond a rudimentary, etymological excavation (Kosselleck 2004). Furthermore, the work of Leo Strauss, not least his contributions to interpretation and political philosophy, also offer another historical alternative to understanding past ideas and how they were later appropriated (Strauss 1980). Finally, the work of Quentin Skinner, who founded the so-called *Cambridge School of political theory*, is an approach that is sensitive to historical context by harking back to how ideas became politicized within a given historical juncture (Skinner 1975; 1978; 2002).

CLASSICAL & EARLY MODERN POLITICAL REGIME CLASSIFICATIONS

There are three classes of intellects: one which comprehends by itself; another which appreciates what others comprehend; and a third which neither comprehends by itself nor by the showing of others; the first is the most excellent, the second is good, the third is useless.
– Niccolò Machiavelli, *Il Principe* (*The Prince*), 1532.

In this section, we bring together several classical and early modern classifications of political regimes. While the list presented here is far from exhaustive, it highlights the most influential voices in this long tradition. Many other scholars have contributed to these concepts in more incremental ways, deepening their application to different periods and yielding their own insights. However, for reasons of space, we have selected the most salient and impactful classifications from various eras.

It goes without saying that the conceptual contributions of **Plato & Aristotle** have been profoundly influential, not only within the European cultural sphere but beyond. Their classifications of constitutions have shaped centuries of political thought. For further exploration of how these ideas intersect with notions of **traditional rule**, readers may refer to the entry on **religions of the world & statecraft**, which discusses how these classical ideas merged with other interpretations beyond Europe.

Following this classical foundation, medieval classifications provide a bridge to late medieval and Renaissance thinkers. During this period, there was a growing drive to compare European polities with non-European ones, marking a significant shift in comparative political analysis. No overview would be complete without mentioning **Machiavelli** or **Montesquieu**, whose works were highly influential on thinkers like Locke, Rousseau, and Hobbes. Although these latter thinkers are not specifically mentioned here, they adhered to classifications with similar understandings of **democracy**, **aristocracy**, and **monarchy**.

One figure too often omitted from the traditional pantheon is Jean **Bodin**. His original thought was highly influential in shaping early modern political theory on regicide (**assassination**) and absolute **power**, and for this reason, his work is included here. We conclude this section with Max **Weber**'s theory of *Herrschaft* or **rulership** (often translated as 'domination' and sometimes as 'authority'), which has become foundational for contemporary methods of regime classification and the concept of **legitimacy**.

All these thinkers were primarily concerned with delineating what constitutes 'just rule.' Given that democracy was still a fringe phenomenon in their time, while other ideological battles raged (i.e., between **monarchies** and **republicanism**), they were more open to considering various (sub-optimal) alternatives to democratic governance. This openness contrasts a significant paradigm shift once compared to late-modern and contemporary classifications of political regimes, which almost always relate to liberal democracy as their proverbial alpha and omega. This is particularly true for dichotomous and trichotomous categorizations of regime types and also continuous measures.

Regarding this observation, Lee Morgenbesser (2024) finds that the scholars of the so-called first generation (ca. the 1950s, i.e., Hannah Arendt, Carl J. Friedrich and Zbigniew Brzezinski, etc.) eclipsed previous scholarship for their successors by not con-

necting sufficiently (or at all) with interwar thinkers and their predecessors. Their 'wave' of scholarship had fixed its gaze on **totalitarianism**, which, together with democracy, became the only two gravity centers in the political regime universe. When, in the 1970s, **authoritarianism** was 'reinvented' (**Linz**), or **dictatorship** was dug up again (**Sartori**), these terms were redefined in relation to either democracy and/or totalitarianism, a stubborn bias that persists today and is not found in pre-war scholars (Morgenbesser 2024), and obviously with thinkers before the advent of democracy.

Another notable advancement in the political thought of these scholars is their routine preoccupation with corrupted forms of rule – often labeled as **tyranny** or **despotism**. This issue remains very much relevant today, reframed as the process of **personalization** in political regimes or the emergence of **personalist rule** – also captured in concepts like **sultanism & neo-sultanism** and **patrimonialism** and **neo-patrimonialism**. This concern with the one-man rule has continuously driven what must be one of the longest-standing efforts of political regime classifications.

Finally, it is worth noting that all archetypes discussed here are honored by separate entries in the first section of the Encyclopedia. Thus, the overviews presented in this section serve primarily as an overarching framework to conceptually link their guiding ideas and provide context for their emergence, logic, *raison d'être* and influence.

Plato & Aristotle – Classification of Constitutions

The true forms of government, therefore, are those in which the one, or the few, or the many, govern with a view to the common interest; but governments which rule with a view to the private interest, whether of the one or of the few, or of the many, are perversions.
– Aristotle, *Politics*, III.7.

Plato (ca. 429-347 BCE) and his disciple Aristotle (384-322 BCE) are usually believed to be the most important philosophers of antiquity, and their way of thinking set the stage for the whole development of Western philosophy, including political philosophy. Plato proposed different ways to classify political regimes in three of his dialogues: the *Republic*, the *Statesman*, and the *Laws*. As Melissa Lane points out, we have to take into consideration that those three dialogues, written in different periods of Plato's life, present different methodologies: "moral-political imagination" (*Republic*), "methodological-political clarification" (*Statesman*), and "theological-political reflection and prescription" (*Laws*) (Lane 2006: 184).

In books VIII and IX of the *Republic*, Socrates describes five types of political regimes, from the best to the worst: (a) the perfect constitution, that is kingship (βασιλεία – *'basileia'*) or aristocracy (ἀριστοκρατία – *'aristokratia'*), (b) timocracy (τιμοκρατία – *'timokratia'*) or rule by property owners, (c) oligarchy (ὀλιγαρχία – *'oligarchia'*), (d) democracy (δημοκρατία – *'dēmokratia'*), and (e) tyranny (τύραννις – *'tyrannis'*). Strauss (1992: 130) suggested that this classification was modeled on the myths of five ages and races found in Hesiod (*Works and days*, 105ff.).

The perfect constitution (a) is based on the contemplative and dialectical knowledge of the Idea of the Good possessed by the rulers, which makes it irrelevant whether there is one ruler (kingship or **monarchy**) or more of them (**aristocracy**). Socrates described (VIII, 544c) the four other regimes as 'perverted constitutions' (*hemartemenai politeiai*) or 'diseases of the city' (*poleos nosema*). **Timocracy** (b), associated by Plato with the Cretan and Spartan constitutions, is driven by the desire for war and the pursuit of personal glory and honor. In oligarchies, the ruling class must have a certain value of property (*timema*). Socrates describes **oligarchy** (c) as the constitution in which the rich rule, while the poor are excluded from power, and all except the ruling class are beggars. **Democracy** (d) is described as a counterpart to oligarchy and is based on equality and freedom. Socrates calls it the most beautiful and colorful of constitutions but points out that it is anarchic and that the excess of freedom leads to tyranny. **Tyranny** (e) is based on enslavement and violence. The tyrant begins as the self-proclaimed protector of the *demos*, but in order to maintain his power, he is forced to purge the city of his enemies by means of terror.

Julia Annas claimed that this classification is loosely related, at best, to the real constitutions existing in Plato's times because it is based on Plato's psychology, and the constitutions represent the states of the soul (Annas 1999: 76-77). For Blössner, Plato merely 'pretends' to take into account empirical observations (Blössner 2007: 355; Bloom 1991: 416-419). Scholars point out that the classifications offered in the two other dialogues, the *Statesman* and the *Laws*, are more realistic and inductive.

In *Statesman*, Plato distinguishes seven types of constitution: the *perfect constitution*, ruled by the 'true statesman,' as he defines him, and six lesser

types (302c-303c). The classification, unlike in the *Republic*, is based on two criteria: (A) the number of those who rule (one, a few, the many) and (B) the presence vs. absence of the rule of law. The first criterion (A) allows the separation of regimes into three groups: kingship and tyranny, aristocracy and oligarchy, and democracy. The second (B) distinguishes these between the good ones (kingship, aristocracy, democracy) and the bad ones (tyranny, oligarchy, and democracy without the rule of law). The bad regimes are the perversions of corresponding good ones. The source of this sixfold division can be found in Herodotus (*Histories,* III.80-82; Klosko 2006: 214; Schofield 2006: 33). This classification exercised an enormous influence on later theorists like Polybius, **Machiavelli** or **Montesquieu**. In *Statesman*, the types of constitutions are evaluated differently than in the *Republic* because whereas kingship is the best and tyranny the worst of all the six, democracy is the most favorable of the three bad constitutions and the least favorable of the three good ones. The rule of the few represents a mean both in the good and the bad regimes.

In his *Laws*, Plato enumerates five types of constitution (kingship, aristocracy, oligarchy, democracy, tyranny), claiming that the best possible political regime is a mixed one, containing elements of monarchy, aristocracy, and democracy (IV, 712b-d). The key principle is that the ruler of this constitution should be the law itself (IV, 712c-715d). The idea of intermediate or mixed forms of constitution appeared already in the *Republic* (*dunasteiai* and *onetai basileiai* in VIII, 544d), but Socrates was not interested in discussing them (Schofield 2006: 75; Lane 2006: 184).

Aristotle's classification follows the one in Plato's *Statesman*. Already in the *Nicomachean Ethics* (VIII.10), he divides the regimes into six. The good ones are kingship, aristocracy, and timocracy or *politeia* (literally, "constitution"), whereas the bad ones are tyranny, oligarchy, and democracy (which, as in *Statesman*, is the least bad of the bad constitutions). In *Politics*, Aristotle uses Plato's deductive criterion of the number of rulers (one, a few, or the many), but he immediately points out that according to the observations of real regimes, the difference between oligarchy and democracy is not so much the number of rulers (this is merely accidental) as the fact that, in the first, the rich are in power, while, in the second, it is all free citizens (III.8). Also, even though Aristotle, just like his master, Plato, points out on many occasions that in the good regimes the law should rule rather than the will of individual rulers, he differentiates between the good and the bad regimes on a different basis. In kingship, aristocracy, or *politeia,* the ruler(s) govern for the sake of the common good, while in tyranny, oligarchy, and democracy, for the sake of their own interest.

Another difference between Plato and Aristotle is that Aristotle refers to existing regimes and offers subdivisions of the six main regimes on the basis of empirical observation (Saxonhouse 2015: 185). For instance, he distinguishes four types of **monarchy**, five types of **democracy** and four types of **oligarchy**, as well as various intermediate and mixed forms. Kingship, for Aristotle, is the most divine type of constitution, and it is based on one ruler whose power may be limited in various ways. Its two historical types are the traditional hereditary kingship of 'heroic' Greek times and the Spartan, limited kingship. **Tyranny** is a monarchy without virtue or the rule of law, and the two existing forms of it are Eastern **despotism** and elective tyranny of some Greek city-states – see Box 1.2 on 'electoral dictatorship.'

Aristocracy is the government of the best (IV.7), and ideally, the virtue of the rulers is taken into consideration. However, in other forms, wealth and/or merit are the prerequisites (like in Carthage or Sparta). **Oligarchy** is the rule of the rich and can differ according to the property rate, and some forms of it can be hereditary (like the rule of powerful families or *dunasteia*, which is called tyranny among oligarchies). **Democracy** is the rule of people with low incomes or people in need. In many cases, the laws are obeyed, but there is also a type where the law is not respected by the multitude, by the instigation of the demagogues (Box 4.6). *Politeia* is a mix of oligarchy and democracy, of wealth and freedom; if there is also virtue present, it is a type of aristocracy in the sense of the government of the best (IV.8). *Politeia* is based on the rule of the middle class of citizens who, because they are neither rich nor poor, usually obey "the rule of 'reason'," If this class is numerous, it provides stability to the regime (IV.11).

Aristotle shares with Plato the assumption that the goal of a political regime is the common good of the whole political community, as well as the belief that virtue in the ruler and the obedience of the ruler to the law are necessary for that (Strauss 1992: 26-27; Morrison 2013: 176). Aristotle favors a more inductive approach, criticizing Plato for being too abstract and theoretical in his thinking, including the classification and discussion of different regimes (Miller 2009: 545-546). However, he also seems to offer either a more idealistic view of the most favorable constitution (in books VII-VIII of *Politics*) or a more pragmatic and realistic one (in books IV-VI), and it is even debatable whether Aristotle's views in *Politics* are coherent (Miller 2009: 540-541). It is usually claimed that for him, the best possible regime is *politeia*, a *"mix of oligarchy and democracy and as a sort of hoplite [citizen-soldier] republic"* (Ober 2015: 224). However, in *Politics,* Aristotle also considers other regimes as the best under certain conditions (like kingship or aristocracy (Miller 2009: 548; Balot 2015: 107).

Medieval Classifications of Constitutions

Our legend of the Renaissance is a Renaissance legend
– C.S. Lewis (1954: 56)

Clive S. Lewis, who was one of the greatest literary scholars on the medieval and early modern period, provocatively and, to some extent, ironically denies the existence of the Renaissance as a European cultural movement, claiming that this is a largely an 'imaginary entity responsible for everything the speaker likes in the fifteenth and sixteenth centuries' (Lewis 1954: 55). He points out, however, something crucial to our understanding of the relationship between antiquity, the Middle Ages, and the early modern period, namely, that while ancient people had no idea they lived in antiquity and medieval people would be quite surprised to learn that they lived in the Middle Ages, intellectuals of the early modern period (fifteenth to eighteenth century) were acutely aware of the period in which they lived. In fact, a key part of the culture of early modernity is an ideologically driven construction of the periodization of history. Lewis said that "our legend of the Renaissance is a Renaissance legend" (Lewis 1954: 56), but the same could be said about the Protestant Reformation and the Enlightenment. Those three movements are self-descriptions, entirely based on the ideological perception of the past by their founders and representatives (cf. Taylor 1989; Hart 2009).

The common feature is the condemnation of the Middle Ages as a dark period 'in-between' (the very name *medium aevum* in Latin signifies that), in which culture deteriorated in comparison to the glory of classical antiquity, predominantly due to the position of the Catholic Church in the West. Because of that, the Renaissance, the Reformation, and the Enlightenment are, on the one hand, a retrieval of the classical light, darkened by the religious superstitions of the medieval period, and a progressive movement toward something even better in the future, on the other.

Why does it matter to our understanding of medieval political theory and its classification of political regimes in particular? The image of the Middle Ages in the public sphere still has little to do with historical sources and is a mythological construct filled with entities such as 'the Inquisition' or 'the Crusades,' supposedly demonstrating how freedom and intellectual curiosity were stifled by religious oppression. It would not matter so much if this legendary view of medieval culture was limited to popular perception, but the power of this construct can be seen among scholars if they have not studied medieval sources in sufficient depth. As Brett (2003: 276) points out, some scholars even questioned the existence of political theory in the Middle Ages.

For instance, John Culcullen and Jonathan Robinson, in their entry in the *Stanford Encyclopedia of Philosophy* (Culcullen & Robinson 2006), admit that ideas that we associate with modern liberalism, constitutionalism, or **republicanism** can be found, to some extent, already with medieval authors, but they seem to express a slight puzzlement that the medieval regime was never 'completely' repressive, or that liberalism could stem from medieval Christian culture. Those caveats are a result of the widely accepted, although largely groundless, assumption that the medieval period, unlike antiquity or early modernity, was a period of strong religious repression of free thinking. Cary J. Nederman points out that in academia, there is "a deeply ingrained pedagogical prejudice" regarding the Middle Ages (Nederman 2009: xiii). What still seems to be hard to accept is that Christianity tended, predominantly, toward limiting violence and oppression of the secular power (cf. Morris 1972: 10-11; Canning 1996: 65). James Blythe emphasizes the persistence of those assumptions or, as Lewis would put it, 'legends,' also among non-medieval historians who, even having read the sources, "frequently lapse into their old world view" (Blythe 1992: 5). It is combined with the fact that the vast number of medieval sources is still not available in critical editions and that those

sources are not being read in the increasingly Latinless culture (see Tierney 1997: 54); this calls for a more open-minded approach to the medieval political ideas.

It is possible to view the Middle Ages as largely continuous with classical antiquity and, in turn, continuous with the early modern period with its 'Renaissances,' 'Reformations,' and 'Enlightenments' – for the almost playful application of those concepts to medieval political thought consult McGrade (2011: 1042-1043); and on the models of 'continuity' and 'rupture' with regard to this, see Nederman (2009: 5-60). Access to Greek sources in the West was severely limited in the early medieval period. (Note that the former bilingualism of the Greco-Roman elites had begun to disappear already in the third century and is not a medieval phenomenon per se.) The situation began to change already in the so-called Renaissance of the twelfth century through the intense activity of translating the Greek and Arabic sources, organized and promoted by the Church from the eleventh century onward, especially in Spain and Sicily. The translations of Aristotle, in particular, influenced the political philosophy of the late Middle Ages (the translation of *Politics* by William of Moerbeke appeared in 1265, followed by an influential commentary written by Thomas Aquinas).

Before that, the key factor was a synthesis of the biblical revelation with the Greek and Roman philosophy, which in the West was conducted primarily by Augustine of Hippo. An example of this is Augustine's interpretation of the biblical claim that human beings are the images of God (*Genesis* 1:26), which strengthened the previous stoic and neo-platonic ideas of the equality and freedom of all individuals by virtue of their participation in God's nature. Authors such as Augustine used *New Testament* references to freedom (in the letters of Paul or the Gospels) to emphasize that slavery, persecution, or oppression is against human nature as God created it. On the other hand, Augustine, in time, accepted the interventions of secular power in religious matters, which was standard in Pagan antiquity but began to be questioned in the Christian period. Augustine, in his *City of God*, developed an influential theory according to which secular, political power, with its use of coercion and repression, did not exist in the primordial state of human innocence but was a result of the fall of Adam and Eve. In Augustine's view, the 'classification of constitutions' was unimportant because all constitutions are unnatural and sinful, allowed by God only as a remedial, corrective punishment for humanity. All human beings, men and women, regardless of their race or social background, were created as free and equal, and no one should exercise any form of domination over another human being. In practice, however, we have to accept the miserable state in which humanity has fallen because it disobeyed God. Nonetheless, as Canning points out, the enduring theme of the Christian medieval political theory was that *"all the baptized were children of the free woman not the slave-girl"* (Galatians 4:31), *"and that they had rights of liberty by virtue of their baptism, as Gregory the Great had emphasized."* (Canning 1996: 165; see also Finnis (1998: 257) on Thomas Aquinas; and Brett (2003: 295) on William of Ockham).

A major shift in medieval political theory occurred in the twelfth and thirteenth centuries, in the age of the 'discovery of the individual' (Morris 1972). The causes are complex, but we may point, first, to the separation and growing conflict between the hierarchical Church (the papacy) and the secular power (the empire), which prevented a concentration of political power, so typical for the modern period, and resulted in social and political liberty, greater than in antiquity and the early Middle Ages. Second, the development of jurisprudence (on its key importance, see Canning 1996: 114-115), especially in Italian universities, led to the revolution in legal thinking, resulting in the emergence of such key concepts as individual rights, due process in court, the people as the source of political power, or the notion of *universitas* or a corporation (understood as an abstract, 'fictitious person' – in Latin *persona ficta* – transcending all its members). Third, the study of Aristotle challenged Augustine's claim that secular power is intrinsically unnatural and sinful (or even created by the devil, as Pope Gregory VII claimed (Canning 1996: 93)), which in time led to the growing interest in a variety of ways in which the naturally emerging and essential for human flourishing political communities can be organized (on the Aristotelian and the juristic current, represented respectively by Baldus de Ubaldis and Bartolus de Sassoferrato, see Canning 1996: 167-171).

A key development was a misunderstanding of Aristotle's *Politics*. William of Moerbeke translated it in the 1260s, and Aquinas wrote a commentary on it, which was completed by his disciple Peter of Auvergne (although it was believed that the work was entirely by Thomas). As Tierney points out, medieval scholars imagined they were paraphrasing Aristotle while, in fact, they were developing their own ideas, originating out of their contemporary medieval Christian education and culture (Tierney 2008: 40).

Aquinas and later Aristotelians accepted the Platonic-Aristotelian sixfold division of constitutions according to the number of rulers (cf. **Plato & Aristotle**). However, they were much more interested in a different classification, namely, that into a 'regal' (*regale*), 'political' (*politicum*), and 'despotic' (*despoticum*) constitution, which they tried to combine with the first. Blythe proposes to refer to the first division as 'forms' and to the second as 'modes' of constitution. (Blythe 1992: 11-12). On the basis of those two ways of classifying constitutions, medieval thinkers came up with what was to be considered the best type, that is, a mixed constitution. The three modes were developed not on the basis of Aristotle's discussion of constitutions but of household management in Book One of *Politics*.

First of all, Aristotle distinguishes (*Politics* I, 1254b1-10) three relationships within a household: (1) that between a master and slaves, which he calls 'despotic' (*despotike*), (2) that between husband and wife, which he calls 'political' (*politike*), and that between a father and his children, which he calls 'kingly' or 'regal' (*basilike*). While despotic rule is

by definition that over slaves, Aristotle explains the difference between regal and 'political' rule (which is over free people) by pointing out that in the first case, one person rules, while in the second, the ruler becomes the ruled, and the ruled the ruler in turn (*kata meros, Politics* I, 1252a15ff). William of Moerbeke did not understand what Aristotle meant and translated *kata meros* as the Latin *secundum partem*, suggesting thus that the ruler is 'partly' the ruler and 'partly' the ruled.

Aquinas, who worked with William's erroneous translation, interpreted this as suggesting that the regal constitution is unlimited, while the political is limited by the law to which the ruler(s) are subject. (*In libros Politicorum* 1.1.15). A despotic constitution is also unlimited by the law, the difference between it and the regal one being that in the first case, the enslaved are ruled, while in the second, they are free people who consent to the ruler's authority. In Aquinas' theory, Aristotle's sixfold schema (one, a few, the many, and good vs. corrupt) become the forms in which the superior modes of rule can be exercised (Blythe 1992: 45). Thus, there could be a regal or 'political' monarchy, aristocracy or democracy. For Aquinas, both regal and 'political' were 'political' when contrasted with despotic (freedom vs. slavery). Also, the number of rulers is accidental and of lesser importance, while the essential distinction is between the unlimited and limited exercise of power, with the law (which Aquinas identified fundamentally with reason) being the key element (Finnis 1998: 255-274).

While in Aristotle, a mixed constitution could only combine aristocracy and democracy, in Aquinas, it consists of all three forms. Thomas uses the description of the Jewish community in the *Book of Exodus,* interpreted through an Aristotelian lens, as a model for what he considers to be the best kind of constitution, that is, a mixed one (Tierney 2008: 90). Although in an ideal world, the regal monarchy, exercised by a virtuous king, would be the best, reflecting the metaphysical order of the universe ruled by God, in the world as it is, the best constitution is a mixture of monarchy, aristocracy, and democracy, where a prince is elected by the people advised by the wise few (*optima politia, bene commixta*, in: *Summa Theologiae* 1-2.105.1). Another difference between Aristotle and Aquinas is that the former was concerned with balancing various social classes in a mixed constitution, while Thomas was not interested in classes. He wants different elements of government to limit each other through mutual 'checks and balances.'

While for Aquinas, the key division was into 'political' and despotic constitution, while regal and 'political' were two subdivisions of the rule over free subjects, for Giles of Rome, the key distinction was between regal and 'political,' the despotic being a subdivision of the regal. Giles of Rome favored absolute monarchy (regal constitution in his terminology) over a 'political' constitution (based on equality and consent, analogical to the relationship of husband and wife, see *De regimine principum* 1.1.23, 2.1.15) (Jones 2011: 419). The difference between regal and despotic constitutions was, for him, Aristotelian: the first was for the benefit of the subjects, and the second was for the benefit of the ruler.

Giles' insistence that the monarch is above the law is an exception in medieval political theory. Other authors emphasized the necessity of the rule of law, popular consent or election and tended toward the mixed constitution. Already in Peter of Auvergne, monarchy as the rule of one is not an option: all legitimate government is mixed (see *Questiones* 3, q. 17). The division into monarchy, aristocracy, and democracy only identifies the dominant element (Blythe 1992: 81).

If Peter of Auvergne is the first to assign an unequivocally positive role to the multitude, Ptolemy of Lucca goes further in dismissing monarchy in favor of **republicanism** (although he, like other medieval thinkers, takes into account some specific geographical, climatic, or social factors, which make any of the constitutions the best in given circumstances). He develops a highly original classification of constitutions based loosely on the first chapter of *Politics*. Ptolemy distinguishes between four kinds of constitutions: (1) sacerdotal and regal, (2) regal alone, (3) 'political,' and (4) economic. In his interpretation of Aristotle, he identifies, quite significantly, the despotic mode with the regal one. In the end, Ptolemy replaces the sixfold or fourfold classification of Aristotle and Aquinas with a twofold classification, in which he reduces all forms of government dependent on multiplicity (monarchy dependent on the people, aristocracy, polity, oligarchy, democracy) to what he calls 'political' constitution and all forms of government dependent on one alone (monarchy, despotism, tyranny) to 'regal' constitution (Blythe 1992: 107).

Engelbert of Admont proposed his variation on the Aristotelian scheme. He assumes four forms: (i) **monarchy** (rule of one, based on virtue), (ii) **aristocracy** (rule of a few, based on virtue), (iii) **oligarchy** (rule of the few, based on wealth and power), and (iv) **democracy** (rule of the many, based on freedom) (Blythe 1992: 130). He describes the degenerate forms of those four constitutions (monarchy degenerating into tyranny, aristocracy into oligarchy, oligarchy into hereditary oligarchy, and democracy into barbarism), which results in the seven forms associated with natural family relationships. A man rules his wife (a) aristocratically, his children (b) regally, and his servants (c) tyrannically. The elder brother rules his siblings (d) oligarchically, but brothers relate to each other (e) democratically (plus corrupt oligarchy and corrupt democracy give seven types) (Blythe 1992: 122). Engelbert also proposes mixtures of those seven, which gives him eleven possible constitutions, which he finds concrete examples for in existing countries.

Bartolus de Sassoferrato takes Aristotle's sixfold classification of constitutions and adds the seventh form, which is the rule of many tyrants. (Blythe 1992: 172-173). He also is extremely pragmatic in his assessment of the value of constitutions. Any government that works for the common good is acceptable, but democracy may be preferable for the smallest countries, and aristocracy for larger ones, while monarchy is for the largest (on this general tendency in

medieval thought, see McGrade 2011: 1046). Marsilius of Padua accepts the sixfold schema of Aristotle, but in distinguishing between the good and the bad forms within this schema, he introduces his theory of the necessity of the will or consent of the subjects in legitimizing any rule: the people are the sovereign (Canning 2011: 95-102). Nicole Oresme, who translated *Politics* into vernacular and provided a commentary on this work in the 1370s, emphasized, like the jurists, the importance of the rule of law in distinguishing between good and bad constitutions. The essential element of corrupt constitutions is a full, unlimited power exercised by the ruler(s). Oresme also proposes to see the six forms of government as a linear continuum, where the boundaries between various forms are not clear-cut (Blythe 1992: 207-217).

When compared to Aristotle, for whom the criterion distinguishing between good and corrupt constitutions was the common good, medieval thinkers were introducing other criteria, such as the rule of law (especially the jurists, but also Aquinas and later Oresme) or the consent of the subjects (Marsilius). They were also quite creative in proposing various classifications based on their interpretations of Aristotle but stemming from a completely other context: the medieval synthesis of the Greco-Roman Pagan thought with the Christian revelation in the context of the development of new forms of social and political life in Western Europe.

Machiavelli – Republics & Principalities

Since there cannot be good laws without good arms, I will not consider laws but speak of arms
– Niccolò Machiavelli, *Il Principe* (*The Prince*), 1532.

Niccolò di Bernardo dei Machiavelli (1469-1527), an Italian diplomat and historian, is heralded as one of the great political thinkers of the Renaissance. His (posthumously published) works have been put in front of many carts to pull all kinds of political thought, and resulting interpretations contain much bias derived from translation and the worldviews of its interpreters. For some, he was an immoral 'apostle of the Devil' or 'teacher of evil' (cf. Leo Strauss) for praising cruel pragmatism before mores, justice and temperance. To others he was merely an 'amoral' realist with a surgical approach to political survival. A few even consider him a front-runner for democracy – *"While appearing to instruct kings he has done much to educate the people."* (Rousseau, cited in Viroli 2005).

In any case, untangling Machiavelli's worldview, his relationship with religion (and the papacy), personal convictions, actual (surviving) writings interpreted by his contemporaries, reinterpretations by scholars of later epochs, and *their* legacies, his mythical reputation, and infamous popular image, from current historical research is beyond the purview of this encyclopedia entry. Below, solely Machiavelli's take on regime classifications is presented in brief.

Machiavelli's *Il Principe* (*The Prince,* written in 1513-1514, but published after he died in 1532) was written as a handbook for princes when he was courting the House of Medici, the ruling family in the Republic of Florence in an attempt to regain their favor. (Before, Machiavelli had been wrongfully accused of conspiring against the Medici in 1513 and was tortured before being released again). Machiavelli embarked on *The Prince* not to flatter the Medici but to prove to them his impeccable competence in the 'art of state.' (Viroli 2005).

Il Principe is probably the most (in)famous of the 'mirrors of princes' (*specula principum* in Latin) and was even placed on the *Index* (forbidden works) by the Catholic church in 1559. Such 'mirrors' originated from a medieval (both Islamic and European) tradition of educating a young sovereign by compiling advice on political and governmental ethics. Together with his *Discourses on the Ten Books of Titus Livy* (1531), this book expresses most clearly his views on principalities (monarchies) and republics (Nederman 1998; 2022).

The scope of Machiavelli's polities under observation was local, limited, and selective: Regimes were located mostly in his native *Regnum Italicum* (the area of Lombardy and Tuscany); foremost limited to city-states (with few kingdoms, the closest one being Naples); and Machiavelli focused on (new) rulers without firm support bases. In his works, he largely ignored *'principi naturali'* (established hereditary rulers) whose rule had been legitimized, but wrote for and about *'principi nuovi,'* "whose origins were recent, remembered, and resented." (Pocock 2010: 145-147) From this Hobbesian starting point, a ruler must be pragmatic to hold on to power and build out a state. In Machiavelli's own words: *"he should not depart from the good if it is possible to do so, but he should know how to enter into evil when forced by necessity."* (Bondanella 2005: 61). These nuances in scope render his insights less universal than commonly assumed, although they fail to diminish Machiavelli's influence on Western political thought. See also J. Barthas (2010) and M. Viroli (2013) for critical overviews of his legacy. For an in-depth analysis of Machiavelli's understudied early work (poetry, military analyses and his diplomatic and personal correspondence), consult C.J. Nederman's (2023) recent work *The Rope and the Chains: Machiavelli's Early Thought and Its Transformations*.

Machiavelli inductively sorted the 'ordered' political world he knew into two firm categories: (a) monarchies ('principalities') and (b) republics (referred to as 'politics'), both operating on a continuum with (c) tyranny at the other end of the spectrum. G. Giorgini (2008) notes that Machiavelli was the first to *not* consider law-bound monarchies opposed to arbitrary, lawless tyrannies, but finding the latter to be *"a reformable regime, capable of being turned into a principality through the education of the ruler."*

His main focus is the distinction between two regimes, both characterized by the rule of law: (a) monarchies and (b) republics. Both types can attain a minimal constitutional order (*vivere sicuro*) or basic level of security, but only (some) republics could create a fully constitutional regime, where liberties are protected by laws (*vivere libero*), where freedom of speech (oratory debate) allows for (non-violent) contention (*lite*) between the nobility and the people, making their active participation an asset to the polity's adaptability and survival. Only the pluralism of republics can avoid the pitfall when a single ruler embarks on a disastrous course of action, either by misguidance or lack of *virtù* (to be interpreted amorally as the 'flexible disposition to act pragmatically' not as moral 'virtue'). A republic (with its pluralism), therefore, is more adaptable and better fit to survive but also has a caveat – a devotion to perpetuate institutional arrangements whose time has passed. (Nederman 2022; Pocock 2010: 153).

In contrast to the former two concepts, Machiavelli's coverage of **tyranny** (c) is really sparse. He stayed true to the Ancient Greek tradition (cf. **Plato & Aristotle**) but in an inconsistent fashion. Most confusion is derived from his prudent writing style – he was writing for princes, after all – and by simultaneously using the term descriptively (equating any monarchy) and prescriptively (corresponding with arbitrary one-man rule) (Giorgini 2008: 232). Tyranny is ruling by fear of armed violence, with the absence of the rule of law. It equals chaos and corruption, and its lack of security makes liberty impossible.

By singling out new, yet-to-be-established rulers as a subject and audience, Machiavelli states it is meaningless and futile to speak of any claim to authority and the right to command in the absence of (the threat of) superior political power. Still, he alludes to the necessity of religion (political **ideology**) to legitimize regimes (Giorgini 2008: 242; Nederman 2022). Focusing on human agency (and not divine intervention), eschewing morals as a guiding principle, placing different regimes on a continuum, and identifying leader and institutional characteristics that may ensure a polity's survival, Machiavelli paved the way for a brand-new way of analyzing political regimes and their transitions. Whatever the interpretations of his writings and ongoing debates, his fingerprints are all over modern political science and its regime classifications.

Although the most famous, Machiavelli was not the first or only authority on ruthless statecraft. See also Box 2.2 on Kautilya and consult Jun-Hyeok Kwak (2022) on the reception of Machiavellian thought and East-West theoretical dialogues on power politics in East Asia.

Bodin – Sovereignty & Absolute Power

[O]h, how many tyrants there would be if it were lawful to kill them! He who taxes too heavily would be a tyrant, as the vulgar understand it; he who gives commands that the people do not like would be a tyrant, as Aristotle defined a tyrant in the Politics; he who maintains guards for his security would be a tyrant; he who punishes conspirators against his rule would be a tyrant. How then should good princes be secure in their lives?
– Jean Bodin, *Six livres de la république* (1576)

Jean Bodin (ca. 1530-1596) was a French jurist and political philosopher. He wrote on economics, naturalism, demonology and politics. His seminal work on sovereignty provides a foundational understanding of political authority in the aftermath of the Reformation when European medieval polities were turning into centralized states. Bodin defines sovereignty as the ultimate, absolute, self-subsisting and perpetual power within a state (not dependent for its validity on the consent of the subject), impacting both its internal governance and external relations. He describes it as *"the most high, absolute, and perpetual power over the citizens and subjects in a Commonwealth,"* which the Latins refer to as *majestas*. This concept of sovereignty is crucial for understanding the full political power a state wields, including its conduct in war and international relations.

Bodin's views on tyrannicide (cf. **assassination**) align with his theories on sovereignty. He argues that while tyrannicide may be justified against usurpers, it is impermissible against a prince who is an absolute sovereign. In such cases, even if the sovereign

Box 2.2 Kautilya – The Arthashastra

Having secured his own personal safety first from his wives and sons, the king can be in a position to maintain the security of his kingdom against immediate enemies as well as foreign kings.
– Protection of Princes, *Arthashastra,* Chapter XVII, Book I.

The *Arthashastra* is an ancient Indian treatise on statecraft, political science, economic policy, and military strategy, attributed to Kautilya (also known as Chanakya or Vishnugupta), who was a key adviser to the first Mauryan emperor, Chandragupta Maurya (ca. 340-297 BCE). While most text fragments were composed in the late fourth century BCE, others were added later, and the *Arthashastra* is a comprehensive guide for rulers on how to govern effectively, maintain power, and ensure the prosperity of their states. Its insights into political regimes and rulership have had a lasting influence on both Eastern and Western political thought.

Arthashastra (अर्थशास्त्रम् – *Arthaśāstram*) translates from Sanskrit as 'the manual on prosperity' or 'science of statecraft' with *shastra* referring to a body of knowledge like 'rules, manual, treatise, etc.' and *artha* to 'wealth, property, prosperity.' *Artha* is one of the four 'transitional aims' in life (*Purushartha – Puruṣārtha*), alongside *Kama* (pleasure, love, psychological values), and – more important – *Dharma* (righteousness, moral values) with the ultimate goal, *Moksha* (liberation, spiritual values, self-actualization) in Hinduism. (Note, these goals feature in a different constellation in Jainism and Buddhism as well).

This collection of books is unique in its comprehensive and detailed treatment of statecraft. They cover a wide range of topics, including administration, law and justice, economic policy, and military strategy. Kautilya's work is not only theoretical but also provides practical guidance for rulers on how to handle various aspects of governance. For example, he outlines the duties and responsibilities of key officials, the organization of the state, and the methods for maintaining law and order. The treatise also includes a penal code and detailed instructions on foreign policy and military tactics.

One of the central themes of the *Arthashastra* is the concept of the state as an organic entity composed of seven essential elements, known as the 'Saptanga Theory.' These elements include (i) the ruler *(Swami)*, (ii) ministers *(Amatya)*, (iii) the land and its people, i.e. 'kingdom' *(Janapada)*, (iv) the fortified capital and other defenses *(Durga)*, (v) the treasury and the polity's economic base *(kosha – koṣa)*, (vi) the armed forces *(Chaturangabala/ Danda)*, and (vii) alliances *(Mitra)*. Kautilya emphasizes that the stability and prosperity of a state depend on the proper functioning and interaction of these elements. This holistic approach to governance underscores the importance of a well-rounded and integrated state apparatus. Note that a 'state' in this histor-

ical context is not a Western concept but refers to *"an order of society which is not created by the king or the people, but which they exist to secure (…) essentially a beneficial institution for protection of human life and welfare and for the better realization of the ideals of humanity."* (Gonda 1957: 159)

Regarding guidance, Kautilya's advice for rulers (i) echoes through time. A ruler's conduct and ability are central to the state, emphasizing virtues like righteousness, honesty, and leadership. Trusted and able staff is crucial, as well as moderation, to avoid **despotism** or **tyranny**. The king's contentment relies on the people's welfare. Kautilya stressed maintaining connections with the populace and staying clear of **kleptocracy** through excessive taxes, with the king representing the state's unity and upholding Dharma.

His selection criteria for ministers (ii) are quite nuanced, urging rulers not to rely on personal ties, i.e., 'classmates' (see also: **personalist rule** and **patrimonialism**) because even if they can be trusted (inasmuch as the ruler knows them well enough), they have been his 'playmates' as well, and would end up despising the ruler. Employing those who are intimate and trusted with a ruler's secrets can result in blackmail from their side. The other way around, employing those whose secrets are known to the ruler will result in sycophancy (Box 6.5), as the fear of disclosure will prevent them from speaking openly and truthfully. Similarly, those with proven devotion might not be competent (cf. **meritocracy**). Those with hereditary positions and a family history of serving the dynasty will try to dominate a new ruler. In turn, employing esteemed scholars of statecraft will result in serious blunders since they only have theoretical knowledge. *"Hence he shall employ as ministers such as are born of high family and possessed of wisdom, purity of purpose, bravery and loyal feelings inasmuch as ministerial appointments shall purely depend on qualifications."* (Shamasastry 2012)

For the study of political regimes, his work appreciates the art of **coup-proofing** and dealing with internal enemies or treason (be they ministers, priests, the commander-in-chief or the heir-apparent). Kautilya even provides advice on how to construct harems (Box 5.11) and outfit them with booby traps and alarms for personal protection. (Shamasastry 2012)

Kautilya's classification of political systems is notable for its emphasis on the practical aspects of governance. He categorizes these based on their primary functions: rule-making, rule-application, and rule-adjudication, thus presenting a functional classification of the various branches of government and their role in maintaining order and ensuring the state's smooth operation.

The *Arthashastra* also introduces the 'Mandala Theory' (*rajamandala* or 'circle of states') for **foreign policy**, which posits that neighboring states are natural enemies, while the enemy's enemy is a friend. This theory provides a strategic framework for understanding and navigating international relations, emphasizing the importance of alliances and diplomacy. (Joshi 2019)

The work is remarkable for its pragmatic and often ruthless approach to statecraft. Kautilya advocates for a realist perspective, where the primary goal is the stability and sustainable expansion of the state. He does not shy away from endorsing the use of espionage, strategic manipulation, and even assassination when necessary to achieve political objectives (cf. **intelligence services**). This pragmatic approach is balanced by an underlying commitment to the welfare of the people, as Kautilya insists that the ruler's ultimate duty is to ensure the prosperity and security of his subjects.

The influence of the *Arthashastra* on Western scholarship is under-explored and under-appreciated. It was lost after the fall of the Gupta Empire (after ca. 550 CE) and remained obscure for nearly 1,400 years until its accidental rediscovery in 1905 by Rudrapatna Shamashastry at the *Oriental Research Institute of Mysore*. The first English translation was published in 1915 (by R. Shamashastry), followed by translations into Russian, German, and other languages.

The *Arthashastra* remains relatively unknown outside of India. (On its reception in post-independence India, consult: Misra 2016). Currently, Kautilya's writings are mostly reappraised as an ancient, coherent, non-Western IR theoretical frame (Shahi 2019), particularly relevant for the field of political realism, by itself an inherently 'Western' invention based on the 'Westphalian myth' – treating the 'Peace of Westphalia' (1648) as the starting point and basis of the modern world order (Dar 2021).

The *Arthashastra* – with its holistic treatise of war, peace and rulership – remains a unique and remarkable contribution to the understanding of **monarchies** and their **foreign policy**, contrasting the Western tradition of isolating 'the art of war' and military strategy (Joshi 2019) and of treating **power** as a means to an end (happiness, prosperity, welfare), not as a goal by itself (Set 2015).

Western scholars have drawn parallels between Kautilya's work and that of Niccolò **Machiavelli**, whose treatise *The Prince* also advocates for a pragmatic and sometimes ruthless approach to governance. Although many take affront when calling Kautilya the 'Indian Machiavelli' – urging for a turning of the tables and labeling Machiavelli as the 'Italian or Mediterranean Kautilya' (Dar 2021) since the *Arthashastra* predates *The Prince* by nearly two millennia.

Both Kautilya and Machiavelli emphasize the importance of maintaining power and control, often through fear and strategic deception. However, Max **Weber** found Machiavelli's *The Prince* harmless compared to Kautilya's elaborate details on deceit, espionage, political **assassination**, and strategic manipulation. (Dar 2021) For instance, Kautilya proposes to set up fake **coup** conspiracies and even 'honey traps' in the harem (cf. Box 5.11) to test the loyalty of ministers. He provides expert tips on how to recruit spies, from what social background (orphans, beggar women, merchants, priests, etc.) to which purposes. (Shamasastry 2012) The *Arthashastra* thus stands out for its 'ethical flexibility.'

While Kautilya advocates for a pragmatic approach to governance, he does not entirely dismiss the importance of ethical considerations and welfare politics, even extended to animals. He emphasizes that a ruler must be learned, just, and dedicated to the principles of *Dharma* (moral and ethical duties), and this balance between pragmatism and ethics is a key feature of Kautilya's political philosophy, distinguishing it from purely Machiavellian thought. (Joshi 2019)

One of the most remarkable aspects of the *Arthashastra* is its enduring relevance. Despite being composed

over two thousand years ago, many of its insights remain applicable to modern political and strategic thinking. Kautilya's emphasis on the importance of a strong and capable ruler, the need for a well-functioning administrative apparatus, and the strategic use of alliances and diplomacy continue to resonate with contemporary scholars and policymakers.

commits heinous acts, subjects are not allowed to act against the sovereign's life or honor. This notion underscores the inviolability of sovereign power, as seen in the absolute monarchies of countries from his time like France, Spain, England, Scotland, Ethiopia, Turkey, Persia and Muscovy (Turchetti 2024).

Bodin also distinguishes between different forms of states and governments. He categorizes **political regimes** into **monarchy** (rule by one), **aristocracy** (rule by a few), and **democracy** (rule by all). However, he notes that these categories can overlap. For example, a monarchy might function as a democracy if the ruler allows all people access to state offices, irrespective of their social status. Conversely, a monarchy can resemble an aristocracy if state roles are reserved for the nobility or wealthy (Turchetti 2024).

Understanding the distinctions between forms of state and government is essential for differentiating royal, despotic, and tyrannical monarchies. In his seminal work, *Les six livres de la R*épublique (1576), Bodin sub-classified monarchies, which he categorized according to their adherence to natural law and the right of conquest. Bodin identified three types: (a) royal monarchy, (b) seigneurial (despotic) monarchy, and (c) tyrannical monarchy.

Royal monarchy (a) This form of government is legitimate and legal, characterized by the ruler's adherence to both divine and natural laws. In a royal monarchy, the subjects obey the laws of the prince, who in turn respects the laws of God. This ensures the protection of natural liberty and property rights for all subjects.

Seigneurial (despotic) monarchy (b) Bodin described this as a legitimate form of rule resulting from conquest in a just war *(justum bellum)*. In this system, the ruler exercises absolute control over both the possessions and persons of the subjects, akin to a master-slave relationship. However, this form of monarchy is considered legitimate if it is established with the consent of the conquered people, acknowledging the victor's rights.

Tyrannical monarchy (c) Tyranny, according to Bodin, is always illegitimate and illegal. It disregards natural law and oppresses free subjects as if they were enslaved, treating their property as if it belonged to the tyrant. Tyranny is marked by the absence of legal and moral legitimacy, as it violates the fundamental rights of the subjects. Only in this case is tyrannicide (**assassination**) permitted.

Bodin emphasized the importance of distinguishing between despotism and tyranny. While both deviate from the ideal of royal monarchy, despotism can be legitimate under certain conditions, whereas tyranny is inherently unlawful. Bodin warned against conflating these concepts, as doing so would obscure the critical differences between legitimate rule by conquest and the oppressive rule of a tyrant. His work laid the groundwork for future discussions on governance and the legitimacy of political authority.

Bodin and J. Locke were among the last of the humanists who made such a nuanced distinction between **tyranny** and **despotism** before these concepts became routinely conflated by the eighteenth century (Turchetti 2018).

Bodin's theory of sovereignty is not synonymous with despotism. When he describes a sovereign as 'absolute,' he refers to the Roman legal concept of *absolutus*, meaning 'not bound' by civil or positive laws. However, a sovereign remains subject to natural and divine laws. This distinction is crucial, as Bodin's notion of sovereignty is supreme yet limited by higher laws. The kings of France exemplified this, with their sovereignty constrained by divine and natural law (Turchetti 2024).

Jean Bodin was a pivotal figure in political thought during the sixteenth century, influencing a wide range of fields, including political theory, jurisprudence, and religious studies. His most significant

contribution was his theory of sovereignty, which became a cornerstone in the development of modern political theory. However, his ideas on sovereignty were interpreted differently across Europe, with some viewing him as an absolutist and others seeing elements of **constitutionalism** in his work (Salmon 1996). Despite being largely forgotten by the eighteenth century, Bodin's work regained scholarly attention in the twentieth century, securing his legacy as a foundational thinker in political philosophy. His influence extended to thinkers like **Montesquieu** and Hobbes, and his ideas on legislative sovereignty impacted English political thought, influencing figures such as Sir Robert Filmer and, indirectly, John Locke (Lindfors, no date).

Despite this, the term **absolutism**, introduced in the nineteenth century, led some historians to misinterpret Bodin as an advocate of unchecked sovereign power. Both royalists and parliamentarians utilized his notion of sovereignty to support their divergent views, particularly in France, where it influenced the absolutist movement and the doctrine of the divine right of kings. Turchetti (2007; 2024) argues that this misunderstanding arises from comparing Bodin to later thinkers like Hobbes and Rousseau rather than examining his work within its respective historical context. To accurately interpret Bodin, one must consider the sources and debates of his time rather than projecting future developments onto his ideas. Thus, Bodin's work should be seen as a systematic definition of sovereignty, distinct from the later concept of absolutism.

Montesquieu – Aristocratic Liberalism

There is no greater tyranny than that which is perpetrated under the shield of the law and in the name of justice.
– Montesquieu

Charles-Louis de Secondat, Baron de La Brède et de Montesquieu (1689-1755), the eighteenth-century liberal thinker, studied the polities of his era at a time when full democracies (according to contemporary standards) had not yet emerged. In contrast to his predecessors, Montesquieu considered **political regimes** on a scale between liberalism and despotism. To capture these distinctions, Montesquieu contributed a typology, dividing forms of government into monarchies, republics and despotism. All three can be considered ideal types, mixing a different proportion of ideals, interests and force (Duindam 2016: 229).

While partial to democratic republics in theoretical principle, he found that "intermediate categories of aristocracy and monarchy appear as the most sensible and pragmatic polities, sensible compromises between human rectitude and frailty." (Duindam 2016: 228). He asserted that what is formally written (constitutions and laws) is not sufficient and that the 'Spirit of the Laws' – the customs and mores of a people – matters more. Unlike **Plato & Aristotle** but following **Machiavelli**, the virtue of the rulers is not taken into account, just the dimension of pluralism (number of rulers) and the level of restraint imposed on the ruler.

Republics (democratic or aristocratic) and monarchies are bound by fixed laws; despotism is not. (a) **Democracy** falters when citizens no longer identify their interests with those of the ruling system ('spirit of inequality') or when the 'spirit of extreme equality' overturns the authority of their chosen magistrates, opening the door to despotism. (b) In **aristocracy,** the guiding principle is 'virtue,' or at least the ability to rule with moderation, refraining from oppressing citizens, as well as from seeking supreme power. Laws should provide checks and balances as well as ensure equality among aristocrats. (c) In **monarchy**, laws should bind the singular ruler, and 'honor' is the principle to ensure its moderation and uphold its intermediary institutions. (Note that honor in this meaning refers to both the moral character of a ruler as well as the ability to bestow honor (titles, **patronage**) on loyal subjects – Duindam 2016: 229). (d) **Despotism** is a corruption of these systems, leading to unbridled, arbitrary power. Its ruling principle is fear. The first three 'moderated' forms of rule involve their respective institutions and governmental structures, eliciting adequate behavior (motivations) from citizens. When these are corrupted, all three descend into the latter. In his thinking, liberty is thus a negative freedom – the protection of the law

against unbridled state power – not the freedom to do whatever one wants (Bok 2018).

Montesquieu was too much of a realist to trust the virtue or honor of politicians and thus advocated for the separation of powers, checks and balances, and warning politicians against the specter of tyranny or unruly chaos. His ideas influenced great thinkers ranging from A. de Tocqueville and E. Durkheim to the Founding Fathers of the US Constitution. His scientific objectivity regarding regime types, comparing each system and its nature with the "human passions that set it in motion" (Scott 2011: 160), was groundbreaking, and Montesquieu is rightly treated as one of the first political anthropologists.

More revered for his treatise on democratic republics and thoughts on liberty, Montesquieu's thinking on aristocratic republicanism has often been ignored. Although his extensive coverage of Rome and Venice – *la Serenissima Repubblica* ('the most serene republic') – is ambivalent at times, he does praise these polities' tranquil longevity, spanning centuries. Despite his normative preference for democratic republics (especially by the end of his life), Montesquieu believes that all three moderated types of rule can obtain a certain form of stability when meeting their required individual standards and principles (Montesquieu 1949; Carrithers 1991).

Aristocratic resistance to centralized power was a cornerstone of political thought to obtain 'just rule' that lasted well in the nineteenth century (de Dijn 2009). (For this reason, Montesquieu only refers to aristocratic republics as 'oligarchies' (cf. Aristotle) if ruling elites abandon virtue and moderation). He finds that aristocratic republics *"possess a certain strength that democracy doesn't have. The nobles there form a body which, through its prerogative and for its particular interest, restrains the people. To ensure that laws are executed, it suffices only to make them."* (Carrithers 1991: 267).

Weber – Rulership

When the righteous thrive, the people rejoice; when the wicked rule, the people groan.
– The Holy Bible, Proverbs 29:2

When the sun rises, it rises for everyone
– Cuban proverb

Max Weber's theory of rulership, encapsulated in his concept of *Herrschaft*, is a foundational framework in political sociology for understanding the legitimization and exercise of power. This entry explores the nuances of translating *Herrschaft*, Weber's goals in classifying principles of rulership, the typology itself and its relevance to comparative authoritarianism, and concludes with criticisms of his approach while underscoring its enduring impact. This entry thus zooms in on his classification as a whole; selected individual concepts that matter greatly for comparative authoritarianism are treated separately in-depth throughout the *Encyclopedia Tyrannica*.

The term *Herrschaft*, central to Max Weber's sociology, poses significant challenges for translation due to its nuanced meaning, which encompasses authority, rule, and domination. Each translation emphasizes different aspects of the concept. The issue at hand is that Max Weber died in June 1920 before finishing his book *Wirtschaft und Gesellschaft (Economy and Society)*. He had finished (and proofed) three chapters but was still working on the fourth, by then mostly fragments with no clear plan on its final outlook to be found in his notes. By 1921, as agreed with his publisher, his first three installments had been published under the intended title. By 1922, his widow saw to it that an updated version appeared with an additional three installments based on his notes and earlier draft. This is the posthumously published version that was translated to English in 1968 (edited by Guenther Roth and Claus Wittich) under the title *Economy and Society. An Outline of Interpretive Sociology,* which makes the biggest splash in the (Anglo-Saxon) scholarly community, boosting Weber's fame. However, fragments of the earlier published version were also translated into English in the 1940s, and these different translations have created quite some havoc in understanding Weber's terminology (K. Tribe in Weber 2019: vii-viii)

Regarding the translation of *Herrschaft*, the term 'Authority,' as used by Talcott Parsons in early translations from the first publication in 1921 (made during the 1930s and published in 1947), highlights legitimacy but may obscure the power dynamics inherent in *Herrschaft*. Parsons also introduced 'imperative control' to reflect these dynamics better (Blau 1963; Szelenyi 2016). The alternative transla-

tion: 'Domination,' favored by Gerth & Mills ([1946] 2013), underscores the asymmetrical power relationship between ruler and ruled, aligning with Weber's definition of *Herrschaft* as the probability that a command will be obeyed (Tribe in Weber 2019: 471-472). However, critics argue that this translation overemphasizes coercion and neglects the role of legitimacy in Weber's theory. In contrast, 'rule' or 'rulership' emphasizes governance and avoids the negative connotations of domination while remaining faithful to Weber's focus on power within social relationships. For these reasons we have consistently used 'rulership' or 'rule' throughout the Encyclopedia.

The complexity of translating *Herrschaft* is rooted in its historical and linguistic context. Unlike the Latin-derived *dominium* (its original meaning resembling that of the Greek δεσπότης *(despotēs)* 'master of the household,' cf. **despotism**), *Herrschaft* evolved differently in German with broader meanings, encompassing terms like 'authority,' 'command,' 'lordship,' and 'sovereignty' (Koselleck 1982). In specific contexts, translations such as 'lordship' for medieval Europe or 'mastership' for industrial production might be more appropriate (Tribe in Weber 2019: 472-473). Ultimately, the choice of translation depends on the context and the translator's interpretation of Weber's intent.

Weber's classification sought to provide a systematic framework for understanding how power is legitimized across different historical and social contexts. His aim was not merely descriptive but analytical, offering ideal types as heuristic tools for comparative analysis. By focusing on legitimacy, Weber moved beyond normative assessments to examine how domination operates empirically. He was particularly interested in historical transitions between forms of rulership, such as the shift from traditional or charismatic rule to legal-rational rule, which he linked to the rise of modern capitalism and bureaucratic states.

Weber's typology has profoundly influenced political science and sociology. Scholars have used it to analyze political regimes, **bureaucracies**, social movements, and leadership dynamics. For instance, his concept of **charismatic rule** has been applied to nationalist leaders and revolutionary movements (Breuilly 2011), while legal-rational rule has shaped studies on state-building and modern governance (Allen 2004). His framework remains central to debates on **legitimacy** and **power** in both historical and contemporary settings.

Max Weber's purpose in classifying rulership was to understand how power is legitimized and exercised across societies and organizations, motivated by the rapid social and economic changes of his time. He viewed legitimacy as central to comprehending authority. Different societies, Weber argued, legitimize power in distinct ways, and his typology relied on 'ideal types' to make comparisons, which are abstract models that capture the essential features of a phenomenon. These ideal types are not intended to perfectly represent reality but serve as heuristic devices to simplify and analyze complex social phenomena. Real-world societies rarely conform entirely to any single ideal type; instead, they often exhibit a mix of different forms of rule.

'Power' *(Macht)* and 'Rulership' *(Herrschaft)* were clearly distinguished by Weber. *Herrschaft* is the probability that a given group of people will obey a command (Weber 2019). *Macht* is defined as the probability that an actor within a social relationship can impose their will despite resistance (Szelenyi 2016: 3). Rulership, thus, involves not only the 'power' to command but also the 'duty' of others to obey. A useful example illustrating this distinction is that of an army commander. While the commander can impose their will on the enemy through superior arms or soldiers, they do not have rulership over enemy soldiers, as their compliance is forced rather than based on authority. Conversely, the commander's troops obey because they recognize the legitimacy of their authority and are duty-bound to follow orders (Blau 1963: 306-307).

In any genuine relationship of rulership, there must be a minimum level of willingness to obey. This willingness can stem from various factors, such as affection for the ruler, adherence to custom, or material rewards for loyalty. However, the most stable foundation for rulership is the belief in the **legitimacy** *(Legitimität)* of the power relationship. This rationalization of asymmetric social relationships between ruler and ruled is what Weber termed legitimacy. *Legitimität* is thus a set of beliefs by the governed that the current political order and power relations constitute a 'just rule.' (Blau 1963: 306-307; Szelenyi 2016: 3; Weber, 2019: 338-339).

In Weber's framework: *Herrschaft = Macht + Legitimität*.

Weber identified three ideal types of legitimate rule and further divided them into subtypes. He called these three 'genetic ideal types,' and 'genetic' in this context highlights the developmental and transformational aspects of these types, as opposed to a static or purely classificatory approach (Breuilly 2011: 479). Of course, actual instances of rulership typically exhibit a mix of these three types. This classification has had a profound influence on the social sciences, being used to analyze political regimes, study bureaucratic development, examine charisma in leadership and social movements, and explore the relationship between democracy and dictatorship, but these were not Weber's original intentions.

Weber foremost looked at rulership from the perspective of capitalist development, making no other value judgments (like morality) besides their economic efficiency and functional rationality. For his belief in the superiority of the Protestant Ethos and the Western development model of statehood, he was rightly characterized as Eurocentric (see below), but there is much value in that his framework was devoid of a democracy bias. Of all these ideal types, the teleological end goal (cf. **modernization theory**) is a legal-bureaucratic rule, but this does not equate with democracy. (If not teleological, it was at least universal, inevitable, and accessible to human understanding and explanation in Weber's view) (Rudolph & Rudolph 1979: 196).

Max Weber's three ideal types of legitimate rule:

(I) traditional, (II) charismatic, and (III) legal-rational – offer a framework for understanding how power is legitimized and exercised in different social and historical contexts.

TRADITIONAL RULE (I) This is rooted in the sanctity of age-old customs and traditions, where legitimacy derives from continuity with the past. Individuals obey not because of personal qualities or legal mandates but because 'that is what our people have always done' (Allen 2004). Obedience is owed to rulers or institutions that embody these traditions, such as monarchs, tribal leaders, or religious figures like popes or caliphs. This form of rule predominated in pre-modern societies and relies heavily on shared belief systems tied to traditions or **religions**. Its pure form lacks a clearly defined sphere of competence subject to impersonal rules (Erdmann & Engel 2007). Instead, the exercise of power is often characterized by a mixture of adherence to established customs and the arbitrary discretion of the ruler (Weber 2019).

Subtypes of the traditional rule include (i) *patriarchalism*, (ii) **patrimonialism**, and (iii) 'estate-type' or feudal rule:

Patriarchal rule (i) This is a group of less complex familial systems (without staff) like *primary patriarchalism* (households characterized by (male) hereditary rule) or *gerontocracy* (characterized by rule by elders). (For a current take on 'gerontocracy,' see Box 1.12). These are the most basic forms of traditional domination, where authority rests with males and/or elders who are seen as custodians of sacred traditions and act in the interest of their community (Weber 2019). This form of authority lacks a separate administrative staff, relying instead on the voluntary compliance of community members. Its scope is typically limited to the household or small community, reflecting its minimal organizational capacity (Weber 2019). Gender-based criticisms berate this implicit masculinization of family systems (see below).

Patrimonialism (ii) As societies grow more complex, patriarchal rule often evolves into patrimonialism. Patrimonial rule is characterized by the emergence of a personal administrative staff loyal to the ruler, blurring the lines between private and public spheres (Weber 2019; Erdmann & Engel 2007). The ruler treats the state as an extension of their personal household, filling administrative positions based on loyalty rather than merit. Weber's historical examples of patrimonial rule include ancient Egypt, China, and the Roman Empire (Weber 2019). In its extreme form, **patrimonialism** can develop into **sultanism**, where power becomes highly centralized and arbitrary, with the ruler exercising unchecked discretion. Both terms have given life to new concepts, respectively **neo-patrimonialism** and **neo-sultanism**, which have shaped comparative authoritarianism in significant ways.

Estate-type or feudal rule (iii) *Estate-type or feudal rule* emerges when the administrative staff – such as vassals or nobles – appropriates power by gaining control over specific resources and responsibilities. This decentralization limits the ruler's authority and creates a system based on reciprocal obligations (Blau 1963). A defining feature is the 'fief,' a grant of land or resources given to vassals in exchange for loyalty and military service (cf. 'feudalism' in Box 1.14). For Weber, while feudalism fosters a web of dependencies, it also restricts economic freedom and market development due to its fragmented and often arbitrary power structures (Weber 2019).

CHARISMATIC RULE (II) This ideal type is based on the extraordinary qualities or perceived divine mission of a leader. This form of legitimacy inspires devotion and voluntary submission from followers who believe in the leader's exceptional sanctity, heroism, or exemplary character. Charismatic rule often emerges during periods of crisis or upheaval and can be transformative. However, it is inherently unstable because it depends on the personal attributes of the leader and often struggles to institutionalize itself into enduring systems (Weber 2019). Examples include messianic figures, revolutionary leaders like Che Guevara or Mahatma Gandhi, and even fascist leaders such as Adolf Hitler or Benito Mussolini. Scholars have extended Weber's concept to analyze modern populist leaders and media-driven charisma (Dow 1969; McCulloch 2014; Joosse & Willey 2020). (**Charismatic rule** has a more detailed entry in the section 'Concepts & Archetypes.')

LEGAL-RATIONAL RULE (III) is grounded in impersonal laws and procedures, characteristic of modern **bureaucracies**. In this form of rulership, legitimacy stems from adherence to a system of rules widely accepted by members of a political organization. Obedience is owed not to individuals but to the office they hold within a bureaucratic hierarchy *(Amsthierarchie)*, which operates on principles such as merit-based appointments and specialization. Legal-rational rule is closely tied to processes of rationalization that underpin **modernization theory**, modern capitalism and (Western-type) state institutions (Allen 2004). Examples of rulers that are obeyed because of rule-based orders include elected presidents, prime ministers, defense ministers, and officials like UN secretaries-general. Charisma can play a role in (directly) elected positions, but it is the obedience toward the office (and the acceptance of the political order) that makes others duty-bound to follow orders. For example, Winston Churchill was appointed as prime minister of the UK on 10 May 1940 after Neville Chamberlain resigned. His directives were followed as long as he held that office (contingent on his support in parliament and in line with the legal prerogative accompanying his position).

Weber emphasized that these ideal types are heuristic tools rather than perfect representations of reality. No society or organization embodies any one type in its pure form; instead, real-world systems exhibit a mix of these forms. Each type also reflects a dynamic process of emergence, operation, persistence, and decline, highlighting how legitimacy evolves (Breuilly 2011). Together, these ideal types provide a powerful analytical framework for under-

standing the diverse ways in which authority operates across different historical and social contexts. Max Weber's approach to rulership has, of course, been subject to several significant criticisms, particularly concerning his use of ideal types, his focus on legitimacy, and the broader applicability of his framework.

Methodological issues Critics argue that his ideal types oversimplify complex social realities and are difficult to apply empirically (Allen 2004). Blau (1963) finds that they conflate conceptual elaborations with hypotheses about factual relationships, leading to assumptions about interconnected elements that may not hold true in empirical reality. Additionally, ideal types can obscure contradictions and conflicts within social phenomena – issues that Weber himself was deeply interested in analyzing. These critiques suggest that while ideal types are valuable analytical tools, they must be applied cautiously and with an awareness of their limitations.

Breuilly (2011) points out a tension between Weber's view of modernity as a fundamental shift in social relations and his use of universal categories like charismatic domination. While traditional and legal-rational rule align more clearly with pre-modern and modern systems of governance, respectively, applying charisma across different historical periods can be problematic. This critique highlights the challenges of adapting Weber's typology to contemporary political movements and leadership styles.

Finally, by neglecting structural factors and focusing foremost on beliefs and legitimacy, Weber is criticized for under-emphasizing the material conditions shaping real-life power dynamics.

Static nature One key critique is the static nature of his typology, which some argue fails to adequately account for social change and the historical conditions that give rise to rulership. Roth and Schluchter (1979) suggest that Weber has no theory of 'evolution;' he rather conceived 'development' over time.

In terms of charisma, for instance, Blau (1963) highlights that Weber's analysis concentrates on how charismatic movements transform into traditional or bureaucratic institutions but does not robustly explain how charisma itself emerges. This limitation suggests that Weber's framework may overlook the dynamic and fluid nature of power relations and the processes through which rulership evolves. In addition, he never assessed these systems 'adaptability' to changing conditions or the power of amalgams.

Orientalism Another criticism concerns the Eurocentrism of Weber's framework. His concepts did not translate seamlessly to non-Western contexts. Wai (2012: 36) observes that Weber's work reflects the Eurocentric biases that Enrique Dussel (1995) critiques, portraying Weber as a deeply Eurocentric thinker whose worldview was shaped by an ethnocentric framework. According to Dussel, Weber's perspective was grounded in the metaphor of Europe as the ultimate historical subject, akin to Hegelian philosophy, positioning Europe as the source of conceptual and historical guidance for the world. This is evident in Weber's framing of world history in *The Protestant Ethic and the Spirit of Capitalism* (1958), where he asks, *"Which chain of circumstances has resulted in the fact that on western soil and only there cultural phenomena have been produced which, as we represent it, show signs of evolutionary advance and universal validity?"* (cited in Dussel 1995: 10).

For Weber, Europe was not just a regional entity but the benchmark for historical progress, asserting that its experiences alone possess universal significance. He further argued that *"neither scientific, artistic, governmental nor economic evolution have led elsewhere to the modes of rationalisation proper to the Occident"* (cited in Dussel 1995: 145, n. 9). This perspective underscores Weber's belief in Europe's centrality to world history while simultaneously revealing the limitations of his approach in recognizing other historical realities (Wai 2012).

Gender bias Gender-based criticisms of Max Weber's typology have focused on the implicit masculinization of leadership and the exclusion of women's experiences and roles within these frameworks. Scholars have pointed out that all of Weber's types – traditional, charismatic, and legal-rational rule – are predominantly modeled on male-dominated historical and social structures, thereby marginalizing or ignoring the ways in which women have exercised authority in both formal and informal contexts. In particular, Weber's concept of charismatic rule has been critiqued for its association with traditionally masculine traits such as heroism, exceptionalism, and public leadership. This framing often excludes or diminishes female leaders by relegating them to 'frivolous' or less 'serious' forms of charisma, as opposed to the 'heroic' charisma attributed to male figures like Napoleon or Hitler. Scholars such as Joosse & Willey (2020) have explored how gender intersects with charismatic power, highlighting the tendency to undervalue the leadership of women or to frame their authority in ways that reinforce gender stereotypes.

Furthermore, Weber's treatment of traditional rule has also been criticized for its patriarchal underpinnings. His examples exclusively present legitimacy from customs and traditions that historically excluded women from positions of power or confined them to subordinate roles within domestic or community spheres. Even with structures such as patrimonialism and feudalism – both deeply embedded in essentially patriarchal systems – Weber's framework risks perpetuating a view of political order that normalizes male dominance.

Despite these critiques, Weber's classification remains a cornerstone of political science. It provides valuable insights into the complex nature of rulership and its role in shaping social and political life while encouraging critical examination of power structures in various contexts. His typology has profoundly influenced political science by providing a framework for analyzing political systems, leaders, and social movements. It has informed studies on democracy and authoritarianism, the role of bureaucracy (Blau 1963), post-communist capitalism (Sze-

lenyi 2016), nationalist leadership (Breuilly 2011), its relation to authoritarian constitutionalism (Alviar García & Frankenberg 2019), and the intersection of charisma with gender (Joosse & Willey 2020).

Hamilton (1984: 394) argues that the core of Weber's sociology of rulership lies in the relationship between three central tenets: principle, legitimacy, and organization. Among these, Hamilton identifies principle as the key tenet that underpins Weber's framework. In comparative authoritarianism studies, however, 'organization' has dominated, and this has skewed later applications of this concept to modern regimes. A recurrent error is the equation of Weber's forms of rulership with **political regimes**. The former are ideal type categories to capture forms of just, legitimate political orders, and the latter are specific constellations of ruling networks.

Still, Weber's typology has been instrumental in this field in analyzing regime types and their mechanisms or strategies of legitimation. Scholars have extended concepts of ideal type amalgams for examining **neo-patrimonial** systems where personal loyalty undermines bureaucratic norms in regimes and polities or **hybrid regimes** that mix democratic procedures with authoritarian practices (charisma or personal rule). (Anter & Bruhns 2020) Even with their own shortcomings, Weber's theories have altered the way we perceive and think about autocracies.

For a deeper plunge into Weber's intellectual legacy for analyzing various (modern) authoritarian phenomena, consult **charismatic rule** for the sources of charisma, its routinization, later interpretations and adaptations (i.e., Breuilly (2011) his fourth type: 'institutional-charismatic legitimacy'). **Traditional rule** is mostly fleshed out in its (original and post-Weberian) subtypes: **patrimonialism**, **neo-patrimonialism**, and **sultanism & neo-sultanism**. Legal-rational rule is not treated separately in this encyclopedia but is covered in **bureaucracies** and **bureaucratic authoritarianism**.

As a final note, in his 2016 article, Iván Szelényi (also) introduces a 'fourth' type of rulership to complement Weber's conceptual trinity. Szelényi identifies this fourth type as a rule based on the *Wille der Beherrschten* ('the will of the governed'), which he presents as a critical refinement of Weber's legal-rational rule. This type emphasizes the role of the governed in legitimizing authority, particularly in the context of **electoral authoritarianism** and **hybrid regimes** where rulers may not strictly adhere to the principles of legal-rational rule or where majoritarian approval coexists with violations of the rule of law. Szelényi uses this framework to analyze post-communist regimes, such as those led by Vladimir Putin in Russia (at the time) or Viktor Orbán in Hungary, which exhibited mixed forms of rule blending legal-rational elements with traditional or charismatic features (Szelenyi 2016).

DICHOTOMOUS CATEGORIES OF POLITICAL REGIMES

Concepts are tools, but poorly designed tools are worse than none.
– Attributed to Giovanni Sartori

Mauveés ovriers ne trovera ja bon hostill
(Bad workmen will never find a good tool)
– Old French saying, ca. 1400

A bad workman blames his tools
(Its modern equivalent)

With the emergence of dichotomous approaches, democracy studies were born. Without self-reflexivity by radically separating and denoting what is democratic in juxtaposition to what is not, Western political systems started to self-identify and embrace this time-old label. Logically, reflecting their class-based regimes at the time, with limited suffrage and colonial contexts, earlier conceptions of democracy were narrowly defined and elitist (**Schumpeter**), focused on their pluralist freedom (**Aron**), or higher levels of development (**Lipset**). All took pride in their political institutions and **constitutionalism**.

With democratic self-awareness, so boomed the study of democratic regimes (Duverger 1978; Lange & Meadwell 1991), party systems (Duverger 1951; Blonder 1968; Lijphart 1968; Sartori 1976) and (democratic) elections (Lijphart 1994; Golder 2005). Most of them stuck to a dichotomous worldview, focusing solely on democracy, slowly expanding their scope beyond the West as familiarity and data collection improved. Note that **Sartori**, while overall espousing a dichotomous approach, did distinguish among dictatorship types.

With the third wave of democracy (Box 6.3) and the emergence of **democracies with adjectives**, so did the need to resurface for conceptual clarity. Hence, a new generation of dichotomous categories emerged, like the **Democracy-Dictatorship Index** (Alvarez et al. 1996), that actively turned away from the prevalent and popular **continuous measures** that had been booming since the 1980s. Even today, such minimal approaches have not ceased to be attractive, and adherents have improved their coding criteria in order to deal better with **hybrid regimes**: e.g., Bernhard et al. 2001; Cheibub et al. 2010; Boix et al. 2013; Bjørnskov & Rode 2020.

An important argument in favor of dichotomous classifications is their clear, consistent, parsimonious coding criteria that are easily reproduced. Foremost, their 'alternation rule' (i.e., regime turnover) to qualify as democracy is the major linchpin that has drawn criticism since this rule risks confusing manipulated but ultimately lost elections with genuinely competitive electoral contests.

However, comparisons with **continuous measures** show that the latter are actually much more demanding before they group cases as being 'democratic enough' on their (respective) scales in order to be labeled as such, so even the latter's arbitrary thresholds embrace much more demanding criteria than the former's categorical binary sorting.

In addition, dichotomous classifications pride themselves on their ability to create datasets stretching back far in time. Their minimalist definition of democracy (including the bare essentials regarding suffrage) is foremost focused on turnover and **elections**, not the nature of **power** or **legitimacy**, and this raises the question that for early modern political regimes when democracy was still a fringe phenomenon, is a dichotomous approach really the most relevant one? Was 'electoralism' the one crucial variable setting political regimes on (meaningful) divergent pathways in their political, economic, social and cultural development? What about **ideology** and the importance of traditional forms of rule and their extremes, like **absolutism**? What about the impact of 'rationalist' modern forms like **republicanism** or **corporatism**? What about patterns of non-democratic **regime promotion** before the advent of the first wave of democracy (Box 6.3)?

To sum up, dichotomous classifications are categorical and incredibly democracy-focused (an exception is **Geddes, Wright & Frantz**, who actually also use a binary cut-off to isolate dictatorships and then proceed to classify these in a polychotomous fashion). In any case, all non-democracies fall under a residual category. Diachronic datasets reaching all the way back to the French Revolution lose their analytical value if they can only observe democratic regimes (in a binary fashion). Adjusting and lowering the bar of what constitutes **democracy** to its bare minimal definition is one way to discover historical patterns of limited inclusion and pluralism in such longitudinal studies, but once that definition becomes too minimalist, it fails to sort out some forms of **electoral authoritarianism** or **competitive authoritarianism**. So, it is not possible to burn the candle at both ends. These typologies are not designed to study dictatorship unless as an undifferentiated group in juxtaposition to democracy.

Schumpeter – Democratic Minimalism

The democratic method is that institutional arrangement for arriving at political decisions in which individuals acquire the power to decide by means of a competitive struggle for the people's vote.
– Joseph Schumpeter (1942)

Joseph A. Schumpeter (1883-1950), renowned economist and once finance minister in Austria (1919-1932), contributed immensely to the study of democracy through his original classification introduced in his seminal work *Capitalism, Socialism, and Democracy* (1942), which represents a significant departure from classical conceptions of democracy. Schumpeter rejected the traditional notion that democracy is defined by the pursuit of the 'common good' or the direct rule of the people. Instead, he proposed a procedural or minimalist definition, focusing on the competitive struggle for leadership through elections. His approach emphasizes that democracy is not about achieving specific substantive outcomes – such as equality or justice – but rather about the institutional process through which leaders are selected. This minimalist view has had a lasting impact on how political regimes are classified and studied within comparative politics.

While Schumpeter did not explicitly outline detailed coding criteria for classifying political regimes, his procedural definition implies several key elements: (a) *competitive election*s – the existence of free and fair elections where multiple political actors vie for power is central to Schumpeter's definition. Democracy, in his view, is a system where individuals acquire power through a competitive struggle for the people's vote; (b) *the institutional framework* – formal procedures and institutions that govern political decision-making (including elections and mechanisms for holding leaders accountable).

Schumpeter's approach focuses almost exclusively on electoral competition as the defining feature of democracy. Unlike broader definitions that incorporate civil liberties, political equality, or popular sovereignty, his approach is foremost concerned with how leaders are chosen rather than what they do once in office. His approach shifted the focus away from normative debates about what democracy should achieve and toward empirical questions about how democratic institutions function in practice. His work helped popularize a procedural understanding of democracy that emphasizes institutional processes, such as the **Democracy-Dictatorship Index** (DD) (Alvarez et al. 1996; Cheibub et al. 2010). By centering elections as the primary criterion for defining democracy, Schumpeter influenced subsequent measures of democracy, such as the **Polity Index** and **Freedom House**, which also prioritize electoral competition in their classifications of regimes.

Of course, Schumpeter's minimalist definition has been subject to significant criticism for ignoring civil liberties, the rule of law, and broader participation beyond elite competition (his personal political views, which radicalized during the inter-war years at the peak of geopolitical tension, have also been condemned). Also, critics argue that free and fair elections alone do not guarantee democratic governance if fundamental rights are not protected. Moreover, his model has been criticized for being overly elitist and sidelining the role of ordinary citizens in shaping policy or influencing governance between elections. Logically, his approach cannot account for electoral authoritarianism or hybrid regimes since these became prevalent in the 1990s (Swedberg in Schumpeter 2003).

Aron – Constitutional Pluralistic vs. Monopolistic Party Regimes

Every political regime contains a minimum of unity and of meaning which the sociologist must uncover.
– Raymond Aron, *Democracy and Totalitarianism* (1968: 27)

Raymond Aron (1905-1983) was one of the greatest political sociologists of the twentieth century. He was truly a political sociologist, not a sociologist of politics (such as Seymour M. **Lipset**). His work on non-democratic politics must be considered in this context. It is a large, complex, and complicated work. The key concepts here, as far as non-democratic politics is concerned, are 'industrial society' and 'the primacy of politics.'

Industrial society is an umbrella term. Aron (1962) analyses three sections of the social life of industrial society: economic systems, social and class structures, and political regimes. In analyzing and comparing economic systems, he distinguishes four situations: (a) the general concept of industrial society, which is a 'genus' or Weberian ideal type; (b) different 'kinds' or types of industrial society; (c) different growth patterns, and (d) different stages of growth (Aron 1962: 363). This is very important because it allows him to compare systems that appear to be antithetical: 'constitutional pluralistic regime' and 'a monopolistic party regime' (Aron 1968), or a Western capitalist regime and a Soviet-type regime. Both regimes are two types of the same genus, or in other words, different methods of solving similar problems. He was convinced of this by his trip to Asia, from where Europe is viewed not as two disparate worlds, the Soviet world and the Western world, but as one reality: industrial civilization (Aron 1962: 50).

The basic distinguishing feature between constitutional pluralistic regimes and monopolistic party regimes is the political criterion of the number of parties: pluralism vs. one-party monopoly. Elsewhere, Aron (1964: 171-172) argues that the 'least bad' distinction between the two regimes is the recognition of free trade unions. So, these are political criteria, not economic or social ones. Whatever the socioeconomic system, there always remains the political problem of what is the relationship between the rulers and the ruled, where it is determined who rules and how, and how the rulers are chosen. Politics is superior to socioeconomic issues. Socioeconomic issues are not the origin of politics but the opposite. What specifically distinguishes modern industrial societies is political in origin. Further, politics has primacy in the humanistic sense. The way rulers are chosen and the way they exercise power shows the human or inhuman character of the whole system (Aron 1968: 11).

Aron (1968) divides monopolistic party regimes into three types: conservative authoritarian or traditional autocratic (Salazar's regime in Portugal is an example), fascist (Nazi), and communist. In this context, he is most interested in two questions. First is the analysis of **totalitarianism**. Aron (1968: 193-194) defines totalitarianism through what are essentially, in his time, five conventional defining characteristics and asks three basic questions: (i) To what extent is totalitarianism historically unique or historically recurrent? (ii) To what extent is Soviet totalitarianism comparable to Nazi totalitarianism, and (iii) to what extent is a one-party regime doomed to totalitarianism (Aron 1968: 194-195)? Regarding the first question (i), Aron was a modernist, like many of the classics on the subject: Arendt (1951), Friedrich and Brzezinski (1956), Linz (2000), and Sartori (1987).

He answered the third question (iii) in the negative. He mentioned Mussolini's Italy as an example of a non-totalitarian one-party regime (Aron 1968: 195). However, he was most interested in the second question (ii), i.e., the comparison between communism and Nazism, which he considered fully legitimate. Aron (1968; 1983) systematically refuted the arguments by proponents of the view identifying fundamental differences between the two regimes; although he admitted the differences, he saw similarities and argued that the fundamental affinity between the two regimes was best justified by Hannah Arendt (1951) in her work *The Origin of Totalitarianism* (Aron 1968: 198). However, Aron's analyses of the differences and similarities between Nazism and communism were not universally accepted and had their prominent critics (cf. Besançon 1998; Todorov 1994).

The works of Max Weber and Montesquieu deeply influence Aron's typology. Aron adopted the German, especially Weberian, hermeneutic approach to social sciences, emphasizing the importance of understanding the meaning behind social actions, which shaped his analysis of political sociology. From **Montesquieu**, Aron drew the concept of examining regimes based on their 'essential' characteristics, principles, and sources of potential 'corruption.' Aron's typology was deductive and time-bound, only applicable to industrial society, and he followed Montesquieu, who broke with a two-thousand-year-old tradition of searching for the best regime by relativizing the question: what is the best regime for which societal type? (Scott 2011: 160).

Finally, there is one more key issue to which Aron

(1957; 1965) devoted much attention, which is indirectly related to the conceptualization and typology of non-democratic regimes, and that is Marxism. He was interested in the role of authentic (i.e., Marx's) Marxism in communist regimes and the relationship between authentic Marxism and Marxist-Leninist ideology. Were communist regimes necessarily oppressive? According to Aron, simplistically speaking, yes. Communism is not a 'degeneration' of Marxism but one of its many interpretations, and all attempts to put it into practice have resulted in **despotism**. The undemocratic character of communist regimes is an inevitable 'perverse effect' (Aron 1984: 31; Boudon 1977) that was foreseen and predicted. In this, Aron agreed with several experts on Marxism, such as Raymond Boudon (1977), Dominique Colas (2002), Leszek Kołakowski (1978) and Martin Malia (1994). It should be noted that Aron's analyses of Marxism and the problem of ideologies, in general, have had a much greater impact than his definitions and typologies of non-democratic regimes, which have influenced foremost the French environment and have not penetrated much into the Anglo-Saxon mainstream.

Lipset – Democratic Stability & Economic Development

Stability is not immobility.
– Klemens von Metternich (1773-1859)

Seymour Martin Lipset's (1922-2006) work on the relationship between economic development and democracy has left a lasting legacy in political science, particularly through his contributions to modernization theory. In his influential 1959 paper *Some Social Requisites of Democracy: Economic Development and Political Legitimacy,* Lipset argued that democracy is more likely to emerge and be sustained in societies that achieve higher levels of economic development. His thesis posited that factors such as wealth, industrialization, education, and urbanization create social conditions conducive to democratic stability.

S.M. Lipset did not propose a formal typology of regimes but laid the groundwork for understanding how socioeconomic factors influence political systems. He used a *de facto* dichotomous classification, based on his own judgment, sorting countries into democracies and dictatorships using two scales: (i) legitimacy and (ii) effectiveness. Lipset (1960: 45) defined democracy *"as a political system which supplies regular constitutional opportunities for changing the governing officials, and a social mechanism which permits the largest possible part of the population to influence major decisions by choosing among contenders for political office."* Note that he thought that the criteria for democracy might differ in different political regions (Vanhanen & Lundell 2014: 2).

Lipset's approach was rooted in **modernization theory**, a movement he influenced greatly. His works find that as societies develop economically, they tend to democratize. He identified several key indicators of economic development – such as per capita income, industrialization, urbanization, and education – that correlated strongly with stable democracies. For instance, he argued that wealthier nations are more likely to sustain democratic regimes because economic stability reduces class conflict and fosters political stability. Similarly, he believed that higher levels of education promote a more informed citizenry capable of engaging in democratic processes. Industrialization and urbanization were also seen as crucial because they fostered social organizations like labor unions, which could mobilize citizens to demand political rights.

Besides Joseph **Schumpeter,** the works of Max **Weber** influenced S.M. Lipset's thinking. This is visible in his emphasis on political **legitimacy** – meaning widespread public belief in the system's fairness and effectiveness – as a contributing factor to democratic

regimes' stability. Without legitimacy, even economically developed democracies could be vulnerable to authoritarian movements.

The stability of political institutions is thus closely tied to both (i) legitimacy and (ii) effectiveness. A fourfold table illustrates the relationship between these two factors, with countries falling into different categories based on their combinations (A – high legitimacy & high effectiveness, B – high-low, C – low-high, D – low-low).

Highly legitimate and effective systems (A), like the United States or the United Kingdom (in the 1950s), tend to be stable and democratic, while regimes that lack both legitimacy and effectiveness (D), such as certain dictatorships, are unstable unless maintained by force. Note that Lipset does highlight **racism** in the US (segregation laws in the America South) and the UK (the colonization of Catholic Ireland) as challenges to the legitimacy of these examples (Lipset 1959: 90-91).

Historical examples from the 1930s show that countries with high legitimacy but declining effectiveness (B) remained democratic, while those with low legitimacy (C), like Germany and Austria, descended into authoritarianism. The analysis also highlights that prolonged effectiveness, particularly through economic development, can eventually confer legitimacy on a political system. Conversely, ineffective systems may lose legitimacy, leading to instability. Thailand's social stability (despite regular **coups**) contrasts with its less-stable neighbors, showing how legitimacy and effectiveness interact in shaping political outcomes (Lipset 1959: 90-91).

The impact of Lipset's work on political regime classification has been profound. His thesis reinforced the **modernization theory** by positioning economic development as a precondition for democracy. It also spurred the development of quantitative measures for classifying political regimes, influencing subsequent research and the creation of datasets.

However, Lipset's approach has faced significant criticism over time. Critics argue that his focus on socioeconomic factors was overly deterministic, implying a linear path from economic development to democracy while neglecting the roles of political agency, culture, and historical context. Additionally, critics have pointed out that Lipset's framework struggles to establish clear causality between economic development and democratization; many countries with similar levels of development exhibit vastly different political systems. Empirical exceptions – such as wealthy authoritarian regimes or poor democracies – have further challenged the universality of his thesis.

To recap, while Lipset's work remains foundational in understanding the social requisites of democracy, it has been critiqued for its overemphasis on economic determinism and its neglect of other critical factors shaping regime transitions. Despite these criticisms, his contributions continue to influence contemporary debates on **democratization** and regime classifications.

Democracy-Dictatorship Index (DD)

There are two sides to every story and then there is the truth.
– Universal saying

The original classification of political regimes by Mike Alvarez, José Antonio Cheibub, Fernando Limongi, and Adam Przeworski (1996) presents a minimalist, dichotomous approach, distinguishing political regimes as either **democracies** or **dictatorships** (the latter term used interchangeably with 'authoritarian regimes').

Their primary sorting criterion is the existence of competitive elections that allow for genuine alternation in power. Specifically, they define a regime as democratic if (a) the chief executive is elected, (b) the legislature is elected, (c) more than one party competes in elections, and (d) an alternation in power has occurred under the same electoral rules.

While imperfect, this classification is noteworthy because it relies exclusively on observable criteria, avoiding subjective judgments about regime characteristics like civil liberties or the quality of governance. This approach has been criticized for its procedural, minimalist definition of democracy, which focuses narrowly on electoral processes and overlooks other important aspects of democratic governance, such as civil liberties, political freedoms, and the rule of law. (Cheibub et al. 2010)

The main critique warns against 'electoralism,' or equating competitive elections with democracy (cf. Karl 1986), as their criteria ignore other essential democratic dimensions like broad suffrage and

civil liberties. Other scholars have pointed out that the distinction between 'observables' and 'subjective judgments' is not as clear-cut as Alvarez et al. (1996) suggest, as even determining whether **elections** are free and fair can involve subjective interpretation.

This main criticism of oversimplification is directed as much against the typology as against the general approach of defining democracy in this fashion. However, it is not just a theoretical position: For example, regimes with competitive elections but restricted suffrage or civil liberties (e.g., Apartheid-era South Africa – Box 4.7) cannot be considered democratic. Alvarez et al.'s (1996) attempt to correct for this by requiring alternation in power is seen as both over- and under-inclusive, as it may classify regimes as democratic even when significant political repression exists or classify as non-democratic those genuinely popular democratic regimes that succeed in getting re-elected over and over again.

In *Democracy and Dictatorship Revisited*, José Antonio Cheibub, Jennifer Gandhi, and James Raymond Vreeland (2010) build on and improve upon the dichotomous classification of political regimes introduced by Alvarez et al. (1996). They improve the scope and add sub-type differentiation.

First of all, Cheibub et al. (2010) extend the dataset to include regimes from 1946 covering almost 200 countries. Second, they deepen the level of detail by introducing a sixfold classification that categorizes regimes as either democracies or dictatorships, with further subtypes for each. Democracies (i-iii) are classified into (i) parliamentary, (ii) semi-presidential, or (iii) presidential systems, while dictatorships (iv-vi) are categorized as (iv) monarchic, (v) military, or (vi) civilian.

The classification remains minimalist; democracies are regimes where government offices are filled through contested elections. This definition involves two key components: 'offices' and 'contestation.' For a regime to be democratic, both the chief executive and legislative body must be elected, and there must be an opposition with a genuine chance of winning. Contestation requires three conditions: *ex-ante* uncertainty (the election outcome is unknown beforehand), *ex-post* irreversibility (the winner takes office), and repeatability (elections occur regularly) (Cheibub et al. 2010).

To classify a regime as democratic, the same four rules must be met: (a) The chief executive is chosen by popular election or an elected body. (b) The legislature is popularly elected. (c) More than one party competes in elections. (d) An alternation of power has occurred under the same electoral rules that brought the incumbent to office.

While the first three rules are straightforward, the fourth rule – alternation in power – does pose challenges. It is difficult to distinguish between regimes where incumbents stay in power due to popularity and those where incumbents manipulate elections to ensure victory. In cases where incumbents would cancel elections if they anticipated losing, the regime should be classified as a dictatorship. The authors address this problem with the assumption that subsequent/current actions reveal what incumbents *would* have done at different points in time.

There are rare cases that defy classification. Like the proverbial Schrödinger's cat, these cases can potentially be either type until one peeks in the box. For example, as of the 2024 general elections, Botswana is ruled by the *Umbrella for Democratic Change* (UDC), which won a parliamentary majority, marking the end of nearly six decades of governance by the *Botswana Democratic Party* (BDP). Up until 2024, the DD classification was unable to classify Botswana as a democracy or a dictatorship since there had been no electoral overturn and there was no way to establish (for sure) if the BDP would have accepted their electoral defeat (thereby extrapolating the observation by assuming they would also have done so in the previous sixty years if they would have lost then). To pick a lane, Botswana was classified (out of caution) as a dictatorship until 2024 (but the case was marked and therefore easily identified in the dataset). So, doubtful cases are dictatorial until proven not guilty.

The authors defend their minimalist definition: *"A minimalist definition of democracy such as the one we adopt in DD is compatible with a variety of specific ways in which social and political life is organized. It does not attach any weight to the specific way governments are formed, political parties compete, candidates are selected, voters vote, and votes counted; to the way justice is organized and dispensed; to how much or in what ways the state intervenes in the economy or to whether private property is upheld. It recognizes that all governments are constrained in their actions, be it by those who hold guns or by those who own capital, domestic or international. All that a minimalist definition of democracy requires is that citizens be given periodically the opportunity to choose their leaders in electoral contests; that they be presented with more than one alternative; and that those who win become, indeed, the country's leaders. The specific characteristics listed above may be used to make further distinctions within or across each regime category. But the minimalist approach begins with the assumption of two sharply defined categories, democracies and dictatorships."* (Cheibub et al. 2010: 73-74).

Still, critics argue that this approach may classify regimes with significant democratic deficits as democracies merely because they held competitive elections (which they lost). The DD dataset thus confuses the outcome of regime performance (and their transition) with its nature. *"Papua New Guinea and Sweden thus receive the same score, despite evident differences in the quality of elections, civil liberties, and barriers to competition afforded in these two settings."* (Coppedge et al. 2011: 249). Gilbert and Mohseni (2011) assert that competitiveness, competition, and tutelary interference are the three dimensions that are important for regime classification today. The DD dataset only measures (observed) competition and, therefore, is ill-equipped to analyze **hybrid regimes**.

The sub-classification of their category for dictatorships – (iv) monarchic, (v) military or (vi) civilian – is done according to their inner sanctums, adhering to objective proxy criteria for the supreme leader: (a) monarch or not? (b) and a member of a royal dynasty? (c); or instead, has a military back-

ground or not? (Cheibub et al. 2010: 83-89). This division can also be criticized for being too simplistic and for not accounting for processes of **personalization** and resulting **personalist rule**, the level of political party pluralism, or the level of military domination. Nor are authoritarian amalgams, like military-monarchic regimes (i.e., Thailand), considered. Rebel regimes can also be misclassified as civilian, and there is no solution for some succession scenarios where successors have a categorically different background from their predecessors.

In any case, the main purpose of the DD dataset is to radically distinguish democracies from non-democracies and erase the uncertainty emanating from 'hybrid regimes' and 'semi-democracies.' The regime typology is deductive, categorical and absolutely democracy-focused. It is particularly valued for its reliability and consistency in distinguishing (two) regime types over time and across countries, making it highly suitable for longitudinal, large-scale comparative studies. However, its definition of democracy is too minimalist to be relevant for all types of research, and the DD dataset is usually combined with additional measures to capture nuances. Like all dichotomous typologies, it cannot account for incremental changes in democratic backsliding.

Recently, C. Bjørnskov and M. Rode (2020) expanded the coverage of the DD index to a total of 192 sovereign countries and 16 currently self-governing territories, spanning from 1950 to 2018, including periods under colonial rule for over 90 entities. Additionally, they provide more detailed institutional information and introduce a new, self-created indicator that tracks both successful and failed coups d'état.

Boix, Miller & Rosato (BMR) – Competition & Suffrage

There are no eternal facts, as there are no absolute truths.
– Friedrich Nietzsche, *Beyond Good and Evil* (1886)

Carles Boix, Michael Miller, and Sebastian Rosato's (BMR) classification of political regimes, developed in their 2013 study, represents a significant advancement in the empirical study of political regimes. They aimed to create a comprehensive historical dataset to measure and classify democracies and non-democracies, covering the period from 1800 to 2007. For a while, this dataset became one of the most widely used tools in comparative politics, particularly in studies of political development, regime transitions, and democratization. BMR's classification has had a profound impact on the field, offering a robust framework for understanding political regimes across time.

BMR's approach to classifying political regimes is democracy-focused, deductive and dichotomous, meaning it divides regimes into two distinct categories: democracies and non-democracies (autocracies) if they satisfy conditions for both *contestation* and *participation*, thus following R. **Dahl** (1971). This binary classification is based on institutional criteria rather than normative assessments of regime quality. The focus is on the formal rules that govern elections and suffrage rather than on broader considerations such as the depth or quality of democracy.

A regime is coded as democratic if it meets several key conditions: (A) *Competitive elections* – The executive must be elected either directly or indirectly through 'popular' elections, and the legislature must be elected in 'free and fair' elections. The competitiveness of these elections is fundamental; opposition parties must be allowed to run, and they must have a reasonable chance of winning. (B) *Universal male suffrage* – a majority of the adult male population must have the right to vote. This criterion reflects historical realities where male suffrage was often the first step toward broader democratic inclusion.

Variable 'A' is calculated using a state's political design and a similar coding mechanism for minimal democracy as used in the **Democracy-Dictatorship Index** (DD) (Alvarez et al. 1996; Cheibub et al. 2010). To determine whether elections are free and fair, Boix et al. (2013) define free elections as those where voters have multiple options on the ballot and fair elections as those without electoral fraud or abuse of government power that undermines opposition chances. They primarily rely on electoral turnover –

the peaceful transfer of executive power to an opposition party – as a strong indicator of free and fair elections. However, turnover is neither a necessary nor sufficient condition. For example, Sweden (1933-1976) is considered democratic despite no turnover, and South Africa post-1994 is judged democratic even without an opposition victory. For periods with prolonged single-party control (over two electoral terms), they examine whether internal coups, external interventions, state power abuses, or fraud explain the lack of turnover. If none are found and elections are contested, the period is coded as having free and fair elections. Similar criteria are used to gauge non-peaceful turnovers. So, in contrast to the DD index, Boix et al. prefer limited (targeted) subjectivity over repeated procedural misclassification.

For variable 'B' – universal 'male' suffrage is achieved when at least half of the male population is enfranchised. The authors acknowledge that this threshold is somewhat arbitrary. They chose this criterion for two main reasons: first, requiring full male suffrage would drastically reduce democratic observations before World War I, losing valuable data on early **democratization** (Huntington's 'first' wave – Box 6.3). A similar loss of information would occur by making female suffrage a condition for democracy. Second, the threshold allows for the exploration of how material and class-based conflicts influenced regime choices over time. The flexibility of this threshold also enables researchers to adjust it based on specific research questions, such as the impact of female suffrage.

Democracy in the BMR classification must meet these clear (cumulative) standards for both contestation and participation (suffrage). This is categorical, as a continuous measure entails no necessary condition for democracy (unless a maximal score on each component is required). If any of these conditions are not met, a regime is classified as non-democratic (autocratic). This (residual) category encompasses a wide range, including electoral authoritarian regimes where **elections** may exist but are non-competitive or where civil liberties are significantly curtailed. For example, regimes where people vote but elections are uncompetitive (and therefore, policymakers are not accountable) or cases with meaningful electoral competition but limited suffrage to a small elite (e.g., Apartheid South Africa).

BMR's coding approach involves evaluating historical records and previous datasets like the **Polity Index** but often reinterpreting cases to improve comparability across their extended period (Boix et al. 2013). For example, BMR reclassified some regimes that had been previously coded as democratic due to more restrictive suffrage laws or less competitive elections.

BMR's classification has had several significant impacts on the field of comparative politics. First, their dataset covers an extensive period from 1800 to 2007, making it the first among the longest-running datasets available for regime classification. This expanded temporal scope, combined with *consistent* criteria, allows scholars to study long-term trends in **democratization**, regime **stability**, and **transition** patterns across different historical contexts. For instance, researchers can examine how events like industrialization or wars have influenced regime transitions over two centuries (Boix et al. 2013).

Despite its strengths, BMR's approach has received several criticisms. One major critique concerns all dichotomous classifications. Like others of the same kind, BMR's framework oversimplifies the complexity of many political systems, which scholars refer to as **hybrid regimes** or **anocracies**. They can also not benchmark intra-regime changes or democratic backsliding, which takes place between election cycles (e.g., **authoritarian constitutionalism**).

Another critique relates to civil liberties, which do not play a central role in their classification system. Some scholars argue that this underemphasis on civil liberties overlooks important aspects of democratic quality (like restricted press freedoms or assembly rights). Finally, while BMR made significant strides in extending their dataset back to 1800, concerns remain about incomplete or unreliable data from earlier periods. For instance, some European democracies under Nazi occupation during WWII were duly classified as democratic. A comparison with **Regimes of the World** (RoW) has shown several of these shortcomings (Lührman et al. 2018).

TRICHOTOMOUS CATEGORIES OF POLITICAL REGIMES

Theories are nets cast to catch what we call 'the world:' to rationalize, to explain, and to master it. We endeavour to make the mesh ever finer and finer.
– Karl Popper, *The Logic of Scientific Discovery* (1959)

At the end of the Cold War, the global political landscape underwent significant changes. Many authoritarian regimes at the end of the 'third wave' (Box 6.3), particularly in the post-Soviet and developing world, began to liberalize to some extent by holding regular elections. However, these regimes fell short of transitioning into full liberal democracies. In the early 1990s, there was still widespread optimism that democracy would become the dominant political system globally. However, as time progressed, it became clear that many of these regimes were not moving toward liberal democracy (cf. 'Transitology' – Box 5.3) at all, but instead found some equilibrium, remaining stuck in a hybrid state – seemingly combining elements of both democracy and authoritarianism.

Initially, these regimes were often classified as **democracies with adjectives** reflecting their partial adherence to democratic norms. However, scholars soon realized that new and better conceptual frameworks were necessary to analyze these hybrid regimes. Early contributions from scholars like **Gasiorowski** (1990; 1993; 1996) provided important data on these regimes in the developing world. Later, **Mainwaring, Brinks & Pérez-Liñán** (2000; 2007) refined the coding criteria for classifying these systems, marking a significant advancement in the field. These scholars all acknowledged that political regimes exist on a continuum between democracy and autocracy and that dichotomous classifications were insufficient to capture the complexity of these new **hybrid regimes**, which they called 'semi-democracy.'

By the early 2000s, a pivotal moment occurred with the publication of a special issue of *The Journal of Democracy* (Volume 13, Issue 2), where scholars like Larry Diamond, Andreas Schedler, and Steven Levitsky and Lucan Way formalized the study of hybrid regimes by introducing terms like 'electoral authoritarianism' (**Schedler**) and 'competitive authoritarianism' (**Levitsky & Way**). This marked a conceptual shift: these regimes were no longer seen as diminished or corrupted forms of democracy (e.g., illiberal democracy, cf. Zakaria 1997) but rather as distinct, new types of authoritarianism that employed elections as tools for maintaining power.

This shift in classifications had profound implications for comparative authoritarianism. It redirected scholarly attention toward studying **elections & electoral malpractice**, **constitutional authoritarianism**, and the unequal playing field in these regimes. Scholars began to focus on how electoral regimes interacted with **civil society** and **opposition** forces while maintaining control through seemingly democratic institutions like parliaments and political parties. This subfield challenged analysts to think carefully about the relationship between **democratization** – which is related to the electoral process – and alternation in power – which relates to electoral outcomes (Donno 2013: 714).

Regimes of the World (RoW) is a spin-off from **Varieties of Democracy** (V-Dem) aimed at tackling hybrid regimes. They, however, split the 'murky middle' between closed autocracy and liberal democracy into two categories: electoral autocracy and electoral democracy, divided along the Dahlian tightrope of minimalist prerequisites for democracy (for their coding details, see the entry on V-Dem.)

In 2021, **Anderson, Brownlee & Clarke** brought the concept full circle: In the 1990s, hybrid regimes were considered a diminished democratic subtype (semi-democracies); in the 2000s, they were treated as a separate type of authoritarianism, and in 2021, Anderson et al. framed them as non-authoritarian non-democracies (NANDs).

As of 2024, it is clear that this reclassification has achieved its goal. The study of electoral authoritarianism has actually become mainstream in comparative politics, enabling scholars to analyze these regimes with greater precision. While trichotomous classifications were initially useful for identifying hybrid regimes, more nuanced **polychotomous categories** have since emerged, offering better tools for understanding the diversity within electoral authoritarian regimes. As a result, no innovative trichotomous datasets have been developed. Instead, scholars have absorbed these insights into more comprehensive frameworks for studying authoritarianism today. For in-depth methodological and theoretical treatises of **hybrid regimes**, consult the entry directly in the section 'concepts & archetypes.'

Gasiorowski – Political Regime Change (PRC)

The only way to make sense out of change is to plunge into it, move with it, and join the dance.
– Alan Watts

Mark J. Gasiorowski's (1993; 1996) classification of political regimes, as implemented in the *Political Regime Change* (PRC) dataset, is a widely used approach in comparative politics to categorize regime types and track transitions between them. The PRC dataset classifies regimes into three main categories: democratic, semi-democratic, and authoritarian. It covered 97 developing countries in Latin America, the Middle East, Africa and Asia (excluding Japan, Australia and New Zealand) with populations of at least one million in 1980. The PRC dataset starts at the date of independence or equivalent from around the same time. His approach was inspired by earlier attempts at classifications and studies of regime transitions like Diamond et al. (1987), **Linz & Stepan** (1978), and Rueschemeyer et al. (1992), who in turn go back to **Dahl** (1971). Unlike Linz (1975), Gasiorowski (1996: 470) classifies totalitarian regimes under authoritarianism since there are so few cases.

In Gasiorowski's system, *democratic regimes* (i) are those where there is meaningful competition for government positions through regular elections that exclude the use of force. These regimes also ensure a high level of political participation, meaning no major adult social group is excluded from the political process. Furthermore, civil and political liberties must be sufficiently protected to guarantee the integrity of political competition and participation.

Semi-democratic regimes (ii), on the other hand, exhibit some degree of political competition and freedom but fall short of full democracy due to significant limitations. These may include restrictions on the power of elected officials, compromised electoral fairness, or constraints on civil liberties that prevent certain political orientations or interests from organizing or expressing themselves fully. In these regimes, while elections may be competitive to some extent, they deviate significantly from popular preferences due to these restrictions.

Finally, *authoritarian regimes* (iii) are characterized by little or no meaningful political competition or freedom. In such regimes, elections (if they exist) are not genuinely competitive, and there is little space for opposition or dissent.

In addition to these three categories, Gasiorowski's dataset includes a *transitional category* (iv) for countries undergoing deliberate efforts to shift from one regime type to another. This transitional category signals periods of institutional flux that researchers might want to account for separately from stable regime types.

The coding criteria in Gasiorowski's PRC dataset are event-based and go beyond simply focusing on **elections** as indicators of regime type. While multi-party elections are considered a necessary condition for democracy, they are not sufficient on their own. The dataset uses additional criteria to assess whether a regime meets the standards for democracy. These include (a) Whether the government unilaterally changes political institutions or invokes legislation to stifle peaceful opposition. (b) Whether the government tolerates information critical of its policies and leaders. (c) Whether the government ensures that the right to peaceful opposition is honored by military or security forces. If a country meets the criterion of competitive elections but fails any of these additional criteria, it is coded as semi-democratic. For cases where competitive elections are not used to assign authority or where important social groups are excluded from electoral competition, regimes are coded as authoritarian unless there is clear evidence that the government tolerates significant forms of peaceful political activity (Reich 2002).

One major criticism of Gasiorowski's classification system is related to the ambiguity surrounding the semi-democratic category. This category often encompasses a wide range of regimes with varying degrees of democratic and authoritarian practices. As noted by Reich (2002), this can make it difficult to clearly distinguish between different types of semi-democratic systems, resulting in conceptual vagueness. The semi-democratic category was designed to capture **hybrid regimes** that emerged during many third-wave transitions (Box 6.3); however, its broad application can sometimes obscure important differences between cases (Munck & Verkuilen 2002; Reich 2002).

Another criticism concerns an over-reliance on elections as a baseline indicator for determining regime type. Although Gasiorowski's framework incorporates broader indicators such as civil liberties and **opposition** rights, critics argue that it still places too much emphasis on electoral processes. This focus can overlook other critical factors influencing regime characteristics, such as informal power structures or constraints on executive authority (Munck & Verkuilen 2002; Reich 2002).

Additionally, the event-based focus of the PRC dataset has been critiqued for potentially missing longer-term trends in regime behavior that discrete events like elections or constitutional changes may not capture. By focusing primarily on the observable, the dataset underestimates gradual shifts in regime characteristics over time. Finally, the coding for the PRC dataset was performed by Gasiorowski alone. This raises concerns about potential coder bias and the lack of intercoder reliability checks. (Munck & Verkuilen 2002; Reich 2002)

While Gasiorowski's work built on earlier conceptualizations of hybrid regimes, his work made a major empirical contribution by offering the PRC dataset that (however imperfect) operationalized these categories.

Mainwaring, Brinks & Pérez-Liñán – Semi-Democracies in Latin America

La democracia es un camino que hay que recorrer todos los días
(Democracy is a path that must be traveled every day)
– Adolfo Suárez González (1932-2014), first democratically elected prime minister of Spain

Scott Mainwaring, Daniel Brinks, and Aníbal Pérez-Liñán's classification of political regimes in Latin America from 1945 to 1999 represents a significant contribution to the field of comparative politics. Their work is particularly notable for its methodological rigor and theoretical innovation, offering a more nuanced approach than previous models.

Like **Gasiorowski** (1993; 1996), Mainwaring et al. (2000; 2007) introduced a trichotomous ordinal scale that classifies political regimes into three categories: (A) democratic, (B) semi-democratic, and (C) authoritarian. Thus, their model recognizes the existence of intermediate regime types that do not fit neatly into either category: this middle ground – semi-democracies (B) – captures the reality of **hybrid regimes**.

At the core of their classification is a minimalist (but not sub-minimal) procedural definition of democracy that is supplemented with discretionary coding. It encompasses four key criteria: (i) free and fair elections, (ii) inclusive suffrage, (iii) protection of civil liberties, and (iv) effective civilian control over the military. These criteria are disaggregated and then re-aggregated to form an overall assessment of a regime's type. For each criterion (democratic principle), a regime can either meet that criterion, partially violate it or violate it in a major way.

Democracies (A) are those cases with no violations of any of the four criteria. *Authoritarian regimes* (C) have at least one 'major violation' for any of the four criteria. *Semi-democracies* (B) have at least one and a maximum of four 'partial' violations.

This method allows for a more detailed analysis of regimes that may meet some but not all democratic criteria, and their classification system is underpinned by explicit coding and aggregation rules designed to ensure transparency and replicability in regime assessments. The rules specify how different types of violations of democratic principles should be coded and distinguish between major and partial failures (violations) (Mainwaring et al. 2000).

The authors admit that while they strive for objectivity in coding regimes, there is an unavoidable element of subjectivity involved in making these judgments. They argue that informed judgments based on case-specific knowledge are preferable to using procedural criteria that can only amount to a sub-minimal definition of democracy. Still, this subjectivity and potential bias have been criticized. Also, there is quite some variation within (B) semi-democratic and (C) authoritarian types.

The introduction of a trichotomous classification system has had a profound impact on comparative politics, particularly in studies focusing on Latin America. It provided greater differentiation between regime types than previous models and could deal with cases from the third wave of democracy (cf. Box 6.3). Their work has also led to improved measurement practices in comparative politics by introducing explicit coding rules that enhance transparency and replicability. Overall, their work has spurred further research into hybrid regimes.

Schedler – Electoral Authoritarianism

The modern history of representative elections is a tale of authoritarian manipulations as much as it is a saga of democratic triumphs.
– Andreas Schedler (2002)

Andreas Schedler's (2006; 2009) classification of political regimes, particularly his concept of 'electoral authoritarianism,' has significantly shaped the study of **hybrid regimes** that blend democratic elements with authoritarian control. His work focuses on regimes that hold regular multi-party elections but systematically violate democratic norms, using elections as a tool to maintain authoritarian rule while presenting an institutional *façade* of democracy.

Schedler's (2002) different take on elections and their function in autocracies co-contributed to a pivotal turn in the field around 2002 (boosting the institutionalist trend in comparative authoritarianism) that closed the door on a previous canon of research that had not been interested in authoritarian elections and opened a new one with a focus on **elections & electoral malpractice**, constitutions (**authoritarian constitutionalism**) and other regime institutions.

With his colleagues, he heralded the age of hybrid regimes: *"The modal dictator in the contemporary world holds multiparty elections. He sets up the institutional façade of democracy, yet undermines its spirit through authoritarian manipulation. He admits regular elections to highest national office and allows independent opposition parties to participate. At the same time, he subjects these elections to severe and systematic manipulation through strategies like media censorship, voter intimidation, the banning of parties or candidates, and electoral fraud. The contemporary dictator, that is, practices 'electoral authoritarianism.'"* (Schedler 2013: 1).

Electoral authoritarianism has become a cornerstone concept in comparative politics, offering a framework for understanding regimes that do not fit neatly into the binary categories of democracy and dictatorship. Schedler defines electoral authoritarianism as a distinct regime type characterized by the presence of multi-party elections for both the executive and legislative branches, which distinguishes these regimes from 'closed' authoritarian systems where elections are either non-existent or entirely controlled by the ruling elite (Schedler 2002). However, despite holding elections, these regimes engage in systematic manipulation to ensure that the ruling party or leader remains in power. Such interference can take various forms, including restricting opposition access to media and resources, controlling electoral administration and vote-counting processes, and using intimidation or violence to suppress opposition activities.

Schedler (2002: 47) considers a sub-classification, distinguishing between two subtypes of electoral authoritarian regimes: 'competitive' and 'hegemonic.' In the former, rulers face insecurity, and elections serve as a real battleground for power, with opposition forces having a meaningful chance to contest. In the latter, rulers seem invincible, and elections are largely symbolic, functioning as a theatrical display to reinforce the ruling elite's dominance.

Regarding operationalization, Schedler (2002) borrowed Diamond's (2002) classification of 192 independent states, classified using a combination of **Freedom House** (FH) scores, electoral data, and informed judgment. Specifically, a regime is classified as electoral authoritarian if it holds multi-party elections but receives average FH scores between four and six, indicating significant restrictions on political rights and civil liberties (Schedler 2006).

Schedler's classification has had a profound impact on how scholars understand political regimes in the post-Cold War era. One of his major contributions is providing conceptual clarity to hybrid regimes that combine elements of both democracy and authoritarianism. Before Schedler's work, these regimes were often poorly understood or misclassified as either flawed democracies or soft dictatorships. By introducing the concept of electoral authoritarianism, Schedler offers a more precise framework for studying such systems on their own terms.

With the third wave of democracy (Box 6.3), many countries transitioned away from outright dictatorship but failed to become fully democratic; thus, electoral authoritarianism emerged as one of the most common regime types, making up more than two-thirds (69.9 percent) of all autocracies in 2002. Miller (2013; 2020) finds this has been a strategic choice on the part of (weaker) autocrats, preferring

elections to the international and domestic costs of not holding them.

Despite its contributions, Schedler's approach has faced several criticisms. One critique (common for trichotomous categories) is that his framework places an overemphasis on elections as the defining feature of electoral authoritarianism and does not give enough attention to other forms of political stability – such as **repression**, **co-optation**, **legitimacy** or other forms of control over civil society opposition. Seeberg (2018) finds that an incumbent's control over the economy correlates with successful election manipulation. Another criticism is that Schedler's category of electoral authoritarianism is still too broad (despite the subtypes he provides) and overlooks important questions about how **power** is exercised once it is obtained. His residual category of 'closed' regimes has also been criticized (cf. Snyder in Schedler 2006) as lumping cases together with too much order and too little control on government.

Levitsky & Way – Competitive Authoritarianism

The ballot is stronger than the bullet.
– Abraham Lincoln

Steven Levitsky and Lucan Way's concept of 'competitive authoritarianism' has become a significant analytical tool for the study of **hybrid regimes** that blend democratic and authoritarian features. First introduced in 2002 and accompanied by an eloquent middle-range theory of **democracy promotion** in their 2010 work *Competitive Authoritarianism: Hybrid Regimes After the Cold War* (see: **Linkage & Leverage Theory**), the authors sought to address the limitations of traditional dichotomous categories of political regimes, and also bring more clarity to the middle ground where formal democratic institutions exist, such as elections and opposition parties, but the playing field is heavily skewed in favor of incumbents; In other words, those regimes upholding a *façade* of democracy while subverting its core principles.

Levitsky and Way define competitive authoritarian regimes quite narrowly as a specific (sub-)type of hybrid regimes: those that hold regular, competitive, multi-party and inclusive elections, offering genuine opportunities for opposition parties to challenge incumbents. However, while **elections** are competitive, they are not fair. The ruling party or leader manipulates state power to suppress opposition and tilt the electoral playing field in their favor. This manipulation can take various forms, including limiting opposition access to media and resources, controlling the **judiciary** to harass opponents, and employing **patronage** networks to secure support.

Despite these manipulations, competitive authoritarian regimes maintain a *façade* of democratic **legitimacy** by holding such elections, which helps them secure **foreign aid** and investment while appeasing domestic pressures for political participation. The defining feature of competitive authoritarianism is the 'uneven playing field' on which political competition occurs. While opposition parties can contest elections and even win some seats in parliament or local offices, they face significant disadvantages compared to incumbents who control state resources and institutions. This distinguishes competitive authoritarian regimes from both full democracies (where elections are free and fair) and closed authoritarian regimes (where elections are non-existent or tightly controlled). A. **Schedler** (2002; 2006) his concept of 'electoral authoritarianism' is thus much broader.

Unlike some regime classifications that rely on rigid quantitative measures, Levitsky and Way's approach is more qualitative. They do not provide a strict set of quantifiable coding criteria but instead focus on four key 'arenas of contestation' where **opposition** forces can challenge **incumbents**: (i) *Electoral arena* – The level of electoral competition is assessed by examining the fairness of electoral rules, access to media for all parties, and the extent of electoral manipulation by incumbents. (ii) *Legislative arena* – This arena looks at whether opposition parties can operate within the legislature, scrutinize the executive branch, and influence policymaking processes. (iii) *Judicial arena* – The independence of the judiciary is evaluated based on its ability to resist pressure from the executive branch, particularly in cases involving opposition figures or challenges to

the ruling party's power. (iv) *Media arena* – Media freedom is analyzed by looking at whether independent media outlets exist and whether opposition voices can be heard in public discourse.

Levitsky and Way (2002) emphasize that these arenas do not need to be uniformly strong across all competitive authoritarian regimes; instead, there can be significant variation in how these arenas function from one regime to another. For example, one regime may have a relatively independent judiciary but highly controlled media, while another may allow some media freedom but tightly control the legislature.

By introducing the category of competitive authoritarianism, Levitsky and Way refined the study of hybrid regimes and moved beyond simplistic dichotomies by recognizing that many regimes combine elements of both systems. However, their claim that these regimes are relatively stable and find some sort of equilibrium has been challenged: Carothers (2018) argues that competitive authoritarianism has proven to be far less stable than previously thought. His analysis shows that most of the 35 regimes identified as such between 1990 and 1995 have either democratized or been replaced by more overtly autocratic systems. Their quasi-democratic institutions have actually often contributed to their breakdown.

One major criticism is that Levitsky and Way did not provide clearly defined coding criteria, thus making it difficult for researchers to identify competitive authoritarian regimes across different countries or periods consistently. In any case, their classification was applied to various world regions and contributed to our understanding of **democracy promotion**.

For applications on Eurasia, consult Levitsky & Way 2010; Way 2017 (Ukraine); Vladisavljević 2016; Castaldo 2020 (Serbia); Bieber 2020 (Balkans); Evans 2024 (Belarus). For comparative work in Africa, see Bogaards & Elischer 2016 and Cheeseman 2016, with Matti 2010 (on the DRC). For MENA, mostly Turkey is an important case: Özbudun 2015; Esen & Gumuscu 2016; 2019. For Latin America, there are several comparative works: Mainwaring 2012; Levitsky & Loxton 2012; 2015; Cameron 2018. Regarding case studies in the Indo-Pacific, see Giersdorf & Croissant 2011; Croissant 2022 (Malaysia); Mostofa & Subedi (Bangladesh).

Regimes of the World (RoW)

Every nation gets the government it deserves.
– Joseph M. de Maistre (1811)

This dataset is a spin-off of **Varieties of Democracy** (V-Dem); therefore, check the latter for an overview of its methodological approach.

The *Regimes of the World* (RoW) framework was developed to systematically classify political regimes based on their *de facto* implementation of democratic principles and processes rather than relying solely on formal institutional arrangements. This typology addresses the increasing complexity of regime classification in a world where most states hold de jure multi-party elections, but the quality and fairness of these elections vary significantly.

RoW identifies four regime categories: (i) closed autocracies, (ii) electoral autocracies, (iii) electoral democracies, and (iv) liberal democracies. These categories are distinguished based on the extent to which regimes meet key democratic criteria derived from Robert **Dahl's** concept of 'polyarchy.' The criteria include free and fair elections, multi-party competition, suffrage, freedom of association, freedom of expression, and institutional guarantees such as judicial and legislative oversight.

RoW (like V-Dem) is a deductive, democracy-focused regime typology, utilizing V-Dem data to inform classification choices. These categories are thus tied to liberal democracy as their alpha and omega (cf. Coppedge 2023), and besides the electoral navel-staring, no other authoritarian features or attributes are considered as sorting criteria to distinguish between non-electoral regimes.

RoW sorts political regimes into four categories – closed autocracies, electoral autocracies, electoral democracies, and liberal democracies – based on their adherence to democratic principles: (i) *closed autocracies* lack *de facto* multi-party elections or meaningful competition, with no fulfillment of Dahl's democratic prerequisites such as freedom of expression or association. *Electoral autocracies* (ii) hold *de jure* multi-party elections for the chief executive but fail to meet democratic standards due to significant irregularities or constraints on competition. *Electoral democracies* (iii), by contrast, meet three key criteria: *de facto* multi-party elections, free and fair elections, and a minimum score of 0.5 on V-Dem's *Electoral Democracy Index* (EDI), which reflects Dahl's institutional guarantees like freedom of association and clean elections. *Liberal democracies* (iv) fulfill all the criteria for electoral democracies while also ensuring robust legislative and judicial oversight, individual liberties, and equality before the law, as measured by a score above 0.8 on V-Dem's *Liberal Component Index* (LCI).

As with V-Dem, the RoW typology innovatively incorporates measures of uncertainty using Bayesian confidence intervals, in this case, to identify ambiguous cases near thresholds between categories. This allows researchers to account for classification ambiguities in their analyses. By combining qualitative thresholds (e.g., free and fair elections) with quantitative indices (e.g., EDI scores), the framework provides a nuanced yet systematic approach to regime classification. It captures the complexity of modern regimes, offering longitudinal coverage from 1900 to 2016 and addressing gaps in prior typologies that often-overlooked electoral manipulation in contemporary autocracies.

The purpose of this typology is multifaceted. First, it provides a robust framework for distinguishing between different categorical types of regimes along both democratic and autocratic spectrums. This is particularly valuable for research on democratization, regime survival, international aid effectiveness, and the diffusion of democratic norms. Second, it introduces a novel approach to addressing uncertainty in regime classification by incorporating measures of ambiguity using V-Dem's Bayesian confidence intervals. This allows researchers to identify cases that are close to thresholds between categories and conduct robustness checks by excluding ambiguous cases.

Lührmann et al. (2018: 68-71) compare its thresholds with various dichotomous (**Democracy-Dictatorship Index**, **Boix, Miller & Resato**, **Geddes, Wright & Frantz**, **Hadenius & Teorell**) and other continuous measures (**Freedom House**, **Polity Index**) and find that: *"Overall the new RoW typology relatively closely tracks the classification of country-years as either democratic or autocratic by major extant binary measures of democracy. This is a good sign of convergent validity. However, there are substantial differences concerning a significant number of cases, primarily where de-facto practices deviate from de-jure standards. We argue that the RoW typology does a better job than others in these instances, discriminating 'real' from 'fake' democracies."* (*Lührmann et al.* 2018: 71).

The RoW typology also improves upon existing measures by offering greater longitudinal coverage (from 1900 to 2016). By combining qualitative thresholds (e.g., multi-party elections) with quantitative indices (e.g., V-Dem's EDI), it strikes a balance between precision and comprehensiveness while minimizing coder bias through advanced statistical modeling.

In summary, this typology serves as a theoretically grounded and empirically validated tool for analyzing **hybrid regimes** across time and space. It enhances our ability to study the nuances of regime types in a world where formal democratic institutions often coexist with authoritarian practices.

Anderson, Brownlee & Clarke – Non-Authoritarian Non-Democracy (NAND)

At the core is still a vacuum
– Jason Brownlee (2010)

The truth is out there
– X-Files

Ashley Anderson, Jason Brownlee and Killian Clarke's (2021) conceptualization of **hybrid regimes** represents a significant departure from traditional approaches in comparative politics. Historically, many scholars have defined autocracies in residual terms – essentially as non-democracies. These **dichotomous categories** classify regimes based on the absence of democratic features such as electoral contestation and alternation of power. In most of these approaches, any regime that does not meet the criteria for democracy is consequently labeled an autocracy, authoritarian regime or dictatorship, but is actually just a 'non-democracy,' a 'pseudo-class' of heterogeneous cases (cf. Satori 1991).

Anderson et al. (2021) argue that this residual approach leads to conceptual slippage, where regimes that are not fully democratic but also not fully autocratic are lumped together under the broad category of **authoritarianism**. To address this issue, they propose a substantive definition of autocracy based on 'positive' criteria rather than the mere absence of democracy. (For these reasons, they also diverge from **Linz's** (2000) ('negative') defining criteria, such as lack of a guiding ideology and lack of extensive or intensive political mobilization, or from Purcell's (1975) characterization regarding the low degree to which they respond to their citizens' demands. The levels of institutionalization or repression are also too varied across cases to count as a defining criterion.

They define *autocracy* as a politically exclusive rule characterized by two key features: (i) Monopolization of state control by a single group and (ii) absence of routinized mechanisms for other groups to share or replace the ruling group in executive power. For *Democracy,* they adhere to a minimalist, procedural definition (cf. Alvarez et al. (1996) – **Dictatorship-Democracy Index**). This leaves their third category: NANDs (Non-Autocratic Non-Democracies).

NANDs capture regimes that do not fit neatly into either democracy or autocracy categories: They do not meet the criteria for electoral democracy (i.e., they lack the procedural elements necessary for being classified as democracies, such as free and fair elections with meaningful contestation), nor do they exhibit the characteristics of substantive autocracy (i.e., they do not have a politically exclusive rule, where a single group monopolizes executive power and prevents others from sharing or replacing them. They actually observe five major manifestations of NANDs: (a) anarchies, (b) foreign occupations, (c) transitional regimes, (d) competitive oligarchies, and (e) competitive authoritarianism. All five of these regime types fall short of the procedural standards of democracy and, for that reason, have often been erroneously treated as autocracies in prior research.

The first three (a, b, c) are all regimes in flux and have routinely been quarantined in datasets because they are so hard to pin down. In none of these cases does a ruler actually rule – power is too diffuse – so they cannot be considered autocratic. Since these regimes also did not hold free and fair elections to the executive, they cannot be considered democracies. The latter two (d & e) are quite different. When regimes did not extend their suffrage extensively enough to meet the 'participation' dimension of democratic definitions, they are considered competitive oligarchies (d). In the final categories, the exclusion of rival or opposition groups is not total and these cases match the conceptualization of **Levitsky & Way** (2002; 2010) and are hence also called 'competitive authoritarian' regimes (e).

Anderson et al. (2021) offer specific coding criteria but do have to fall back on an arbitrary cutoff to mark the dividing line between authoritarianism and competitive authoritarianism (i.e., above and below 80 percent of the vote share for the ruling group). They also take an 80 percent threshold for electoral suffrage to count as a democracy (above 80 percent) or non-democracy (below 80 percent). The authors are fully aware that the operationalization of their classification will face a different set of hurdles than its conceptualization.

POLYCHOTOMOUS CATEGORIES OF POLITICAL REGIMES

Science is rooted in the effort to discover something about the world, rather than to be content with one's own or another's illusions.
– Karl Popper, *The Logic of Scientific Discovery* (1959)

The study of regime classifications has long been shaped by a dichotomous framework that juxtaposes democracy against non-democracy. Even the most influential classifications of autocracies – such as those by **Linz** or **Geddes, Wright & Frantz** or **Hadenius & Teorell** – begin by isolating democracies as a distinct category before applying criteria to classify the remaining non-democratic regimes. This approach, while methodologically consistent with the rise of democracy as a dominant political ideal, reflects an inherent bias. Democracy serves as the foundational reference point, shaping the conceptual and empirical boundaries of regime typologies. This bias is deeply rooted in Western-centric normative assumptions that liberal democracy represents the pinnacle of governance.

Historically, earlier classifications (e.g. **Plato & Aristotle**) avoided this dichotomous bias due to the absence of democracy as a dominant regime type in those times. These frameworks often employed true polychotomous approaches, dividing regimes into multiple families and subcategories without privileging democracy as the starting point. Nonetheless, contemporary classifications are typically considered polychotomous because they offer nuanced categorizations within the broader dichotomy of democracies versus autocracies.

The evolution of regime typologies has also been influenced by shifting scholarly priorities. For instance, Hadenius and Teorell (2007) emphasized **elections** as a stepping stone toward **democratization** (following a broader electoral turn alongside **Schedler** and **Levitsky & Way**), while others, such as **Kailitz**, reintroduced ideological dimensions to authoritarianism. Despite these innovations, all classifications face methodological challenges. Polychotomous frameworks, while offering greater explanatory power by incorporating multiple variables, are prone to observation biases and difficulties in categorizing hybrid regimes.

A major issue that plagues many categorical classifications but is particularly pronounced for those focused on dictatorships is that when cases are once pigeonholed into one category or another, they can no longer 'move' between types before they break down and are replaced. The initial coding is usually done carefully: when a new dictatorship comes to power, many coders prudently wait until the transitional period is over in order to label it, but slow-evolving, incremental changes are not accounted for. For example, some regimes become personalist over time (like Mao Zedong's communist party regime in China), while their initial (single-party) label sticks. The issue is even more pronounced after **succession** (meaning a leader transfer, not a **transition**), where new rulers can either be very much controlled by the inner circles of their predecessors or exhibit notable higher levers of personalism, e.g., after a palace coup (Van den Bosch 2024a).

Of course, current regime classifications have developed measures for **personalization**. Some coders reclassify regimes from single-party to multi-party labels as they take stock of regimes' institutional adaptation. However, too many regime features are fluid and are either captured in binary fashion or omitted. For this reason, Van den Bosch (2024b) proposes to introduce vectorial dimensions for personalization, the intensity and dominance of the guiding ideology, and pluralism while also accounting for various organizational features (and their amalgams: party-based, military and tutelary bodies).

The overview below presents the most influential polychotomous classifications, as well as some lesser-known ones (Sartori 1971; 1993; Wintrobe 1990) and brand-new ones (Kailitz 2024; Anckar & Fredriksson 2018).

Sartori – Purifying Classifications & Typologies

What democracy is cannot be separated from what democracy should be.
– Giovanni Sartori, *The Theory of Democracy Revisited* (1987)

Giovanni Sartori (1924-2017) is not usually regarded as an original scholar of undemocratic politics. Perhaps this is because his insights on dictatorship are scattered in various texts; he did not write a coherent book on dictatorship theory, and his arguably most important texts on the subject remain in the original Italian (see Sartori 1971: 456-485; 1995). Thus, we associate Sartori more with classifications and typologies (not the same thing, in his view) of parties and party systems (Sartori 1976; 2005) or democratic regimes (Sartori 1994). We also know him as a methodologist of the social sciences, where comparisons, typologies, etc. play a central role (Collier & Gerring 2009; Kubát & Mejstřík 2019; Sartori 1984). His contributions to methodology cannot be downplayed; Sartori (1970) introduced the ideas of 'conceptual traveling' and 'conceptual stretching,' which are critical reflections to ensure that political concepts are applied correctly across different contexts.

Sartori was primarily interested in three issues in relation to the conceptualization and typology of non-democratic regimes. The first is the use of different words (concepts) in terms of their historical development, or what terms we can use to refer to historical and contemporary regimes, and to what extent we can or cannot confuse them. Second, it is the circumstances surrounding the use of the concepts of **authoritarianism** and **totalitarianism** (including their definitions). Third is the general theory of dictatorship and the typology of dictatorships.

Non-democratic regimes have been variously labeled, some of which are of historical origin, while others emerged only in the twentieth century. Terms such as 'tyranny,' 'despotism' or 'absolutism' are a thing of the past. **Tyranny** is an anachronistic term and should, therefore, only be used in the context of antiquity. **Despotism** is also a historical concept, except perhaps for regimes that originated and operated outside the Western civilizational and cultural world (Sartori 1995: 65-67). The most appropriate historical term for it is **absolutism**, which is a general term for unrestricted political power (Sartori 1995: 68). On the contrary, 'authoritarianism' and especially 'totalitarianism' are modern terms. **Totalitarianism** is a regime that must have advanced technological means at its disposal to allow the expansion and penetration of totalitarian power into different spheres of life. Another aspect of the modernity of totalitarianism is the ideologization of politics and the ideological indoctrination of society (and the party nature of the regime) (Sartori 1987). Indeed, Sartori's conception of totalitarianism does not substantively depart from the mainstream 'six-point syndrome' (Schapiro 1978: 18) of Friedrich and Brzezinski's (1962: 9-10) definition.

Sartori further advocated that the word 'totalitarianism' should not be used to refer to a specific political system but should be replaced by the prefix 'totalitarian' in the sense of a term denoting the essence of an extremely despotic type of dictatorship (Sartori 1995: 253). It is, therefore, in his view, correct to use the term 'totalitarian dictatorship' rather than 'totalitarianism,' which is consistent with his view that totalitarianism (and authoritarianism) is a Weberian ideal type of dictatorship that is more universal as a concept.

On the borderline between historicism and modernity is the concept of 'dictatorship,' which is a general term that encompasses all the above-mentioned words and terms. Sartori paid the most attention to the concept of dictatorship. The term 'dictatorship' is clear enough; it is simply a general label for any non-democratic regime. Sartori was not satisfied with the existing typologies of dictatorships. He argued that they conflated disparate geographical, ideological, and political criteria. To manage this confusion, he first proposed a classification (Sartori 1971; 1995) and later a typology (Sartori 1993) of dictatorship (cf. **dictatorship** for these details). With his classification of dictatorship, Sartori carefully organized this concept, which is both very diverse and very common (Panebianco 2005: 259-260).

On the other hand, it is somewhat lost in the vast number of typologies of non-democratic regimes (cf.

Balík & Kubát 2015; Brooker 2014) while naturally overlapping with some of them. It could not compete with more established typologies, notably Juan J. **Linz** (2000) or, for example, Wolfgang Merkel (1999), even if translated into English. His later typology of dictatorship (in English) suffered a similar fate. Sartori (1924-2017), for natural reasons, could not enter the discussion of the new forms of dictatorships of recent years.

Linz & Stepan – Totalitarianism & Authoritarianism

A simple dichotomy between democratic regimes and nondemocratic rule obscures the distinctiveness of the totalitarian phenomenon.
– Juan José Linz (2000)

Juan José Linz (Storch de Gracia, 1926-2013), along with his co-authors Alfred Stepan (1936-2017) and Houchang Chehabi, has had a profound impact on the study of dictatorships and non-democratic regimes. Their regime classifications, based on Linz's original work from 1975, have been as influential as they have been criticized. The saying 'tall trees catch much wind' absolutely applies, and Linz and his colleagues undoubtedly advanced the field by generating so many debates.

While Linz is primarily recognized as a scholar of **totalitarianism**, continuing and refining the intellectual tradition of figures like Hannah Arendt, Carl J. Friedrich, and Zbigniew Brzezinski, his broader goal was to make sense of the growing diversity of political regimes that fell between the poles of democracy and totalitarianism. His typology aimed to bring analytical clarity to this 'in-between' space, offering a nuanced framework for understanding non-democratic governance. Linz's typology is considered polychotomous but has a trichotomous bias. He distinguished authoritarian regimes from the vantage point of both democracies and totalitarian systems but did subdivide this space by separating authoritarianism from regimes based on traditional legitimacy (such as **monarchies**) and those defined by personal rule.

The problem started with delineating totalitarianism. The concept was very narrowly defined and, according to Linz (1975), does not even encompass a significant portion of communist and fascist states (Kailitz & Köllner 2013). A detailed treatise of Linz's **totalitarianism** can be found under its dedicated entry, but suffice to note that contemporary classifications have broadened the concept and now refer to ideologically-guided regimes as **ideocracies**. For instance, **Kailitz** (2013; 2024) includes the latter in his dataset. More on Linz & Stepan's diminished subtype 'post-totalitarianism' can be found under 'totalitarianism' as well.

Linz's framework for **authoritarianism** was groundbreaking in its time but not without limitations. His definition of authoritarianism was primarily residual and negative – isolating those regimes that were both non-democratic and non-totalitarian (Kailitz & Köllner 2013). This reliance on juxtaposition with (foremost two) ideal types (democracy and totalitarianism) shaped the choice for his four main sorting criteria: (a) levels of pluralism, (b) the presence or absence of a guiding ideology, (c) the degree

of leadership restraint, and (d) the extent of political mobilization.

This affected the definition of authoritarianism, which feels negative and imprecise as it blows hot and cold at the same time in identifying those regimes characterized by constrained *but* unaccountable political pluralism, lacking a comprehensive or directive ideology *but still* shaped by distinctive mentalities, with minimal political mobilization – both in scope and intensity – *except* during certain phases of their evolution, and where authority is wielded by a leader *or* a small group, operating within ambiguous and loosely defined boundaries (Linz 1964; 1975).

These criteria were originally designed to identify (and contrast) democracy and totalitarianism rather than authoritarianism itself (a full overview of the contrasting features of the latter two can be found in **authoritarianism**.) As a result, authoritarianism became a broad category that was difficult to imagine as an ideal type in its own right; it is more an equilibrium between two extremes and an ideal type. Critics have rightly noted that Linz's umbrella category of authoritarianism is too expansive to facilitate meaningful comparisons between cases. Moreover, its subtypes (see below), in contrast, are too narrowly specific to compensate for this issue.

The seven subtypes of authoritarian regimes, all covered under the same entry, can be compared based on their characteristics of pluralism, ideology, leadership, and mobilization. These distinctions expose their diversity and their internal dynamics, but all subtypes are also ideal types, and actual cases often exhibit characteristics from multiple categories.

His work on personalist regimes, particularly in collaboration with Chehabi on (neo-)sultanism, has been influential but also methodologically challenging due to difficulties in operationalizing the criteria for these regimes. Hence, the shift to **personalist rule** in the last 30 years. Note that Linz actually categorized 'personal rule' into four distinct systems: (i) *oligarchic democracy,* (ii) *caciquismo,* characterized by the dominance of local political bosses, (iii) *caudillismo,* marked by the leadership of military chieftains rather than professional officers, and (iv) modern *sultanism,* which was the most contemporary and widespread form of personal rule. (Brooker 2000: 33). For a detailed overview of *caciquismo* and *caudillismo,* consult Box 1.10. Linz's (neo-)sultanism is fully covered in **sultanism & neo-sultanism** and compared to its Weberian origin.

Kailitz and Köllner (2013) rightfully note that it is still often overlooked that Linz fundamentally viewed sultanistic (personalist) regimes and monarchies as independent types and not as 'authoritarian regimes' in the proper sense. This means that Linzean 'authoritarianism' cannot be equated with our contemporary and prevalent use of the term authoritarian regimes as synonyms of autocracy and dictatorship (see Table 1.2 under **authoritarianism**).

While his separation and distinction of (neo-) sultanism brought attention to the unique characteristics of personalist rule, it arguably diminished the analytical coherence of authoritarianism as a category by failing to treat personalist tendencies as features that could exist across regime types.

Operationalization has been another major challenge for Linz's typology. His classifications rely heavily on subjective assessments, making replication difficult. Furthermore, his framework lacked clarity regarding coding criteria and their hierarchical application. This ambiguity complicates efforts to classify regimes consistently or compare them systematically. For instance, while Weberian concepts of legitimacy guided Linz, his primary focus was on how power is exercised within regimes rather than how access to power is gained – a critical dimension in studies of transitions and regime change (Schedler 2009).

Linz's typology also reflects its historical context. Developed in the 1970s and expanded in the 1990s, it was rooted in post-WWII conceptualizations of political regimes. Consequently, it struggled to account for newer phenomena, such as **hybrid regimes** or electoral authoritarianism**,** that emerged prominently after the Cold War. His framework did not incorporate dimensions like state capacity or 'stateness,' which are now recognized as important for understanding regime durability and performance and, in many ways, crucial to benchmark how power is exercised (Schneider 2010: Gilbert & Mohseni 2011).

Over time, the typology was refined with the expansion of two previously under-highlighted categories: post-totalitarian (Linz & Stepan 1996) and sultanistic regimes (Chehabi & Linz 1998). However, these expansions failed to address criticisms from contemporary scholarship, which has largely moved away from this framework, deeming it obsolete (Snyder & Mahoney 1999; Hadenius & Teorell 2007). Critics have highlighted not only the typology's lack of general applicability but also its misalignment with the complexities of empirical political realities (Lidén 2011; 2013).

Despite these limitations, Linz's work remains widely cited for its insights into non-democratic governance. His meticulous attention to nuance influenced later typologies and classifications of political regimes. However, his framework has not been broadly applied due to its methodological difficulties and its inability to adapt to rapidly changing political realities after the 1980s.

Wintrobe – Tinpots & Totalitarians

The paradox is that the more the dictator uses his repressive apparatus to stifle opposition, dissent, and criticism, the more reason he has to be afraid, because the more opposition is stifled, the less he knows how much support he really has.
– Ronald Wintrobe (1990)

This two-dimensional classification by Ronald Wintrobe was inspired by earlier works on **totalitarianism**, especially those of J. Kirkpatrick (1982), H. Arendt (1951) and Friedrich and Brzezinski (1965). With the focus limited to autocratic rulers only, grounded in economic and rational choice theory, Wintrobe deductively extrapolates dictators' attitudes toward demanding loyalty, retaining control and collecting the fruits of office (**rent-seeking**) along two dimensions: (A) Opting for personal consumption (**rents**) with minimally required repression or instead seeking full control. (B) Seeking loyalty or not by providing public services in exchange for political support (Wintrobe 1990; 1995).

The rationale of this leader typology is to show different dictatorships' resilience to economic change and make policy suggestions for democratic regimes on how to deal with them and which ones will be more likely to reform and liberalize in light of economic downturns and enticements (foreign aid). Wintrobe's works contributed significantly to the study of correlations between civil liberties and economic performance by positing that **repression** and **co-optation** can be treated as two substitutes for maintaining authoritarian control (Svolik 2012: 9).

His typological matrix yields four categories of rulers: (a) *tinpots*: characterized by low levels of repression and loyalty, minimizing the costs for staying in power. (b) *tyrants*: characterized by high levels of repression and low loyalty, not investing in institutions to foster support. (c) *totalitarians*, characterized by high levels of repression and loyalty, and (d) *timocrats*, characterized by low levels of repression and high loyalty, maximizing the welfare of the people (see also **timocracy**). Only tinpots (a) and totalitarians (c) find themselves in some sort of equilibrium (Wintrobe 1990; Ezrow & Frantz 2011: 12-13).

Wintrobe's contributions remain mostly theoretical since his deductive typology does not have clear coding criteria or thresholds. Islam and Winer (2004) developed a dataset (borrowing available indexes as proxies) to test Wintrobe's hypotheses but could only partially confirm his theory, finding that positive economic growth leads to a reduction in the degree of freedom in totalitarian regimes, while negative growth having either a positive impact or no effect on freedom levels. However, broadening the defining scope of 'totalitarian' worsens these findings (Islam & Winer 2004: 315).

In later revisions, Wintrobe (2019) aims to establish bridges between his categories and other classifications. This is troublesome because his typology came out of a (bygone) Cold War reality and focuses on a ruler's rational choice (not on regime behavior as such). He considers military regimes (from the 1980s) a subtype of tinpots (both have short lifespans), and he equals single-party regimes with totalitarians (notwithstanding the absence of an **ideology**). However, there does seem to be an empirical equivalent for 'timocracies,' Wintrobe (2019: 306-307) admits these biases, his personal preference for rational-choice theories, and concedes the complexity of such comparisons.

Wintrobe extended his theory to suicide **terrorism** (2006), coup d'états (2012) and **hybrid regimes** (2018), papal **theocracy** (Padovano & Wintrobe 2013) and a recent article (Qvortrup et al. 2020) links the typology to explain the use of plebiscites in autocracies.

Geddes, Wright & Frantz (GWF)

As virtually all close observers of authoritarian governments have noted, politics in such regimes, as in all others, involves factionalism, competition, and struggle. The competition among rival factions, however, takes different forms in different kinds of authoritarian regimes and has different consequences.
– Barbara Geddes (1999: 121)

The typology developed by Barbara Geddes, Joseph Wright, and Erica Frantz (GWF) has become one of the most influential frameworks for classifying authoritarian regimes since the early 2000s. Their contribution marked a significant departure from earlier paradigms (e.g., **Linz & Stepan**), which treated non-democracies as a residual category between democracy and totalitarianism. By abandoning the concept of totalitarianism altogether, GWF isolated all non-democratic regimes under a single analytical framework.

The GWF typology broke with the Linzean tradition of viewing **authoritarianism** as a residual category. Instead, it adopted a deductive, dictatorship-oriented perspective, focusing on identifying and analyzing variations among authoritarian regimes. Although at its core, it should be counted as one of the **dichotomous categories** – since GWF rely on an arbitrary threshold to distinguish democracies from non-democracies – their classification was designed to explore differences within authoritarian systems rather than between democracies and autocracies. One cannot make the argument the democracies are the residual category since their coding criteria clearly define all dictatorships as non-democracies before classifying them further into subtypes.

A regime is coded as democratic in the GWF framework if the executive comes to power through 'reasonably fair competitive' direct or indirect elections with suffrage extending to at least 10 percent of the population (Geddes et al. 2013: 6). However, this criterion requires significant subjective judgment from coders. For instance, determining whether an election was 'reasonably fair and competitive' often relies on reports from election observers, which can be problematic due to the lack of universally agreed-upon standards among such organizations. Furthermore, key concepts such as what constitutes a 'competitive' election or a 'large' party remain ambiguously defined in Geddes et al. (2013). Similarly, their method for estimating the size of parties that operated without legal recognition is unclear (Wahman et al. 2013).

Initially, the typology (Geddes et al. 1999) categorized non-democratic regimes into three primary types: party-based/civilian (**single-party regimes**), **military regimes**, and **personalist rule** (it also included residual categories for countries under foreign occupation or colonial rule and states with populations under three million inhabitants). **Monarchies** were initially subsumed under personalist rule. However, subsequent updates introduced monarchies as a distinct category, cf. Geddes et al. (2014b; 2018). Since these three/four categories all respond with authoritarian archetypes, each of them is expanded upon in a separate entry in the section 'Concepts & Archetypes.'

One of the most impressive aspects of the GWF typology is its accompanying dataset. The original dataset provided clear coding criteria and covered regimes from the early 1970s to 2000. Over time, it was expanded to include most regimes worldwide after WWII. The coding criteria focused on distinguishing leadership groups and identifying the dictator's background. Analogous to **selectorate theory**, one finds that GWF analyzed the size and composition of the **winning coalition**, as well as its relationship with the ruler (**incumbent**). This explanatory typology enabled scholars to theorize regime behavior using rational choice and game-theoretic models. By focusing on leadership dynamics and coali-

tion structures, GWF provided a robust framework for studying both the performance and behavior of dictatorships. This approach complemented earlier research that primarily distinguished democracies from non-democracies using democracy-focused **dichotomous categories** or **continuous measures**.

Despite its innovations, the GWF typology faces significant challenges in classification, especially regarding its amalgams. As Svolik (2012: 31) observes, *"the simultaneous establishment of a single-party, military involvement in politics and a high concentration of power in a dictator's hands are neither logically nor empirically exclusive."* This highlights how authoritarian regimes often exhibit overlapping characteristics that resist neat categorization into one of GWF's three pure types. For example, personalist leaders frequently emerge within military or single-party regimes but rarely eliminate these institutions after consolidating power (Svolik 2012). As a result, distinguishing when a regime transitions from military or party rule to personalist rule is particularly challenging. Moreover, some dictatorships do not fit any of GWF's original categories: for instance, *"regimes that simply do not experience military interventions, do not have a single party, and are not governed by a leader who managed to monopolize power (e.g., contemporary Iran)"* (Lidén 2013).

Similarly, amalgams that combine elements of multiple types – such as military-single-party regimes or military-personalist regimes – pose difficulties for classification due to their conceptual ambiguity (Svolik 2012) (the methodological intricacies of these amalgams are discussed in the methodological section under **personalist rule**). This lack of clarity raises questions about whether GWF's typology is collectively exhaustive or capable of addressing increasingly complex authoritarian configurations.

Personalist rule remains one of the most debated aspects of GWF's typology. This was greatly facilitated because Geddes et al. abandoned the older idiosyncratic terminology of Linzean **sultanism & neo-sultanism** and replaced it with **personalist regimes** (as did S. Huntington) and provided explicit coding criteria. Borderline cases, e.g., between personalist and military rule, existed and were particularly difficult to pigeonhole (as GWF admit themselves). A leader may have a military background or even wear a uniform but still function as an individual leader rather than as part of a collective military institution (Lidén 2013). Such methodological debates pushed efforts to better understand and operationalize personalism as either a regime type or a latent variable and really paved the path for this subfield of **personalization**.

Elections are another matter. The GWF typology was designed solely to capture the regime institutions that shaped and constrained the leadership coalition. It was not created to deal with elections, legitimacy, relations with the people or how state institutions are subverted and manipulated by regimes to stabilize or consolidate their rule. For this reason, many critics argue that GWF overemphasizes single-party regimes at the expense of other types of **electoral authoritarianism**. This structural shortcoming boosted new approaches, both within **trichotomous categorizations** (i.e., **Schedler** and **Levitsky & Way**) and in **polychotomous categorizations** (i.e., **Hadenius & Teorell** and **Kailitz**).

Despite these challenges, the GWF typology has had a transformative impact on comparative authoritarian studies. By offering systematic criteria for analyzing dictatorships based on leadership dynamics and coalition structures, it has significantly advanced our understanding of authoritarian behavior and their performance (both domestically and internationally).

Furthermore, GWF implicitly acknowledged that the era of totalitarianism had largely passed, necessitating updated classification systems that reflected contemporary realities. Their work has inspired new generations of scholars to explore how different regime types shape political outcomes such as stability, **repression**, and economic performance, as well as their **foreign policy** behavior.

Hadenius & Teorell – Pathways to Democratization

Getting to democracy is easier from a regime in which competition is encouraged and the main challenge is to broaden participation; getting to democracy is much more difficult from a regime that has no tradition of political competition, however inclusive and participatory it might be.
– Axel Hadenius & Jan Teorell (2007: 56)

The classification of political regimes by Axel Hadenius and Jan Teorell (H&T) represents a significant contribution to the study of democratization and regime typologies, particularly in understanding the role of **elections** and varying levels of pluralism in authoritarian and hybrid regimes. Their framework critiques and complements earlier classifications, such as those by **Geddes, Wright & Frantz** (GWF), by addressing gaps in how electoral regimes are conceptualized.

The core principle of their dataset is the recognition that **elections** can serve as a significant institutional feature in certain authoritarian regimes. Competitive elections differ fundamentally from those in which opposition parties are either prohibited or excluded, allowing only the ruling party to participate. In such cases, opposition parties are unable to nominate candidates or gain representation in the legislative assembly. These differences matter in studying **democratization** patterns, making it a valuable tool for studying **transitions** from authoritarianism.

Hadenius and Teorell's (2006; 2007) critique of the GWF dataset centers on the latter's inability to capture the nuances of electoral regimes adequately. Specifically, they were dissatisfied with those **trichotomous categories** that divided regimes into democracies, closed autocracies, and hybrid regimes, cf. L. Diamond's **hybrid regimes**, A. **Schedler** and **Levitsky & Way.** To address this limitation, they proposed a more refined typology based on the 'organizational nexuses' of power. This approach examines how elites organize their authority within various institutions and structures, focusing on how decision-making and leadership selection processes are confined to specific organizations.

A key innovation in their classification is the differentiation among party-based regimes allowing various forms of pluralism for governance. They distinguish between limited multi-party elections, single-party elections, and no-party candidate elections as distinct models of (authoritarian) electoral pluralism. This differentiation is particularly important for understanding hybrid regimes where monarchies or military governments can also hold elections with varying levels of pluralism. By accounting for other organizational mechanisms in authoritarian regimes, they do not reduce their complexity to solely one dimension (pluralism).

Developed in 2007, the typology focuses on institutional features that define the modes of accessing and maintaining political power. First, they separate their democracies and non-democracies (see below); in the next step, their typology identifies three primary types of authoritarian regimes: (A) monarchies, (B) military regimes, and (C) electoral regimes. **Monarchies** (A) are characterized by hereditary **succession**, where power is passed within a royal family under constitutional or traditional norms. **Military regimes** (B) are defined by the predominance of military officers in political decision-making through actual or threatened force. *Electoral regimes* (C) are distinguished by the use of elections to confer legitimacy, further divided into subtypes: (i) *no-party* regimes (where parties are banned, but sometimes individual candidates compete for office), (ii) *one-party* regimes (with only one legal party), and (iii) *limited multi-party* regimes (where **opposition** parties exist but elections are not fully competitive) (Hadenius & Teorell 2007).

The dataset not only categorizes main regime types and their hybrids (see below) but also identifies several minor types of authoritarian regimes to account for cases that do not fit neatly into the primary typology. **Rebel regimes** represent a distinct subcategory of military rule. These regimes arise when a rebel movement originating outside the regular armed forces seizes power through military means. They remained classified as such as long as the regime had not yet transitioned or been reconstituted into another type of governance (an example of this is Congo-Kinshasa since 1997 (Hadenius & Teorell 2006: 6)). Also, **theocracy** is a distinct category where political power is concentrated in the hands of a religious elite, as seen in Iran since 1979. *Transitional regimes*, designed to oversee political transitions, are classified separately, such as Togo from 1991 to 1993. Additionally, there are cases where central governments lack full territorial control due to factors like *civil war* (e.g., Somalia since 1991) or *foreign occupation* (e.g., Afghanistan from 1979 to 1989). Finally, a residual 'other' category includes unique cases that defy conventional classification, such as Libya since 1977 and Lesotho from 1972 to 1985 (Hadenius & Teorell 2007: 148-149; Wahman et al. 2013: 28).

The classification emphasizes institutional structures over individual leadership or ideological orientation. This approach allows for a systematic comparison across cases and periods, distinguishing it from earlier typologies like GWF's focus on personalism or **Linz & Stepan**'s broader regime categories. The dataset accompanying this typology spans 1972–2003 and uses a combined **Freedom House** and **Polity Index** score to dichotomize democracy and autocracy, setting a threshold at 7.5 on this aggregated new 0–10 scale (Hadenius & Teorell, 2007).

In 2013, Michael Wahman, J. Teorell, and A. Hadenius introduced an updated version of this dataset, incorporating several key improvements. First, they expanded the time coverage to include the period from 1972 to 2010. Second, they refined the coding

criteria for electoral regimes by addressing criticisms related to the ambiguity of dominant-party systems. The updated dataset distinguishes between dominant-party multi-party systems (where the ruling party consistently wins more than two-thirds of the vote) and more competitive multi-party systems (as shown in **parties**, this matches the distinction between a 'hegemonic party' and a 'dominant party'). This differentiation is crucial for understanding regime dynamics because dominant-party systems often behave more like one-party regimes in terms of stability and democratization prospects (Wahman et al. 2013).

The updated dataset also addresses methodological critiques by offering greater transparency in coding decisions and providing robustness tests for different democracy thresholds (e.g., 6.5, 7.0, or 7.5). This flexibility allows researchers to adapt the data to their specific analytical needs while maintaining comparability with other datasets like those by Geddes et al. (2012) or Cheibub et al. (2010). The original threshold for classifying democracy was adjusted downward compared to the original edition (Hadenius & Teorell 2007) – where it was initially set at 7.5 it is now 7.0. The updates take into account **Freedom House** its less stringent 'electoral democracy' category instead of the more demanding 'free' category used in the earlier version. This shift demanded a recalibration of criteria, resulting in a lower threshold for defining democracy.

Regarding hybrids, military or monarchy regimes may coexist with electoral dimensions (e.g., multi-party, one-party, or no-party systems). While the disaggregated hybrid typology captures these combinations in detail, the simplified main typology classifies hybrid monarchies as monarchies and hybrid military regimes as military regimes to avoid multiple observations per country-year. This simplification reflects the view that the nature of rule – whether by a monarch or the military – is a more fundamental characteristic than electoral features. Their amalgams differ from those in the GWF's typology because H&T only allow the overlap of two categories, not three (Wahman et al. 2013: 28).

However, the H&T classification has faced criticism for certain methodological choices. One major critique is their decision not to account for **personalist rule** as a distinct regime type. While they acknowledged that personalism is a latent variable that can manifest across all regime types, they opted to use longevity as a proxy for personalism – a measure deemed inadequate by many scholars. This omission limits their ability to capture the varying degrees of **personalization** within different regime types. In contrast, other typologies that treat personalist rule as a separate category can at least isolate regimes where personalism is overtly influential.

Another criticism concerns the essentially dichotomous nature of their classification system when it comes to their approach of systematizing the universe of **political regimes**, which first separates democracies from non-democracies before applying additional criteria to categorize forms of authoritarian rule based on organizational structures. While this approach aligns with the GWF framework, H&T used combined **Polity Index** and **Freedom House** indices to establish a cutoff threshold for distinguishing democracies from non-democracies. Although this threshold was empirically validated against other classifications, it remains an arbitrary measure that relies on **continuous measures** not directly linked to definitions of democracy. Since the H&T typology serves foremost to map pathways toward **democratization**, their dichotomous bias can be forgiven, of course, but in this sense, its mission overlaps much more with that of **trichotomous categorizations**.

Despite these limitations, the H&T typology was a timely intervention in comparative authoritarianism research. It underscored the importance of **elections** in authoritarian regimes and provided a nuanced framework for analyzing how different forms of electoral pluralism operate within autocratic systems. Critics have argued that the typology is overly complex and that cases are fragmented into several categories (cf. Brownlee 2007: 520). While it is true that the classification is more descriptive than explanatory, tracing the pathways of rare regimes with a few cases still yields valuable insights. The framework was often used in conjunction with other classifications before the advent of **Varieties of Democracy** (V-Dem) and served its purpose of advancing the study of political regimes by offering a sophisticated analysis of electoral mechanisms and pluralism in authoritarian contexts. While not without its flaws – particularly regarding personalism and arbitrary thresholds – it remains an influential framework for understanding **democratization** pathways and the institutional dynamics of non-democratic regimes.

Kailitz – Ideocracies & Variations of Political Regimes

Die Legitimation von Ideokratien liegt in ihrer utopischen Ideologie, die als Leitmotiv für politische und gesellschaftliche Transformationen dient.
(The legitimacy of ideocracies lies in their utopian ideology, which serves as a guiding principle for political and societal transformations.)
– Steffen Kailitz & Patrick Köllner (2013)

Steffen Kailitz's typology of political regimes, grounded in the principle of 'legitimation,' represents a significant contribution to comparative politics by offering a nuanced framework for understanding how regimes justify their rule. His approach innovates existing typologies by emphasizing legitimation strategies (or their sources), introducing more relevant regime categories, and addressing electoral dynamics in authoritarian contexts. However, it has also faced criticism for certain conceptual ambiguities and practical limitations.

Kailitz's classification is inductive and dictatorship-oriented, with seven generic regime types based on their primary mode of legitimation. It thus identifies the mechanisms regimes use to justify their rule rather than focusing solely on their organizational structures or the background of their power-holders.

The seven types are: *(i) liberal democracies* – these regimes derive legitimacy from free and fair elections and the effective constraint of executive power through institutions like parliaments and judiciaries; *(ii) electoral autocracies* – while these regimes also hold elections, they are neither free nor fair, and executive power is only weakly constrained; *(iii) communist ideocracies* – legitimacy is rooted in a dominant ideology based on Marxist-Leninist principles; *(iv) one-party autocracies* – these regimes rely on a single party for legitimacy but are not necessarily grounded in communist ideology. *(v) Military regimes* – legitimacy stems from control by the armed forces; *(vi) monarchies* – these regimes base their legitimacy on hereditary succession and traditional authority; *(vii) personalist autocracies* – legitimacy is centered on the **charisma** or **personality cult** of a single leader. (Kailitz & Köllner 2013; Köllner & Kailitz 2013).

Kailitz's approach introduces several innovations that set it apart from earlier frameworks, such as those by Geddes (1999), Hadenius & Teorell (2007), or Cheibub et al. (2010). Unlike typologies that emphasize who holds power (e.g., military, party), Kailitz centers his classification on how regimes justify their authority. This shift highlights the normative and ideological dimensions of regime stability. Kailitz distinguishes between communist **ideocracies** and one-party autocracies, underscoring the role of **ideology** in legitimizing rule. This adds granularity to the analysis of party-based systems and contrasts with scholars like Cheibub et al. (2010), who struggle to unify civilian dictatorships beyond their exclusion from other categories analytically.

This typology has been influential, foremost because it reintroduced ideology as a central criterion for categorizing regimes. Drawing on the works of H. Arendt, Z. Brzezinski, C.J. Friedrich, J.J. Linz, A. Stepan, and others, Kailitz isolated regimes with utopian ideologies in a (somewhat) broader sense. His broader definition *de facto* conflated **totalitarianism** and 'post-totalitarianism,' which were more narrowly delineated by Linz & Stepan.

His original framework was primarily focused on communist ideocracies, but its updated version expanded to include other ideological systems (see below). Kailitz argued that ideology constitutes a distinct source of legitimacy for such regimes, even though they are relatively rare in the twenty-first century. Their presence and significance, however, remain important for typologies, particularly for those aimed at making historical comparisons or observing long-term evolutions.

Another key innovation is Kailitz's introduction of 'electoral dictatorship' as a distinct regime type within autocracies. He, however, sees them as 'Potemkin villages' (deceiving institutional *façades*), unlike **Hadenius & Teorell** (2007; Wahman et al. 2013), who provide a highly detailed but potentially idiosyncratic typology of electoral regimes. Kailitz thus navigates a middle path by acknowledging elections as tools for legitimizing authoritarian rule while maintaining broader applicability across contexts.

Kailitz's framework avoids the pitfalls of overly rigid or overly detailed classifications – what Sartori (1993) termed 'model mania.' By focusing on broad yet meaningful distinctions, he provides a practical framework that balances theoretical clarity with empirical applicability.

In his first database, Kailitz (2013) applies his typology to analyze regime durability from 1946 to 2010, revealing the following patterns: Monarchies emerge as the most durable regime type, followed by communist ideocracies. Military and personalist regimes tend to be short-lived. Electoral autocracies occupy a middle ground, using elections as tools for legitimization but often lacking the stability found in monarchies or ideologically cohesive systems.

In 2024, his original dataset (Kailitz 2013) was expanded and updated. Rebaptized *Varieties of Political Regimes* (Va-PoReg), Kailitz (2024) and his colleagues (impressively) extend the temporal scope from 1900 to the present, covering not only independent countries but also polities under occupation and colonial regimes. Still using legitimation as the defining criterion, Va-PoReg covers the following regime types: democracy (i), electoral autocracy (ii), ideocracy (iii), one-party autocracy (iv), military (v), absolute monarchy (vi-a), constitutional monarchy (vi-b), personalist (vii), electoral oligarchy (viii), semidemocracy (ix), non-electoral transitional regime (x), (in addition to 'colonial' (xi) and 'occupation regimes' (xii), and residual categories like 'no

central authority' or 'part of other country').

A logical result of this increased level of nuance and detail is that the complexity grows alongside the margin of coding error. In the updated classification, several new categories were introduced. Among these, the distinctions between *electoral oligarchy* (viii), *semi-democracy* (ix), and the differentiation between *absolute* (vi-a) and *constitutional monarchies* (vi-b) are particularly noteworthy.

Ideocracies (iii) were also subdivided to encompass a broader range of guiding ideologies, distinguishing between regimes structured around left-wing (iii-a **Communism** & **Socialism**) and right-wing ideologies (iii-b) **Fascism** & **Corporatism**), as well as those ruled according to political interpretations of Islam (**political Islam** & **Islamic States**).

The inclusion of *semidemocracy* (ix) aimed to capture regimes that do not extend full suffrage – especially cases where suffrage was restricted to males while excluding females from the electorate. This categorization relies on Tatu Vanhanen's participation measure, which uses the (arbitrary) threshold of at least 15 percent average electoral participation to delineate semidemocratic inclusivity.

Electoral oligarchy (viii), by contrast, is more restrictive and was designed to capture regimes such as Apartheid-era South Africa, where entire racial groups were excluded from the electoral process. These regimes are defined as lacking even universal male suffrage or falling below the 15 percent threshold on Vanhanen's index of participation.

The differentiation between *absolute* (vi-a) and *constitutional* (vi-b) monarchies hinges on the level of consultation involved in governance. Constitutional monarchies are characterized by the presence of electoral parliaments chosen by at least 15 percent of the population, introducing a degree of consultation and inclusivity. A nice addition is that they use the suffix 'monarchical' to identify those monarchies that do not fall into the category of constitutional or absolute monarchy due to the lack of governmental power of the monarch (e.g., monarchical democracies like Belgium, the Netherlands or Denmark).

Personalist autocracies (vii) are better identified than in the original version (Kailitz 2013). Here, they are defined negatively by the absence of institutions capable of effectively constraining a ruler's power. This approach aligns with Geddes' classification. Symptoms such as self-coups also play a significant role in identifying personalist autocracies.

This additional complexity comes with several costs. By borrowing best practices from **Vanhanen** and others, they also invite criticisms regarding the latter's arbitrary thresholds and methodological baggage. Coding such cases now heavily depends on the intervention and subjective judgment of the coders. For instance, when coding *oligarchies* (viii), scholars must verify whether low participation rates – falling below 15 percent on Vanhanen's index – are not caused, for instance, by electoral boycotts.

Despite the increased complexity and nuance introduced by these additional categories, Kailitz's typology remains binary for individual categories when considering latent measures like personalization or ideological salience, which can evolve. For example, personalization may gradually manifest within a regime even if it is not immediately apparent in its formal structures. Similarly, ideology – whether totalistic or just dominant – may erode in importance while still playing a significant role in legitimizing a regime's organization.

A key challenge arises when regimes undergo institutional changes that appear to shift their sources of legitimacy. For instance, if a military junta eventually allows elections, does this signify a genuine transition of the regime's legitimacy? (Can't they revert to force the moment their electoral experiment fails?) Are **elections** always a form of legitimation, or is the electoral arena merely a strategic tool for dividing opposition forces, gathering information on opposition parties' preferences, or providing hesitant collaborators with a fan of options to cooperate (more or less) with the regime? These questions highlight ambiguities inherent in categorizing regimes based on a mix of institutions and theoretically deducted forms of legitimation alone.

To be fair, such criticisms are not unique to Kailitz's framework but extend to other categorical typologies as well. The interplay between ideology, legitimacy, and institutional structures remains complex and dynamic, posing challenges for scholars attempting to classify political regimes with precision and consistency over time.

Anckar & Fredriksson (A&F)

The distinction between past, present, and future is only a stubbornly persistent illusion.
– Albert Einstein

The inductive typology developed by Carsten Anckar and Cecilia Fredriksson represents a recent, categorical contribution to this field, particularly due to its longitudinal scope, covering regimes from 1800 to 2016. The inspiration for this approach stems from earlier longitudinal dichotomous frameworks that divide regimes into two broad categories, democracy and non-democracy, but go no further (like Alvarez et al. 1996; Boix et al. 2013) or have imprecise sub-classifications (Cheibub et al. 2010).

Anckar and Fredriksson's (2018) typology (A&F) is a nominally polychotomous classification system that seeks to sub-classify both democracies and autocracies into distinct categories. The primary purpose of the typology is to measure the evolution of political regimes over a long historical period. At its core, A&F retain the fundamental dichotomy between democracies and autocracies. However, they go further by offering detailed subcategories for each group (and not just for one, like Geddes et al. 2014 or Hadenius & Teorell 2007).

For democracies (I), the typology distinguishes between constitutional monarchies (I-A) and republics (I-B), with further subdivisions into parliamentary (I-A-i) and semi-monarchic (I-A-ii) systems for monarchies and presidential (I-B-a), semi-presidential (I-B-b), and parliamentary systems (I-B-c) for republics. Constitutional monarchies (I-A) are primarily parliamentary (i) systems but include rare cases of semi-monarchies (ii) where executive power is shared between a monarch and elected officials. Republics (I-B) are categorized based on their executive structure: presidential systems (a) feature presidents elected by popular vote with significant executive authority; semi-presidential systems (b) share executive power between a president and a prime minister; parliamentary systems (c) lack a popularly elected president with substantial powers.

Autocracies (II) are divided into absolute monarchies (II-A), military regimes (II-B), party-based (II-C) systems, split into single-party (II-C-i) and multi-party regimes (II-C-ii); personalist regimes (II-D), and oligarchies (II-E) (including monarchic oligarchies and other forms). This structure allows for a nuanced understanding of regime types across different historical contexts.

A&F combine indices and measures from several existing datasets, including both continuous and categorical variables, to create a unified framework for coding absolute **monarchies** and **military regimes**. A&F fall back on **Hadenius & Teorell** (2007); for party-based rule and **oligarchy,** they borrow from **Geddes, Wright & Frantz (GWF)** (2014); for **personalist rule,** they follow GWF and treat it as a separate subtype but follow Linz's definition of (neo-)sultanism (derived from **Weber**) – see also **sultanism & neo-sultanism**.

The coding criteria rely heavily on institutional characteristics rather than leadership traits or ideological orientations. For instance, democracies are distinguished from autocracies based on the presence of contested elections that meet criteria for competition and participation. Autocratic subcategories are defined by the mechanisms through which leaders acquire and maintain power – whether through hereditary succession, military force, party dominance, or personal authority.

One notable strength of A&F's approach is its historical breadth. While datasets like **Freedom House** provide valuable insights into regime characteristics since WWII, they lack the temporal depth necessary for analyzing long-term trends in political development. By extending their dataset back to 1800, A&F offer an additional resource for studying historical patterns in democratization and authoritarianism.

However, the typology inherits some methodological challenges from its predecessors. For instance, the reliance on strict categories may oversimplify complex political realities, such as **hybrid regimes** that exhibit characteristics of both democracy and autocracy. Additionally, the dataset does not account for variations in personalism – a limitation acknowledged by the authors themselves, nor do they observe **ideology**, although the latter is a defining criterion (its absence) in the Linzean approach to isolate personalist types.

The main issue is that the classification places the distinction between constitutional monarchies and republics at the same hierarchical level as the distinction between autocracies like military or party-based regimes. This (intended) equivalence glosses over the fact that dictatorships often differ more from one another than they do from democracy. This thus underlines the essentialist dichotomous bias in this polychotomous typology.

The A&F typology is an ambitious attempt to classify political regimes over more than two centuries. Most of its offered categories have proven to be meaningful in the past and distinguish between more features of authoritarian regimes than **Regimes of the World** (RoW) or Cheibub et al.'s **Democracy-Dictatorship Index**. Since it is a new typology, it is hard to assess its reception in the scholarly community of comparative authoritarianism. Its authors have, of course, built upon it (Anckar 2021; 2022) and sparked in-depth research in semi-presidentialism (Åberg & Denk 2024).

CONTINUOUS MEASURES FOR CLASSIFYING POLITICAL REGIMES

Better measure short of seven, than spoil all at once.
– Gaelic saying

Measure twice, cut once.
(Its modern equivalent)

Continuous measures of democracy remain vital tools in comparative politics today. These datasets – now characterized by their comprehensive data and scale-based approach – are among the most widely used in the field. Their primary advantage is their ability to measure 'democraticness' (Van den Bosch 2014: 214), capturing the extent to which regimes vary on both horizontal (power-sharing) and vertical dimensions (societal relations), cf. Table 2.1. By examining the balance of power among legislative, executive, and judicial branches, along with the level of freedom enjoyed by citizens (including political and civil rights), continuous measures offer a single, comparative measure for all regimes. While these measures may overemphasize certain variables or encounter coding inaccuracies, they nonetheless provide a systematic and repeated assessment across nearly all countries.

Early operationalizations like those designed by **Cutright** (1963), **Vanhanen** (1984) or **Bollen** (1980) were far from perfect, oversimplified, and working with scarce and unreliable data. In addition, their authors pursued many (in retrospect) unsuccessful hypotheses and dead ends. Still, they pioneered the practice; others learned from their mistakes and their methodological insights. In most instances, these trailblazers were very much aware of the shortcomings of their models and assiduously annotated their recommendations for future generations.

Polity IV and Freedom House, two prominent measures of democracy, have their origins in these earlier efforts. The **Polity Index** traces its roots to the work of Ted Robert Gurr in the 1970s, who sought to assess political authority and regime characteristics over time, emphasizing institutionalized democracy and autocracy (and **anocracy**). **Freedom House**, founded in 1941 by Eleanor Roosevelt, Wendell Willkie, and many other prominent politicians, scholars and journalists, initially aimed to promote democratic values during World War II. Its annual reports on global freedom began in the 1970s, measuring political rights and civil liberties. This index is influenced by earlier democratic theories, particularly Robert Dahl's (1971) concept of 'polyarchy,' which emphasizes competition and participation as key components of democracy.

By the mid-1990s, there was a counter-move away from scales toward **dichotomous categories**, with both sides defending their positions, i.e., Elkins' (2000) empathetical and accurate defense of gradual measures. In the same period, there was a generation of scholars that continued to build on previous models but were soon overtaken by the Internet age and its better data collection possibilities. For instance, Z. Arat's (1991) classification is somewhat forgotten.

Zehra F. Kabasakal Arat, in her book *Democracy and Human Rights in Developing Countries* (1991), offered an innovative approach to understanding political regimes by emphasizing the balance between civil-political and socioeconomic rights. Arat argues that democracy cannot be sustained without addressing both sets of rights equally. Her classification of regimes is based on this balance, using a ratio (RT) to measure how well governments protect *civil-political rights* (e.g., freedom of speech, political participation) versus *socioeconomic rights* (e.g., access to healthcare and education). A balanced regime would have an RT close to 1, indicating equal attention to both. Arat's innovation lies in her argument that neglecting socioeconomic rights can destabilize democracies, a perspective often overlooked by traditional liberal democratic theories. However, her approach faced criticism for its overemphasis on socioeconomic rights – as Western-centric – and the difficulty of measuring these rights consistently across different countries. Despite these critiques, Arat's work was influential in integrating human rights into discussions about democratic stability in developing nations.

By the early 2000s, electoral authoritarian regimes had become so widespread that a new branch (**trichotomous categories**) developed just to study these in-between regimes. Also, a new appreciation was

found for the FH Index and *Polity IV*, despite ongoing methodological concerns. New measures were created, like the *Bertelsmann Transformation Index* (BTI) by the *Bertelsmann Foundation*, published in 2006, or the *Democracy Index* launched by the *Economist Intelligence Unit* (EIU) the same year.

Unrelated, a deductive frame with a theorization of a radically new continuous measure came out in 2003. **Selectorate theory** stands out in this category because it aspires to cover all political regimes without being democracy-focused or democracy-biased, a rare feat. Although the framework's operationalization has been criticized, as well as some of its conceptual assumptions, it proved very influential when it comes to our comparative understanding of **political regimes**.

As A. Schedler (2006: 10) argued in defense of **Freedom House** (FH) and similar continuous measures: *"In its assessments of political rights, Freedom House asks more questions than we need, yet still asks the right questions, in order to judge the democratic quality of electoral processes."* Despite critiques regarding the transparency and consistency of coding criteria, these continuous measures have reliably tracked countries' positions over time, with wide acceptance of their classifications by most scholars (Van den Bosch 2014: 215).

Pemstein et al. (2010) offered a new solution to the ongoing challenge of having to select one measure among a booming amount of democracy measures by developing the *Unified Democracy Scores* (UDS), a latent variable model that synthesizes ten existing democracy indices. These indices – all rooted in Dahl's conceptualization of democracy (focusing on contestation and participation) – often diverge due to differences in operationalization and aggregation methods. Rather than arbitrarily choosing one measure, the UDS model aggregates them, leveraging their strengths while accounting for their individual uncertainties and errors. This approach allows researchers to avoid discarding valuable information embedded in other scales. Overall, the UDS revealed a high degree of convergence among these measures, as they generally capture the same underlying concept of democracy. However, confusion cases made different indices go haywire. By averaging these differences and providing uncertainty estimates, the UDS offered a more reliable and nuanced measure of democracy (Pemstein et al. 2010).

The idea of measuring democracy as a *latent variable* that cannot be directly observed and only indirectly measured represented a significant shift in the political science methodology since it acknowledges democracy's complex and often unobservable qualities rather than treating it as a simple, binary concept. Bollen and Paxton (2000) were among the first to conceptualize democracy in this way, using confirmatory factor analysis to construct democracy scores that account for both observed indicators and the unobserved dimensions of democratic quality. This foundational work inspired later scholars, including Treier and Jackman (2008), who further developed the concept by employing a *Bayesian Item Response Theory* (IRT) model, treating democracy as a latent variable inferred through multiple indicators such as civil liberties, political participation, and institutional constraints. Their probabilistic approach allowed for more nuanced classification across a spectrum, recognizing variations in democratic attributes among regimes.

Coppedge et al.'s (2011) and Lindberg et al.'s (2014) **Varieties of Democracy** project (V-Dem) adopted a latent variable framework to operationalize democracy along multiple dimensions, such as electoral, liberal, and participatory democracy, making it one of the most granular and versatile measures available (note that Boix et al. (2013) also contributed to this shift with a probabilistic model in their extensive historical dataset, which applies Bayesian methods to handle incomplete data and recognizes gradations between authoritarian and democratic regimes over time).

The big game changer in this field has been the creation of V-Dem. This dataset, unlike FH or Polity IV, did not stumble into its role as a global authority on the measurement of 'democraticness;' this was specially designed for it. V-Dem originated in 2014 as a response to the limitations of existing democracy indices, which were seen as too simplistic and over-focused on electoral aspects. Co-founded by political scientists Staffan I. Lindberg, Michael Coppedge, John Gerring, and Jan Teorell, the *V-Dem Institute* manages over 2,000 experts worldwide to continuously update and refine a highly detailed dataset with over 329 indicators related to various dimensions of democracy, covering more than 200 countries since 1900.

Finally, regarding continuous measures' ability to distinguish between democracy and autocracy, Kasuya & Mori (2019; 2022) investigate inconsistencies in democracy measurement thresholds, particularly in the cutoffs set by popular continuous democracy indices: FH, Polity IV, and Varieties of Democracy (V-Dem)/RoW. These indices frequently set cutoffs to distinguish democracies from non-democracies, but the selected thresholds are often arbitrary and lack a solid theoretical or empirical foundation.

To compare, Yuko Kasuya and Kota Mori use categorical classifications like **Boix, Miller & Rosato** (BMR), the **Democracy-Dictatorship Index** (Cheibub et al. 2010) and **Geddes, Wright & Frantz** (GWF) as benchmarks because they believe such measures align better with theoretically grounded definitions of democracy. Their analysis reveals that the thresholds that best align continuous measures with categorical ones are actually lower than the cutoffs these continuous measures commonly use (specifically, they find optimal thresholds at around 3.5–3.7 for FH, 4.5–5 for Polity, and 0.39–0.42 for V-Dem/RoW. In contrast, the traditional cutoffs (2.5 for FH, 6 for Polity, and 0.5 for V-Dem/RoW) represent stricter criteria for democracy).

Their findings thus suggest that continuous democracy measures set a higher standard for what qualifies as democracy than binary measures, indicating a potential misalignment with theoretically informed definitions and a need for reconsidering

conventional cutoff points to improve conceptual consistency.

To recap, these datasets are particularly useful for mapping the democratic trajectories of countries over extended periods, helping to assess whether regimes are progressing or regressing in democratic quality or human rights protection. However, it is crucial to remember that these measures do not fully capture the qualitative differences between regimes that may appear similarly democratized (Kailitz 2013: 39). Additionally, accepting a continuous measurement implies a willingness to acknowledge the existence of (low but positive) levels of democracy even within authoritarian regimes (Cheibub et al. 2010). This can complicate qualitative, explanatory analysis and may lead to unintended (or misguided) quasi-categorical classifications. Especially when groups of regimes with similar or close rankings are labeled for convenience, and these labels are rendered or interpreted by other scholars as categorical distinctions. This, regrettably, is an all-too-common pitfall that should be absolutely avoided (Van den Bosch 2014: 215).

Dahl – Polyarchy

A definition of democracy can serve as the basis for a distinction between democracies and nondemocracies only if it includes a universal standard that reflects the principle of political equality.
– Robert Dahl (1989)

Robert A. Dahl's (1915-2014) theory of polyarchy, introduced in *Polyarchy: Participation and Opposition* (1971), has left a lasting mark on the field of comparative politics, particularly in the study of political regimes and democracy. Dahl's work shifted the focus from classical democratic theory, which often emphasized ideal forms of direct democracy, to a more empirical and procedural understanding of how democracy functions in real-world settings. The concept of 'polyarchy' ('the rule by many'), originally coined by Dahl & Lindblom (1953), provided a framework for understanding this attainable form of democracy as a system that exists along a continuum rather than as a binary condition of either democracy or autocracy. Polyarchy is a quality of a political system (like democracy) and also a dimension (unlike democracy). The absence of polyarchy is hegemony (see below) (Coppedge & Reinicke 1990: 52). This allowed for more nuanced classifications of political regimes and contributed to the development of empirical tools for measuring democracy.

Dahl's classification of political regimes is based on two main dimensions: contestation and participation. (A) *Contestation* refers to the extent to which citizens can freely and fairly compete for political power. This dimension includes the existence of competitive elections where opposition parties and candidates can challenge incumbents without fear of repression. (B) *Participation* focuses on the inclusiveness of the political system, specifically the proportion of the population that has the right to participate in political processes, such as voting or running for office.

Dahl argued that polyarchies are characterized by high levels of both contestation (A) and participation (B), making them the closest approximation to democracy in practice. To further define polyarchy, Dahl (1998) outlined six institutional guarantees –

originally eight (cf. Dahl 1971) – that are necessary for a regime to qualify as a polyarchy: (i) elected officials, (ii) free and fair elections, (iii) freedom of expression, (iv) alternative sources of information, (v) associational autonomy, and (vi) inclusive citizenship. These criteria emphasize both procedural aspects (elections) and broader civil liberties necessary for meaningful participation (Lührman et al. 2018; Teorell et al. 2019).

Dahl (1989) directly responded to **Schumpeter's** (1942) minimalist definition and found that the latter considers the mere formation of government as the endpoint of democracy. Munck (2009: 122) explains: *"Schumpeter's definition can be seen as starting with voters, running through elections, and ending, unambiguously, with the public offices to be filled by election winners."*

Second, Schumpeter's definition neglects rights beyond traditional political rights like voting. While he hints at freedom of the press (Schumpeter 1942: 272), he does not explicitly include it or other civil rights. In contrast, Dahl expands democracy to include civil rights and freedoms such as the press, assembly, and expression and considers how economic inequalities affect participation (Dahl 1989: 114-115, 178-179; 1998). Dahl thus raises another important question: Are there rights beyond political rights that are essential to democracy? (Munck 2009: 122-123)

Dahl's (1971) theoretical continuum stretches out alongside these two scales: (A) liberalization (public contestation) and (B) inclusiveness (participation) – and thus identified four ideal types: closed hegemonies (A-low, B-low); competing oligarchies (A-low, B-high); inclusive hegemonies (A-high, B-low); and 'polyarchy' (A-high, B-high). While Dahl did not develop specific coding criteria for classifying regimes based on these dimensions (reliable or complete data were not available), his framework inspired generations of scholars to operationalize his concepts into measurable indicators: Coppedge & Reinicke 1990 (*Polyarchy Scale*); Teorell et al. 2016; 2019 (*Polyarchy Index*); Lührman et al. 2018 (**Regimes of the World (RoW)**. Dahl's work had a transformative impact on comparative politics by shifting the study of democracy from normative theorizing toward empirical analysis. His emphasis on observable features – such as elections, civil liberties, and participation – provided a practical framework for comparing political systems across countries and periods.

One major contribution was Dahl's influence on how scholars classify political regimes. Dahl's work helped shift the field away from **dichotomous categories** toward continuous measures. This shift allowed scholars to account for varying degrees of democratic features within different regimes and embark on the study of **democratization**, a path paved by Dahl himself. Dahl's conception also contributed to the study of **hybrid regimes**.

Despite its profound influence, Dahl's approach has faced several criticisms of overemphasis on procedural elements, overlooking substantive outcomes like social justice or economic equality. Also, some critics argue that while his model ensures competition and participation, it does not guarantee that these processes lead to genuinely representative governance or public accountability. Next, some argue that Dahl underestimates how entrenched elites can manipulate democratic institutions even within polyarchies; see Box 2.3 on 'aoratocracy.' A common criticism for scholars of his time is that his model is largely based on Western liberal democracies and may not fully apply to non-Western societies with different cultural or historical contexts. His model did not account for factors contributing to the long-term stability or resilience of democratic institutions. (Krouse 1982; Munck 2009)

Robert Dahl's classification of political regimes through his concept of polyarchy remains one of the most influential frameworks in comparative politics. His work shifted the field toward empirical analysis and influenced numerous subsequent measures of democracy.

Box 2.3 In Invisible Hands: Aoratocracy?

I don't know why people are so keen to put the details of their private life in public. They forget that invisibility is a superpower.
– Banksy

Linguistically derived from Greek, *aoratocracy* literally means rule by the invisible. The term is a neologist umbrella term proposed by the undersigned. For the sake of clarity, we want to emphasize at once that the proposed term in no way refers to nor suggests any conspiracy antics featuring secret world governments and all kinds of cozy occult societies. Rather, it refers to policy and decision-making processes and governance systems that are *decisively* influenced and shaped by actors who remain – either voluntarily or because they are obliged to do so – largely invisible to the public eye.

Let us briefly look at a few examples of (potential) key actors in *aoratocracies*. Although they often conduct public advocacy and thus also work in the open, policies shaped by lobbies and lobbying firms and associations certainly fit into the definition *if* their influence and impact are such that policy choices and political decisions would be radically different without their presence. In some cases, the positions, roles and influence of actors involved in supposed *aoratocracies* are traditionally heavily underestimated.

This is the case, for example, with civil servants, like the stereotypical *éminence grise.* Although civil servants are usually not supposed to publicly take political sides, on the interface of their capacities as citizens and state employees, they might influence policy choices or obstruct the implementation of policies, given their crucial position at different levels of governance and the dependency of elected officials on their work. Finally, what also qualifies as *aoratocracies* are 'parallel governance systems' by resistance movements, provided these systems are not openly advertised or claimed. We propose that there is only an *aoratocracy* at work if and only if the practical consequences of the influence and actions of the aforementioned actors shape politics and policies in a more decisive way than that of the publicly 'visible' actors.

Cutright – Index of Political Development

Large scale comparative studies of national political systems offer the social scientist a methodology of great analytic power if only proper use can be made of the material at hand.
– Phillips Cutright (1969)

A value laden curiosity about democracies and dictatorships is not substitute for theoretical focus.
– Phillips Cutright (1963)

Phillips Cutright's (1930-2020) regime classification, developed in 1963, stands as one of the early and significant contributions to the quantitative analysis of political systems. His framework aimed to systematically measure political regimes based on empirical indicators that could be coded and analyzed.

S.M. **Lipset's** (1959) dichotomous categorical approach with intuitive measures was unsatisfactory and insufficient to capture the relation between democracy and development: *"one cannot distinguish among national political systems without a scoring system that assigns values to different nations according to some stated criteria. Although Lipset states his criteria he does not differentiate between France and Albania, Brazil or Chile. We would be better able to assess his descriptive statistics if the dependent variables – the national political system – had been indexed or scaled."* (Cutright 1963: 254).

At its core, Cutright's approach sought to explore the relationship between political regimes and socioeconomic development, offering insights into how different regime types might impact social and economic outcomes. His work was pioneering for its time, as it attempted to quantify developmental indicators, laying the groundwork for future studies in comparative politics.

Cutright follows Lipset (1959) and accepts the clas-

sification of political regimes into two broad camps: democratic and non-democratic systems, but he deducted his own continuous classification based on a set of coding criteria designed to measure various aspects of political participation, institutional development, and stability. These variables were cumulated into an index, and their total sum was crucial in determining whether a regime was *overdeveloped* or *underdeveloped*. Note that Cutright (1963: 37) emphasizes that the terms 'over-' and 'underdeveloped' are not meant to reflect a moral or ethical judgment about what a nation *should* have in terms of its political system. It is just a technical assessment of their institutional features relative to a nation's level of communications development.

The first coding criterion was (i) *political participation*, which measured the degree to which citizens could engage in the political process. This included factors such as the regularity, competitiveness, and inclusivity of elections. High levels of political participation – where citizens had meaningful opportunities to vote in free and fair elections – were typically indicative of democratic regimes. The second criterion was (ii) *legislative development*, which assessed the effectiveness and independence of legislative bodies. This involved evaluating whether a country's legislature served as a meaningful check on executive power or whether it functioned as a rubber-stamp institution. A well-developed legislature that acted independently from the executive branch was seen as a hallmark of democratic governance. The third criterion was (iii) *political stability*, which measured the durability of political institutions and their ability to avoid frequent disruptions such as coups or revolts. More stable systems were often associated with consolidated regimes, particularly democracies (Cutright 1963).

In addition to these broad criteria, Cutright's *Index of Political Development* (1963) introduced specific variables for coding regimes. This index awarded points based on four key factors: the (a) presence or absence of a parliament, (b) the composition of parliament, (c) the method of recruitment for the chief executive, and (d) the latter's support base. For example, countries lost points if the largest party in a multi-party legislature held more than 70 percent of seats, as such dominance suggested a lack of pluralism. Similarly, dominant-party control over both parliament and the presidency resulted in further point deductions unless the people directly elected the president (Cutright 1963; Vanhanen & Lundell 2011). Cutright and Wiley (1969) later added a score for voting rights to include a measure of *political representation* (iv).

Cutright's coding system was an early attempt to apply reproducible, comparative measures to classify regimes. It relied heavily on available data points like election outcomes, levels of representation in parliament, and reports on institutional functionality. This approach allowed him to create an index that could be used to compare political systems across countries systematically. He laid the foundation for later scholars who would build more sophisticated models for understanding political systems.

Another significant contribution was Cutright's focus on linking regime types with social and economic development outcomes. He argued that democratic regimes were more likely to achieve higher levels of social development in areas such as education and healthcare. This emphasis on development outcomes helped shape what would later become known as **modernization theory** (see also S.M. **Lipset**) – the idea that democracy and development are mutually reinforcing processes. Cutright's index was invoked frequently in the 1960s and 1970s in research on the relationship between democracy and socioeconomic development, social mobilization, social inequality, and mass communications (Bogaards 2007: 1212).

Moreover, Cutright's work helped refine how scholars conceptualized democracy for empirical research purposes by emphasizing three core elements: participation, legislative function, and stability. These components remain central to many contemporary studies on democracy today.

Despite its groundbreaking nature, Cutright's approach received substantial criticism from both methodological and theoretical perspectives. One major critique centered around his simplification of regime types. By categorizing regimes as either democratic or non-democratic based on his criteria, Cutright's framework often failed to capture more complex or hybrid regimes within his binary system.

Another criticism focused on Cutright's static approach to regime classification. His framework provided a snapshot view of political systems at a given moment in time but did not account for **transitions** between regime types or variations over time. This limitation made it harder for scholars using his model to analyze shifts toward democracy or authoritarianism within countries experiencing political change.

Scholars also pointed out that Cutright's criteria reflected a Western-centric bias, particularly in his emphasis on institutions like parliaments that might not function in the same way in non-Western contexts. This bias limited the applicability of his classification system beyond Western democracies, where different institutional arrangements might still support stable governance.

Like other early adherents of **modernization theory,** Cutright aimed to correlate democracy with development outcomes. Critics argued that his approach often implied correlation without causation and later studies showed that development is possible under authoritarian rule.

Lastly, critics noted that Cutright did not clearly specify how his index related to broader concepts of political development beyond institutional complexity or specialization. The assumption that more complex institutions equated with higher levels of development left many scholars questioning whether his measures fully captured what it meant for a country to be politically developed.

Vanhanen – Index of Democratization (ID)

It was better to use quantitative indicators instead of using subjective evaluations when measuring democracy.
– Tatu Vanhanen (1990)

Tatu Vanhanen (1929-2015) was a Finnish political scientist and sociologist. His typology of political regimes, particularly his *Index of Democratization* (ID), represents an ambitious attempt to quantify democracy through a simple and objective framework. The core logic behind Vanhanen's approach is that democracy can be measured by focusing on two key dimensions: (i) political competition and (ii) political participation. These dimensions are operationalized using electoral data, specifically the level of voter turnout and the distribution of votes among political parties. While this method offers a straightforward way to differentiate between democracies and non-democracies, it has been subject to significant criticism for its oversimplification and methodological shortcomings (Bogaards 2007).

Tatu Vanhanen's journey in developing his ID began in the 1960s with his efforts to measure variations in political systems, although he initially did not focus directly on democracy. His early work, including his 1968 doctoral thesis *Puolueet ja pluralismi* (*Parties and Pluralism*), examined the pluralism of party systems in Commonwealth countries. Vanhanen hypothesized that the distribution of power within a society depended on the distribution of resources, and he used the largest party's share of votes as a measure of political pluralism. Over time, his focus shifted toward **democratization**, and by the early 1970s, Vanhanen introduced two key variables to measure the distribution of political power (see below). These variables were combined into an index by multiplying them, which later became his ID (Vanhanen & Lundell 2014).

Influenced by Robert Dahl, Vanhanen was convinced that two variables (competition and participation) were sufficient to capture the core aspects of democracy. His subsequent studies expanded to cover multiple regions and historical periods (Vanhanen 1975; 1977a/b; 1979), consistently using these two variables to assess democratization. By 1984, Vanhanen (1984; 1990; 1997) explicitly shifted his focus from simply measuring power distribution to measuring democracy itself, renaming his index accordingly. This framework became central to his later comparative studies on democratization (2003; 2009) across different countries and periods (Vanhanen & Lundell 2014).

Drawing from **Dahl's** (1971) *Polyarchy*, Vanhanen's deductive typology is built on the assumption that the essence of democracy lies in the ability of citizens to participate in elections and the degree to which political power is contested. To capture these elements, he uses two variables: the *election turnout index*, measured as a percentage of the total population (not just eligible voters), and the vote share of smaller parties, calculated as 100 minus the vote share of the largest party. This latter measure forms what Vanhanen calls the *competition index*, which reflects how competitive elections are by indicating how much power is concentrated in a single party versus spread across multiple parties.

The two variables – turnout and competition – are then multiplied to generate an overall ID. The resulting score is intended to reflect both the inclusiveness of political participation (through turnout) and the extent of political pluralism (through competition). Higher scores indicate more democratic regimes, while lower scores suggest less democratic or authoritarian systems. Vanhanen also sets specific thresholds to distinguish between democracies and non-democracies: if voter turnout is below 10 percent or if smaller parties receive less than 30 percent of the vote, a country is classified as non-democratic.

Despite its clarity and simplicity, Vanhanen's typology has faced several critiques from scholars who argue that it fails to capture the full complexity of democratic governance. One major criticism is its arbitrariness. The cutoff points that Vanhanen uses to distinguish between democracies and non-democracies – such as 30 percent for smaller parties' vote share and 10 percent for voter turnout – are acknowledged by Vanhanen himself as arbitrary. These thresholds lack clear theoretical justification, raising concerns about their overall validity in accurately categorizing regimes (Bogaards 2007).

Another significant critique is the oversimplification inherent in reducing democracy to just two variables: competition and participation, excluding civil liberties, political rights, the rule of law, and institutional checks and balances. By focusing solely

on electoral data, the index provides an incomplete picture of democratic governance, especially when compared with more comprehensive measures like **Freedom House** (FH) or the **Polity Index** (Mainwaring et al. 2000).

Moreover, there are concerns about subjectivity in coding. In countries where both parliamentary and presidential elections occur, Vanhanen weights election results based on his assessment of the power balance between these institutions. This introduces a degree of subjectivity to what is otherwise presented as an objective measure. Additionally, his index does not account for scenarios where different parties control different branches of government (e.g., one party controls the presidency while another controls parliament). This neglect of divided control limits its ability to capture political competition in such cases fully (Bogaards 2007).

Vanhanen's ID is clearly democracy-focused and struggles with differentiating between highly autocratic regimes. Research has shown that at the extreme end of authoritarianism, his index fails to make meaningful distinctions between (closed) authoritarian regimes. This significantly weakens its utility for analyzing non-democratic systems. (Vaccaro 2021)

Finally, there has been a noted decreasing association with other democracy measures over time. While Vanhanen's index initially correlated well with other widely used measures of democracy, such as those from FH or Polity IV, this correlation has weakened since 1980 with the emergence of **electoral authoritarianism** (Vaccaro 2021). This raises questions about its validity and reliability, particularly in more recent periods where democratic backsliding (**autocratization**) and **hybrid regimes** have become more common.

Bollen – Democracy as Rights & Liberties

The concept of political democracy is continuous. We talk and think about the degree to which democracy is present.
– Kenneth A. Bollen (1990)

Kenneth A. Bollen's conceptualization and measurement of democracy represent a significant contribution to the study of political regimes, particularly in the field of comparative politics. His approach is grounded in a procedural and multidimensional understanding of democracy, which emphasizes the distribution of power between elites and non-elites.

Bollen defines democracy (as a scale) as *"the extent to which the political power of the elites is minimized and that of the nonelites is maximized"* (Bollen 1980: 372). By political **power**, Bollen (1990: 9) refers to the capacity to influence or control the national governing system. 'Elites' are those individuals or groups within society who hold a disproportionate share of political power. These elites include members of the executive, judicial, and legislative branches of government, as well as leaders of political parties, local governments, businesses, labor unions, professional associations, and religious organizations. This (working) definition highlights a procedural focus on political rights and liberties rather than on specific institutional arrangements or outcomes, making his approach distinct from minimalist definitions that concentrate solely on electoral processes.

Bollen's work has been influential in promoting a

multidimensional and continuous approach to measuring democracy. Rather than treating democracy as a binary concept, Bollen views it as existing along a continuum. This allows for a more nuanced analysis of regimes by incorporating various aspects of political rights and liberties into composite indices. His datasets, such as the *Cross-National Indicators of Liberal Democracy*, 1950-1990 (Bollen 1998), operationalize this conceptualization by measuring political rights and liberties across different countries and periods. These indices provide researchers with tools to evaluate not only whether a regime is democratic but also the degree to which it exhibits democratic characteristics.

Bollen's (1989; 1990; 1993) focus on measurement issues and validity has also been pivotal in advancing the field. His collaborative works aimed to refine his original classification (Bollen & Grandjean 1981; Bollen & Jackman 1989; Bollen & Paxton 2000). He has consistently emphasized the importance of addressing conceptual challenges, urging scholars to consider how they define and operationalize democracy carefully. His work on methodology factors in cross-national measures highlights the need for critical evaluation of both data sources (e.g., subjective judgment by original coders) and methodologies (aggregation of data) used in regime classification (Bollen & Paxton 2000; Treier & Jackman 2008).

Despite these contributions, Bollen's approach has faced several criticisms. One major critique concerns the difficulty on how to operationalize his concept of democracy. While he emphasizes political rights and liberties as key dimensions, critics argue that it remains unclear how these elements interact: *"It is not clear, however, whether regimes that protect political rights and liberties minimize the political power of elites and maximize that of nonelites, and it is doubtful that this is true in anything resembling linear fashion, as the definition suggests would be the case. This problem is emblematic of those stemming from nonprocedural definitions."* (Mainwaring et al. 2000: 3-4).

Another criticism centers on Bollen's limited attention to institutional details. While his focus on political rights and liberties broadens the scope beyond electoral processes, critics argue that this emphasis might overlook crucial institutional factors that shape democratic systems. For instance, elements such as electoral systems, political party structures, or checks and balances play vital roles in determining how power is distributed within a regime. By not giving sufficient weight to these institutional details, Bollen's approach misses important variations in how democracies function.

Additionally, Bollen's multidimensional approach raises challenges related to aggregation and weighting. Combining various indicators into a single index can be subjective, with different aggregation methods potentially leading to different outcomes in regime classification. Critics argue that this process may obscure important variations within each dimension (e.g., political rights vs. civil liberties), making it difficult to capture the complexity of democratic regimes fully.

Despite these criticisms, Bollen's work has had a lasting impact on the study of political regimes. His multidimensional framework has stimulated debates about how best to conceptualize and measure democracy, pushing scholars to move beyond simple dichotomies toward more sophisticated approaches. His emphasis on continuous measurement remains influential in contemporary efforts to assess democratic regimes across time and space.

Polity Index – Measuring Authority Structures

The only real prison is fear, and the only real freedom is freedom from fear.
– Aung San Suu Kyi

The Polity Index is one of the most widely used tools in political science for measuring political regimes, offering a quantitative framework to classify states along a spectrum from autocracy to democracy. Developed by Ted Robert Gurr (1936-2017) in the 1970s, the dataset has evolved through several iterations – *Polity I* was created in 1975, *II* in 1985, *III* in 1995, and the commonly used version,

Polity IV, was released in 2000. Currently, the work is continued under M.G. Marshall at the *Center for Systemic Peace* (CSP). The Center is based in Vienna, Virginia (US), and its mission focuses on promoting peace and reducing global violence through comprehensive data analysis and research on political instability, governance, and societal development. Besides Polity, CSP operates the *State Fragility Index* and reports on global conflict trends to inform policy and foster sustainable development.

The *Polity Project* (Marshall et al. 2019) was designed to measure 'authority patterns' rather than 'freedom,' distinguishing it from other indices like **Freedom House**. The latest index provides a 21-point scale ranging from -10 (most autocratic) to +10 (most democratic), derived from two underlying scales: the *democracy score (Democ)* and the *autocracy score (Autoc)*. These scores are calculated based on five key institutional dimensions: (i) competitiveness and (ii) openness of executive recruitment, (ii) constraints on executive authority, and (iv) regulation and (v) competitiveness of political participation. By subtracting the *Autoc* score from the *Democ* score, the Polity Index generates a single value that places countries into one of three regime classifications: autocracies (-10 to -7), **anocracies** (-6 to +6), and democracies (+7 to +10) (Van den Bosch 2014: 113-114).

The Polity Index's methodology has been praised for its focus on institutional characteristics, yet it is not without significant criticisms. One major issue is its lack of transparency and conceptual vagueness. Critics argue that the coding rules for its components are abstract and inconsistently applied, making it difficult to understand how scores are assigned. Furthermore, the aggregation process – combining component scores into a single index – is opaque, with no clear theoretical justification for the weighting scheme used. This has led some scholars to question whether the index accurately measures democracy or autocracy as conceptualized in political theory (Cheibub et al. 2010; Gleditsch & Ward 1997).

Additionally, while the scale appears continuous, its distribution is often bimodal, clustering countries at either end of the spectrum and leaving intermediate categories underexplored or poorly defined (Reich 2002). This dichotomous nature limits its utility for analyzing hybrid regimes that blend democratic and authoritarian elements. This group is called **anocracy** and is described separately in its own entry since it is often used as synonymous with **hybrid regimes** (Boix et al. 2013; Coppedge et al. 2011).

Another criticism concerns Polity's overemphasis on electoral processes and executive constraints at the expense of other democratic dimensions such as civil liberties, political rights, and the rule of law. While these institutional features are central to democracy, their narrow focus may overlook critical aspects of regime quality. For example, regimes that hold elections but suppress dissent or restrict freedoms may receive relatively high scores, obscuring their authoritarian nature (Alvarez et al. 1996).

Moreover, Polity's handling of conflict-affected states has been contentious. Since the idea behind Polity was to quantify institutional frameworks, the index reached its limits in cases where there was no regular institutional setup. The introduction of *Polity II* in 1985 attempted to address issues related to coding interregnum or transition periods by assigning a value of zero during such times but has been criticized for overrating countries undergoing anarchy or transitions compared to other indices like **Freedom House** or **Varieties of Democracy** (V-Dem) (Boese 2019).

Colomer et al. (2016: 20) identify at least two significant concerns that discourage relying on the Polity Index for measuring transitions. First, while Polity includes a 'transition' category, it paradoxically often does not result in a shift to a different type of regime. Second, despite the inclusion of this category, the database frequently classifies short-lived experiences – lasting only one or two years or a few brief periods – as distinct regimes rather than treating them as transitional phases.

Although efforts were made in Polity IV to remove explicit references to conflict in coding definitions, previous versions measured conflict directly, and critics find this is still the case indirectly. This renders the correlation of anocracy with civil war 'virtually tautological' (Vreeland 2008), and conflating regime type with instability or weakness does not advance our understanding of the nature of political regimes (Van den Bosch 2014).

Despite these limitations, the Polity Index has had a profound impact on comparative politics and international relations research. From its inception, its continuous scale has encouraged researchers to move beyond binary classifications of regimes as either democratic or authoritarian. Its long time-series data covering over two centuries and numerous countries have made it an invaluable resource for studying regime dynamics and transitions. Usually combined with other measures, scholars have used Polity data to explore questions about democratization, regime stability, and the relationship between political systems and outcomes such as economic development or conflict. Often, Polity is taken apart, and its measures are upcycled into other **continuous measures** or Large-N research.

Ultimately, while the Polity Index remains a cornerstone of political science research, it must be used with caution and awareness of its methodological limitations. Its strengths lie in its ability to quantify institutional patterns over time and across cases, but its narrow focus, vague coding criteria and potential biases necessitate supplementation with alternative indices and qualitative approaches.

The *Polity V* project is still in progress and has seen partial releases. It aims to cover countries from 1800 to 2018, focusing on states with populations of 500,000 or more. In April 2020, a hybrid version of *Polity V* was made available, updating data for 74 of 167 countries. These updates focused on countries experiencing 'polar factionalism,' a precursor to political instability. The full release of *Polity V* has not yet been announced (Center for Systemic Peace, 2020).

Freedom House (FH)

Liberty, when it begins to take root, is a plant of rapid growth.
– George Washington

Freedom House (FH), a US-based NGO, has been at the forefront of assessing political rights and civil liberties across the world since 1972. Its annual *Freedom in the World* reports have become a widely utilized resource in comparative politics, offering insights into the state of democracy globally. The organization's classification system and its methodology have significantly influenced how political regimes are understood and categorized. However, despite its contributions to the field, the FH approach has faced a long history of criticism, particularly regarding transparency, subjectivity, and ideological bias.

Traditionally, FH classifies countries into three groups based on their levels of political rights and civil liberties: 'Free,' 'Partly Free,' and 'Not Free.' These groupings each reflect a spectrum of freedom rather than a binary distinction between democracy and authoritarianism. Countries classified as 'Free' exhibit robust political rights and civil liberties, with open political competition, respect for individual rights, and a vibrant civil society. 'Partly Free' countries have significant restrictions on these freedoms, often characterized by limited political competition and government interference in media and civil society. 'Not Free' countries experience severe violations of political rights and civil liberties, typically under authoritarian rule with little to no respect for individual freedoms (Freedom House, 2024b).

This three-tiered system offered more nuance compared to earlier **dichotomous categories** of regimes as either democracies or dictatorships. It echoes Robert **Dahl's** emphasis on contestation and participation but extends beyond electoral processes to include civil liberties as integral components of democracy. This broader understanding enables FH to capture the complexity of political regimes that may hold elections but still restrict civil liberties.

As a continuous measure, FH employs a detailed checklist approach to assess political rights and civil liberties in each country. The coding process is based on expert analysis of various sources such as news reports, academic studies, and information from international organizations. The checklist is divided into two primary dimensions: (I) *Political Rights:* This dimension evaluates factors such as the electoral process, political pluralism, participation, and the functioning of government. (II) *Civil Liberties:* This dimension assesses freedoms of expression, association, religion, rule of law, and personal autonomy.

Each item on the checklist is scored on a scale from 0 to 4, with higher scores indicating greater freedom. These scores are then aggregated to generate overall ratings for political rights and civil liberties for each country. The average of these two scores determines the country's overall 'Freedom Rating' on a scale from 1 (most free) to 7 (least free). Based on this rating, countries are classified into one of the three categories: 'Free' (1–2.5), 'Partly Free' (3–5), or 'Not Free' (5.5–7).

With its 2004 edition, FH introduced a 'Democracy Score' – an average of each country's ratings on all of the indicators covered in its survey. This score was designed to simplify the analysis of the countries' overall progress or deterioration from year to year. Based on its scale of 1 (most free) to 7 (least free), FH identifies the following groups: consolidated democracy (score 1–2), semi-consolidated democracy (3), transitional government/hybrid regime (4), semi-consolidated authoritarian regime (5), and consolidated authoritarian regime (6–7).

While this checklist approach allows for systematic evaluation across countries, it has been criti-

cized for its aggregation rules. Scholars like Cheibub et al. (2010) argue that the FH methodology lacks transparency in how different scores are combined to arrive at final classifications. They contend that the aggregation process is arbitrary and could lead to billions of possible combinations that result in different classifications (Van den Bosch 2014). The FH ratings do not reflect consistent criteria across cases (see below); therefore, countries with very different democratic qualities can receive the same top scores, with FH thus failing to capture the diversity in how democracy is implemented.

FH groups together cases and labels these, either along the cutoff thresholds on the 'Freedom Rating' or the 'Democracy Score,' but under no circumstance can these be considered 'conceptual categorizations.' Too often, scholars refer to these group labels ('Free' – 'Partly Free' – 'Not Free'), separated by arbitrary cutoff points on their ranking scale, as 'categories' identifying distinct 'regime types' – FH is guilty of this – killing any research design findings that are based on this (due to methodological error overdose).

Despite these criticisms, FH's classification system has had a profound impact on the field of comparative politics. Its data provides a longitudinal measure of freedom across a large number of countries over time, making it an invaluable resource for scholars studying **democratization** trends or regime **transitions**. The extensive coverage offered by its cyclical *Freedom in the World* reports allows researchers to conduct cross-national comparisons and analyze how democracy correlates with other variables such as economic development or conflict.

Moreover, FH reports have influenced not only academic research but also policymaking and advocacy efforts. International organizations often cite FH data in policy debates or when allocating **foreign aid** based on democratic credentials. Advocacy groups have also used the organization's rankings to promote **human rights** or pressure governments to uphold democratic norms.

FH has faced significant criticism over several aspects of its methodology, with *"problems in all areas of conceptualization, measurement, and aggregation."* (Munck & Verkuilen 2002: 28). This, in turn, has stimulated important debates within the field about how democracy should be conceptualized and measured. Scholars have developed alternative indices – such as the **Polity Index** or **Varieties of Democracy** (V-Dem) – that aim to address some of the limitations identified in the FH approach.

As mentioned above, one major critique concerns coding transparency: FH does not provide enough disaggregated data or clear explanations for how its ratings are calculated (Cheibub et al. 2010), making it difficult for researchers to scrutinize the coding process or assess whether individual scores are justified.

A related issue is the subjectivity in coding: Since FH relies heavily on expert assessments rather than objective indicators, there is real concern that personal biases may influence how countries are rated (Coppedge et al. 2011). For example, Kenneth Bollen has proven that expert-based evaluations are prone to systematic measurement errors due to subjective judgments (Bollen & Paxton 2000).

Finally – and perhaps most controversially – FH has been accused of ideological bias in the past. Numerous studies have shown evidence that countries with Marxist-Leninist regimes were systematically downgraded during the Cold War era (Boese 2019: 104). Even today, some critics argue that FH tends to favor Western-style liberal democracies while downrating socialist or left-leaning governments. This ideological bias raises questions about whether FH ratings reflect an objective assessment of freedom or merely align with US foreign policy interests.

In conclusion, while FH's regime ranking has played a prominent role in shaping our understanding and tracking of democracy and authoritarianism globally, it is not without its flaws. Its checklist approach provides valuable insights into political rights and civil liberties across countries (and its country reports are valuable even without comparative intent), but its index suffers heavily from issues related to transparency, subjectivity in coding decisions, and (lingering) ideological bias.

Still, one has to acknowledge that FH does a reasonable job in evaluating electoral processes and that its qualitative country reports can offer insightful assessments (Schedler 2009). In any case, FH remains an influential voice in both academic research and policy advocacy concerning global freedom trends – a testament to its enduring relevance despite ongoing debates about its methodology.

Selectorate Theory

It's always better for a ruler to determine who eats than it is to have a larger pie from which the people can feed themselves.
– Bruce Bueno de Mesquita & Alastair Smith, *The Dictator's Handbook* (2012)

With its roots in economics and comparative politics, selectorate theory integrates the logic of political survival with theories of coalition building and public and private distribution politics (**patronage**). It is a universal theoretical frame created by Bruce Bueno de Mesquita, Alastair Smith, Randolph M. Siverson, and James D. Morrow, presented in one seminal work, *The Logic of Political Survival* (2003), this deductive analytical lens can be applied to all political regimes, not discriminating between democracy and autocracy. Since it extrapolates power dynamics based on the relative size (and relation) of distinct groups within polities, it is considered a continuous measure to classify regimes.

Selectorate theory divides all polities into the following groups, hierarchically presented here from those with the most political power to those disenfranchised (Bueno de Mesquita et al. 2003: 38-39, 51,70-76, 342-346). Note that abbreviations are the original ones used by the authors.

Incumbent (I) The current leadership or supreme holder(s) of power: president, king, prime minister, head of the politburo, etc. Depending on the polity, this can be one or more persons. The leadership has the authority to raise revenue and allocate resources, dividing it between public goods allocations that benefit everyone in society with private rewards that only go to members of the winning coalition. In the model, incumbents do have rivals: A *challenger* (C) refers to an individual or would-be leadership group (from the selectorate) attempting to depose the incumbent leader within the 'rules' or norms of transition in the existing system with the goal to gain control over policy choices regarding taxing and spending.

Winning coalition (W) A subset of the selectorate of sufficient size such that this subset's support endows the leadership with political power over the remainder of the selectorate as well as over the disenfranchised members of the society. In exchange for their support, members of the winning coalition receive a share of whatever private benefits the incumbent doles out to her supporters. Common synonyms for this group are 'inner circle' or 'ruling coalition.'

Selectorate (S) Defined as the set of people whose endowments include the qualities or characteristics institutionally required to choose the government's leadership and necessary for gaining access to private benefits doled out by the government's leadership. For instance, in a monarchy, the selectorate is the royal family and related aristocrats; in a military regime, it is a group of officers; in a party regime, the bulk of the group are active party members. The term was adopted from British parliamentary politics to denote the group within a political party that has effective power to choose leaders (Shirk 1993: 71). Peter Paterson (1967) seems to be the first to have conceptualized it.

Opposition (O) An organized subset of the selectorate that is oppressed by the winning coalition and incumbent because they challenge the established or proposed political order and/or the rules (both formal and/or informal) to become part of or replace the winning coalition.

Residents (N) The group of residents of the polity that are unenfranchised or otherwise excluded from political power. Their policy preferences are ignored on a daily basis, though depending on the openness of the regime they can obtain political leverage by organizing and pressuring the government through strikes, manifestations, boycotts, sit-ins, riots, etc. but also through lynch mobs, revolution, supporting rebels or separatists.

The selectorate and winning coalition are very different in various polities. The categories to be included this group range from: (a) personal origin: birthplace and lineage; (b) special proficiency: skills, beliefs, and/or knowledge; (c) wealth (also land ownership); and (d) gender and/or age. Military prowess is among the most common special skills used to determine selectorate membership. Possession or control over arms is a special type of expertise that continues to play a crucial role in many polities with small W and S. (Bueno de Mesquita et al. 2003: 43, 46)

In inclusive democratic elections for instance, the selectorate *(de jure)* equals the electorate, making the winning coalition much more inclined to provide public goods to the population as a whole in order to win re-election. Even so, the theory does differentiate among democratic systems like proportional or first-past-the-post (single member electoral district) systems, finding that the former favor larger minimal W.

Autocracies are as different from each other as from democracies, but a common characteristic is the small size of the S and W. Of course, context is everything here: Military **juntas** can have a small S if the previous **coup d'état** was done by higher officers and much bigger S when lower officers ousted the last ruler. There is one observation though: loyalty toward the ruler is higher when a W is small and a S large.

Since the theory applies quantified game theory to the power relations of an established **incumbent** *vis-à-vis* the ruling coalition and other groups, the theory cannot be applied to study the emergence or demise of political regimes, just their ongoing politics.

The theory and related terms are still very influential and prevalent, even when its more salient conclusions have been pulled into question. While

experimental game theory tests confirm the findings (Bausch 2014; 2017), many have found issues with the original authors' empirical measurement criteria (Clarke & Stone 2008; Rockoff 2014; Kennedy 2019). The authors did respond with additional clarifications (Morrow et al. 2008; Bueno de Mesquita & Smith 2015) and several others have also proposed modifications to the theory (Arena & Nicoletti 2014; Cao & Ward 2015).

Bueno de Mesquita & Smith (2022) updated their model recently using **Varieties of Democracy** (V-Dem) data, finding that institutions, rather than attitudes and behaviors, provide a stronger foundation for distinguishing government resource allocations across all types of governments.

J. Weeks (2014) and many others have criticized some of the selectorate theory's core assumptions: e.g., members of the winning coalition do not automatically lose power when the incumbent is ousted (they can have their own support bases and that all actors perceive the world in the same way, thus ignoring a lot of the uncertainty (and disinformation) that exist in real-life politics. Van den Bosch (2021: 11-12) finds that the theory does not qualify the nature of power relations between groups (collegial or dependent) but extrapolates findings merely based on their quantified (relative size) and relational proportions, which is problematic for a nuanced understanding of **personalist rule**.

Callagher and Hanson (2015) provide an excellent critical review of the theory and conclude that the theory is a 'dull blade' for understanding authoritarianism – *"It can be useful for an initial stab at predicting general tendencies in politics, but it is not the right tool for every job, nor is it advisable for detailed work."* (2015: 368). This is a criticism often voiced for other continuous measures beholden to the assumption that democracies and dictatorships can and should be analyzed along a continuum.

In detail, Callagher and Hanson (2015) focus on three problematic aspects of selectorate theory and its application. First, they question the utility of the theory's key concepts of S and W in authoritarian regimes where formal institutions to structure political transitions are absent or inconsequential. Second, the theory underestimates the role of the unenfranchized members of society, the 'ejectorate' that has the power to oust the regime with extralegal means (cf. Zimmerman 2014). Third, the theory assumes that the members of the S are homogeneous, and it unrealistically links public goods and political rights. With only the size of W as a relevant feature the theory struggles to explain even policy change. Moreover, selectorate theory neglects the role of authoritarian political institutions such as legislatures and parties in providing rulers the capability to grapple with threats arising from within the ruling elite and from society at large (Callagher & Hanson 2015: 368-369, 381).

Svolik – Institutions in Dictatorships

This is the essential lesson of politics: in the end ruling is the objective, not ruling well.
– Bruce Bueno de Mesquita & Alastair Smith, *The Dictator's Handbook* (2012)

Milan Svolik (2009; 2012) chooses radically to map (only) dictatorships along a continuous spectrum benchmarking their institutional variety, foregoing strict categorization. He eloquently boils down the heterogeneity of autocracies along two single conceptual dimensions: (A) authoritarian control and (B) authoritarian power-sharing. His deductive approach is to counter the prevailing practice of classifying dictatorships into a few ideal types or according to their prominent descriptive features; criticizing this practice for collapsing multiple and distinct conceptual dimensions of authoritarian politics into a single typology. He finds biases in difficult classification judgments that weigh incommensurable aspects of authoritarian politics for sorting regimes into categories that are neither mutually exclusive nor collectively exhaustive, compromising the validity and reliability of the research based on them and limiting the appropriateness as general-purpose typologies of dictatorships (Svolik 2012: 17, 29).

His approach explicitly identifies the two above-mentioned conceptual dimensions of authoritarian politics and develops scales to measure them. The accompanying dataset (borrowing existing data) focuses on the political organization of dictatorships by coding their use of authoritarian institutions (as well as informal rules). At the country level, he measures four conceptual dimensions: (a) military involvement in politics, (b) restrictions on political parties, (c) legislative selection, and (d) executive selection, and links them with data on leadership change and ruling coalition duration and composition (Svolik 2012).

In this impressive attempt to unburden scholars of the restrictive chains of categorization, Svolik cannot fully forego the use of categories himself (he still resorts to a typology to circumscribe various shades of military rule). On the other hand, he exposed the (at the time) current use of 'leader tenure' as a faulty proxy to measure 'regime durability' (Wright 2015: 577). Using rational choice and game theory, Svolik made enormous inroads in the study of the process of **personalization;** he consolidated current thinking about the power relations of the inner circle, the use of institutions for information-gathering purposes by the dictator (for reducing uncertainty), and as a tool for binding junior cadres to the regime.

Svolik's dataset serves its designed purpose, scaling the internal power (sharing) relations, the level of power concentration, and its application of institutions to maintain power. Its strict focus on the logic of the inner sanctum allows it to map autocratic trajectories (or countries' authoritarian spells – Box 2.4), but it cannot be used to study **democratization**. Because the theory is reliant on rational choice and game theory, it cannot account for executive mistakes or the 'irrational' actions of other regime insiders, other crucial factors such as ideology, culture, and historical context, nor the effects of international cooperation (and learning) among dictatorships (cf. Knutsen et al. 2017).

Another critique concerns Svolik's emphasis on power-sharing mechanisms between dictators and elites as a primary means of maintaining regime stability. Frantz and Ezrow (2011) argue that such approaches underestimate the diversity of strategies regimes use to retain power. For instance, **personalist regimes** may rely more heavily on **clientelism** or **patronage** networks rather than formalized power-sharing arrangements. Svolik's framework may not fully capture the variety of tools specific authoritarian leaders develop and employ to uphold regime stability.

Svolik is also criticized for insufficiently addressing how authoritarian regimes interact with their populations. Gerschewski (2013) notes that Svolik's focus on elite dynamics neglects how dictators seek **legitimacy** or build popular support through propaganda, social programs, or economic development – factors that are critical in many regimes' survival strategies. Moreover, Svolik's reliance on quantitative data to test his framework raises questions about generalizability. Pepinsky (2014) points out that such data may not fully capture the unique cultural and institutional factors present in countries like China or Russia, limiting the applicability of his conclusions across different contexts.

Still, despite these limitations, Svolik's work is a fundamental contribution to the study of autocracy for its cold logic and crystal conceptualizations.

Box 2.4 Authoritarian Spells

I put a spell on you!
– Song written and recorded by 'Screaming' Jay Hawkins (1956)

In comparative politics, the term *authoritarian spells* refers to a period during which a country experiences authoritarian rule, typically following a democratic breakdown or other political transition (e.g., occupation). An authoritarian spell is marked by the suspension or significant curtailment of democratic institutions and practices, such as competitive elections, civil liberties, and political pluralism and will last as long as a country is ruled this way.

Authoritarian spells are often counted in country-years and analyzed in terms of their beginning and end points, which coups, revolutions, or gradual democratic transitions may trigger. Autocracy-to-autocracy transitions or leadership transfers within dictatorships do not interrupt such spells.

Depending on the definition of **democracy** and its classification criteria, authoritarian spells can end the moment a democratically elected government takes over (either the powerholders change or the previous government is elected in free and fair elections) or later when a country experiences its first democratic turnover (a regular, democratic, peaceful transfer of power of one democratic government to another with a different political coalition). Because of these different approaches, it is important to check the exact coding criteria of datasets. The concept is useful for understanding how regimes transition between democracy and various forms of authoritarianism and for tracking the intensity of **authoritarian legacies**.

Some research specifically tracks 'personalist spells' (cf. **personalist rule**) or 'totalitarian spells' (cf. **totalitarianism**) to explore the impact of these particular forms of rule on state structures (foremost institutions) and their societies, in particular **civil society**, the organizational capacity of **opposition** forces, and the quality of journalism and free press.

Varieties of Democracy (V-DEM)

Democracy requires more than an aggregation of existing preferences; it demands public reasoning focused on the common good.
– V-Dem website

Presented to the world in 2014 (Lindberg et al. 2014), *The Varieties of Democracy* (V-Dem) project represents a groundbreaking initiative in the study and measurement of democracy, offering a nuanced, multidimensional, and highly disaggregated framework. Its purpose is to address the limitations of traditional democracy indices by capturing the complexity of democratic governance, recognizing that democracy extends far beyond the mere presence of elections. V-Dem's approach has had a transformative impact on academic research, policymaking, and advocacy while also facing critiques that underscore the inherent challenges of measuring such a multifaceted concept.

Currently the king of continuous measures, V-Dem is exceptional in disaggregating its comprehensive, maximalist definition of liberal democracy into hundreds of observable indicators. With an elaborate, transparent and standardized method for harnessing the power of thousands of country experts, the observed data points can then be transformed into either a continuous measure (V-Dem) or turned into a (essentially trichotomous) categorical classification: **Regimes of the World** (RoW). Specially designed for democracy, this inductive, democracy-focused measure has several limits when it comes to differentiating authoritarian regimes (i.e., with competing ideologies), although, notwithstanding its complexity, its indicators can be accessed individually by students of dictatorship.

The primary aim of V-Dem is to provide a comprehensive and detailed understanding of democracy by conceptualizing it through seven key principles: electoral, liberal, majoritarian, consensual, participatory, deliberative, and egalitarian. Of these, five – electoral, liberal, participatory, deliberative, and egalitarian – are operationalized as separate indices. This framework acknowledges that different schools of thought prioritize different democratic values (Coppedge et al. 2011). For example, while electoral democracy emphasizes free and fair elections as fundamental, liberal democracy focuses on constitutional protections for individual rights and checks on executive power. By disaggregating these dimensions into over 350 indicators (later expanded to 470), V-Dem allows researchers to analyze specific aspects of democracy in detail and trace their evolution across 177 countries from 1900 to the present.

Note that V-Dem also has a Historical V-Dem project that codes democracy indicators and institu-

tional features from the French Revolution (1789) to the early twentieth century, covering 80 polities with around 200 V-Dem indicators, including 130 expert-coded indicators. Its integration with V-Dem (using overlapping data) ensures consistent data from 1789 to the present for countries with continuous lineages like France and India, as well as former entities like Bavaria and The Two Sicilies.

V-Dem's methodology is distinguished by its rigor and transparency. It employs a combination of factual data (A-type indicators) and expert assessments (C-type indicators), relying on a network of over 2,800 country experts who provide ratings for various democratic practices and principles. To ensure reliability and mitigate biases in expert coding, V-Dem uses *Bayesian Item Response Theory* (IRT) models (see also Treier & Jackman 2008). (Coppedge et al. 2024a/b)

Bayesian IRT is a statistical method for measuring abstract concepts, like democracy, using multiple indicators. In democracy research, such as V-Dem, it analyzes expert ratings of indicators (e.g., electoral integrity, freedom of expression) to estimate a country's 'democracy level.' Indicators vary in importance and difficulty, and Bayesian IRT accounts for these differences. Unlike traditional IRT, the Bayesian approach incorporates prior knowledge and quantifies uncertainty. It adjusts for biases in expert ratings and weights indicators based on their informativeness. The result is a continuous democracy score for each country, with uncertainty estimates, enabling nuanced comparisons and tracking changes over time. Bayesian IRT is powerful because it systematically handles complex data, providing a transparent and flexible framework. It transforms subjective expert ratings into reliable, probabilistic measures of democracy, supporting research on global democratization trends and differences between countries.

This statistical approach thus accounts for coder error and cross-national comparability issues by generating probabilistic estimates for each indicator for each country-year. Once aggregated into latent factor scores using the Bayesian factor analysis, the scores are then combined into the five main democracy indices through clearly defined aggregation rules. By providing measures of uncertainty for its estimates, it allows users to assess the robustness of its findings (Coppedge et al. 2024a/b).

The impact of V-Dem has been profound. In academic research, it has facilitated studies on democratic transitions and backsliding, the relationship between democracy and development, and the effects of democratic institutions on governance outcomes. Policymakers use V-Dem data to diagnose weaknesses in democratic systems and design targeted interventions to strengthen governance structures. Advocacy groups leverage its findings to raise awareness about global trends in democracy and human rights. Organizations such as the *World Bank*, *United Nations Development Programme* (UNDP), *Transparency International*, and International IDEA (*Institute for Democracy and Electoral Assistance*) have incorporated V-Dem data into their analyses and programs.

In its pursuit of modeling various definitions of democracy, V-Dem sometimes encounters its limits and reopens older conceptual debates in the process: for instance, when V-Dem initially sought to operationalize Arend Lijphart's consensus-majoritarian dimensions of democracy, it abandoned this effort due to the inability to replicate Lijphart's findings with broader datasets, questioning the empirical validity of these dimensions outside the author's original framework (Coppedge 2023).

Despite its strengths, V-Dem has faced criticism on several fronts. One concern is the complexity of its aggregation procedures. While the multidimensional approach allows for a nuanced understanding of democracy's components, critics argue that combining these dimensions into a single score risks oversimplification or distortion. For instance, strong performance in one dimension could mask deficiencies in another. Another critique pertains to the subjectivity inherent in expert coding. Although V-Dem employs rigorous training and aggregation methods to minimize bias, the reliance on subjective judgments introduces potential inconsistencies across countries and periods. Additionally, some scholars have questioned how V-Dem integrates *de facto* (practical) versus *de jure* (legal) aspects of democracy into its measures. For example, while suffrage laws *(de jure)* are included in the *Polyarchy index* – a spin-off index (Teorell et al. 2016; 2019) – as an indicator of participation, actual voter turnout *(de facto)* may not be fully captured (Boesse 2019; Vaccaro 2021).

As mentioned, the tendency to treat authoritarianism as merely the absence of democracy has been critiqued for ignoring institutional and power dynamics within authoritarian regimes. These critiques underscore areas for refinement while affirming V-Dem's broader contributions to democratic measurement. This also applies to their categorical spin-off, **Regimes of the World** (RoW).

A final critique is a painful one, especially considering its name, 'Varieties of Democracy' – recently, Wolf (2023) argued that V-Dem has progressively shifted away from its original emphasis on exploring the varieties of democracy, instead placing disproportionate focus on 'liberal democracy.' This shift is reflected in V-Dem's publications, where alternative democratic models are increasingly marginalized. While V-Dem continues to offer data on diverse conceptions of democracy, Wolf (2023) highlights that its scholarly and policy-oriented outputs predominantly center on liberal democracy, implicitly framing it as the sole legitimate form of democracy. A reflective paper by Coppedge (2023) acknowledges some of these criticisms and explains what role the works of **Dahl** and Lijphart have played in the development of V-Dem's approach.

In conclusion, V-Dem has absolutely redefined how democracy is measured by offering an unparalleled level of detail and transparency. Its multidimensional framework enables researchers to explore diverse conceptions of democracy while providing policymakers with actionable insights into governance challenges. However, its methodological com-

plexity (which is probably the main reason why other (much simpler) **continuous measures** are still popular) and reliance on expert coding highlight ongoing debates about how best to measure such an elusive contested concept. As V-Dem continues to refine its approach through iterative improvements and feedback from the scholarly community, it remains an indispensable tool for understanding democracy's varied forms and trajectories worldwide.

SECTION 3
REGIME BEHAVIOR

100 Escudos, Cape Verde (1989), depicting Amílcar Cabral, independence leader of Guinea-Bissau and Cape Verde.

100 Meticais, Mozambique (1989), depicting Eduardo Mondlane, independence leader and founder of FRELIMO.

5 Kwanza, Angola (1999), depicting António Agostinho Neto and José Eduardo dos Santos. They are Angola's first (1975-1979) and second rulers (1979-2017) and key leaders of the MPLA.

Autocratization

The means of defense against foreign danger, have been always the instruments of tyranny at home.
– James Madison, 1787.

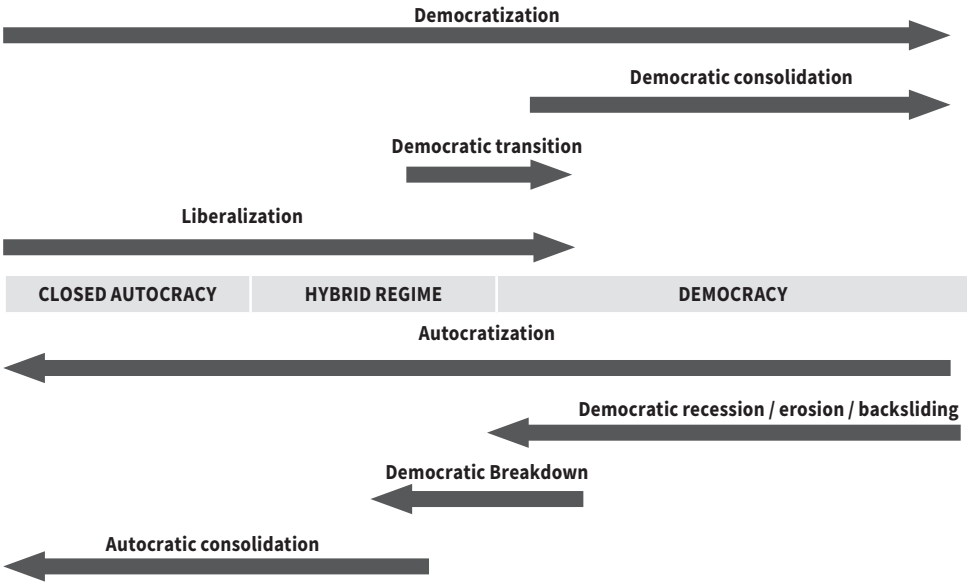
The ship of democracy, which has weathered all storms, may sink through the mutiny of those on board.
– Grover Cleveland

Autocratization refers to the gradual deterioration of democratic institutions and governance, characterized by discrete changes in rules and informal procedures affecting **elections**, civil liberties, and political rights. It often involves elected leaders consolidating power (executive aggrandizement), often with public support, using legal channels like legislative majorities or pliant judiciaries. This process can give autocratic power grabs a semblance of democratic legitimacy. Autocratization challenges the 'transition paradigm' (Box 5.3), highlighting that regimes do not automatically move toward democracy.

DEFINITION Autocratization refers to the deterioration in the quality of democratic institutions, governance and transparency. Autocratization encapsulates a wide range of processes and takes place through a series of discrete changes in the rules and informal procedures that shape not only elections but also civil liberties, political rights, and accountability. There may also be greater power to actors that do not have electoral accountability such as *de facto* leaders (Ercan & Gagnon 2014).

While **democratization** is the gradual process of a country transitioning to democracy, autocratization is the gradual degradation of the democratic system. The changes may be nuanced and happen slowly over time. Though these changes are initiated by the incumbent leader and/or ruling party, they take place with the support of the public to some extent. Public support may enable an opportunistic leader to accumulate power using pre-existing legal channels such as through legislative majorities or referenda. If the leader has a pliant **judiciary**, they can also use the courts to enforce greater levels of executive control. Thus, these institutional changes take place through a vote or with the support of other officials, giving these autocratic power grabs the veneer of a taking place through a democratic mandate (Bermeo 2016). In the notable case of Hungary, Viktor Orbán's *Fidesz* party controlled about two-thirds of the parliament. He used this massive advantage to ram through a series of new laws that increased executive power, referring to this as his 'two-thirds revolution.'

Autocratization often starts with the democratically elected leader undermining the media in order to control the narratives about the regime. The leader uses hostile rhetoric and characterizes the information that the media produces as 'false' – or, more recently, 'fake' news. Thus, would-be autocrats can call into question the veracity of any of the mainstream media's reporting. As the leader goes on the offensive to tarnish the media's image, this can lead to self-censorship, a much more common occurrence in autocracies. The government can also try to control public broadcasters by punishing, co-opting or nationalizing the private media. In Poland, the ruling *Law and Justice Party* (PiS) passed laws in 2016 that granted government-appointed officials control over the public media (**propaganda**). Would-be autocrats can create more obstacles for any media that is critical of the regime, such as refusing to grant a license, raising taxes on the media, or fining individuals or media establishments that violate new rules on what can be reported.



Another aspect of autocratization is to undermine various mechanisms of horizontal accountability. One such target is judicial independence. With a weakened judiciary, would-be autocrats can use the courts to remove barriers to their power and undermine the rule of law while using the **judiciary** to target their opponents. To ensure greater control over the judiciary, leaders can decrease the retirement age for judges so that they can appoint loyalists. They can also interfere with the appointment process by giving the executive greater power to appoint high-level judges. Would-be autocrats can also give the executive and possibly a pliant legislature greater power over the judiciary – such as giving a council directly appointed by the president the power to inspect and remove judges.

Autocratizing regimes also make institutional changes that can affect vertical accountability. They can change the rules of how **elections** are run, such as who gets to vote, how they get to vote, how votes are counted, how votes translate into seats and who gets to run in elections. Gerrymandering districts is one way that the incumbents can gain an unfair advantage in the legislature without ever having to gain more supporters. Another tactic is to alter the rules for how long the leader can stay in power. Thus, eliminating **term limits** – often only seen in autocracies – is now a more common tactic used by democracies as well. Today, 33 percent of term limit extensions occur in democracies, up from just eight percent prior to 1989.

Autocratizing countries also try to erode **civil society**, using national security arguments such as the threat of **terrorism** and instability to justify greater control over society. These carefully crafted narratives also make citizens more likely to support these restrictions on civil liberties in the name of stability. NGOs, in particular, face greater scrutiny.

Autocratization is often conceptualized by what it is not. Autocratization is distinct from autocratic replacement, such as when one authoritarian regime is replaced by another authoritarian regime (cf. **transitions**). Authoritarian regimes break down and are frequently replaced by another authoritarian regime, such as when Ugandan dictator Idi Amin

Figure 3.1 – Autocratization & Democratization

Source: editors' own work, based on: Lührmann & Lindberg (2019: 1100)

was ousted from power but was quickly replaced by another dictator, Milton Obote (Levitsky & Way 2015). Autocratic replacement constitutes a maintenance of the *status quo* while autocratization consists of a worsening of democratic conditions (Cassani & Tomini 2020).

A failed democratization attempt and state failure are also beyond the scope of autocratization (cf. **fragile & failed states**). If shortly after authoritarian breakdown takes place, elections are held, but the autocracy is reinstalled soon after, these cases are considered reversals or 'aborted openings' (Diamond 2000). For example, after Hosni Mubarak was ousted from power in 2011, Egypt briefly attempted to democratize, but within a few years, General Abdel el-Sisi was installed in power indefinitely.

Autocratization also does not constitute the attempts of authoritarian regimes to consolidate control and counter democratic narratives around the globe. These efforts to fight against pro-democratic movements and external **democracy promotion** are about sustaining the *status quo* and ensuring authoritarian resilience (Heydermann & Leenders 2011).

Autocratization can also be distinguished from democratic breakdown, as shown in Figure 3.1. While democratic decay is a gradual and continuous process, democratic breakdown is the endpoint of the process when a democracy has failed (Svolik 2015; Kapstein & Converse 2008; Denk & Anckar 2014). In studies of democratic breakdown, there has been a clear rupture or break with democracy that is easy to pinpoint. In contrast, autocratization may eventually lead to a democratic breakdown, but this could take years to achieve and may not be as easy to pinpoint when exactly it has happened.

SEE ALSO there are many different terms to describe this process, including democratic decay, democratic decline, democratic erosion, democratic backsliding, executive aggrandizement, and authoritarianization. A specific process that falls under autocratization is **personalization** – when a ruler centralizes power in an already authoritarian regime. Related topics can be found under **transitions,** and if external powers are involved in the autocratization process, the latter are sometimes considered **black knights.** External interactions and influence can range between **authoritarian learning** and **authoritarian diffusion** or with direct support for autocracy; these can be considered **authoritarian collaboration** or **authoritarian promotion**.

KEY SIGNIFICANCE Autocratization demonstrates that the break from democracy is often not sudden. Though there are still coups taking place around the world, **coups d'état** are becoming far less frequent, as there are other processes of becoming authoritarian, such as slow and gradual executive aggrandizement that is taking place with some public support. This process is not only gradual but also more clandestine than in the past. Aspiring autocrats are able to learn from each other and subvert electoral standards without breaking the democratic *façade*.

Autocratization also illustrates that many regimes are not fully democratic or fully autocratic but instead lie somewhere in between. However, autocratization challenges the transition paradigm. More

specifically, it highlights that not all non-democratic regimes are weak, and not all transitioning regimes are becoming more democratic. In fact, in the 2020s, more regimes are becoming more autocratic rather than the other way around. At the moment, the headwinds may be pushing these regimes to become more autocratic. This is not just a plateau but a bleak picture for democracy. Thus, the study of democratic rollback is an important new research frontier that needs to be further explored. (cf. Box 6.3 on waves of autocracy)

ORIGIN Autocratization is a relatively recent term, popularized by the **Varieties of Democracy** institute, but the process of backsliding has been written about for some time now (Cutright 1969; Shoemaker 1981; Stack 1978; Winham 1970). As scholars in the 1970s, 1980s and 1990s studied the different waves of democratization taking place, they also noticed that democratizing regimes were struggling to consolidate; they were either stalling in democratization efforts or were actually moving in the wrong direction (Diamond et al. 1989; Haggard & Kaufman 1994; Linz & Stepan 1996). Many works started to look at the problems related to the quality of democracy in newer democracies and the emergence of **hybrid regimes** (Diamond 2002). During the mid-2000s, the number of articles and books focusing on this topic mushroomed, with scholars using various terms to identify and, in some cases, sound the alarm that regimes were becoming increasingly authoritarian. With the improvement and rising availability of datasets that measure the quality of democracy, there have been more scholarly works tackling autocratization.

LITERATURE The biggest debates in the literature on autocratization center on how it should be referred to, defined and measured. According to Andrea Cassani and Luca Tomini (2020), autocratization can take different forms, depending on the regime of the country autocratizing (i.e., the point of departure), what institutional dimensions are involved, and what the new regime looks like (i.e. the point of arrival). Thus, there are so many different ways of conceptualizing autocratization and different types of autocratization.

For this reason, Anna Lührmann and colleagues at the Varieties of Democracy specifically use the term autocratization for all of the processes of regimes becoming increasingly autocratic. By using the term autocratization this denotes that the process can take place in a democracy or an autocracy because it constitutes a deliberate process of regime change that is moving toward autocracy regardless of what the starting point is. For example, China has become increasingly authoritarian under Xi Jinping, but while this is a case of autocratization, it is not democratic backsliding. That is because 'democratic' erosion, decay or decline, for example, can only take place in regimes that are democratic. This is important to note because the process of autocratization is more likely to take place in a regime that is not democratic (Levitsky & Way 2015), as two-thirds of autocratization episodes around the world took place in countries that were already autocratic, with only one-third taking place in democracies.

CLASSIFICATIONS There are a host of different terms used to describe this process of becoming less democratic. Some scholars use the terms democratic backsliding (Bermeo 2016; Waldner & Lust, 2018), democratic regression (Erdmann & Kneuer 2011), democratic recession (Diamond 2015); democratic decay (Daly 2019); democratic deterioration (The Economist); democratic erosion (Plattner 2014; Coppedge 2017); de-democratization (Tilly 2003; Cunha 2015; Ágh 2015); performance deficit (Fukuyama, 2015); and democratic deconsolidation (Foa & Mounk 2016). The term that describes all of these processes is autocratization.

Larry Diamond (2021) highlights different types of autocratization, including (i) a decline in stability or quality of democracy in a younger democracy, sometimes referred to as backsliding, erosion or decay; (ii) a decline in the vigor of long-established democracies known as democratic deconsolidation; and finally, (iii) a deepening of authority in non-democratic states.

Democratic deconsolidation (ii) refers to the erosion of democratic norms. In consolidated democracies, constitutions and laws may not be as easy to change. The US constitution, for example, is nearly impossible to change without super majorities from congress and state legislatures.

Nevertheless, in consolidated democracies, there has been a slow erosion of how the public and elites feel about democratic procedures and democratic norms. Survey data helps reveal whether or not there are lower levels of trust in the system and growing dissatisfaction with democracy, a greater willingness of political actors to violate the rules of the system, low levels of political literacy, and a belief that democracy might not be on the only game in town. Some other examples of democratic deconsolidation are the declines in voter turnout, declines in civic engagement in politics, greater support for anti-system political parties and a decline in membership of political parties (Foa & Mounk 2016). In Latin America, public disillusionment over the benefits of democracy and its capacity to bring opportunities and prosperity has raised concerns over the continued legitimacy of democracy as the best form of government. Brazil has seen a declining public faith in democracy and a greater willingness of political actors to breach fundamental rules of democracy (Borges 2021; Foa & Mounk 2016; Meyer 2021).

Some scholars have noted that this process is distinct from backsliding and is known as hollowing, or where there is a declining interest of citizens in participating rather than just a change in the institutions and processes (Greskovits 2015). According to this view, civic engagement may continue while backsliding is taking place, and democratic hollowing could be occurring even while democratic institutions are intact. For example, although the US constitution has remained unchanged, there are increasing concerns that US citizens are no longer willing to sustain the constitution due to a lack of civic education and faltering commitment to essen-

tial democratic values.

One reason why a hollowing of democratic norms can take place while democratic procedures are still in working order is that political and cultural norms change so slowly. Therefore, cultural erosion can evolve in comparison to the relatively swift changes that can be made to weaken institutions. Pippa Norris uses the analogy that old floorboards can crack for years without the foundations collapsing (2017: 2-3).

Legal scholars have more specifically focused on the rule of law backsliding, where the courts, law and rights are undermined (Pech & Scheppele 2017). The Philippines represents a perfect case of this. Since the 2016 election of Rodrigo Duterte (reign: 2016-2022), the rule of law has been ignored in favor of vigilante justice against alleged drug dealers and users (cf. **death squads**). Duterte was arrested in March 2025 and delivered to the international criminal court (ICC) in The Hague to account for these unlawful killings.

Other scholars refer to judicial capture and constitutional capture, or where a democratic constitutional system is reshaped to benefit an incumbent regime. The courts, the laws and rights are sidelined. In some cases, regimes play constitutional hardball (Box 3.1) – or engage in practices that are technically permissible under the constitution but which violate existing constitutional understandings (Tushnet 2003). In other cases, such as Hungary, an entirely new constitution was adopted that suited leader Viktor Orbán and the *Fidesz* party.

Other scholars have looked at how regimes are becoming more authoritarian by using terms such as authoritarian deepening or resurgence (Walker 2015; 2016), reconsolidation or re-solidification of autocracies (Levitsky & Way 2015; Carothers 2002), and authoritarian backsliding (Waldner & Lust 2018). There is some disagreement over whether or not the process of authoritarian regimes becoming increasingly authoritarian constitutes a form of backsliding, which is why the more inclusive term autocratization is more appropriate.

MEASUREMENT There are various ways to measure autocratization. Autocratization is typically measured by evaluating the quality of democracy in a regime and then identifying any discrete changes taking place over time in a negative direction. The areas that are examined include the quality of electoral processes, political rights, civil liberties and institutional capacity. While the **Polity Index** series has been looking at political rights and freedoms since the 1960s, the **Freedom House** Index has been measuring political rights and civil liberties since 1972.

Today, there are more datasets available that conduct democratic assessments over a wider period and space with more accuracy, reliability and specificity. In addition to these reports, the *Economist Index of Democracy,* **Varieties of Democracy** and the international *Institute for Democracy and Electoral Assistance* (IDEA) have also produced valuable reports and indices on the state of democracy. Scholars are now able to use large data sets to build Large-N studies that help identify patterns of not only breakdown but backsliding as well.

There is also an effort to capture waves of autocratization and not just individual cases or episodes of this (cf. Box 6.3). For Huntington, a wave of democracy was when more countries were transitioning to democracy than the number of breakdowns taking place. Note that the comparison is between a group of countries in transition (or undergoing a dynamic process) with a group of countries that has completed a discrete event. Measuring a wave of autocratization looks at the number of countries transitioning toward autocracy, exceeding those that are becoming more democratic.

METHODOLOGICAL ISSUES Measuring autocratization presents many different methodological issues, namely being able to measure various components of democracy accurately and being able to identify whether the quality of democracy is suffering. This entails having clear measures of democracy that are updated regularly to identify if any backsliding is taking place. Some of the measures used to assess the quality of democracy use expert surveys that rely on the perceptions of experts to assess the quality of democratic processes and institutions. This comes with issues pertaining to assessor reliability and validity in making these judgments.

Full breaks with democracy are easier to measure, such as **coups**, which are often announced by the military. In contrast, it is much more difficult to capture the cuts to democracy. Thus, some scholars have noted that the incremental regime changes taking place lack a theoretical explanation of the different thresholds (Coppedge 2017; Edgell et al. 2020; Lührmann & Lindberg 2019; Tomini & Wagemann 2018). Are we looking at a decline in electoral democracy or a decline in liberal democracy? Which type of decline is more serious?

Others claim the thresholds are too arbitrary (Pelke & Croissant 2021). What changes need to take place to qualify as autocratization? It needs to be meaningful enough to cause outright transformation in the formal and informal institutions, affecting how political power is assigned and exercised. Negative changes in terms of executive constraints, civil and individual liberties, political rights, electoral integrity, competition and participation can vary in magnitude and do not necessarily trigger regime change. It may be easier to identify different types of hybrid regimes based on **continuous** measurements, such as flawed democracies, semi-democracies, and electoral authoritarian regimes, but this comes with problems of how these regimes in the gray zone are measured.

Another issue with autocratization is that there is no way to measure how much power is concentrated in the hands of one person – or, effectively, the level of **personalization** (Sinkkonen 2021). Much of autocratization today is driven by the rise of **personalist rule** in politics. However, it is difficult to measure the level of personalism across a wide set of regimes.

A final issue is that autocratization has a much smaller sample size of cases of democracy ending in this manner. Most democracies still end via **coup**

d'etat or an elite seizure of power. While autocratization is the most common direction that regimes are moving, most regimes are not going from democratic to autocratic but rather are going from autocratic to very autocratic. There are fewer examples of countries plunging from democracy to full-blown autocracy, but notable cases of Turkey, Hungary and Venezuela are useful for understanding this process.

EXAMPLES Turkey is one of the most well-known cases of autocratization leading to full democratic breakdown. When Recep Erdoğan and the *Justice and Development Party* (AKP) came to power in 2002, they boasted impressive electoral victories. Early successes in delivering economic growth and investment made the AKP very popular with professionals and intellectuals in the big cities on the one hand, and traditional supporters from the countryside. Under Erdoğan's leadership, Turkey appeared to be focused on democratic and economic reform, increasing rights for the Kurds and joining the European Union. Nevertheless, through a series of discrete maneuvers sanctioned by the public, Turkey has become fully authoritarian (Azgin 2020; Esen & Gumuscu 2020; Özbudun 2015). Erdoğan has been an expert at using 'democracy' to sustain himself in power indefinitely.

Erdoğan's early moves to consolidate power faced little backlash, such as when the AKP passed more than 500 laws (Bermeo 2016). There was also public support for a 2007 referendum to elect the president by popular vote instead of by the parliament, which Erdoğan won in elections in 2014 and 2018. In 2010, Erdoğan passed two-dozen constitutional changes via a national referendum (Baser & Öztürk 2017). One of these changes granted Erdoğan the power to appoint 14 of the 17 Constitutional judges. Erdoğan was also able to remove more than 3,000 sitting judges in 2014. Judges were also removed from their task of deciding what parties were legal for elections, as the AKP-controlled legislature was given the power to make these decisions instead (Bermeo 2016).

Erdoğan was able to assert greater control by using real or manufactured threats to justify repression. After protests broke out in 2013 against the government tearing down Gezi Park in Istanbul, the government responded with over 5,000 arrests. Another 8,000 individuals were injured, and 22 people were killed (Demirel-Pegg 2020). The government then ramped up attacks on the media, and Turkey became the world leader in imprisoning journalists, according to *Human Rights Watch*.

A 2016 coup attempt brought further repression. Erdoğan responded by declaring a state of emergency, purging the regime of dissidents from the media, the judiciary and even the AKP (Whiting & Kaya 2016). On the heels of these events, Erdoğan pushed through a referendum that expanded his presidential powers and enabled him to stay in office, possibly until 2029. Subsequent counter-terror legislation was passed after the two-year state of emergency expired, giving the government tremendous power to dismiss public officials and amplifying the authority of the police.

It is helpful to return to the case of Hungary – a commonly cited example of autocratization in a country that started as a democracy. Viktor Orbán, who has led the *Fidesz* party since 1993, was elected prime minister in 2010 by a wide margin. As mentioned previously, this led Orbán to declare that a two-thirds revolution had taken place. *Fidesz* worked to rewrite the constitution within months of taking power, and the state was politicized with *Fidesz* allies installed in the civil service.

After *Fidesz*'s 2010 victory, the regime made changes to the electoral system that would guarantee its success in future years. Voters used to cast two votes in national elections for a party list and a representative in their constituency. Only the number of votes for the candidates that did not win their constituency would be added to the aggregate votes for their party in the national list. This was a safeguard to ensure better support for smaller parties. The regime changed this system to allot a proportion of the winning candidate's votes to be added to their party's aggregate, which would make it incredibly challenging to defeat the *Fidesz* party. The opposition would have to secure three percentage points more of the popular vote in order to win. The governing party relies on state resources, media bias and questionable campaign financing.

The next change was that the number of parliamentary seats was reduced from 386 to 199, with new gerrymandered districts that would increase the chances of *Fidesz* maintaining control. This made it more difficult for progressive areas such as Budapest to vote for their parties, while the conservative countryside was given more representation in spite of having fewer people. A 2010 law gave citizenship to ethnic Hungarians in neighboring countries which gave them the right to vote, and they were largely supportive of Orbán's right-nationalist agenda, voting for *Fidesz* at an astonishing 95 percent rate. Fake parties were created to divide and split up anti-*Fidesz* votes in competitive districts. These tactics gave *Fidesz* an insurmountable edge.

Additionally, because *Fidesz* controls the parliament by at least two-thirds, it also benefits from the rule that for any motion to be heard by the parliament must be decided by qualified majority voting (or two-thirds majority). It will be very difficult for the opposition ever to reverse some of these reforms and appointments *Fidesz* has made through this process.

There are also changes to the judiciary that have undermined the rule of law. The Constitutional Court, which was established in 1990, originally had 11 members that were nominated by a parliamentary committee, which consisted of one representative from each party in parliament and then elected by a two-thirds majority vote. Members of the Constitutional Court then elected the president of the Court. After the 2010 elections, *Fidesz* amended the constitution to remove the cap on the number of members of each party that could sit on the committee, ensuring that the number of members was proportional to the size of each party's seats. *Fidesz* then increased the number of court justices to 15 and lengthened the

tenure for judges from nine to 12 years. All judges over 62 had to retire, and all new seats were filled with loyalists.

The independence of the press is increasingly challenged. The private media has been targeted, with government advertising being withheld and higher taxes on revenues employed. The independent media has also faced attacks and constant political interference, leading to mass resignations. By 2017, 90 percent of all media in Hungary was owned by either the state or a *Fidesz* ally, according to a count by Budapest-based scholar Marius Dragomir. This media empire includes every single regional newspaper in the country. The media is also under the control of KESMA – the non-profit government-owned conglomerate of more than 400 media products and companies, including television, radio, websites and advertising, spewing out government **propaganda**. The government-controlled media has a new media board and editorial slant that mirrors *Fidesz*'s positions. By taking control of the media, the government can ensure that the public is mostly exposed to government narratives.

Ironically, *Fidesz* also passed a new law that penalizes the spread of fake news, but this is primarily used to target rivals of the party. Anyone who criticizes the government can be detained based on how the regime interprets the new law. Other civil liberties and political rights are also under attack, such as the rights of the LGBTQ+ community. The *Fidesz* party decided to ban the depiction and promotion of homosexuality. NGOs also face constant scrutiny. NGOs are subject to regular financial inspections by the State Audit Office, especially those that are foreign-funded.

Fidesz's rule will also have a long-lasting legacy since young people during their impressionable years have been targeted. *Fidesz* has passed laws to reshape the curriculum in order to deemphasize critical thinking and other skills that might lead students to question the government's narratives.

Increasingly, Orbán is able to run the country without **opposition**. When emergency laws were passed due to the COVID-19 pandemic, this gave Orbán extraordinary powers. Though this was eventually withdrawn by 16 June 2020, new regulations have been implemented that help ensure that Orbán can make decisions virtually unfettered. In response to the 2015 European migrant crisis, *Fidesz* declared a state of emergency that has since been renewed. Then, in the wake of the war in Ukraine, Orbán declared another state of emergency to be able to respond swiftly to the fallout of the conflict.

Dissent has been stamped out in every major aspect of political and social life, but hard measures have not yet been implemented, such as banning elections altogether or creating a police state. Thus, on the road to autocratization, many autocratizing regimes may land on soft **fascism** rather than the more repressive authoritarian regimes that dotted the landscape in the twentieth century.

IMPACT ON POLICY The recent autocratization wave that has taken place has put numerous pressures on states and international organizations to respond, while policy makers have struggled to mount an effective defense. NGOs, which used to focus on democracy support, are now also having to play defense. This has led to policymakers seeking to understand the ways in which autocratization is taking place and how to counteract it best.

NEW FRONTIERS Autocratization is a new subfield of comparative politics. As such there continues to be new literature looking into the drivers of autocratization and what are the most effective modes of resistance. Marlies Glasius (2018) takes a different approach to analyzing autocracy by not focusing on elections but on accountability, which could be used to benchmark democratic backsliding by differentiating between illiberal practices and authoritarian practices. Knutsen et al. (2024) are refining Large-N data and comparing datasets in order to account for nuanced instances of autocratization and democratic backsliding.

Authoritarian Constitutionalism

For my friends, anything – for my enemies, the law.
– Getulia Vargas, President of Brazil

Prawo jest jak słup – przeskoczyć się go nie da, ale obejść zawsze można
(The law is a pillar – too tall to leap, but easy to step around.)
– Polish saying

In political theory, 'authoritarian constitutionalism' refers to the practice of an authoritarian regime utilizing or manipulating a constitution to obtain or hold on to power. In doing so, it goes against the **ideology** of **constitutionalism** that propagates limits on executive governance to render it legitimate, utilizing means such as the rule of law, the protection of civil liberties, and the division of powers (into well-delineated legislative, judiciary and executive branches with checks and balances). Constitutionalism is thus a core tenet of liberal **democracy** and is conceptually challenging to merge with **authoritarianism**.

Elkins et al. (in Ginsburg & Simpser 2014: 142-143) aptly summarize the need to understand the phenomenon: "*if all provisions in constitutions [across regime types] were operating manuals, we would expect that democratic and authoritarian constitutions would diverge. If all provisions were window dressing, we might expect convergence. Oddly, if we find that constitutional texts are similar across regime type, it implies that the practices of constitution making may be playing very dif-*

ferent functions. The same terms may be genuine promises in democracies and mere obfuscation or window dressing in the authoritarian context."

DEFINITION As a phenomenon, authoritarian constitutionalism is approached from different angles (A, B, and C below). Constitutions themselves, of course, are also the direct object of comparative study within this context, but the results of such study are surprising. It is actually hard to define an 'authoritarian constitution:' Not all of them are 'drafted by dictators' and the timing (of their creation) and context should be taken into account. Elkins et al. (in Ginsburg & Simpser 2014: 143-148) argue that an authoritarian constitution is one promulgated in a year when the country is under authoritarian rule.

Elkins et al. (in Ginsburg & Simpser 2014: 143, 162) find that the empirical evidence shows few statistically significant differences between authoritarian and democratic constitutions when controlling for other factors. The differences observed – such as fewer rights or less judicial independence in authoritarian constitutions – are minor. Surprisingly, authoritarian constitutions often grant less formal **executive** power. Over time, authoritarian constitutions tend to resemble democratic ones, suggesting that authoritarian regimes adapt their constitutions to imitate democratic models while innovating in informal practices. Overall, regime type has less influence on constitutional form than factors like region, era, and constitutional legacy (i.e., the path dependency derived from institutions chosen for the first constitution in a country's history).

Sometimes, authoritarian constitutionalism is treated as a *regime type* (A) that combines authoritarian governance with the presence of institutional constraints on power. It involves a political system where constitutional mechanisms are used to legitimize and sometimes limit authoritarian rule, but without adhering to democratic principles such as fundamental rights, justice, or equality (Pozas-Loyo & Ríos-Figueroa 2019b; Isiksel 2013). According to Barros (2002: 20), such *"institutional limits imply a legal standard, a mechanism of enforcement, and a division between those subject to the standard and those enforcing it, ensuring that actors are bound by prior decisions in the form of rules."*

Tushnet (2015: 438) dismissed the idea that constitutional 'institutional constraints' by themselves are effective in limiting executive power in authoritarian regimes. (Authoritarian executives adopt laws unchecked and usually possess absolute majorities in the legislatures they control anyhow). Only when elites share an ideological commitment to the principles of 'constitutionalism' can constitutions constrain public power. From this interpretation flow three observations: (a) It brings authoritarian constitutionalism back into the realm of worldviews, belief systems and ideology – and renders it a diluted subtype of **constitutionalism**. (b) It posits that there is a different mode of constitutionalism in democracies and non-democracies, but that there exists semantic equivalence when qualifying both modes. (c) Thus, the category of constitutionalism can be pluralized, allowing the creation of typology to draw distinctions between regimes that should be normatively distinguished (Tushnet 2015: 395; Pozas-Loyo & Ríos-Figueroa 2019b: 342) – more details can be found under 'classifications & methodological issues' below.

At other times, authoritarian constitutionalism is treated as the mere *practice* (B) of utilizing constitutions for authoritarian purposes. (Following this interpretation, this entry is thus listed here, in the encyclopedia section of **authoritarian behavior**, and not under regime types). This approach, however, radically separates 'constitutionalism' in democratic and authoritarian contexts (Pozas-Loyo & Ríos-Figueroa 2019b: 342), where constitutions are thus used for categorically different purposes. In democratic constitutionalism, the practice is ideological (devoted to ideas of constitutionalism); in the authoritarian context, it pertains to regime survival, elite interests, tactics and as a 'means to an end.'

Alternatively, but rarely used this way, the term describes a certain *stage* (C) of regime behavior on a journey between liberal democracy and closed authoritarianism, often overlapping (but not synonymous) with **hybrid regimes** and rather evolving in the direction of an autocratic endpoint (**autocratization**). Although one can argue, this stage can also take place in the opposite direction, for instance, in the context of a controlled **transition** – e.g., a military dictatorship returning to the barracks and abandoning the political scene – where constitutional provisions are forced upon the new regime by the outgoing incumbents to guarantee a desirable **exit option**. (cf. Negretto in Ginsburg & Simpser 2014) In the latter case, authoritarian constitutionalism is one of the stages of a larger transition toward liberal democracy. (In any case – as shown in Box 5.3 on 'transitology' – no trajectory has a certain outcome, of course).

SEE ALSO This entry is closely related to the **ideology** of **constitutionalism** and overlaps with the functioning of courts (**judiciaries**) under **authoritarianism** or through changes due to **populism** affecting democratic polities. Authoritarian constitutionalism is a good example of a non-democratic rule-based order, in line with Max **Weber's** theories of **legal-rational rulership**; see also the introduction in Alviar García & Frankenberg (2019). For other institutions that function differently under dictatorship, consult **bureaucracies** and **legislatures**. For a pre-modern example of 'rule by law' as an authoritarian ideology, see **legalism**.

CLASSIFICATIONS & METHODOLOGICAL ISSUES
While 'constitutionalism' is a normative term referring to a worldview, 'authoritarian constitutionalism' encompasses a set of factual ways how to distort a constitutional order and enable regimes to engage in **autocratization** (either democratic erosion or autocratic consolidation). When scrutinizing this (relatively) new term, some (law) scholars take issue with this conceptual tension forced upon the term **constitutionalism** – a doctrine for limiting government, not to enable its dominance – concluding that 'authoritarian constitutionalism' is an oxymoron, seemingly

absurd and nonsensical. (Lachmayer 2017)

To overcome this, Mark Tushnet (2015: 420) insists upon the need "to pluralize the idea of constitutionalism," urging us to move beyond a strictly liberal-democratic framework. A reductionist approach, confined to such a framework, *a priori* dismisses the possibility of non-liberal constitutionalism, thus minimizing not only the scholarly and normative significance of the term but also the long and rich constitutional history of authoritarian regimes (e.g., like those of Latin America).

Constructively, some propose to replace 'authoritarian constitutionalism' with 'constitutional authoritarianism' since its main features: ill-defined limits, lack of accountability, execution and concealment of violence by the ruling elite, belong to the conceptual category of **authoritarianism** and not to the category of 'constitutionalism' (Lachmayer 2017; Niembro Ortega 2017). *"Constitutionalism is also not a characteristic of authoritarianism, but authoritarianism can be constitutional, in the sense, that it applies the strategy of (mis-)using constitutional law to pursue authoritarian ideas."* (Lachmayer 2017)

As a distinct *regime type* (A), Mark Tushnet (2015) designed a classification that distinguishes 'authoritarian constitutionalism' (i) from 'absolutist constitutionalism' (ii) and mere 'rule-of-law constitutionalism' (iii) by examining elites' degree of normative commitment to constitutional principles and the extent of political freedoms and constraints:

Absolutist constitutionalism (ii) involves a single decision-maker, such as a monarch, who rules with absolute authority but consults widely and generally protects civil liberties. Decisions are made at the ruler's discretion, without formal mechanisms for challenging them once made. This system lacks institutional checks on power but allows some public discussion and criticism. (Tushnet 2015: 396; 415-416).

Mere *rule-of-law constitutionalism* (iii) satisfies core rule-of-law requirements like publicity, prospectivity, and generality but does not constrain rulers with substantive rules regarding civil liberties. Decisions conform to procedural requirements (and are thus technically 'legal') and are implemented through independent courts, yet rulers can change laws at will while maintaining procedural legality. (Tushnet 2015: 396; 416-418) Often, security doctrines adopted in constitutions can 'legally' trump civil liberties.

Authoritarian constitutionalism (i) then is characterized by a system that combines reasonably free and fair elections with a moderate degree of repressive control over expression and personal freedoms. It operates under a constitution that has a modest normative commitment to constitutional principles, but these principles are often manipulated to serve the regime's interests. The judiciary may appear independent, but it typically aligns with the government's strategic goals. (Tushnet 2015: 439).

Tushnet's analysis highlights that while these systems differ in their adherence to constitutional principles, they all use constitutional frameworks to maintain control, with varying degrees of normative commitment and strategic manipulation. There is a clear overlap of authoritarian constitutionalism with **hybrid regimes**, operating at intermediate levels of liberal freedoms and resorting to low to intermediate levels of force and fraud during elections. (Tushnet 2015: 397) Tushnet's ideal-type conceptualization is exemplified foremost through the case of Singapore.

Such regimes can transform in two ways. First, they might evolve into fully constitutionalist systems by gradually increasing tolerance for dissent and expanding co-optation mechanisms. As dissent grows, regime insiders may feel less threatened and more inclined to abandon authoritarian practices, especially if new leaders assure them of safety during the transition. Alternatively, they can autocratize further if leaders fail to instill a 'normative commitment to consultation and responsiveness' in successors, leading to repression and violence in response to dissatisfaction. Leaders may also resort to repression if they fear bad **leader fates**, thus maintaining their grip on power. (Tushnet in Ginsburg & Simpser 2014: 47-48)

Still, there are some limits to Tushnet's design: his type only matches civilian regimes and does not account for other factors of intra-regime variation, e.g., the level of **personalization**. Pozas-Loyo and Ríos-Figueroa (2019b: 343-344) also point this out and criticize such oversimplification of authoritarian regimes, providing the example of Mexico, where *"powerful presidents under the authoritarian hegemonic-party rule could not (neither de jure nor de facto) alter art. 83 of the Constitution that establishes a six-year presidential term without re-election, despite the fact that the president was the head of the party that controlled supermajorities in both houses of the federal congress as well as states' executives and legislative branches."* This challenges Tushnet's (2015: 438) claim that dismisses constitutional 'institutional constraints' as effective in limiting executive power in authoritarian regimes. (His typology of pluralistic constitutionalism does not account for effective institutional limitations).

As a *practice* (B), Roberto Niembro Ortega (2016; 2017) considers authoritarian constitutionalism as a method by which ruling elites (either with clear authoritarian tendencies or operating in not fully democratic states) exercise power. In such cases, the liberal democratic constitution, rather than limiting state power and empowering the powerless, is repurposed for practical and authoritarian ideological functions. This approach does not stipulate a specific regime type where this practice may occur, nor equates the practice with **hybrid regimes** (although they do overlap).

In his classification, Niembro Ortega (2016) distinguishes systems that have authoritarian constitutions and those that merely use constitutional mechanisms to achieve authoritarian goals (cf. 'democratic backsliding' as a stage in **autocratization**). He explains that in (i) *authoritarian constitutionalism*, while a liberal constitution may be in place, it fails to deliver on the promises of constitutionalism. By contrast, in (ii) *constitutional authoritarianism*, the constitution itself contains authoritarian elements and is aimed at authoritarian consolidation

by entrenching the ruling regime and providing it with some **legitimacy** of **legal-rational rule** (cf. Max **Weber**), in line with 'authoritarian consolidation' as a (final) stage in autocratization. Note that Elkins et al. (in Ginsburg & Simpser 2014:162) found that blatantly authoritarian constitutions actually do not survive the tooth of time and are likely tossed out entirely with regime change.

Pozas-Loyo and Ríos-Figueroa (2019b: 344-346; 351-352) offer a similar classification of practices as Niembro Ortega but expand upon it and switch some of the labels. *Authoritarian constitutionalism* (a) refers to the presence of effective institutional constraints on power within (collegial) authoritarian regimes that effectively limit executive power, in Chile under Pinochet or Brazil's dictatorship, where courts played significant roles, or under Mexico's PRI, where **term limits** applied. Under *constitutional authoritarianism* (b), provisions merely serve as symbolic 'parchment' barriers (e.g., Trujillo in the Dominican Republic). Here, authoritarian regimes freely manipulate constitutional mechanisms for authoritarian ends. In democracies with authoritarian behaviors, one finds *abusive constitutionalism* (c) as a distinct type. The latter knows two main practices: Using bludgeoning majorities to approve a series of constitutional amendments that (taken together) effectively remove restraints on the executive and thus erode democracy – like in Venezuela when Chávez came to power after 1998; or the reliance on 'emergency powers,' designed as a *"means of saving democracy from a threat, however well or ill designed."* Faced with social unrest and insurrection, the Columbian exclusionary government spent 35 years between 1949 and 1991 (so about 83% of that time) under a 'state of exception.' The fourth type of practice is *democratic constitutionalism* (d).

As a *stage* (C), authoritarian constitutionalism reverse mirrors the evolution of the concept of **hybrid regimes**. Initially, the latter were also treated as transitional stage 'in between' but were later re-conceptualized as a stable regime type because of their permanence and observed universal features. Treating authoritarian constitutionalism as a phase in regime transitions allows for a closer study of the role of constitutions during regime changes, either as populism erodes democracy or hybrid regimes consolidate their rule. Angela Di Gregorio (in Ginsburg & Simpser 2014) expands upon the phenomenon as an intermediate political system, linking it to the literature on 'democracies with adjectives' and illiberal democracy.

Regarding classifications of constitutions, D.S. Law and M. Versteeg (in Ginsburg & Simpser 2014) offer a typology based on the relationship between their formal *(de jure)* and actual *(de facto)* constitutional commitments. It distinguishes countries along two dimensions: whether they respect rights in practice and how ambitious their constitutional promises are. Countries with *sham constitutions* (i) have documents that promise extensive rights but fail to uphold them in practice, such as Sudan, where the formal constitution overstates actual governance. On the opposite side, countries with *modest constitutions* (ii) understate their true commitments. For example, Australia's constitution contains fewer formal promises, yet the government respects more rights than are explicitly outlined. *Strong constitutions* (iii) refer to countries that deliver on broad promises both on paper and in practice. Finland is an example where constitutional commitments are met both *de jure* and *de facto*, aligning with democratic governance. On the other hand, *weak constitutions* (iv) describe countries that uphold their constitutional promises because the constitutions impose few constraints or demands. Saudi Arabia exemplifies a regime where constitutional commitments align with practice, but the standards are low, making them easy to meet.

The larger gap between constitutional promises and actual behavior in autocracies is not surprising, as they often make constitutional promises just for appearances. However, not all authoritarian regimes resort to sham constitutions. Many opt for constitutions that candidly acknowledge their limited respect for rights, leading to the classification of weak constitutions, which explicitly offer low levels of rights protection. Law and M. Versteeg find this tendency statistically significant among monarchical and military regimes, which are more likely than civilian regimes to adopt such weak constitutions. This pattern arises from strategic constitution-writing behaviors that align with the specific characteristics of each regime type. For more oppressive regimes, adopting a weak but accurate constitution can facilitate internal coordination and reduce backlash compared to a sham constitution filled with empty promises, which might unite opponents against the regime. Civilian regimes, in contrast, may prioritize ideological legitimacy, prompting them to promise a broader array of rights, even if they are not fully realized. (Ginsburg & Simpser 2014: 187-188)

LITERATURE The edited works (Ginsburg & Simpser 2014; Alviar García & Frankenberg 2019; Belov 2021) contain core works that explore different shades of constitutional authoritarianism. Tom Ginsberg's (2012) edited work looks at the process of constitutional design. The article by Tushnet (2015) triggered most conceptual debates, presented in detail by Niembro Ortega (2016) and Pozas-Loyo and Ríos-Figueroa (2022). Zoltán Pozsár-Szentmiklós (in Belov 2021) delves deeper into the nuances of the separation of powers.

MEASUREMENT The *Comparative Constitutions Project* (CCP) database can be used to make basic comparisons between authoritarian and democratic constitutions. The CCP collects data on over 600 features of constitutions, covering aspects such as government structure, rights, and forms of governance. (Elkins et al. 2009)

EXAMPLES Examples of authoritarian constitutionalism include Turkey's use of its constitution to prioritize state security over individual liberties (Tushnet, 2015; Isiksel, 2013), but most of all, the 'Singapore model' of 'rule by law' is heralded. By blending democratic processes with strict control over political

freedoms, the *People's Action Party* (PAP) maintains power through regular elections yet employs tactics like gerrymandering and libel laws to suppress **opposition**. The legal system, rooted in British common law, supports economic efficiency while curbing dissent through laws that restrict free speech. Constitutional amendments are used to limit judicial power, ensuring that the courts cannot challenge government authority. This selective application of the rule of law facilitates economic prosperity and social stability but at the expense of genuine democratic freedoms. (Ratah 2012; Tushnet 2015)

KEY SIGNIFICANCE The primary purpose of authoritarian constitutionalism is pragmatic. It provides a veneer of legitimacy to the regime by maintaining the appearance of constitutional governance while allowing the ruling elites to exercise significant control over political processes and institutions. Scheppele (2018: 581-582) finds that the "*new autocrats look like democrats playing hardball, not like dictators playing softball.*" The de-liberalization of constitutional systems involves complex changes that are difficult for the general public to understand. These changes include adjustments in judicial appointments, jurisdictional rules, parliamentary procedures, and the structure of independent commissions, all crucial for maintaining liberal constitutionalism. However, most people only perceive the continuity of institutions like the constitutional court, parliament, and election commission without recognizing the deeper implications.

Tom Ginsburg and Alberto Simpser (2014: 1-8) argue that constitutions in authoritarian regimes serve multiple functions. They act as 'manuals' to facilitate coordination within the ruling group. Constitutions serve as 'billboards' to communicate messages to both domestic and international audiences and as 'blueprints' that offer guidance to officials and citizens on the actions they are permitted or required to take.

Gandhi (in Belov 2021: 204-206) also finds that constitutional constraints on the executive affect the **elite pacts** of opposition forces. *De jure* limitations for supreme office holders on appointing cabinet positions (e.g., enforcing legislative participation) increase the likelihood that any future head of government will respect the pre-election coalition agreement regarding the distribution of cabinet posts among coalition parties. This affects the ability of opposition movements to band together and settle on a champion to challenge an incumbent, trusting that the compromises involved will be honored post-election (if they win).

REGIONAL VARIATION Latin America and the former Soviet Union dominate the case studies, besides the various authors covering Singapore (see 'examples' higher).

Indo-Pacific For Southeast Asia consult: Bünte & Dressel 2017; for South Asia: Bajpai & Kureshi 2022; for East Asia: Ginsburg 2002; 2008; Croissant 2010. For a comparison of both Chinas, see Lin (2016).

Latin America Pozas-Loyo & Ríos-Figueroa (2019b) compare various Latin American and Caribbean examples. Barros (2002) is a classic for Chile. The edited volume by Hübner Mendes et al. (2022) is the best recent comparative overview of constitutions.

Eurasia For Russian constitutional legacies, see W. Engelking (in Belov 2021). Galushko (2021) covers Ukraine and Belarus, their (Soviet) constitutions, and related **authoritarian legacies**. For Hungary, Moldova and Romania as case studies, see Pozsár-Szentmiklós (in Belov 2021); on Hungary's concept of rule of law, see Z.J. Toth (in Belov 2021); on the roots of Polish and Hungarian's illiberal institutionalism, see Szente (2023); Drinóczi & Bień-Kacała (in Belov 2021). On Poland under *Law and Justice,* see the chapters by Tacik and Bień-Kacała et al. (in Belov 2021). Scott Newton (2021) compares Central Asian legal systems and constitutions in particular (also: Newton in Alviar García & Frankenberg 2019).

For other cases, consult Davis (2020) investigates post-Apartheid South Africa. For Egypt's constitution, see Stilt (in Ginsburg & Simpser 2014); for Syria and Turkey, see El Manfalouty (in Alviar García & Frankenberg 2019) and Isiksel (2013). Hartmann (2022) traces constitutional legacies on **term limits** in Africa, differentiating authoritarian spells (cf. Box 2.4).

Co-optation

If you want to go fast, go alone. If you want to go far, go together.
– African proverb

Non-cooperation with evil is as much a duty as is cooperation with good.
– Mahatma Gandhi

Co-optation is a central tool in the survival strategies of authoritarian regimes, functioning alongside repression to maintain control and stability. While **repression** involves the use of force or coercion to suppress **opposition**, co-optation refers to the intentional distribution of benefits to potential challengers in exchange for their loyalty (Frantz & Kendall-Taylor 2014). This strategy is particularly effective in dictatorships, where the regime seeks to neutralize threats by incorporating rivals into the political system, often through the establishment of institutions such as political **parties** and **legislatures** (Geddes 2006; Gandhi & Przeworski 2007). These institutions provide a credible framework for exchanging benefits for loyalty, reducing the incentives for opposition groups to challenge the regime and thereby extending autocratic survival (Gandhi 2008; Magaloni 2008).

One of the primary functions of co-optation in dictatorships is to create a network of loyal supporters who have a vested interest in the regime's continuation. This is achieved through selective benefits that are distributed exclusively to proven supporters of authoritarian rule. For example, ruling parties in authoritarian regimes often monopolize access to social and economic privileges such as land titles or educational opportunities, ensuring that these benefits are available only to party loyalists (Magaloni & Kricheli 2010). This conditional distribution of resources allows regimes to exploit natural career aspirations and create an enduring stake in the regime's survival (Svolik 2012).

There are two ways how autocrats can dole out **rents** to co-opt strategic groups (**patronage**): Formally or informally. The former explains one of several functions why dictatorships have **legislatures** and hold **elections** and why even personalist rulers end up creating their political **parties**. Such formal institutions facilitate the co-optation of **opposition** and rivals, who can then 'select' to what degree they want to be associated with the ruling regime (Gandhi 2008). Such formal institutions have other functions like information-gathering, consultation platforms, and applying divide-and-rule tactics. Informally, dictators adhere to the same techniques, but usually covertly, for regime insiders and allies through **systemic corruption**, **neo-patrimonialism**, and creating patronal networks (cf. **patronalism**).

Scholars have extensively studied co-optation as a key mechanism of authoritarian control. Research highlights how dictators balance repression and co-optation depending on the nature of the opposition and the external environment. For instance, **Wintrobe** (2000) presents a theory suggesting that dictators maintain power through a combination of repression and loyalty-building strategies like co-optation and was one of the first to suggest that these two practices complement each other. **Elections** also serve as mechanisms for co-optation; in Egypt under Mubarak, vote-buying transformed elections into decentralized distribution systems for patronage, incentivizing voters to support regime-sanctioned candidates (Blaydes 2011 in Tanneberg 2020: 13).

Similarly, Frantz and Kendall-Taylor (2014) developed a framework showing how institutionalized co-optation influences repressive strategies. Their work emphasizes that while repression may be necessary for dealing with radical opposition groups

Box 3.1 Constitutional Hardball

Every strike brings me closer to the next home run.
– (George Herman) 'Babe' Ruth (Jr.) (1895-1948), baseball legend.

The word 'hardball,' with its undertones of fierce competition, always leads my mind to 'dodgeball' – and inevitably to the memorable line from the absurd comedy *Dodgeball: A True Underdog Story* (2004): "If you can dodge a wrench, you can dodge a ball." From there, I cannot help but think of a twist: "If you can dodge precedent, you can play constitutional hardball."

'Constitutional hardball' refers to the use of legal and procedural mechanisms by political actors in ways that push the boundaries of established norms for partisan advantage, often straining or violating long-standing constitutional conventions without necessarily breaking formal laws. The term was coined by legal scholar Mark Tushnet in 2004 and has since been used to describe tactics that, while technically legal, undermine the spirit of democratic governance by destabilizing shared norms and expectations that help maintain a functioning political system. Constitutional hardball is characterized by high-stakes maneuvers designed to entrench political power or shift the balance of power in a way that could have long-term consequences. Examples include tactics such as court-packing, filibustering judicial appointments, using the debt ceiling as a political bargaining chip, voter suppression, and refusing to accept electoral outcomes or peaceful transitions of power. For example, after losing the 2020 US (re)election, incumbent Donald Trump rallied 147 Republicans (eight senators and 139 representatives), who voted to object to the certification of the Electoral College results on 6 January 2021, citing unsubstantiated claims of voter fraud. Such actions are often seen as undermining democratic principles because they prioritize short-term partisan gains over the stability and fairness of the political process.

The concept has been applied to various political contexts, including shifts toward authoritarianism in countries like Argentina and Venezuela, where leaders like Juan Perón and Hugo Chávez used constitutional hardball tactics to consolidate power. For the US, Fishkin and Pozen (2018) have noted an increase in such practices, particularly in recent decades, with some arguing that these tactics have contributed to an erosion of democratic norms.

In essence, constitutional hardball exploits gaps between what is legally permissible and what is democratically acceptable, often leading to a breakdown in mutual trust between political actors and encouraging reciprocal escalation of such tactics.

that cannot be easily bought off, co-optation is often more effective for managing moderate opponents who can be integrated into the regime's political apparatus. This balance between repression and co-optation is crucial for maintaining stability in dictatorships.

The effectiveness of co-optation lies not only in its ability to neutralize opposition but also in its flexibility. Autocrats can manipulate political institutions to fine-tune co-optation strategies without threatening regime stability (as Malesky & Schuler (2010) show for Vietnam) by offering opposition real but limited policy influence in a national legislature. By adjusting how benefits are distributed and who receives them, dictators can manage internal tensions while maintaining control over key constituencies. However, there are limits to this strategy. Co-optation primarily addresses material incentives for loyalty but may fail to account for non-material motivations such as ideological commitments or grievances against the regime (Tanneberg 2020). Additionally, selective co-optation can exacerbate social divisions if benefits are distributed unevenly among different groups (cf. **hoarding**).

Co-optation is thus a multifaceted tool used by dictatorships to maintain power by extending benefits in exchange for loyalty. It operates alongside repression but offers a more subtle means of control by incorporating potential challengers into regime structures. Johannes Gerschewski (2013; 2015) with his colleagues (2013) reframed co-optation as one of three communicating vessels of regime behavior alongside **repression** and **legitimacy**, which was blended into a middle-range theory calling these the 'three pillars of regime stability.' This so-called 'WZB-model' is being tested in empirical cases (Kailitz & Tanneberg 2015; Lueders & Croissant 2015; Schneider & Maerz 2017), but with mixed results. (It is called WZB after the institute where it was invented, the *Wissenschaftzentrum Berlin für Sozialforschung* or Social Science Research Center Berlin).

Lueders and Croissant's (2015) empirical findings

suggest that the WZB model may only partially apply to electoral autocracies. Additionally, they question whether election outcomes (victories or defeats) are valid indicators of regime stability, arguing that elections occur at the end of a process where the pillars have already weakened, making them more a symptom of instability rather than a direct cause of regime change. Gerschewski (2017) acknowledges that the model is a heuristic tool and not a definitive explanation for all autocratic regimes. He sympathizes with Schneider & Maerz (2017) their suggestion to focus on the complementarity and interaction between the three pillars rather than viewing (and testing) them in isolation.

Scholars have demonstrated that institutionalized forms of co-optation – such as political **parties** and **legislatures** – are particularly effective at reducing opposition incentives and prolonging autocratic rule. However, while co-optation can stabilize regimes by creating networks of loyal supporters, it also has limitations when it comes to addressing non-material grievances or managing deeply divided societies.

Coup-Proofing

Quis custodiet ipsos custodes?
(Who guards the guardians?)
– Juvenalis

When the going gets tough, the tough get going
– American saying

Because the most common mode of exit of any autocratic ruler is a **coup d'état**, dictators have taken steps to prevent coups from happening. Scholars have termed the actions governments take to reduce the chance of such a violent ouster by regime insiders as 'coup-proofing.' Several studies have found that while coup-proofing strategies reduce the likelihood that a coup will take place, these strategies also have the unintended consequence of reducing a country's military capacity and efficiency (Reiter & Stam 1998; Biddle & Long 2004; Pilster & Böhmelt 2011). The scope of coup-proofing frameworks varies: some scholars focus exclusively on the military, and others include 'palace coups' as well.

DEFINITION Peter Feaver (1999) tackles the definition of coup-proofing from the perspective of the ruler's intent to raise a coup's organizational costs, stating that *"coup-proofing efforts attempt to lower either the willingness or ability of militaries to attempt*

a coup." However, when broadening the purview to palace coups, the definition should be modified to coup-proofing efforts attempt to lower either the willingness or ability of militaries or other elites to attempt a coup. (Van den Bosch 2021: 31-32)

SEE ALSO To study the dynamics of coup-proofing, it is foremost required to have a good understanding of the **coup d'état**, its actors, drivers and execution. Coup-proofing has both 'carrot' and 'stick' aspects, and this set of techniques partly overlaps with **co-optation**, **patronage** and **clientelism** ('carrots' to foster loyalty), and **repression** ('sticks' to discourage coups). While repression is usually aimed at opposition figures, journalists, and the people as a whole, coup-proofing also targets elites within the regime.

CLASSIFICATIONS The wide range of coup-proofing techniques used in modern regimes can be broadly categorized with the following short-hand terms: ethnic stacking, **purges**, game-of-chairs, counterbalancing, spoiling, and starving – which are the best known. Lesser-known techniques could consequently be labeled as: 'versailling,' hiding, **indoctrination**, and **personality cults**.

Most of these tactics boil down to the same age-old principle of 'divide-and-rule' by fostering an atmosphere of resentment and competition between and within groups, resulting in a selected, outnumbered elite tied to the ruler in order to safeguard their livelihood (and lives), hence securing their loyalty; and with a larger, fragmented group of armed have-nots vying amongst themselves for favor and **patronage**. This ongoing balancing act by the ruler aims to prevent elites from linking up with the have-nots and simultaneously preoccupies the have-nots with competition amongst themselves to preclude collective action.

Ethnic stacking A common coup-proofing technique is to fill the top posts in the security apparatus with family members or members of the same ethnic (or religious) group or sect. The idea is to recruit from a community of trust and that 'loyalty trumps competence.' In Syria, the Alawite community enjoyed positions of power in the military, regardless of their experience. (Quinlivan 1999) This has proven critical to ensuring that the military remained loyal to the al-Assad regime during the protracted civil war (2011-2024) triggered by the **Arab Spring**. The military may also use **mercenaries** from other nationalities, which would have a low likelihood of ever staging a coup, such as in the case of Libya under al-Qaddafi and currently in the case of Bahrain. A somewhat related tactic is to place civilian personnel, such as party members, in military command units to ensure that there is oversight of the security services, known as a shadow command. In other cases, civilians were appointed to important positions in the military because they were deemed more loyal. In Iraq, Saddam Hussein never appointed any commander who had a military background. Instead, dependable but incompetent soldiers were promoted while capable but possibly disloyal officers were demoted (Ezrow & Frantz 2013; Albrecht 2015).

Glass ceilings regarding promotions and preferential treatment of kith and kin effectively divide the military, resulting in feelings of discrimination and other grievances. Promoting loyalty over merit makes militaries (and other institutions) more corrupt – and therefore less disciplined, incompetent (Frantz 2007: 9), and fragmented, thus reducing their coup potential as well as their combat efficiency. Matthews (2022) finds that political commissars within armies are incredibly effective at snuffing out coup plots but cannot stop them once they are initiated.

Purges This technique entails the systemic exclusion of potential (political) rivals and the purging of the military or party. P. Roessler (2011: 314-315) considers it a short-term strategy by the ruler to terminate the internal security dilemma. This technique is also a form of **repression** (cf. **purges**) and does not resolve the underlying power conflict but merely displaces it from within the regime to society. A purged army will be less willing to stage a coup, and its capabilities and operative cohesion will be reduced by the expulsion of many competent (and therefore dangerous) members. (Van den Bosch 2021: 32; Powell 2012b: 59; Biddle & Zirkle 1996; Sudduth 2014) Its counterinsurgency capabilities will be lower as well because it cannot tap into local networks. (Roessler 2016) At times, purges are symptoms of a ruler's **personalization** process – acquiring unchallenged, supreme power within a regime.

Keep in mind that firing undesirables is one thing, but violent **repression** against regime insiders is generally counterproductive for the survival of autocratic leaders. According to Bove & Rivera (2015: 462): *"This is because repression against members of the supporting coalition shapes actors' views with regards to the leader and their own prospects for life. Indeed, when actors within the ruling coalition perceive that resort to repression by the leader is unfair or even unpredictable, they are more likely to consider their safety at high risk and hence will be more prone to lead or support a plot against the dictator."*

Game-of-chairs This technique – also called 'musical chairs' – is to continuously shuffle around elites in the security services to prevent any one individual from developing a large enough support base that could challenge the incumbent. This is a common tactic under **personalist rule**, who engage in a similar strategy with civilian elites as well (Pollack 2002).

Every new appointee to a position will occupy the post temporarily, lack experience, and not share any corporate identity with the institution they are in charge of. Knowing they will move on soon, they are more focused on self-enrichment than on their responsibilities. In armies, the military officers below their command may soon feel that they alone are competent to judge on such matters as size, organization, recruitment and equipment for forces, leaving them at odds with the political control and, at times, willing to intervene, especially during wartime. (Van den Bosch 2021: 34)

Counterbalancing Another strategy is to counter-

balance the regular armed forces with numerous rival forces that check and balance one another. (Belkin & Schofer 2003) Such parallel units are usually charged with protecting the regime. Examples include the *Islamic Revolutionary Guard* balances the regular military in the case of Iran, and the *National Guard* in Saudi Arabia. This tactic can sometimes backfire if the regular military becomes concerned that their institution is under threat. Parallel armies with better weapons, training and greater prestige can effectively thwart a regular army's ability to take over. Although a higher number of paramilitary organizations does not contribute to more stability, so *"leaders (...) would be better served by increasing the resources of a single paramilitary body."* (Powell 2012a: 1036) Lutscher (2015) finds a U-shaped relationship between armed forces fragmentation and the likelihood of defection during nonviolent mass uprisings. De Bruin (2020a) stresses that such measures can also increase the grievances of troops (competing for resources) and, thus, their willingness to intervene in politics.

In rare cases, **mercenaries** are used as coup-proofing units. Among subtypes of **personalist rule**, Van den Bosch (2021: 250-251) found that civilian dictatorships are more likely to do so than personalist rulers with a military background. Gentil-Fernandes et al. (2023) find that rulers with high coup risk and low international accountability are especially likely to hire mercenaries.

Such parallel security agencies, each with their line of communication and command structure, of course, do have an overlay of responsibilities, and thus, together form a market with multiple sellers of 'security services' and a single demanding buyer (the ruler). (Quinlivan 1999: 148-149) The result is that various actors constantly monitor the regular army's central command and communication lines for any suspicious activity, which seriously impedes its effectiveness and (speed of) intercommunication when officers are afraid to act autonomously within their respective purviews of command, preferring to get approval higher up first before issuing orders.

Spoiling This technique includes overpaying the security services by offering higher salaries, a much bigger budget, purchasing more equipment, or providing the military with access to lucrative business deals, etc. – all meant to buy the loyalty of the armed forces. By doing so, the security apparatus is more vested in the incumbent regime and is less likely to want to stage a coup to change the *status quo*, but only in the short term, as Sudduth (2017) notes, because this increases a military's capabilities to stage a successful coup in the future.

This technique, however, works very well when combined with ethnic stacking. (Albrecht 2015: 43-44; White 2023) In contrast, Choulis et al. (2023) find that a higher level of mechanization in militaries structurally reduces the risk of a coup because, in more mechanized military organizations, the coup execution and coordination costs become more complex.

Starving This one is aimed at cutting budgets, reducing training, and depriving an army of the capability and tools to launch a coup successfully. Quinlivan (1999: 142) finds that in such cases, even a navy or air force will possess restricted reserves of fuel or ammunition, so their units do not have the range or firepower to commit a coup. Mostly applied in underdeveloped countries with (weak) regimes, unable to coup-proof the army by other means, this is a foolhardy technique that contains many risks and undesired consequences, not to mention a plummet of the combat-readiness and discipline: The widespread grievances felt by the rank-and-file over time result in illegal activities (smuggling and trafficking) destabilizing local economies, and even predatory behavior like widespread looting, extortion or bullying of the general population by soldiers.

Versailling While not researched comparatively, this understudied technique involves a consultative, plenary institution and the imposition of theatrical, ritualistic power politics over regime insiders who are required to attend in person. France's Louis XIV's (1638-1715, *Le Roi Soleil* – the Sun King) especially-constructed palace at Versailles near Paris serves as the blueprint for such a 'royal' court, the stage for top-level political intrigue. By regularly demanding the physical attendance of **inner circle** elites (sometimes for extended periods) to participate in court ceremonies, a clear but fluid hierarchy among elites is established and continuously signaled to the inner sanctum. Under the umbrella of palace ceremony, the wheel of fortune turns as the leader bestows praise and honors on followers or doles out rants of public humiliation for real or perceived offenses.

This tactic is only common in highly centralized regimes (cf. **personalist rule** and Box 1.7 on Mobutu) where elites have public, ritualized audiences with the ruler, routinely praising the supreme leader *in plenum*, always signaling devotion and deference – and arbitrary judgment (reciprocation or rebuke) is received. It is an intimidation tactic involving an arbitrary system of reward and punishment. These cringey (to outsider observers) regime theatrics position the ruler as the ultimate giver of **patronage** and supreme judge. A fall from grace can caused by a bad performance review, the indifferent necessity of setting an example (finding a scapegoat), but also the slightest breach of protocol or hint of disloyalty (even by family members). Such palace politics distract elites and erode their collective identity by actively fostering discord, sycophancy (cf. Box 6.5) and denunciations among the elites. Through fear and humiliation, collective agency is reduced. Note that falls from grace can be undone in time (through increased loyalty) and are seldom fatal (else elites would be unwilling to participate in this 'game').

The system is closely entwined with the game-of-chairs technique, and for this reason, a big aspect of 'Kremlinology' (see Box 3.2) is based on detangling these palace politics in extremely secretive and opaque regimes (e.g., Stalin's Russia, North Korea, Turkmenistan, Laos, etc.). Analysts fall back on official (state) footage of public events, ranging from where one stands at military parades or sits at state

dinners (an honorary position; how far located from the leader?) to who is allowed to attend which official visits (factory inspections, product launches, etc.); or which elites are invited for top-level audiences or designated with special tasks or missions? (acting as an emissary on behalf of the ruler).

Hiding A ruler barracking themself in a palace is one thing, but hiding in a fortified bunker to ride out a coup attempt raises an additional hurdle for prospective coup plotters. Coups, by definition, have to be executed quickly, and a ruler hiding behind heavy fortifications can slow down the process critically, especially if dictators have ongoing access to media and rally for popular resistance, reinforcements from allies and international condemnation. Many dictators construct these, while some even have a habit of turning them into the locus of power and ruling from them. Historically, sultans were known to hide in their harems (cf. Box 5.11), acting as a 'palace within a palace' during mutinies and coups.

Indoctrination This is one of the few coup-proofing techniques that is posited not to have a negative effect on an army's effectiveness. D. Reiter (2020: 6) identifies three types of **indoctrination**: (a) education about the difficulties of successfully executing a coup (to discourage actors), (b) to have militaries accept the norm of civilian (or party) control, and (c) to cultivate loyalty to specific rulers and their mission to lead or defend the nation. A regime's revolutionary origins (cf. **revolutionary legacies**) are known to reduce the coup risk significantly. A coherent **ideology** can strengthen military obedience to the party but can also be a source of **legitimacy** for the leader. (Van den Bosch 2021: 255)

Personality cults Closely related to 'versailling' but not identical is the **personality cult**. Besides having different purposes (like nation-building and boosting **legitimacy**), such cults also signal that nobody matters aside from the ruler. Other officials fade into anonymity, and top officials are only portrayed when revering the leader. The message is that there is nobody else to follow or credible enough to take over. Of course, this deterrent technique can only be applied in regimes where leaders have already obtained a position of absolute power. (Svolik 2012: 80-81; Van den Bosch 2021: 38)

LITERATURE The older works did not call it coup-proofing but analyzed aspects of the same phenomenon under the scope of civilian control. (Perlmutter 1969; Welch 1976; Nordlinger 1977) The term 'coup-proofing' appeared somewhere in the late 1990s. Note that the field of civil-military relations is much broader in scope and that while regime type is known to be a crucial factor determining this relationship (Bland 1999), most scholars in this field only distinguish between democratic, democratizing or autocratic regimes. (Brooks 2019).

Most scholarly work aims to assess the efficiency of coup-proofing on regime survival (see: **longevity, stability & resilience**). Does the practice really prevent coups (from happening and/or from succeeding?), and when and how do they fall short? (Belkin & Schofer 2003; 2005; Powell 2012a/b; Albrecht 2015a/b; Böhmelt & Pilster 2015) Furthermore, there is a large body of literature that (A) focuses on the causal link between coup-proofing and rebellion or civil war (Driscoll 2008; Murphy 2015; Braithwaite & Sudduth 2016; Powell 2014, 2019); or (B) on the effects of coup-proofing on military effectiveness during interstate wars (Pilster & Böhmelt 2011; Narang & Talmadge 2018) and how regimes try to mitigate these negative effects: for instance, overcompensating by pursuing chemical, biological or nuclear weapons and forging alliances (Brown et al. 2013; Boutton 2019; McWard & Yoon 2021); by carefully selecting coup-proofing techniques in the face of rebel threat (Sudduth 2016; Paine 2021) or when coping with foreign threats (Florea 2018); by soliciting nonstrategic development aid for post-conflict regimes (Girod 2015; Binetti 2021).

The literature on coup-proofing originates from contrasting civil-military relations in democracies and non-democracies and comparing their combat efficiency and readiness (in the Cold War context). The existing literature barely connects with polychotomous **regime classifications** to distinguish between autocratic regime types and coup-proofing practices. (Geddes 2009; Escribà-Folch et al. 2020) A few do extend the same frame to study how democracies today are still coup-proof (Pilster & Böhmelt 2012), e.g., on democratic India (Joshi 2015). Nordlinger (1977) looked at military regimes exclusively when these were still prevalent. Most scholars find that **personalist rule** or **sultanism & neo-sultanism** – by principle – rely most on coup-proofing and are, therefore, most affected by it if dictators maladjust their threat perception. (Talmadge 2013; Van den Bosch 2021) A few studied the impact of **democratization** on coup risk (Tang & Li 2021).

Overall, the relationship between the drivers of coups and coup-proofing is complicated: Sudduth (2017) finds that rulers become less likely to initiate coup-proofing efforts as the coup risk increases (in order not to trigger the army in acting). The choice of parallel security forces also plays a role: Carey et al. (2016) focus on the role of militias in coup-proofing schemes and the security risks this entails during civil wars. Böhmelt and Clayton (2018) compare the reliance on paramilitary forces and pro-government militias.

MEASUREMENT To our knowledge, no comprehensive dataset of regimes' coup-proofing techniques exists. Although one can find data on 'counterbalancing' and 'ethnic stacking.' Several datasets on intra-regime military actors can verify if they are used for this purpose by rulers. For instance, the *Pro-government Militias Database Version 2.0* covers 504 pro-government militias (and their details) across the globe between 1981 and 2014. (Carey et al. 2022) The *State Security Forces (SSF)* dataset, which includes 375 security forces in 110 countries, 1960-2010, tracks how each security force is commanded, staffed, equipped, and deployed, as well as the number of security forces and potential counterweights in each state's security sector as a whole. (De Bruin 2020b) Zooming in on another coup-proofing tech-

nique, the *Ethnic Stacking in Africa Dataset* provides the first comprehensive data on the ethnic stacking practices of all African countries from independence to 2018 (with 95.7% of leaders and 98.3% of country years recovered) (Harkness 2022). While not specifically gauging the ethnic constellation of paramilitaries, the *Ethnic Power Relations (EPR) Data Set (version 3)* by A. Wimmer et al. (2009) identifies all politically salient ethnic groups in political regimes (1946-2010, global coverage) and their respective access to state power.

KEY SIGNIFICANCE & IMPACT ON POLICY The study of coup-proofing matters greatly to assess the military threat of foreign nations or explain the breakout of civil wars, but it has also been paramount to understanding a country's descent into chaos after autocratic (especially personalist) **ousters** (e.g., Saddam Hussein in Iraq in 2003 or Muammar Qadaffi in Libya in 2011) Western allies supporting 'emerging' democracies after such ousters, were forced to contend with the limited effects of their military training programs, because of the stubborn coup-proofing policies of their protegees. This became very visible when al-Maliki's Iraqi army crumbled against the much smaller ISIS troops in 2014. Similarly, the Taliban takeover in Afghanistan in 2021 was facilitated by the Afghan army because troops were routinely stationed in provinces far away from their homes and families, resulting in high desertion rates (Hoekstra 2020; Matisek 2021).

EXAMPLES The most prominent example of an ongoing assessment of the combat effectiveness of an autocratic military is Putin's Russia. Since his regime's invasion of Ukraine in February 2022, the military superpower was bogged down within a month of its surprise offensive, despite its numerical overweight and large stockpiles of weaponry, and this is down to coup-proofing:

"The leadership culture is dictatorial and enforced by fear. Corruption is structurally encouraged by the Kremlin so that the civilian authorities have the threat of legal action against military commanders. Corruption, however, wreaks havoc on Russian logistics. Fear of punishment has created a military in which soldiers will doggedly implement orders even when they no longer make sense." (Watling 2022)

Russian troops turned out to be demoralized, under-equipped and under-trained, with sporadic evidence of mutinies among the rank-and-file (at times even going as far as murdering their own officers), large-scale defections, and (at times) unseen infighting of parallel security services (with open animosity of their respective commanders) vying for influence in the Kremlin.

METHODOLOGICAL ISSUES The main challenge in the study of coup-proofing is the general secrecy clouding the inner circle and security service politics. Scholars unable to rely on classified intelligence obtained by foreign secret services have few inroads to gauge the internal hierarchies of a regime save from puzzling together fragmented evidence or interviews with defectors. Another issue is that there is not so much transcontinental comparative research. The bulk of the case studies are drawn from MENA (see: 'regional variation' below), and few studies actually distinguish between monarchic, military, party-based and personalist regimes, even when these differences matter greatly. Van den Bosch (2021) accounts for different coup-proofing techniques in (African) **personalist regimes** with a civilian or military institutional outlook and even finds some distinctive patterns for civilian personalist regimes run by (former) military officers.

Keep in mind that works probing military efficiency and the impact of coup-proofing use different standards of how the former should be measured. For frameworks relating to coup studies, see Finer 1962; Brooks & Stanley 2007; Reiter 2020. When assessing coup-proofing by counter-balancing security forces, note that the mere presence of a military actor (paramilitary, militia, mercenary group, etc.) in a regime does not mean they are actually engaged in coup-proofing. They might have other functions (denunciations, strike-breaking, punishment campaigns, etc.)

REGIONAL VARIATION Not all area studies have equally contributed to research on coup-proofing, but this field is relatively new, so new insights are expected from these still under-explored regions.

MENA Due to the high geopolitical stakes in this region, most scholarship analyzing coup-proofing has been applied there. Although the tradition traces back to the works of K.M. Pollack (1996, 2002) and R.A. Brooks (1998), the **Arab Spring** really kickstarted the study of coup-proofing in MENA. (Albrecht 2015b; Al-Hamdi 2020) Many works deal with several specific case studies: Libya (Gaub 2013; Nassif 2021a); Tunisia (Brooks 2013; Nassif 2014, 2021a); Egypt (Quinlivan 1999; Brooks 2006; Nassif 2014, 2021a/b; Albrecht 2015a); Syria (Quinlivan 1999, Nassif 2014, 2021a; Florescu 2017) Yemen (Makara 2013); Turkey (Bacik & Salur 2010; Kaynar 2022); Saddam's Iraq (Quinlivan 1999, Kiyani 2021); post-war Iraq (De Bruin 2014; Nassif 2014; Bausch 2018; Hoekstra 2020); Iran (Roush 2022); Bahrain (Louër 2013); the Gulf states (Hertog 2011; Barany 2021); and Saudi Arabia (Quinlivan 1999; Mabon 2012).

Sub Saharan Africa This region has, strangely, received far less attention despite its higher number of recorded coups, but there are some older comparative works (First 1970) and new ones (Khisa & Day 2022) available, as well as some selected case studies, like Uganda (Rwengabo 2012; Murphy 2016); Guinea-Bissau (and its alliance politics) (Boutton 2019); and the Ivorian conflict (Murphy 2016). Van den Bosch (2021) features comparative overviews backed by in-depth case studies but exclusively focuses on this practice under **personalist rule**. Rabinowitz and Jargowsky (2018) look at how African dictators – instead of buying off urban consumers – forge alliances with rural elites to (successfully) thwart coups. Very interesting is the analysis by Mehrl & Choulis (2021) looking at French colonial legacies (setting up paramilitaries for control) that translate into contemporary coup-proofing styles afterward.

Latin America This infamous coup-prone region (before and during the Cold War) is similarly ignored by coup-proofing scholars (although general works on civil-military relations abound). The few available works, in particular, tackle the regimes of the radical, populist side of Latin America's 'New Left' (Rittinger & Cleary 2013; Rittinger 2020), such as Evo Morales of Bolivia, Rafael Correa of Ecuador, Manuel Zelaya of Honduras, and Hugo Chávez and Nicolás Maduro of Venezuela (Martin 2017; Norden 2021).

Indo-Pacific After independence, this world region hosted a large mix of civilian, military, revolutionary and personalist regimes with widely diverse civil-military traditions. Few comparative works exist, with J.S. Hoadley (1975) covering the years 1933-1975 and A. Croissant (2013) comparing different coups (and their success and drivers) for five countries: Myanmar (Burma), Thailand, Indonesia, Papua New Guinea, and Fiji. Other case studies cover the Philippines (Marcum & Brown 2017) and (democratic) India (Joshi 2015).

Eurasia Eurasia is very much overlooked when it comes to coup-proofing because there are so few coups. Its long legacy of revolutionary indoctrinated militaries precludes a culture of 'coup traps' (see Box 5.2). Georgia (1991-1992) is a rare example. Emerging research is mostly focused on Russia, for instance, Matveev 2022. Europe and the West consists mostly of consolidated democracies, which are inherently more resistant to coups due to their diffused political power. In the US, Donald Trump's 'coup attempt' (the 6 January 2021 US Capitol attack) did trigger some debate if the country (and others like Brazil) would be resilient enough to withstand such (attempted) populist *autogolpes* (Golby 2021; Gramer 2022).

NEW FRONTIERS Interesting is the impact of military academies on coup-plotting cultures and how Western foreign interventions coupled with military training programs (establishing military schools) can actually increase coup risk in non-democratic regimes or emerging democracies. (Böhmelt et al. 2019) Also Mehrl & Choulis (2021) deserve a mention for their exploration of colonial legacies regarding this topic. Another outlier is a rare historical example of early-modern Spain (1850-1915) and its coup-proofing legacies (Sabaté et al. 2022).

Disinformation

Falsehood flies, and the truth comes limping after it
– Jonathan Swift

Disinformation refers to the deliberate dissemination of false or manipulated information with the intent of misleading or deceiving. It includes spreading various types of inaccurate content for political advantage or financial gain. Disinformation, rooted in **propaganda**'s history, became more accessible, affordable, and effective with the spread of social media. Using false information helps non-democratic leaders stay in control, as autocracies with high levels of disinformation are less likely to undergo democratization.

DEFINITION Intentionally disseminated false information is designed to mislead or deceive (Fallis 2014; Hernon 1995). This includes all forms of inaccurate, misleading, or false information designed, presented, and promoted to cause public harm or for profit on purpose (Kapantai et al. 2020). Its circulation poses a threat to the notions of fact and truth when citizens believe and give credibility to false, inaccurate, or misleading messages (Pérez-Escolar et al. 2023). According to D. Fallis (2015), the term 'to disinform' denotes an activity close to lying.

Disinformation is characterized as *"intentional falsehoods spread as news stories or simulated documentary formats to advance political goals"* (Bennett & Livingstone 2018: 124). E. Humprecht's definition (2019) introduces a profit motive, describing disinformation as information intentionally created and posted on various websites, subsequently disseminated via social media for either profit or social influence. Disinformation can also be seen as a form of political communication (Freelon & Wells 2020).

SEE ALSO Disinformation is closely associated with fake news, **propaganda**, manipulation of individuals and groups, and information warfare. Disinformation can be labeled as 'black propaganda' because it operates covertly and depends on spreading false information. Both **democracies** and **autocracies** spread disinformation, both internally and externally. Autocracies that are willing to manipulate information extensively and spread false narratives are likely to employ traditional forms of **repression** as well. Disinformation relates also to the rise of **cyber warfare** and **digital authoritarianism.**

KEY SIGNIFICANCE At its core, disinformation represents an assault on the integrity of knowledge. When false information circulates and is accepted as truth by members of society, it contaminates the information environment (Tsipursky 2017). Disinformation can erode public trust in science, experts, elites, and politicians, with some of these figures possibly being the originators and spreaders of false information (Pérez-Escolar et al. 2023). Usually, disinformation is perceived as a threat to democracy. According to Bennet and Livingstone (2023: 1): "*The intentional spread of falsehoods and related attacks on the rights of minorities, press freedoms, and the rule of law all challenge the basic norms and values on which institutional legitimacy and political stability depend*."

The dissemination of false or inaccurate information has been a phenomenon present in human soci-

Box 3.2 Kremlinology: The Dark Art of Arcane Comparative Politics

Kremlin political intrigues are comparable to a bulldog fight under a rug. An outsider only hears the growling, and when he sees the bones fly out from beneath, it is obvious who won.
– Winston S. Churchill
Kremlinology (…) arose not at Harvard but in the Soviet Union. It was how the regime itself operated, and in some ways it was what everyone living there did, to varying degrees, at varying levels, from their immediate environment up to the Kremlin. Kremlinology was, one could say, a way of life.
Stephen Kotkin (2002: 49)

Kremlinology is the study and analysis of closed and opaque autocracies with particular focus on the leadership, domestic elite politics and its foreign policy executive by aid of intelligence, the critical induction of official documents, and other sources. The goal is to explain or predict policy initiatives using a range of techniques employing methods from sociology, political psychology, and critical readings of political biographies of elites, combined with insights from game theory. Like the FBI's psychological profiling of serial killers in the US in the early 1970s, Kremlinology is afflicted by the problem of data scarcity. As an approach, it is far from perfect, but when applied rigorously, supported by middle-range theories, it is more than just intellectual speculation.

The concept derives from the 'Kremlin' (Кремль – *Kreml'* in Russian) in Moscow, the most (in)famous of all fortified citadels of this type, and the seat of power in the USSR and the Russian Federation. Historically, a *kremlin* is any fortified palace complex in a major town, but this impregnable 'information black box' inside Soviet Russia's closed society became a symbol of secretive 'byzantine court' politics at the height of the Cold War.

As a set of analytical frameworks, kremlinology has been applied to other autocracies out of necessity, because of their extreme secrecy. Obvious objects of study are contemporary Russia and China because of their high stakes in the world order, but two other cases with long kremlinologist traditions are Turkmenistan and North Korea (due to their extreme isolation at the international level). Cuba and Laos (Sayalath & Creak 2017) are still communist, and thus kremlinologists can rely on old tools to analyze their shared socio-political practices of signaling and **propaganda**. In the same fashion, Azerbaijan, Belarus, Kazakhstan and Uzbekistan also share such legacies (and **censorship** models).

The term emerged in the late 1950s and early 1960s (Jacobson 2016), but the approach was increasingly criticized and ridiculed by the end of the Cold War. In a witty satire on Cold War kremlinologists, Patrick Cockburn (1988) derisively noted that *"the perceptions of* [visiting journalists] *were conditioned less by the interviews they conducted than by the quality of the hotels in which they stayed. In the absence of concrete information, visitors regarded the particular virtues or failings of their hotel as a symbol of the condition of Soviet society as a whole."* Cockburn does have a point, observing that the old kremlinologists missed the fact that by Brezhnev's time there was no longer a small group of top officials who wholly determined policy and that society can fundamentally change (even under **totalitarianism**), despite the reactionary mindset of the leadership. Cockburn and others rightfully criticize the intentional fallacies, confirmation biases, selection biases that did creep into mainstream kremlinology by the 1980s. As Russia became more open and chaotic after Gorbachev's reforms, some kremlinologists failed to acknowledge this and stuck to their old ways. Urging a new journalism in the post-Cold War world, H.A. Grunwald (1993) wrote that *"gone are the days when clues to Moscow politics could be read in the lineup atop Lenin's tomb and between the lines of the official press."* (Similarly, the reputation of criminal profiling has been damaged by rogue pundits, overestimating its limits and boasting that their insights will directly lead to arrests.)

Kremlinology's reputation seems to have clearly made a comeback around 2020 with the unabashed title of Alexander Baturo and Johan A. Elkink's book: *The New Kremlinology: Understanding Regime Personalization in Russia* (2021); especially after Russia's all-out invasion of Ukraine and the renewed journalist focus on ongoing power struggles within regimes in Russia (Osborne 2023) and China (Ferreira Marques 2022)

Note that most case studies are characterized by **personalist rule**, which allows for simpler analytical models of game theory (with one leader versus subordinate elite factions) in contrast to more collegial regimes (with their ebb and flow of various ruling elite coalitions). Many such rulers also revert to 'versailling' (see **coup-proofing**) referring to the theatrical, ritualistic power politics in which domestic elites are forced to partake to profess their loyalty and which can be used by analysts to gauge regime hierarchy. Key topics for kremlinology are **personalization**, **succession** and **transitions**, but also the understanding of dynamics behind **purges**, actual or attempted **coups d'état**, or reforms.

Kremlinology draws on the collection of fragmented sources to induct changing power relations among elites. Observers look at the relationships of top officials with the supreme power-holder and other leaders of the regime, their policy influence, rhetoric, and career trajectories (Baturo & Elkink 2021: 20). Continuously, dedicated country experts come up with innovative techniques, even if they would never label themselves as kremlinologists. A (temporary) opening of archives is considered to be a unique moment of truth, but even here there are limits to what the surviving 'everyday' paperwork of top regime officials can reveal. Barros (2016) and Kotkin (2002) provide some excellent critical thoughts on how to approach such sources.

Most famous is the study of altered footage of the Russian Revolution, with pictures and films portraying

its leaders. As time went on, first Lenin purged ideological dissidents from the politburo (Box 8.4), then Stalin eliminated rivals on his path to supreme power. Russian historiography, tightly controlled by the state, evolved alongside these events to reflect the current official narrative, resulting in the careful removal of disgraced fellow revolutionaries from famous pictures and films, and literally rewriting Soviet history.

The critical study of discourse is of course key in these studies – not only what is said and how it is said, but also what is omitted. Elites operating in these regimes are adept at deciphering small nuances in official discourse, but then again, their life sometimes depends on it. For instance, where the study of foreign policy is concerned, Urbansky and Trecker (2018), in their treatment of state media as intra-bloc diplomatic tools, explore the official portrayal of Communist China in the East German, Hungarian and Polish press, looking for disparities that not only highlight the uncertainty surrounding the Sino-Soviet split, but also finding that satellite states opportunistically used their national media to pick sides, e.g. during the Sino-Indian conflict.

The public displays of court politics (entwined with **personality cults**) can yield important information as well. For North Korea, Ishiyama (2014) studies the changing composition of the leadership networks around both Kim Jong-Il and Kim Jong-Un, using data from the entourages that accompanied these rulers on their "on the spot guidance" inspection tours of factories, government facilities and other public events. Similarly, Newson and Trebbi (2018) track the specific biographical information of North Korean cadres to map their co-appearances in official public events, broadcast by the state propaganda agency, inducting clear factional jousting as Kim Jong-Un consolidated his rule.

Kremlinology is a crude tool, but lacking authentic or reliable sources it remains a necessity in order to study the most opaque regimes.

eties for centuries (Kapantai et al. 2020). However, digital media technology, particularly social media, facilitated the swift production and widespread distribution of incorrect information through decentralized and distributed networks (Benkler et al. 2018). In non-democratic regimes, the proliferation of disinformation represents a formidable challenge to the pursuit of truth and the functioning of an informed citizenry. **Digital authoritarianism** is on the rise, bolstered, i.e., by the widespread and relatively unrestricted dissemination of disinformation on social media platforms, accompanied by the seemingly ever-expanding market of accessible and affordable ICT tools.

While social media serves as 'liberation technology' for democratic mobilization (Diamond 2012), playing a crucial role in the arsenal of activists (Pospieszna & Galus 2019), it simultaneously provides authoritarian regimes with a means to enforce **censorship**, control information dissemination, promote pro-regime **propaganda**, manipulate both domestic and foreign populations, and monitor and **repress** citizens (Polyakova & Meserole 2019; Morozov 2011; Pearce & Kendzior 2012; Aday et al. 2010; Kendall-Taylor et al. 2020). Consequently, digital authoritarianism is reshaping the power dynamics between democracies and autocracies (Polyakova & Meserole 2019).

In autocracies, the manipulation of information becomes a key instrument for consolidating power, as state actors exploit media channels to disseminate **propaganda** that aligns with their narratives. The findings of Y. Sato, F. Wiebrecht and S.I. Lindberg's (2023) global comparative study on disinformation and episodes of regime transformation indicate that in authoritarian regimes, the use of disinformation aids rulers in maintaining their grip on power, as regimes characterized by elevated levels of disinformation are less prone to democratization episodes. Conversely, in democracies, disinformation raises the likelihood of **autocratization** onsets, but disinformation itself is unlikely to lead to a complete democratic breakdown. G. Schleffer and B. Miller (2021) observed in robust authoritarian regimes an inten-

sifying effect of social media, suggesting that autocrats can effortlessly disseminate disinformation and fake news both domestically and internationally, fortifying their hold on power. Critiquing the disinformation strategies as instances of authoritarian efforts to manipulate new media platforms may seem straightforward. However, it is equally plausible to identify similar tactics used by democratic governments (Mejias & Vokuev 2017).

L. Hunter's (2022) findings from a cross-national analysis of 158 states from 2000-2019 indicate that social media disinformation, the utilization of social platforms for coordinating offline violence, and online political polarization diminish the overall levels of democracy.

Social media has various political effects on both democratic and authoritarian states, with a weakening effect on strong democratic regimes, a radicalizing effect on weak democratic regimes, an intensifying effect on strong authoritarian regimes, and a destabilizing effect on weak authoritarian regimes (Schleffer & Miller 2021). Disinformation plays a significant role in the weakening of strong, liberal democracies by amplifying extreme views and conspiracy theories, increasing polarization, sowing doubts, and weakening people's trust in democratic institutions and processes. In weak democratic regimes, the utilization of social media platforms to spread fake news and disinformation during an election process results in a radicalizing impact by deepening domestic polarization, exacerbating politics, and embracing nationalism. In both weak and strong democracies, the malign, disinforming use of social media as a part of 'perception management' can be orchestrated both by domestic populists and external, usually authoritarian forces like Russia (see 'examples' below).

In non-democratic regimes, the proliferation of disinformation represents a formidable challenge to the pursuit of truth and the functioning of an informed citizenry. The deliberate spread of false or misleading information, often orchestrated by authoritarian governments, serves as a potent tool for maintaining control, suppressing dissent, and shaping public perception.

ORIGIN The notions of 'dis-' and 'misinformation' have a history as long as that of communication itself (Pérez-Escolar et al. 2023). False information existed long before its wide circulation became facilitated by the invention of the printing press (Aïmeur et al. 2023). In Roman times, Octavian's **propaganda** campaign against Mark Anthony, which deployed slogans etched onto coins to smear Antony's reputation circa 44 BCE (Posetti & Matthews 2018), can be seen as evidence of early disinformation campaigns.

The term 'disinformation' originated in the Russian language as *desinformatsiya* (десинформатсия) in 1923, denoting "*false, mistaken, or misleading information in an intentional, deliberate, or purposeful effort to mislead, deceive, or confuse*" (Fetzer 2004: 231). Initially, it was closely associated with spies and **intelligence services**. For decades, various entities, including individuals, groups, and governments, have attempted to manipulate public opinion by disseminating falsified and forged information to influence political alignments.

G.S. Jowett and V. O'Donnell (2012) characterize disinformation as 'black propaganda' due to its covert nature and reliance on false information, drawing a connection to the historical KGB division, *desinformatsiya*, dedicated to such **propaganda**. Political forces have long employed deception and disinformation to gain an advantage over adversaries, with *Operation Bodyguard* during World War II serving as a notable documented instance of successful deception (Shu et al. 2020). *Operation Bodyguard* was the code name for a WWII disinformation campaign implemented by the Allied states and aimed at misleading the Germans about the intended location of the D-Day invasion of northwest Europe in 1944; the strategy involved the transmission of false radio signals and the fabrication of deceptive military reports regarding the landing site (Farquhar 2005). The notion of disinformation has been in widespread use since the 1950s (Manning et al. 2014).

Examples of prototypical disinformation include misleading advertising in both business and politics, government **propaganda**, manipulated photographs, forged documents, fictitious maps, Internet scams, fraudulent websites, and even edited Wikipedia entries (Fallis 2014).

LITERATURE Most of the scholarship on disinformation has focused on definitions, the social spheres where disinformation is recognized as problematic, and the sources responsible for creating or disseminating disinformation along with its channels. Despite the plethora of scientific studies on the field, many of them introduce *ad hoc* and isolated approaches, resulting in a fragmentation problem (Kapantai et al. 2021). Scholars across various disciplines, including communications, political science, and psychology, are paying attention to the creation, consumption, and spread of disinformation.

The literature offers a rich picture of the *what*, *who* and *of* the channels, with rather a modest picture of the *effects* of disinformation (Pérez-Escolar et al. 2023). While studies generally recognize disinformation as a significant challenge for democracies, certain scholars contend that its reach and influence are limited (Lanoszka 2019; Allcott & Gentzkow 2017; Grinberg et al. 2019; Guess et al. 2019). The major themes in research on disinformation pertain to the field of health, politics and democracy, and conspiracy theories. Studies on dis-informative sources examine social network users, mainstream media outlets, anonymous online personas, and political actors (Pérez-Escolar et al. 2023). Scholars have concentrated also on fact-checking – a process of debunking false and manipulated information. A wide range of journalistic and non-profit organizations currently engage in different practices and procedures to correct false information (Graves & Cherubini 2016; Walter et al. 2020).

A diverse array of actors, including trolls, bots, fake news websites, conspiracy theorists, politicians, highly partisan media outlets, mainstream media, and foreign governments, play overlapping and sometimes competing roles in generating

and amplifying disinformation in the contemporary media landscape. Across various disciplines, research has delved into the motivations and functions of these actors in the creation and dissemination of disinformation (Faris et al. 2017; Linvill & Warren 2020; Tsfati et al. 2020).

Considerable disagreement exists in both academic research and policy circles regarding the classification of the terms *disinformation* and *fake news* (Aïmeur et al. 2023; Kapantai et al. 2021). Disinformation is different from misinformation, which relates to unintentional behaviors that inadvertently mislead (Chadwick & Vaccari 2019). *Disinformation* and *fake news* are often unjustifiably used as synonyms. The latter is a broad and ambiguous label encompassing various forms of communication containing some degree of falsehood. Furthermore, it has been manipulated by far-right political entities as a strategic tool in their efforts to undermine media outlets that stand in opposition to them (Farkas & Schou 2018; Koliska & Assmann 2021). The Collins English Dictionary defines *fake news* as false and frequently sensational information presented as news reporting; however, the term has evolved and now commonly refers to the dissemination of false information (Cooke 2017). It does not have to be spread with the intention of causing harm, as in the case of disinformation.

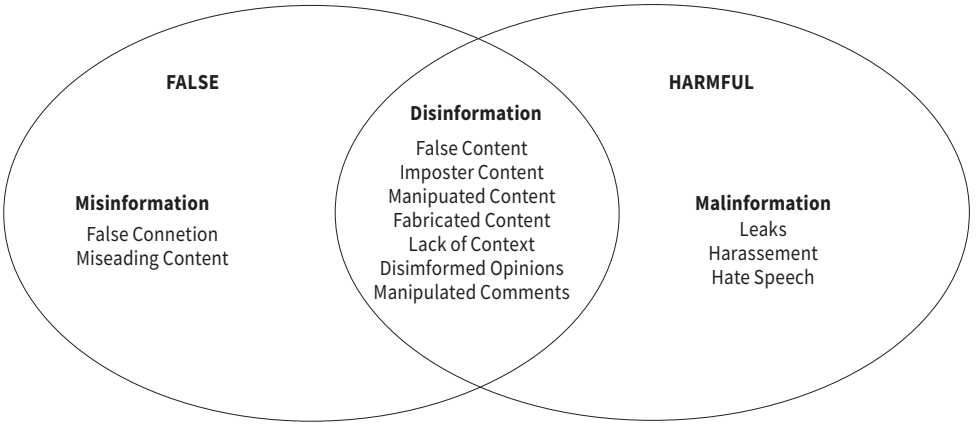
When reflecting on this expanding field of study, according to L. Ha et al. (2021), covering the scholarly development for the period 2008 to 2017, nearly half of the analyzed 142 journal articles about fake news and misinformation over the past decade were written by communication scholars and psychologists. The authors did not distinguish information in terms of intent to cause harm or lack thereof, but when mapping the literature, they also included disinformation.

Key research topics identified include the causes and motivations behind the production of fake news and misinformation; sources of such content; how audiences identify or recognize fake news; the effects of fake news and misinformation; the content, attributes, and characteristics of fake news; strategies and solutions to combat or reduce misinformation; and the consumption, processing, and memory of fake news and misinformation. (Ha et al. 2021). The influence of American scholars on the topic remains evident, particularly in terms of author affiliations and study settings. To highlight this, the authors included tables comparing research topics studied in the US with those examined in non-US contexts. (Ha et al. 2021: 304-305).

CLASSIFICATIONS A widely accepted framework (Wardle & Derakhshan 2017) classifies information disorder into three types: mis-, dis-, and mal-information, as shown in Figure 3.2. This conceptual framework hinges on the dimensions of harm and falseness. Misinformation involves unintentionally sharing false information, while dis-information entails knowingly spreading falsehoods to cause harm. Mal-information, in contrast, involves sharing authentic information with malicious intent, often exposing private details publicly (similar to 'kompromat' in Box 8.3). This framework offers a concise understanding of the diverse manifestations and motivations behind information disorder.

C. Wardle and H. Derakhshan (2017) delineate seven categories of dis- and misinformation, illustrating the extensive range of problematic online content. These categories encompass satire or parody, misleading content, impostor content, fabricated content, false connection, false context, and manipulated content. Satire and parody, which, although artistic expressions, can transform into misinformation when audiences misinterpret the intended message, to outright fabricated content.

Distinct typologies have been proposed by researchers, offering valuable frameworks for classifying and comprehending the diverse manifestations of misinformation. S. Zannettou et al. (2019) delineate categories such as fabricated content, **propaganda**, impostors, conspiracy theories, hoaxes, and biased or one-sided information. S. Kumar and N. Shah (2018) propose a classification encompassing misinformation, disinformation, opinion-based, and fact-based content. V. Lemieux and T.D. Smith introduce categories including disinformation, hoax, bias in fact selection, rumor, hyperbole, and misinformation. These typologies provide researchers and scholars with structured approaches to categorize the multifaceted nature of false information.



D. Fallis (2014) proposes a classification of intentionally misleading information in general: misleading about the accuracy of the content; misleading about the source believing the content; misleading about the identity of the source; misleading about an implication of the accuracy of the content.

MEASUREMENT The absence of a unanimous definition for disinformation has fueled disagreement on how to measure it. Disinformation can be measured by examining false or manipulated pieces of information or disinformation narratives through content analysis and/or qualitative discourse analysis (Al Khaja et al. 2018; León et al. 2022; Patra & Pandey 2021; Punziano et al. 2021; Scannel et al. 2021; Xia et al. 2019). Actors of disinformation can be explored by implementing social network analysis (Guarino et al. 2019; Luo et al. 2021; Shrivastava et al. 2020; Sivasankari & Vadivu 2021). Data can also be scrapped directly from fact-checking organizations' websites (Lee et al. 2023).

Scholars try to measure the scope of disinformation (Golovchenko 2020; Fletcher et al. 2018), its effects as well as resilience to disinformation. The dimensions that could be measured regarding disinformation are motive, 'facticity,' and verifiability (Kapantai et al. 2021). To understand the emotional impact of disinformation and its effects on individuals exposed to or sharing it, in-depth interviews or similar qualitative research with small, purposeful samples are necessary (Pérez-Escolar et al. 2023).

Certain authors highlight the inconclusive nature of empirical evidence regarding the rise of online disinformation and its societal consequences, particularly noting a limited understanding of the situation outside the US. This underscores the need for a framework conducive to cross-national com-

Figure 3.2 – A Typology of Disinformation in the Social Media Environment

parative work. To address this issue, E. Humprecht et al. (2020) developed a predictive framework for cross-country assessment of exposure to disinformation, comprising multiple indexes: a populism index (inverted), polarization index (inverted), media trust index, shared media, the strength of PBS (public broadcasting services), social media index (inverted), and market size (inverted).

Created using the **Varieties of Democracy** (V-Dem) infrastructure, the *Digital Society Project* (DSP) offers data from 2000-2021 for 179 countries that can be utilized to investigate disinformation. Available indicators include government dissemination of false information domestically and abroad, party dissemination of false information domestically and abroad, foreign governments dissemination of false information and foreign governments' (misleading) ads (Mechkova et al. 2022). Data are coded by experts and describe different aspects of 'coordinated information operations' (Mechkova et al. 2022: 14-16). V-Dem/DSP's data proved valuable as variables in global comparative studies (Sato et al. 2023; Chang et al. 2023) and provided concise insights into selected cases (Walsh 2020; Wiebrecht 2022; Köhler 2023).

To obtain data from social media, researchers created *NewsGuard ratings*, *CrowdTangle* and *comScore* (Altay et al. 2022; Edelson et al. 2021; Recuero et al. 2022; Sanderson et al. 2021; Théro & Vincent, 2022). *CrowdTangle*, a public insights tool (owned by *Meta*), is commonly used by scholars to derive data on public content spread on Facebook and Instagram (CrowdTangle 2021). An application of content analysis to *CowdTangle* data is also possible (Punziano et al. 2021).

There are several thematic databases regarding disinformation/misinformation/fake news (depending on the incorporated definitions) available:

EUvsDisinfo database An open repository of disinformation cases originating in pro-Kremlin outlets. The database uses data analysis and media monitoring services in multiple languages and is updated every week, currently containing 16303 cases of Russian disinformation (as of 26 November 2023). Data can be filtered by country/region, language, data and thematic tags. *EUvsDisinfo* is led by the EU *East Stratcom Task Force*.

CIC Truth Seeker Dataset 2023 The Canadian Institute for Cybersecurity's (University of New Brunswick) benchmark datasets with more than 180,000 labeled tweets (posts on Twitter/X) related to 700 real and 700 false information. The data for the *Truth Seeker* and *Basic ML* datasets were generated through the crawling of tweets related to Real and Fake news from the *PolitiFact Dataset*.

PolitiFact Fact Check Dataset This comprises 21,152 fact-checked statements between 2008 to 2022 coming from the *PolitiFact* website, categorized into six levels of truthfulness. Records include sources of appearance and links to the fact-checked article published by *PolitiFact* – a fact-checking organization.

The Fact Checker's database documents 30,573 false or misleading claims made by US President D. Trump while in office (2017-2020). The dataset filters the statements by topic, source, frequency, and date and provides fact-checks.

CHECKED This Chinese COVID-19 misinformation dataset based on the *Weibo platform* provides a total of 2,104 verified suspected news information ('microblog' posts) related to COVID-19 from December 2019 to August 2020, identified by using a list of keywords. The dataset contains information on reposts, comments, likes and multimedia information (Yang et al. 2021).

ESOC COVID-19 *Misinformation Dataset* records 5,613 stories on misinformation/disinformation efforts on social media and news outlets from different countries from the early days of the pandemic through the end of December 2020. It features a listing of select URLs carrying disinformation based on *ESOC, AFP,* and *NewsGuard* data. The dataset was created by

ESOC Empirical Studies of Conflict at Princeton University.

PolitiFact-Oslo Corpus A dataset for false information analysis and detection; contains samples of both fake and real news in English, collected from the fact-checking website *PolitiFact.com*. The main application of the dataset is automatic fake news detection (Põldvere et al. 2023).

FakeCovid A multilingual cross-domain dataset of 5,182 fact-checked articles concerning COVID-19, collected from 4 January 2020 to 15 May 2020 (Shahi & Nandini 2020). Data are available in 40 languages from 105 countries.

METHODOLOGICAL ISSUES studies focusing on citizens usually have smaller sample sizes compared to those examining social networks (Pérez-Escolar et al. 2023). The former, often using experimental designs, explores how ordinary people consume and respond to disinformation. On the contrary, the latter concentrates more on identifying and describing the spread of disinformation, employing larger samples through methods like tweets, *Facebook* likes, *WhatsApp* messages, or *Instagram* interactions.

M. Pérez-Escolar, D. Lilleker and A. Tapia-Frade (2023) examined 756 publications on disinformation and found 74.6% of articles to be empirical and the remaining 25.4% to be essays. In empirical studies, there is a leaning toward descriptive studies (69%) rather than causal (1.9%) and experimental studies (29.1%). In terms of research methods, the majority (72.1%) of studies preferred quantitative methods rather than qualitative (26.3%). Other conclusions come from a review of fake news studies. It uncovered that the methodologies and data-gathering techniques employed in fake news research were distributed as follows: 64.1% qualitative, 28.2% quantitative, and 7.8% mixed methods (Arqoub et al. 2020).

Comparative cross-national studies on disinformation are rare (Chang et al. 2020; Sato et al. 2023). In the example of Sub Saharan Africa, D. Madrid-Morales and H. Wasserman (2021: 41) summed up that methodological challenges remain "*the difficulty to identify the most appropriate unit of comparison, and the importance of taking proactive steps to guarantee research outputs that are inclusive of the diverse range of individual experiences with disinformation.*"

EXAMPLES Disinformation is pervasive globally, encompassing various contexts. It manifests in issues ranging from health concerns like the safety of childhood vaccinations to environmental challenges like global warming and even extends to consumer topics (Tsfati et al. 2020). In the realm of disinformation literature, three pivotal thematic areas stand out. The initial focus revolves around COVID-19, which was accompanied by intense efforts by scientists all over the world to understand the mechanisms of creating, disseminating and believing in false information on the pandemic, vaccines and health in general (Ball & Maxmen 2020; Das & Ahmed 2021; Siwakoti et al. 2021). The authors of UNESCO's policy brief on Deciphering COVID-19 disinformation coined the term *disinfodemic* and pointed out nine key themes of it (Posetti & Bontcheva 2020: 1).

A notable illustration of deliberately propagated misinformation surfaces in the domain of climate disinformation (Gwiazdon & Brown 2023; Lewandowsky 2021; Treen et al. 2020). Climate change disinformation involves spreading false or misleading information to downplay the severity of climate change, often driven by vested interests seeking to undermine public awareness and policy efforts. The third overarching theme that commands attention in the literature is disinformation orchestrated by political entities, spanning both democratic and authoritarian regimes.

Democratic regimes Scholars generally concur that the campaigns during the 2016 US presidential election and the UK referendum on EU membership (Brexit) heightened conversations regarding the possible impact of intentionally misleading content disseminated to target audiences (Humprecht et al. 2020; Pérez-Escolar et al. 2023). Donald Trump, the former and current president of the United States, leads with an unprecedented frequency of distortions, misleading statements, and outright lies, contributing significantly to a substantial erosion of trust among Americans (Brenner 2020). The *Washington Post* Fact Checker team cataloged Trump's 30,573 false or misleading claims over four years of his first presidency (Kessler et al. 2021). Trump's loss in the presidential election in 2020 and the subsequent disinformation campaign #StopTheSteal, falsely claiming Joe Biden had stolen the election, can be seen as the inciting incident in the Capitol attack that took place on 6 January 2021 (Jeppesen et al. 2022). His 2024 electoral campaign and current presidency continue this trend.

Similar events related to the spread of disinformation took place two years later in Brazil when supporters of the country's far-right former president, Jair Bolsonaro, stormed the country's congress, presidential palace and supreme court in Brasilia (Sullivan 2023). Both Trump and Bolsonaro were found to spread disinformation related to COVID-19 and presidential campaigns (Brenner 2021; Ferreira & Alcantara 2023; Froehlich 2021; Ricard & Medeiros 2020; Ozawa et al. 2023) to obtain political advantage. GSP's data show a notable surge in Brazil's and the US's domestic spread of false information (Köhler 2023). Those two examples illustrate how public figures can utilize disinformation as a weapon to undermine democratic standards and mobilize the electorate and supporters. In the aforementioned research conducted by G. Schleffer and B. Miller (2021), the impact of social media on robust democracies, considering disinformation, is illustrated through the weakening influence observed during the 2016 US Trump presidency. Additionally, the radicalizing effect is exemplified by the rise of Bolsonaro in Brazil.

Authoritarian regimes Russia and China have emerged as leaders in **digital authoritarianism**, developing and exporting technology-driven strategies for non-democratic governance (Polyakova & Meserole 2019). Disinformation tools are central to both coun-

tries' propaganda efforts (Huang 2015; Rozenas & Stukal 2019). Beyond influencing their populations, autocracies like China, Russia, and Iran use disinformation campaigns to expand their geopolitical influence by either attacking or supporting other nations (Chang et al. 2023). Data from the GSP highlights a steady rise in the spread of false information abroad by China, Iran, Russia, and Turkey since 2000 (Wiebrecht 2022). China's disinformation efforts are particularly evident in its extensive attacks on Taiwan, a frequent target of its neighboring autocracy (Chang et al. 2023; Dickey 2019; Walsh 2020).

In recent decades, Russia has adeptly employed **propaganda** and disinformation to influence public opinion internally and externally (Polyakova & Meserole 2019; Lucas & Pomeranzev 2016; Schleffer & Miller 2021), with social media platforms amplifying their impact. Ben Nimmo (2015) characterized Russia's disinformation tactics as dismissing the critic, distorting the facts, distracting from the main issue, and dismaying the audience. Randolph et al. (2023) added, causing distrust. Importantly, Russia has been found to directly interfere in democratic elections in liberal-democratic states through social media, most notably in the US (Davis 2018; Linvill & Warren 2020; Guess & Lyons 2020; Polyakova & Meserole 2019). For these reasons, Russia is referred to and analyzed by both scholars and policymakers as a notable example of utilizing disinformation on multiple fronts.

Russian disinformation campaigns are known for their strategic use of information to deceit and manipulate public opinion domestically and internationally – the war in Ukraine highlights all of this. Examples of such disinformation can be found in, for instance, the *EUvsDisinfo database,* EEAS (2023) report on foreign information manipulation and interference, The Atlantic Council's (2023) *Digital Forensic Research Lab*'s report on Kremlin information operations aimed at eroding global confidence in Ukraine and the NATO Parliamentary Assembly's (2023) report on defense against Russia's disinformation campaigns. The latter includes case studies of tactics targeting Europe as well as African and Latin American countries. Most common disinformation narratives regarding the war in Ukraine are outlined in a few reports issued by the European Digital Media Observatory. Russian and Chinese disinformation and propaganda about the war in Ukraine were compared by Legucka and Szczudlik (2023).

While some authors suggest that the turning point for the global epidemic of disinformation started with Russia's invasion of Ukraine in 2014 (Khaldarova & Pantti, 2016), others highlight that the phenomenon of coordinated political disinformation campaigns, propaganda and rumors have long been a part of the social fabric, even before disinformation has become an important subject of scholarly debate in the Global North (Wasserman & Madrid-Morales 2022). Many non-democratic countries are experiencing a growth in routine disinformation by authoritarian governments (Wasserman & Madrid-Morales 2022).
